Substantial changes in the x-ray equipment have occurred over the last decade. The movement from cine film to a digital medium has been completed, and the transition from the standard image intensifier to the flat-panel image detector is in progress. Flat-panel detectors enhance image uniformity and brightness and have a much greater dynamic range compared to the standard image intensifier. Radiologists routinely receive formal training in understanding how x-ray images are created, but this learning process is much more informal in cardiology. This section provides an overview of how x-ray images are made and discusses the role of each of the pieces of equipment. The major changes over the last decade include changes in the generator, x-ray tube, image detector, image processing, and image display. The dose-area product (DAP) is a measure of the total radiation exposure and is derived from an ionizing chamber on the output of the x-ray tube. It does not address the amount of radiation to specific organs. The use of the interventional reference point (IRP) is recommended to estimate the amount of skin dose the patient receives.

The biological risk from x-rays is due to disruption to the cellular DNA backbone either by direct or indirect (free-radical) injury. A deterministic injury results in enough individual cellular death to create organ dysfunction. These types of injury are dose-dependent (such as skin burns). A stochastic injury to the DNA results in mutations or cancers, and a single x-ray can be at fault. Although the likelihood of this happening increases with the dose, it is not dose dependent. The effective dose encompasses the stochastic risk and is used to provide a metric of radiation safety. It is the weighted sum of the estimates of dose to each individual organ. The breast, bone marrow, and lungs are among the most sensitive organs in this model. The effective dose correlates with the DAP.

The IRP dose at the isocenter of the gantry (usually the midportion of the patient) is derived by estimating the dose in the midportion of the patient and then dropping back 15 cm (assuming that is where the skin on the patient's back is located). It provides an estimate of the deterministic injury dose.

Recommended guidelines for patient and operator dose limits to reduce deterministic and stochastic injury are provided in the document and reflect current National Council on Radiation Protection and Measurements (NCRP) reports. The NCRP now accepts as a minimum the wearing of a single monitoring device on the thyroid collar; however, the recommended 2-monitor technique provides the best estimate of risk. A pregnant worker must also wear a monitor at waist level under the lead apron. Maximum allowable radiation for medical workers is 50 millisieverts (mSv) per year whole body and a lifetime cumulative dose of 10 mSv × age.

An understanding of x-ray image formation and basic radiation safety principles allows for the understanding of means to limit exposure to both the patient and operator. Exposure to the patient can be reduced by minimizing the framing rate, reducing imaging time, use of retrospectively stored fluoroscopy instead of acquisition, use of pulse fluoroscopy, and limiting use of "high-dose" fluoroscopy, avoiding magnification when possible, using collimation and other filters at the output of the x-ray tube, keeping the image detector close to the patient, and avoiding angulation that increases the source-to-image distance. For the operator, the same rules apply. Plus it is important to remember time, distance, and barriers. The impact of x-rays decreases in proportion to the inverse-square law ($1/d^2$). Lead shielding is effective if use properly.

All cardiac catheterization laboratories manufactured since 2005 are required to provide real-time exposure information, including reference point air kerma. Most fluoroscopes also

Downloaded from content.onlinejacc.org by on May 16, 2012

provide DAP readings. A summary of these data should be incorporated in the patient record and part of the QA/QI process.

Special Concerns for the Pediatric Catheterization Laboratory

There are 120 specialized children's hospitals in the United States, and all have cardiac catheterization facilities. All facilities that perform cardiac catheterization on pediatric-aged patients must have the full complement of resources available, including cardiovascular surgery. Pediatric laboratories may be dedicated facilities or shared with an adult program.

Differences in Goals Between the Pediatric Laboratory and the Adult Laboratory

Diagnostic catheterizations in children are essentially always focused on structural heart abnormalities. Hemodynamic measures plus chamber and vessel angiography are much more commonly done than in adult laboratories. Because of the variability in patient size, most data are indexed to body surface area. Often the procedure requires significant sedation or general anesthesia. Due to improvements in noninvasive imaging, three fourths of all pediatric catheterizations are therapeutic and not simply diagnostic. A substantial number of unique procedures are performed in congenital heart disease (such as atrial septostomy) and are not applicable to adults. Therapeutic procedures that might also be performed in certain adult congenital patients include PFO and ASD closure, valvuloplasty, angioplasty, stent implantation in pulmonary and arterial vessels, vascular closure (patent ductus arteriosus, fistulae, anomalous vessels), devise closure of a ventricular septal defect, transcatheter pulmonary or aortic valve replacement, foreign body retrieval, pericardiocentesis, endomyocardial biopsy, and a range of electrophysiological procedures. Hybrid procedures are becoming more important where novel access may be provided (i.e., palliation of the hypoplastic left heart patient with access provided directly through the anterior right ventricle).

Who Should Perform Pediatric Catheterizations?

All pediatric catheterizations should have a director responsible for all aspects of the laboratory operation, similar to the adult laboratory. Attending physicians should be board-certified in pediatrics and at least board eligible in pediatric cardiology. There may be exceptional cases where a competent operator can be granted privileges, but this should not be common practice.

The pediatric age range is from 0 to 18 years. It is recommended that catheterizations in patients within this age range be done by a pediatric cardiologist. Adult congenital heart disease patients may have procedures performed by a pediatric cardiologist or with an adult and pediatric cardiologist together. The only exception is the adult cardiologist with a special interest and expertise in adult congenital heart disease.

Quality Assurance Issues in the Pediatric Cardiac Catheterization Laboratory

Complication rates differ substantially from the adult laboratory and are much higher due to the serious nature for many of the disease processes and the critical hemodynamic state at the times encountered. In 1 registry, adverse events in the pediatric laboratory were found to be 16% overall, with 10% related to diagnostic catheterization and 19% related to interventional procedures. Death occurred in 0.9%. The latest addition of pediatric data to the ACC-NCDR via the IMPACT (Improving Pediatric and Adult Congenital Treatment) registry should provide ongoing monitoring of these procedures. By necessity, informed consent is usually provided by the patient's parents. Similar concerns regarding informed consent in the adult laboratory still apply.

Inpatient Versus Outpatient Settings for Procedures

For most children, an overnight stay following the procedure is medically prudent. This is especially the case with young children where it is difficult for them to remain still after the procedure. Any blood loss may be significant in small children. Often families have traveled long distances, and local medical attention to a problem may not exist. Despite the small size, the sheaths used during pediatric catheterizations are similar to those in adults (5-F to 8-F). Each laboratory should establish a written policy on who might be expected to be discharged immediately following the procedure.

Operator and Laboratory Volumes

Similar to the discussion regarding adult laboratories, the heterogeneity of the patient population and the low volume of procedures make specific minimum volumes problematic. The American Academy of Pediatrics Guidelines suggests the use of specific outcome benchmarks rather than minimum operator or laboratory volumes as a guide to competence. The committee consensus, however, suggests a minimum operator volume of 50 per year and a minimum laboratory volume of >100 per year seems reasonable.

Having a robust QA/QI program in pediatric laboratories is of great importance. There should essentially be no "normal" cardiac catheterization procedures. The same rules outlined for an adult QA/QI program apply to the pediatric laboratory otherwise.

Procedural Differences Compared With the Adult Cardiac Catheterization Laboratory

The need for specific baseline laboratory data greatly differs in the pediatric catheterization laboratory. Many patients do not have noncardiac disease and are not on any medications. There is no standard laboratory data required before the procedure, and no standard pre-medication regiment. Se-

JACC Vol. 59, No. 23, 2012
June 5, 2012:xxx

dation is almost always required to perform the procedure. Vascular access is also individualized depending on whether the patient is a neonate, young or older child, or is of adult size. Most procedures are performed via the femoral artery and vein. Transseptal procedures are common. Newborn procedures are performed generally via the umbilical vein. Venous access can also be accomplished via the internal jugular, subclavian, basilica, and transhepatic approaches. In very young children, balloon aortic valvuloplasty or stenting open the patent ducts may require a carotid artery cut-down. Heparin is variably used during the procedure, whereas vascular occluders are not used in children. As more invasive percutaneous methods are being developed, the potential for catastrophic events increases. There should be access to ECMO in addition to routine resuscitation equipment.

Biplane x-ray capabilities should be standard, though certain procedures can be done with single-plane systems satisfactorily.

Hemodynamics and Angiography

Right and left heart hemodynamics and angiography are routine procedures and require high-resolution equipment to ensure the diagnosis. The framing rates depend on the patient's heart rate and 30 frames per second (fps) is often required to capture all the necessary information. Due to the high heart rates, contrast must be injected at a higher rate (i.e., over 1 to 2 s).

Laboratory Personnel

There is essentially no difference in the types of personnel needed to run an efficient pediatric catheterization laboratory dedicated to the highest standards compared with an adult laboratory.

Radiation Protection and Pregnant Patients

The same principles apply in this age group as with adults. Children are more susceptible than adults to the stochastic effects from ionizing radiation (they live longer and that increases the risk of a cancer developing). A urine or serum beta-HCG level should be obtained within 2 weeks of the procedure in menstruating women. If a pregnant patient must be studied, all of the previously described means to reduce radiation exposure should be followed, and the abdominal and groin area should be shielded from direct x-ray exposure. Scattered radiation still occurs, however.

Summary

The cardiac catheterization laboratory has undergone major changes in the last decade. It is a much more sophisticated environment where a gradual shift in emphasis from a diagnostic laboratory to a therapeutic environment is occurring. As the risk of both diagnostic and interventional procedures has declined, there has been liberalization in the types of patients who may safely have procedures performed in both outpatient settings and in laboratories without cardiovascular surgical backup. The influence of peripheral vascular and structural heart intervention has also required a change in focus for many laboratories and has given rise to the hybrid cardiac catheterization facility. The advances in percutaneous therapies for structural heart disease are just now beginning to impact both the adult and pediatric catheterization laboratory.

Some of the routine practices in many laboratories are being questioned. For instance, the committee no longer suggests a protime be obtained before a procedure, unless an abnormality is anticipated. Overnight NPO orders should be replaced with shorter-term fasting as hydration is important. Acetylcysteine is no longer recommended to reduce contrast nephropathy.

QA is a focus of this report, and its importance is mounting as it becomes harder to justify minimum volume requirements for both the operator and the laboratory. The importance of national databases to provide benchmarks is emphasized.

Radiation safety has also entered into the discussion more prominently as patients and regulators have expressed concern regarding the amount of medical radiation the public receives. Measures of the amount of radiation exposure should be a routine part of the cardiac catheterization report.

The cardiac catheterization laboratory and its functions will continue to evolve and grow over the next decade as newer devices and treatment options emerge. The cardiac catheterization laboratory of today differs significantly from that of a decade ago. It is anticipated that the cardiac catheterization laboratory 10 years from now will undergo a similar evolution.

1. Introduction

The last expert consensus document on cardiac catheterization laboratory standards from the ACCF and SCAI was published in 2001 (1). Although the fundamentals of invasive cardiovascular procedures remain unchanged, many changes have occurred related to the catheterization laboratory and its operational environment. Modifications and evolution have occurred with the imaging equipment technology, the range of diagnostic modalities, the spectrum of pharmacological therapies and mechanical interventions, and the local delivery of cardiovascular health care. Community hospitals without surgical backup have begun performing diagnostic catheterizations on higher-risk patients as well as elective interventional procedures on lower-risk patients, and community programs have been developed that permit onsite primary angioplasty on patients with AMI. At the same time, the cardiac catheterization laboratory has become a multipurpose interventional suite undertaking many therapeutic procedures for the coronary, cerebral, and peripheral vessels, providing corrective intervention for congenital and structural heart disease, sometimes merging with surgical suites into hybrid procedure rooms for valvular and

Downloaded from content.onlinejacc.org by on May 16, 2012

complex nonvalvular interventions. This document is designed to update the latest information regarding the catheterization laboratory environment and its operation.

1.1. Document Development Process and Methodology

The development of consensus documents involves multiple healthcare professionals and often 2 or more medical societies. Given the importance of practice guidelines and expert consensus documents, governing principles have been established to ensure the accuracy, balance, and integrity of the content, as well as the composition of committees responsible for these documents. The ACCF has created a methodology manual for expert consensus document writing committees that can be accessed at www.cardiosource.org (2).

1.1.1. Writing Committee Organization

This writing committee was commissioned by the ACCF TF CECD in conjunction with SCAI. Coordination and staff support were provided by the ACCF. Nominations for writing group membership were made to the TF CECD with representatives and liaisons solicited from the TF CECD, SCAI, STS, and SVM. Care was taken to select acknowledged experts in cardiovascular catheterizations and interventions with members from both the academic and private practice sectors and representing a diverse geography. The committee consisted of 16 members: 12 from ACCF, 3 from SCAI, 1 from STS, 1 from SVM, and 1 invited radiation physicist content expert.

1.1.2. Relationships With Industry and Other Entities

As part of the nomination and application process, all writing committee candidates were required to provide an up-to-date disclosure of their relationships with industry and other entities (RWI). Both the ACCF and SCAI believe that including experts on writing committees who have relationships with industry strengthens the writing effort, though a stringent approach to keeping all relationships transparent and appropriately managed is necessary. As such, it was required that the majority (>50%) of writing committee members had no RWI relevant to the entire document. All relevant relationships occurring in the prior 12 months were required to be disclosed (Appendix 1), including the nature and extent of the relationship, as well as the establishment of new industry relationships at any time during the document writing process. Members with relevant RWI were not allowed to draft or vote on document sections where a conflict may have been perceived present.

The writing committee chair was selected by the TF CECD chair, and it was required that this individual have no relevant RWI. The writing committee chair along with support staff created and reviewed a tentative outline of sections for the consensus document. Companies, vendors, and other entities that had products or services related to the catheterization laboratory document were identified and categorized according to which sections of the document a relationship might exist. Writing committee members were then selected and assigned to specific sections. Each section had a primary author who could have no relevant RWI for that section or topic area. Each section also had 1 primary (internal) reviewer from the writing committee.

1.1.3. Consensus Development

The writing committee convened by conference call and e-mail to finalize the document outline, develop the initial draft, revise the draft per committee feedback, and ultimately sign off on the document for external peer review. All participating organizations participated in peer review, resulting in reviewers representing 371 comments. A group of 10 experts, separate from the writing committee, was selected for official review: 3 were nominated by ACCF, 3 by SCAI, 2 by STS, and 2 by SVM. In addition, 21 content reviewers from 3 ACCF Councils provided comments. There were no restrictions regarding the reviewers' RWI, though all reviewers were required to provide full disclosure regarding relevant relationships. This information was made available to the writing committee and is included in Appendix 2.

Comments were reviewed and addressed by the writing committee. A member of the ACCF TF CECD served as lead reviewer to ensure that all comments were addressed adequately. Both the writing committee and TF CECD approved the final document to be sent for board review. The ACCF Board of Trustees and SCAI Board of Directors reviewed the document, including all peer review comments and writing committee responses, and approved the document in February 2012.

The STS and SVM endorsed the document in February 2012. This document is considered current until the TF CECD revises or withdraws it from publication.

1.1.4. Document Methodology

The writing committee for this expert consensus document on cardiac catheterization laboratory standards began by reviewing the 2001 "ACC/SCAI Clinical Expert Consensus Document on Cardiac Catheterization Laboratory Standards" (1). At the same time, the group conducted a brief review of the literature and clinical practice evolution relative to the catheterization laboratory environment. With this insight, it was agreed that there was enough important information to warrant a new consensus document. A formal review of the literature was performed and clinical data were reviewed considering a range of cardiovascular topics including, but not limited to, the following: hospitals and clinical environments with and without surgical back-up for complex diagnostic and interventional procedures; QA, proficiencies, and patient safety; procedural and postprocedural management issues including unique patient groups; new pharmacological and mechanical therapies; laboratory designs, imaging equipment, and technologies.

1.2. Purpose of This Document

The workplace and function of the cardiac catheterization laboratory has steadily evolved over the last 70 years. Although numerous historic events have occurred during this time, and the developmental phases of the catheterization laboratory are not strictly delineated, 4 broadly defined intervals can be considered. In the earliest phase, roughly from 1940 to 1960, procedures were primarily focused on hemodynamic assessments and structural heart disease. With the development of radiographic techniques and subsequently surgical revascularization, anatomy-focused diagnostic studies became the mainstay of laboratory activity in the interval from 1960 to 1980. The advent of PCI and multiple percutaneous revascularization devices were the hallmarks requiring changes in the catheterization laboratory in the era from 1980 to 2000. Most recently, interventions on peripheral and cerebrovascular disease, structural cardiac abnormalities, and percutaneous valve therapies are influencing the needs and resources of the catheterization laboratory.

2. The Cardiac Catheterization Laboratory Environments

2.1. The Current Landscape

Over the 10 years since the publication of the "ACC/SCAI Clinical Expert Consensus Document on Cardiac Catheterization Laboratory Standards" (1), much has changed in the cardiac catheterization laboratory. The importance of invasive hemodynamic assessment has been supplanted by major improvements in noninvasive imaging technologies. With this change, there has been an unfortunate loss in the capability of many laboratories to provide complex hemodynamic information, even when it might be of value clinically. The focus has now shifted primarily to coronary anatomy assessment, where sophisticated tools now allow for low-risk coronary interventions that were completely unavailable just a decade ago. Improved techniques have also reduced the overall risk for cardiac catheterization and transformed diagnostic catheterization into an outpatient procedure. Similar advances in interventional methods have nearly eliminated the need for immediate surgical standby for low-risk procedures, and a substantial amount of interventional procedures are now being performed in settings without an in-house coronary surgical team even available—something the prior consensus document condemned.

Of the 5,099 hospitals in the United States, the 2007 National Healthcare Cost and Utilization Project statistics note that a remarkable number of hospitals, a total of 4,345 (85.2% of all), now provide cardiac catheterization services, and 1,061 (20.8%) provide cardiac surgical services (3). As reported in the 2009 Update on Heart Disease and Stroke statistics from the AHA (4), the total number of inpatient cardiac catheterizations, however, actually declined slightly from 1996 to 2006, despite the incidence of inpatient PCI rates increasing from 264 to 267 per 100,000 population. During the same period, the incidence of coronary artery bypass grafting (CABG) declined from 121 to 94 per 100,000 patients (5). It is clearly a very dynamic time in the cardiac catheterization laboratory.

2.2. General Complications From Cardiac Catheterization Procedures

With the increase in the widespread use of cardiac catheterization, there has been a general decline in the risk of the procedure. Complication rates from diagnostic catheterization are quite low. As suggested by the "ACCF/AHA/SCAI Clinical Competence Statement on Cardiac Interventional Procedures" in 2007 (6), complications can generally be divided into 3 major categories: coronary vascular injury, other vascular events, and systemic nonvascular events. Major adverse cardiac and cerebrovascular events (MACCE) include death, stroke, myocardial infarction (MI), and ischemia requiring emergency CABG. MACCE for diagnostic procedures occurs in <0.1% of diagnostic procedures (6). Additional complications include vascular access site complications, contrast nephropathy, excessive bleeding, and other miscellaneous complications such as arrhythmias, hypotension, coronary perforation, and cardiac tamponade. The specific definitions of cardiac catheterization complications have been standardized to a great extent and outlined by the ACC-NCDR (7).

In a single-center review of diagnostic cardiac catheterization for 7,412 patients over a 10-year period (8), only 23 (0.3%) had major complications, and there were no deaths related to the diagnostic procedure. Complications were least common after procedures done by more experienced physicians, when smaller catheter sizes were used and when only left heart (and not left and right heart) procedures were performed. Obese patients had more vascular complications. Data from the ACC-NCDR database regarding PCI for both elective procedures and for acute coronary syndromes (ACS) are shown in Table 1 (9). These data reveal a trend toward fewer complications from PCI and a low risk-adjusted in-hospital mortality of 2.0% for ACS patients who had undergone PCI and 0.5% for elective PCI patients.

In 2009, the Mayo Clinic published 25-year trend data regarding their experience with 24,410 PCI procedures (10) (Fig. 1). The authors analyzed the first 10 years (1979 to 1989), the period from 1990 to 1996, the period from 1996 to 2003, and then finally the period from 2003 to 2004. They found that despite an older and sicker population with more comorbid conditions, the success rate from PCI had improved from initially 78% to 94%, hospital mortality had fallen from 3.0% to 1.8%, and the need for emergency CABG had dropped from 5% to 0.4%. In their latest assessment, major adverse complications following PCI occurred in only 4.0% of in-hospital patients.

Arteriovenous fistula	0.07	0.05	0.27	0.27
Bleeding complications, %				
Access site bleeding	1.20	0.78	0.67	0.49
Retroperitoneal bleeding	0.33	0.42	0.25	0.17
Gastrointestinal bleeding	0.54	0.67	0.27	0.15
Genitourinary bleeding	0.20	0.13	0.07	0.05
Other bleeding	0.60	0.97	0.27	0.27
In-hospital outcomes, %				
Transfusion after PCI	5.1	4.7	2.6	2.3
Stroke	0.3	0.3	0.1	0.1
Emergency bypass	0.4	0.4	0.2	0.2

Note: all outcomes are self-reported with only a small portion validated. Modified with permission from Roe et al. (9). Source of new data: ACC-NCDR Cath PCI Registry.
ACS = acute coronary syndrome (includes unstable angina); BMS = bare-metal stent; DES = drug-eluting stent; Non-ACS = those without any acute ischemic criteria; PCI = percutaneous coronary intervention.

2.3. The Cardiac Catheterization Laboratory at a Hospital With Cardiovascular Surgical Capability

Table 2 outlines the optimal onsite support services that allow for cardiac catheterization to be performed safely in any patient with heart disease. A hospital with all of these services is considered a "full-service" facility. Although cardiac surgical capability is the defining service, the other important support services listed are critical for optimal patient care and management. The catheterization laboratory in this setting is fully equipped for the most complex studies. Although direct surgical intervention is infrequently needed during percutaneous interventional procedures, the associated depth of expertise within the facility (technology, equipment, personnel, and specialized physicians such as anesthesiologists, perfusionists, and surgeons) have experience with the most complex cases and greater experience with emergent and critically ill patients. Often associated higher volumes translate into improved patient care and outcomes for high-risk patients. Therefore, although surgical service may not be directly required, the associated local expertise is available should the need arise. Essentially all laboratories that have full support services are located in a hospital setting. There may be special situations where a mobile laboratory is temporarily attached to or in an adjacent facility beside the hospital. In this latter setting, the situation should be considered similar to the inpatient laboratory with full support services in the hospital.

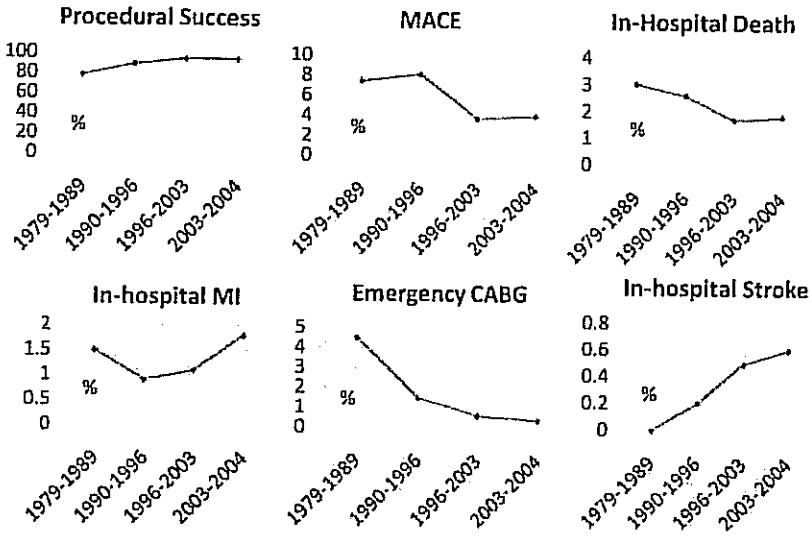

Figure 1. Trends in In-Hospital Outcomes Following PCI: The Mayo Clinic Experience

Modified with permission from Singh et al. (61). In-hospital MI = Q-wave MI; MACE = major adverse cardiovascular events.

2.3.1. Patients Eligible for Invasive Cardiovascular Procedures at a Hospital With Full Support Services (Including Cardiovascular Surgery)

In this environment, all patients and all procedures can, in general, be safely undertaken, provided the operators are sufficiently experienced and competent in the procedures being performed. Even though a hospital may have the appropriate support services as outlined above, some patients should still be referred to an even more highly specialized center if the technical expertise and experience required (e.g., transseptal puncture, valvuloplasty, assessment of complex congenital disease, and percutaneous ASD occlusion) are not available. To this end, there is a growing number of centers focused on structural heart disease. This is particularly true for the pediatric patient population. The laboratory setting appropriate for the pediatric population is outlined in Section 10.7 of this document.

Table 2. Optimal (Recommended) Onsite Support Services for Invasive Cardiac Procedures

Cardiovascular surgery
Cardiovascular anesthesia
Intensive care unit
Vascular services
Nephrology consultative services and dialysis
Neurology consultative services
Hematologic consultative and blood bank services
Advanced imaging services (echocardiography/Doppler, MRI, CT)
Mechanical circulatory support services
Endovascular surgery/interventions
If a pediatric catheterization laboratory, similar services for pediatric-aged patients

CT = computed tomography; MRI = magnetic resonance imaging.

2.4. The Cardiac Catheterization Laboratory at a Hospital Without Cardiovascular Surgical Capability

With the increase in the number of cardiovascular laboratories over the last couple decades, the performance of both diagnostic and interventional coronary procedures is now becoming more commonplace in settings without cardiovascular surgery, despite guideline recommendations limiting PCI in these settings. Perhaps surprisingly to many, evidence exists that having a strict CON regulatory program is only modestly associated with lower rates of cardiac catheterization. In fact, in 1 review, only minimally reduced rates of equivocally or weakly indicated procedures for AMI were found in CON states, whereas the presence of a CON requirement had no effect on strongly indicated procedure rates (11).

The actual number of laboratories without onsite surgical backup providing either elective or primary PCI is difficult to confirm. Data from the ACC-NCDR database suggests that about one third of the laboratories performing cardiac catheterization do not have cardiovascular surgery backup, with at least elective PCI being performed without surgical backup in around one fourth (ACC-NCDR database information).

These data are similar to other databases. For instance, from July 2000 through December 2006, according to the National Registry of Myocardial Infarction (NRMI), 35.1% of participating hospitals providing primary PCI reportedly did not have onsite surgery. Of note, only a little more than half (53.6%) were in rural settings (12), suggesting the possibility of multiple primary PCI sites in an urban environment.

There are limited data on comparative costs, but 1 report suggests that the costs and charges of elective PCI at a hospital without cardiovascular surgery might be considerably more than those at a full-service hospital ($3,024 more in costs and $6,084 more in charges) (13). Based on the available information, therefore, anywhere from about one fourth to one third of

Downloaded from content.onlinejacc.org by on May 16, 2012

the currently operating cardiac catheterization laboratories do not have onsite cardiovascular surgery. This is quite a large number considering that most national organizational guidelines have discouraged the practice over the last decade.

Some insight into which patient groups might benefit from undergoing PCI can be gained by considering risk factors for periprocedural death. The latest data from the New York State Cardiac Advisory Committee (2005 to 2007) is of interest and summarized in Table 3. It seems appropriate to be cognizant of the patients at greatest risk for developing an adverse outcome when considering whether PCI can be safely done in low-volume settings or in those institutions without cardiovascular surgical programs.

Table 3. Multivariate Risk Factors for Deaths Within 30 Days Following PCI, 2005–2007

Risk Factor	Prevalence	Odds Ratio
Non-emergent PCI risk factors		
Demographic		
Body surface area squared		3.0
Ventricular function		
LVEF 40% to 49%	13.3%	1.9
LVEF 30% to 39%	6.1%	2.8
LVEF 20% to 29%	3.2%	2.1
LVEF <20%	0.8%	3.9
Preprocedural MI		
MI; 1 to 7 days prior	12.9%	3.4
MI; 8 to 14 days prior	1.3%	3.4
Comorbidities		
Cerebrovascular disease	8.0%	2.0
CHF, current	5.4%	2.6
COPD	6.4%	2.6
Malignant ventricular arrhythmias	0.4%	4.1
Peripheral vascular disease	7.3%	1.8
Renal failure, creatinine 1.6 to 2.5 (mg/dL)	5.9%	1.9
Renal failure, creatinine >2.5 (mg/dL)	1.4%	2.4
Renal failure, dialysis	2.1%	4.2
Vessels diseased		
Three-vessel disease	13.7%	1.8
Left main disease	3.9%	1.9
Emergency PCI risk factors		
Demographic		
Female gender	27.1%	1.8
Hemodynamic state		
Unstable	4.1%	4.4
Ventricular function		
LVEF 20% to 29%	6.2%	2.2
LVEF <20%	1.2%	3.7
Comorbidities		
CHF, current	5.1%	2.3
Malignant ventricular arrhythmias	1.6%	3.3
Renal failure, creatinine 1.1 to 1.5 (mg/dL)	38.2%	1.7
Renal failure, creatinine 1.6 to 2.0 (mg/dL)	4.7%	3.2
Renal failure, creatinine >2.0 (mg/dL)	1.8%	6.0
Renal failure, requiring dialysis	0.7%	7.0
Severity of CAD (1-, 2-, or 3-vessel disease): no severity with odds ratio >1.5

CAD = coronary artery disease; CHF = congestive heart failure; COPD = chronic obstructive pulmonary disease; LVEF = left ventricular ejection fraction; MI = myocardial infarction; PCI = percutaneous coronary intervention.

Diagnostic cardiac catheterization is increasingly being performed in facilities without onsite surgical backup. These facilities include hospital settings (often rural), freestanding laboratories, and mobile cardiac catheterization units (either parked at a hospital or occasionally at a cardiovascular clinic). With diagnostic cardiac catheterization now principally an outpatient procedure, these types of laboratories have become more accepted and widespread. To ensure these sites are properly monitored, and that contingencies are in place for urgent transfer if a complication occurs that may require surgical intervention, SCAI has proposed a list of requirements for offsite surgical backup of PCI procedures (14). Before performing elective procedures, the cardiothoracic surgeon must be available and the receiving hospital must be capable of accepting patients before the procedure is initiated. These requirements are outlined in Table 4 and have been modified by this committee. Although primarily designed for programmatic backup of interventional procedures, similar requirements should be in place even for diagnostic procedures in a setting without onsite cardiovascular surgery. The focus of these requirements is to ensure that a written and monitored program is in place before any invasive cardiovascular procedures are considered acceptable in a facility without onsite cardiovascular surgery.

2.4.1. Patients Acceptable for Diagnostic Cardiac Catheterization at a Facility Without Cardiovascular Surgical Capability

Given the low risk of complications outlined above and the favorable reports regarding both safety and the quality, the committee feels that the prior relatively stringent restrictions regarding eligibility for undergoing diagnostic cardiac catheterization suggested in the 2001 cardiac catheterization standards document may now be relaxed. The highest-risk patients are still better served clinically in a laboratory with onsite cardiovascular surgical backup. For the most part, however, the vast majority of stable patients can safely undergo diagnostic cardiac catheterization in this setting. Table 5 outlines the current recommendations regarding the specific types of patients who should be excluded from laboratories without cardiovascular surgical backup and contrasts them with the previous document (1). The committee feels these newer recommendations better reflect the reality of the clinical care currently being provided in the cardiology community. The data to support this change are based on available literature for identifying the high-risk patient and a general consensus of the committee.

2.4.2. Patients Acceptable for Elective Coronary Intervention in a Facility Without Cardiovascular Surgical Capability

There are now multiple reports that the performance of elective PCI in hospitals without onsite cardiovascular surgery has acceptable outcomes and risk, if proper patient

Downloaded from content.onlinejacc.org by on May 16, 2012

Table 4. Minimum Requirements for the Performance of Invasive Cardiovascular Procedures in a Setting Without Onsite Cardiovascular Surgical Services

1. A working relationship between the interventional cardiologists and cardiothoracic surgeons at the receiving hospital must be established.
2. The cardiothoracic surgeon must have privileges at the referring facility to allow review of treatment options.
3. Surgical backup must be available for urgent cases at all hours and for elective cases at mutually agreed times.
4. Ideally, face-to-face meetings between cardiothoracic surgeons and cardiologists involved should occur on a regular basis.
5. Before performing elective procedures, the cardiothoracic surgeon must be available and the receiving hospital must be capable of accepting the patient before the diagnostic or PCI procedure is started.
6. The interventional cardiologist must review with the surgeon the immediate needs and status of the patient should an urgent transfer be required.
7. The interventionalist should be familiar with and have available appropriate life support devices, such as an intra-aortic balloon pump.
8. The interventionalist should be qualified to deal with emergencies such as pericardial tamponade (pericardiocentesis) and embolization, should either event occur.
9. Hospital administrations from both facilities must endorse a transfer agreement.
10. Both the referring and the receiving hospital must have a rigorous and detailed protocol for rapid transfer of patients, including a listing of the proper personnel.
11. A transport provider must be available to begin transfer within 20 minutes of a request and must have appropriate life-sustaining equipment.
12. The transferring physician should obtain surgical consent prior to transfer.
13. The initial diagnostic and PCI consent should inform the patient that the procedure is being done without onsite surgical backup.

Modified with permission from Dehmer et al. (14).
PCI = percutaneous coronary intervention.

selection, procedural precautions, and backup preparations are in place. Data from the ACC-NCDR reveal an increase in the number of such facilities from 8.7% to 16% during the period from 2004 to 2005 (15), despite national guidelines to the contrary. As suggested by the NRMI database, the number may be as high as 25% to 35% in 2010.

Table 5. General Exclusion Criteria for Invasive Cardiac Procedures in a Setting Without Cardiothoracic Surgery

Exclusions: Catheterization Laboratory Without Cardiothoracic Surgical Backup	
2001 Document	**Current Document**
Diagnostic procedures	
Age >75 years	No age limitation
NYHA functional class 3 or 4	No limitation
Pulmonary edema due to ischemia	Pulmonary edema due to ischemia
Markedly abnormal stress test with high likelihood of LM or 3-vessel disease	No stress test result limitation
Known LM coronary disease	No coronary anatomic restriction
Severe valvular dysfunction with reduced LV function	No valvular or LV function limit unless severe (Class 4) symptoms
Patients at risk for vascular complications	Permissible only if vascular services are available
Complex congenital heart disease	Complex congenital heart disease
Acute or intermediate coronary syndromes	ACS except where PCI procedures are approved
All pediatric procedures	All pediatric procedures
Therapeutic procedures	
Diagnostic or therapeutic pericardiocentesis	Pericardiocentesis allowed if operator competent
All therapeutic procedures in adult congenital	All therapeutic procedures in adult congenital
All pediatric therapeutic procedures	All pediatric therapeutic procedures
Elective PCI	Elective PCI permissible under specified guidelines (55)
Primary PCI (not available at time)	Primary PCI permissible under specified guidelines (55)

The current recommendations are compared to the prior consensus document (1).
ACS = acute coronary syndrome; LM = left main; LV = left ventricular; NYHA = New York Heart Association; PCI = percutaneous coronary intervention.

Downloaded from content.onlinejacc.org by on May 16, 2012

This issue remains controversial. This may especially be the case when other active PCI programs are located within the same geographic area. It behooves the cardiology community to foster these programs only when such programs improve access to a higher level of cardiovascular care than would otherwise be available. This has become a particular hot button issue since the publication of certain politically provocative articles such as COURAGE (Clinical Outcomes Utilizing Revascularization and Aggressive Drug Evaluation) (16), which suggests PCI did not improve the rates of death or MI in patients with stable angina, or SYNTAX (Synergy Between Percutaneous Coronary Intervention with Taxus and Cardiac Surgery) (17), which asserts that PCI with drug-eluting stents is inferior to CABG for left main and multivessel disease. There is a declining volume of PCI despite the improvement in outcomes from stent technology and consistent with a better appreciation of which procedures provide optimal benefit to patients. These types of studies suggest maturation of the technology so that further expansion may be limited despite concerns regarding a need for more procedures in an aging population. To this end, some have called for a moratorium on allowing any further expansion of PCI services, especially to low-volume facilities without cardiovascular surgical backup (18).

If the financial and marketing incentives are ignored, however, when patients are appropriately selected, most published studies regarding the risks of elective PCI at facilities without onsite cardiovascular surgical backup have shown the procedure to be relatively safe. The Swedish Coronary Angiography and Angioplasty Registry (19) of 34,383 patients found no difference in outcomes of elective PCI between hospitals with or without surgical backup. Similarly community sites in the United States (10,13,20–22), Germany (23), Japan (24), the Netherlands (25), the United Kingdom (26), and Australia (27) all confirm there is little or no difference in the outcomes among patients undergoing elective PCI in hospitals with or without onsite surgery. A similar finding was suggested by an analysis of 4 controlled trials (28–31) involving 6,817 patients (32). A meta-analysis of nonprimary PCI (elective and urgent; n=914,288) also found no difference in outcomes in PCI performed at sites with onsite cardiovascular surgery compared with those without (33).

The issue is further complicated due to the fact the published literature to date is limited by its methodology (registries, cohort studies, self-reported, and unmonitored data) and lack of long-term follow up. In addition, the exceeding low event rate in the elective setting makes it difficult to demonstrate differences in smaller studies (type II error). Finally, there is simply a lack of large, randomized studies with independent monitoring of events in this arena.

In 2007, SCAI addressed the issue and concluded that although they were unable to support the widespread use of PCI without onsite surgery, they acknowledged that many of these programs are now in existence and suggests that criteria be met in order to ensure patient safety. They proposed that certain patient characteristics and lesion characteristics should be considered "high risk," and these features should be taken into account before deciding whether a patient is a candidate for PCI in this setting. It is the consensus of this committee that high-risk patients or those with high-risk lesions should not undergo elective PCI in a facility without onsite surgery (Table 6).

In the 2007 "ACCF/AHA/SCAI Update of the Clinical Competence Statement on Cardiac Interventional Procedures" (6), similar patient and lesion characteristics were found to be associated with higher short-term mortality after PCI and would thus be considered high risk. That statement also included the following groups as high risk: the advanced in age, females, and those with ACS, a peripheral vascular disease, or impaired renal function (especially in diabetic patients with regard to contrast nephropathy). High-risk target-lesion anatomic features included the modified 1990 classification scheme proposed by the ACC/AHA Clinical Task Force on Clinical Privileges in Cardiology (34). In that scheme, lesions were classified as Type A, Type B1, Type B2, or Type C. Type C lesions were considered the highest risk and had an angioplasty success rate of 61%, in those days, and a complication rate of 21%. The characteristics of a high-risk Type C lesion included

Table 6. Elective PCI Patient and Lesion Characteristics That Identify High-Risk Patients Who May Be Unsuitable for PCI in a Facility Without Cardiothoracic Surgical Backup

High-risk patient
1. Decompensated CHF (Killip Class 3 to 4)
2. Recent (<8 weeks) cerebrovascular accident
3. Known clotting disorder
4. Left ventricular ejection fraction ≤30%
5. Chronic kidney disease (creatinine >2.0 mg/dL or creatinine clearance <60 mL/min)
6. Serious ongoing ventricular arrhythmias
High-risk lesion
1. Left main stenosis ≥50% or 3-vessel disease (>70% proximal or mid lesions) unprotected by prior bypass surgery
2. Target lesion that jeopardizes an extensive amount of myocardium. Jeopardy scoring systems, such as SYNTAX, may be useful in defining the extent.
3. Diffuse disease (>20 mm length)
4. Greater than moderate lesion calcification
5. Extremely angulated segment or excessive proximal or in-lesion tortuosity
6. Inability to protect side branches
7. Older SVG grafts with friable lesion
8. Thrombus in vessel or at lesion site
9. Vessel characteristics that, in the operator's judgment, would impede stent deployment
10. Chronic total occlusions
11. Anticipated probable need for rotational or other atherectomy device, cutting balloon, or laser

Modified with permission from Dehmer et al. (14) and high-risk features from the New York State Percutaneous PCI Registry 2006–2007 (58).

CHF = congestive heart failure; PCI = percutaneous coronary intervention; SVG = saphenous vein grafts; SYNTAX = Synergy Between Percutaneous Coronary Intervention with Taxus and Cardiac Surgery.

Downloaded from content.onlinejacc.org by on May 16, 2012

chronic total occlusion, a high grade (80% to 99% diameter stenosis), stenosis bend of >60 degrees, and excessive tortuosity. The data from these resources suggest that high-risk patients and target lesions can be defined prior to the performance of an elective PCI procedure and that it is appropriate to avoid these patients when there is no onsite cardiovascular surgery available.

In 2011, the initial results from the randomized Atlantic Cardiovascular Patient Outcomes Research Team (Atlantic C-Port-E) trial was reported (35). Only those sites with >200 PCIs per year and performing 24/7 PCIs were eligible for enrollment. Individual operators were required to meet the standard of >75 PCI cases per year. Sixty sites participated, and 13,981 patients were enrolled at sites without cardiovascular surgery whereas 4,515 patients were enrolled at sites with surgery. The authors concluded that PCI success was >90% in both situations, but this was lower in hospitals without onsite surgery (a success rate difference of 1.1% on per-patient basis and 0.7% on lesion basis). In addition, slightly more unplanned catheterization and PCI procedures occurred in patients undergoing PCI at a nonsurgical site. Emergency CABG was rare, but it was slightly higher in sites without surgery (0.2% versus 0.1%). Overall mortality and catheterization complications were similar between the 2 groups. Their conclusion was that PCI was safe within the bounds established by the trial.

Finally, further support for the safety of PCI in facilities without cardiovascular surgery comes from the ACC-NCDR data registry (36). These data revealed that centers without onsite cardiovascular surgery were predominantly in nonurban areas, had lower PCI volumes, treated a higher percentage of patients who presented with subsets of MI, and had better reperfusion times in primary PCI than centers with onsite facilities. There was also no difference in procedure success, morbidity, emergency cardiac surgery rates, or mortality (regardless if elective PCI or primary PCI). Although the data are observational, voluntarily submitted, and included from only 60 sites without cardiovascular surgery, it does suggest the current usage of these facilities may be safe and emphasizes the importance of reporting outcomes to a national data registry.

2.4.3. Patients Acceptable for PCI in ACS in a Facility Without Cardiovascular Surgical Capability

Primary PCI has now been shown to be more effective than fibrinolytic therapy in obtaining coronary reperfusion in patients with STEMI (37). Based on GRACE (Global Registry of Acute Coronary Events) data from 1999 to 2005, the use of primary PCI increased worldwide from 16% to 53%, whereas fibrinolytic therapy decreased from 50% to 28% (38). The improvement in patient outcomes as a result of this shift has led to a growing interest in offering primary PCI to as many patients as possible. Due mostly to access issues, however, only about 33% of patients with STEMI in the United States receive primary PCI, whereas 56% still receive fibrinolytics, and the remainder receives neither (39). This has provided the impetus to consider regionalization of STEMI care in the United States and a relook at the potential advantage of primary PCI particularly at rural hospitals without onsite cardiovascular surgery (40).

A standard treatment protocol using rapid interhospital transfer of STEMI patients between 6 referral centers and 2 STEMI accepting hospitals (41) revealed that 87.7% of patients received primary PCI. Door 1-to-departure time averaged 46 minutes, and Door 1-to-balloon time at the accepting hospital averaged 117 minutes. The authors suggested that, in a coordinated healthcare system, primary PCI can be centralized.

An NRMI report compared 58,821 STEMI patients from 214 hospitals with onsite cardiovascular surgery to 52 hospitals without. The authors found no difference in mortality among patients undergoing primary PCI at the different sites. They did report, however, that the overall STEMI mortality was higher, and the patients were less likely to receive guideline-recommended medications at the hospitals without surgical backup (42). In an NRMI database follow-up report (42) involving 100,071 patients from 2004 to 2006, the in-hospital mortality was found to be lower at hospitals with cardiovascular surgical support compared with those without (5.0% versus 8.8%). Hospitals with surgical services had higher use of guideline-recommended medical therapies, which may have contributed to better outcomes.

Support for the concept of performing primary PCI at the local facility also comes from a small randomized trial (43) and 2 registries (44,45) with favorable outcomes, though a study from Michigan also suggests that expanding a primary PCI program to hospitals without onsite cardiovascular surgery only improves access to a modest degree (46). A recent meta-analysis of primary PCI for STEMI of 124,074 patients demonstrated no increase in in-hospital mortality or emergency bypass at centers without onsite surgery compared with those that had cardiovascular surgery available (33). Despite the mixed data, there remains much enthusiasm from rural and hospitals without cardiovascular surgery to offer this service. Some of this is driven by the importance of providing timely access to early reperfusion strategies for STEMI patients in the local community. It is also driven by fear of loss of profitable cardiac patients and the concern that without the service, the hospital will be perceived as less than a full-service facility.

Some of these programs are also only providing primary PCI during working hours and not during off-hours. A review from the NRMI database has pointed out that there is a 70% less likelihood of patients with STEMI undergoing primary PCI if the presentation is off-hours (12). Since no clinical characteristics explain the reason a smaller percentage of these patients undergo primary PCI, the conclusion is that the procedure is just not available when the patient arrives in the emergency department. In fact, the authors note that 47% of the hospitals in the study perform <10 primary PCIs per year, suggesting that the volume of such

Downloaded from content.onlinejacc.org by on May 16, 2012

procedures may be too low to provide optimal care when primary PCI is only performed during normal daytime laboratory hours and not 24/7.

The 2009 Focused Update of the ACC/AHA Guidelines for the Management of Patients With STEMI also focused on the strategy to be followed, depending on whether the patient initially presents to a PCI-capable facility or to a non–PCI-capable facility (47). It does not specifically address whether the hospital has onsite cardiovascular surgery. A consensus document from the SCAI notes that there is no justification for providing elective PCI procedures without onsite surgery and without providing primary PCI 24 hours a day (14). AHA has also endorsed the principle that a facility providing primary PCI care should be operating around the clock (48). There are few data in this regard, but in 1 small study, the results of primary PCI done during off-hours appears similar to those done during regular working hours (49).

The ACC/AHA guidelines for the management of acute STEMI patients focus on the development of a community-wide system. Table 7 outlines their current recommendations for triage and transfer of STEMI patients for PCI. Included in the table are definitions for the "high-risk" STEMI patient. Although it is tempting to recommend that patients with these high-risk features be excluded from primary PCI at a hospital without cardiovascular surgery services, there are no data to confidently support that recommendation. In addition, coronary anatomic features are only discovered after angiography has been performed, so it is difficult to include such features as contraindications for intervention.

In an attempt to gather data on the wisdom of the use of primary PCI in the community at large, several ongoing programs have been undertaken including regionalization of care across the United States (50): the AHA's Mission: Lifeline program (48), the Reperfusion of Acute Myocardial Infarction in Carolina Emergency Departments (RACE) (51), and the ACCF's D2B Alliance (www.d2balliance.org). These programs are all working to develop community-based approaches to providing the optimal reperfusion strategy in STEMI patients, and they are tracking the results. Regionalization and improvements regarding in-field diagnosis, transfer and triage improve access times (door to balloon [D2B], emergency medical serivces to balloon [E2B], and/or S2B [symptoms to balloon]) and can optimize the use of primary PCI while avoiding duplication of local services. Given that fibrinolytic therapies are still in use in about 25% of U.S. hospitals, and even at PCI-capable hospitals (12), the choice of a reperfusion strategy is complex.

In many geographic situations, the ability to provide primary PCI at a hospital without surgical backup is suggested as a necessary step if other systematic approaches are unable to minimize the time from symptom onset to reperfusion. Evidence from the TRANSFER-AMI (Trial of Routine Angioplasty and Stenting After Fibrinolysis to Enhance Reperfusion in Acute Myocardial Infarction) study and CARESS (Combined Abciximab Reteplase Stent Study in Acute Myocardial Infarction) studies suggest a pharmacoinvasive approach with immediate transfer to a PCI center improves outcome (52–54). If the pharmacoinvasive approach is verified, this semielective approach to PCI at a tertiary hospital may reduce the concern over needing to offer primary PCI services in the local community or all local hospitals.

The Atlantic Cardiovascular Patient Outcomes Research Team (C-Port) trial randomized 451 AMI patients at

Table 7. Recommendations From the 2009 Joint STEMI/PCI Focused Update on the Appropriate Performance of Primary PCI in Settings Without Onsite Cardiovascular Surgery

Class I: Each community should develop a STEMI system of care that follows standards at least as strong as those developed for the American Heart Association's national initiative, *Mission: Lifeline*, to include the following:

- Ongoing multidisciplinary team meetings that include emergency medical services, non–PCI-capable hospitals/STEMI referral centers, and PCI-capable hospitals/STEMI receiving hospitals to evaluate outcomes and quality improvement data;
- A process for prehospital identification and activation;
- Destination protocols for STEMI receiving centers; and
- Transfer protocols for patients who arrive at STEMI referral centers who are primary PCI candidates, are ineligible for fibrinolytic drugs, and/or in cardiogenic shock. *(Level of Evidence: C)*

Class IIa: It is reasonable for "high-risk" patients who receive fibrinolytic therapy as primary reperfusion therapy at a non–PCI-capable facility to be transferred as soon as possible to a PCI-capable facility where PCI can be performed either when needed or as a pharmacoinvasive strategy.

Consideration should be given to initiating a preparatory antithrombotic (antiplatelet plus anticoagulant) regimen before and during patient transfer to the catheterization laboratory. *(Level of Evidence: B)*

Class IIb: Patients not at high risk under the same conditions as listed in Class IIa recommendation. *(Level of Evidence: C)*

High risk is defined in CARESS-in-AMI (59) as STEMI patient with ≥1 high-risk features. High-risk features include extensive ST-segment elevation, new-onset LBBB, previous MI, Killip Class >2, LV ejection fraction ≤35% for inferior MI; any anterior MI with ≥2 mm ST-segment elevation in ≥2 ECG leads.

High risk is defined in TRANSFER-AMI (60) as STEMI patient with ≥2 mm ST-segment elevation in 2 anterior leads or ≥1 mm ST-segment elevation in inferior MI along with at least 1 of the following: systolic BP <100 mm Hg, heart rate >100 bpm, Killip Class 2 to 3, ≥2 mm ST-segment depression in anterior leads, or ≥1 mm ST elevation in right-sided V_4 lead, indicative of RV involvement.

Reprinted from Kushner et al. (47).

BP = blood pressure, BPM = beats per minute; CARESS = Combined Abciximab Reteplase Stent Study in Acute Myocardial Infarction; ECG = electrocardiogram; LBBB = left bundle-branch block; LV = left ventricular; MI = myocardial infarction; ST = the ST segment of the ECG; STEMI, ST- elevation myocardial infarction; PCI = percutaneous coronary intervention; RV = right ventricular; TRANSFER = Trial of Routine Angioplasty and Stenting After Fibrinolysis to Enhance Reperfusion in Acute Myocardial Infarction.

Downloaded from content.onlinejacc.org by on May 16, 2012

hospitals without onsite cardiovascular surgery, and at 6 months, found better composite outcome (driven primarily by a reduction in reinfarction), in the primary PCI group compared with the fibrinolytic cohort with no significant difference in mortality (43). The newest PCI guidelines have reflected the more recent data since the last Catheterization Standards document and have elevated the use of elective PCI from a Class III indication to a Class IIb (55). Primary PCI in facilities without onsite cardiovascular surgery is considered a Class IIa instead of Class IIb indication in the latest revision of these guidelines.

Recommendation: Because of the current lack of definitive data in this area, this committee recommends that all facilities that perform primary PCI in a setting without cardiovascular surgical backup comply with all current guidelines on the establishment of such a program (as outlined in this section and in the accompanying tables). It is critical the facility documents that all medication and risk stratification guidelines are being followed as well, and that the facility has availability for STEMI patients 24 hours per day, 7 days per week. The committee cannot recommend any PCI programs without cardiovascular surgical backup that only provide primary PCI coverage during daytime and weekday hours.

To further ensure quality oversight, the facility should also be part of a defined registry to monitor outcomes and track all complications on a regular basis. D2B should be tracked closely, with goal D2B times of <90 minutes in >75% of cases. Regionalized systems of care may provide a more efficient system of diagnosis and triage and transfer, and they may or may not justify the current trend of establishing primary PCI capability at hospitals without surgical backup (56).

Finally, pharmacoinvasive strategies (54,57), if confirmed in other experiences, may provide superior, or at least comparable, outcomes to primary PCI at low-volume centers, and this should be evaluated further to determine whether increased centralization of services may result in improved outcomes.

3. Quality Assurance Issues in the Cardiac Catheterization Laboratory

The modern cardiac catheterization laboratory is an amalgamation of complex, highly sophisticated medical and radiological instrumentation used in the diagnosis and management of patients with both chronic stable disease and acute life-threatening illnesses. In any complex, procedure-oriented area, it is essential to have a QA program that incorporates QI to provide ongoing feedback within an established infrastructure for change. The Cardiac Catheterization Laboratory QA/QI committee should be considered a separate entity specific to the cardiac catheterization laboratory. Interactions with other medical staff and/or hospital QA/QI committees are critical, with personnel often assigned to work in multiple QA/QI committees and to share similar concerns, projects, and expertise.

The following discussion summarizes the key components of a QA/QI program for the diagnostic and interventional cardiac catheterization laboratory. These components are as follows: 1) clinical proficiency; 2) equipment maintenance and management; and 3) peer review. A fourth component, radiation safety, is discussed separately in this document. Table 8 outlines clinical proficiency based on cognitive skills, procedural conduct, and clinical judgment.

Table 8. Assessment of Proficiency in Coronary Intervention

Type	Component	Mode of Assessment
Individual	Cognitive	• Formal training program
		• Present requirement by ABIM: 3-year fellowship in ACGME-accredited program
		• Board certification: requirement for added qualification in interventional cardiology: 12 months in ACGME-accredited program and pass grade on ABIM examination ("Board") for interventional cardiology
	Procedural	• Risk-adjusted outcomes
		• Individual data benchmarked against the ACC-NCDR or similar database
		• Peer recognition
	Judgment	• Appropriateness
Laboratory	Procedural outcomes	• Risk-adjusted outcomes
		• Comparison with similar institutions
		• Laboratory data benchmarked against national databases (e.g., ACC-NCDR database)
	Activity	• A minimum of 200 to 400 interventions per year
		• Director with career performance of enough PCI cases to be a competent independent operator (ideally >500 interventions). Must be board certified in interventional cardiology
		• QA staffing to monitor appropriate use, complications, and outcomes
	Support	• Experienced support staff to handle emergencies
		• Regularly scheduled mortality and morbidity conferences and a review of all major complications
		• Facilities and equipment for high-resolution fluoroscopy and digital video processing

ABIM = American Board of Internal Medicine; ACC = American College of Cardiology; ACGME = Accreditation Council of Graduate Medical Education; NCDR = National Cardiovascular Data Registry; PCI = percutaneous coronary intervention; QA = quality assurance.

Downloaded from content.onlinejacc.org by on May 16, 2012

3.1. Patient Outcomes in the Diagnostic Catheterization Laboratory

3.1.1. Rate of "Normal Catheterizations"

The frequency of normal hemodynamic and angiographic findings at diagnostic catheterization is a function of the pretest likelihood of disease and the physician's clinical acumen. For purposes of definition, "normal" coronaries are defined pragmatically as those without a "significant" diameter reduction (<50%) on visual inspection. Since the publication of the 2001 Expert Consensus Document on Catheterization Laboratory Standards, there has been scant information reported on this topic in populations of patients undergoing diagnostic coronary angiography. New data from SCAI indicate that the frequency of normal angiograms is 20% to 27%, which appeared to vary little over a reporting period of several years (62,63). Notably, in a report from the ACC-NCDR, the proportion of patients undergoing elective diagnostic catheterization who were found to have minimal obstructive disease (<20% stenosis) was remarkably high at 39.2% (64).

It is recognized that many studies include patients with "insignificant disease," which is defined as <50% coronary diameter narrowing by visual estimate. Clearly, ACS occurs in patients without "significant" antecedent luminal narrowing on angiography. In addition, certain clinical syndromes may relate to coronary endothelial or microvascular dysfunction. Some laboratories may also have a high prevalence of patients studied for noncoronary issues, such as pulmonary hypertension, cardiomyopathy, valvular heart disease, or adult congenital heart disease. Ultimately, the rate of normal studies in any facility may more properly be viewed as a system performance metric as the outcome of any given angiographic study reflects pretest likelihood, complex decision pathways, local practice, and patient preference (65).

3.1.2. Specific Complication Rates Following Diagnostic Catheterization

There is extensive, albeit dated, literature on the major complications of diagnostic cardiac catheterization (62,63,66). Fortunately, the (composite) rate of MACCE is "acceptably" low at <1% to 2%. As expected, the likelihood of major complications increases significantly with the severity of the underlying cardiac and noncardiac disease (67). Patients with both valvular and coronary artery disease are slightly more likely to sustain a complication than patients with isolated coronary artery disease (68). Although complications encountered in patients with valvular or myocardial disease are more likely to reflect the patient's underlying clinical status, specific complication rates for transseptal catheterization (69) and endomyocardial biopsy (70) have been reported and fall within the previously referenced range. Because of patient selection, the likelihood of major complications during outpatient studies is less than that found during inpatient examinations (67), although the constantly changing definition of "outpatient" may blur this distinction. Current estimates from the NCDR continue to support the validity of the above-cited estimates for MACCE.

3.1.2.1. ACCESS SITE COMPLICATIONS

Although not considered a "major complication" of diagnostic procedures, access site complications remain an important contributor to patient morbidity (71). It must be acknowledged that over the past decade, dynamic changes have occurred in the choice of access site for procedures, the caliber of diagnostic catheters, anticoagulation and antithrombotic protocols, and the means of achieving access site hemostasis (72,73). Progressive changes in the practice of invasive cardiology, in addition to advances in technology and technical competence, have led to significant reductions in access site complications for patients undergoing invasive diagnostic and therapeutic procedures (72).

3.1.2.2. CEREBROVASCULAR COMPLICATIONS

Reported rates of clinically evident periprocedural cerebrovascular complications were generally <1 per 1,000 patients undergoing diagnostic cardiac catheterization and angiography (62). More recently, reports of subclinical manifestations of cerebrovascular events during and immediately following retrograde aortic valve catheterization in the setting of evaluation for aortic valve stenosis have appeared (74). Although admonitions against this practice have appeared in the literature (75), the true rate of clinical "stroke" in this setting is still unknown. However, in view of the increasing interest in catheter-based aortic valve repair/replacement techniques, this salient complication will remain an important focus of attention. Cerebrovascular complications in the setting of PCI will be discussed below.

3.1.3. Diagnostic Accuracy and Adequacy

An important, although generally ignored area, is that of the completeness and accuracy of diagnostic catheterization procedures. Incomplete procedures (aborted or technically inadequate procedures) that fail to obtain the critical information for diagnostic purposes and erroneous interpretation of the acquired information are markers of quality no less important than outcome data. Failure to selectively engage native coronary arteries or coronary bypass grafts often results in insufficient opacification of the lumen to accurately assess coronary anatomy or stenosis presence and/or severity. Inability to recognize the presence of anomalous coronary arteries contributes to this problem. The implications of inadequate or incomplete studies are significant and range from the need to repeat procedures to the performance of unnecessary and more invasive procedures. Inadequate opacification of the ventricle due to hand injections is inappropriate. In the coronary interventional era, the need for high-quality diagnostic angiography is great, as life-altering decisions are generally made on the basis of this information. This includes failure to opacify vessels fully due to inappropriate injection, incorrect catheter sizing, or failure to obtain adequate views that best characterize the

Downloaded from content.onlinejacc.org by on May 16, 2012

lesion. Inadequate attention to the details of accurate hemodynamic recordings in patients with valvular heart disease and the failure to accurately demonstrate coronary anatomy must be viewed as critical measures of outcome. For all the above reasons, it is reasonable to expect a rate of either inadequate or incomplete procedures to be <1%.

3.2. Patient Outcomes After Coronary Interventional Procedures

3.2.1. Major Adverse Cardiac or Cerebrovascular Events

Although patient outcomes are often considered the most important indicators of proficiency and competence in interventional cardiology (76), they are arguably the most difficult to accurately quantify. Moreover, the importance of risk adjustment for even crude event frequencies cannot be overstated (77). Therefore, it is essential that careful and complete preprocedural and intraprocedural information is accurately and reliably collected, sorted, and analyzed. Given that operator and institutional outcomes depend on many demographic, clinical, anatomic, and administrative variables, an adequate information system within the laboratory is mandatory, and the emphasis on both individual and institutional outcomes is appropriate (78–80). This is particularly so when attempting to risk-adjust outcomes for low-volume operators (81). The ability to estimate the likelihood of a significant complication (82,83), choose devices, and conduct procedures appropriately (84), promptly recognize and treat ischemic and other complications (85), and ultimately select (or refuse) cases appropriately are the hallmarks of an experienced, competent operator.

It is the responsibility of the director of the cardiac catheterization laboratory to establish a method of QA to track major events, (e.g., death and serious hemodynamic and/or arrhythmic events). Ongoing peer review of randomly selected cases from all operators is highly desirable and strongly encouraged. It should include the assessment of angiographic quality, technique, and thresholds being used for intervention. In addition, periodic review of less severe complications (e.g., hematoma or other vascular entry site injury) should be part of any ongoing QI program. Admittedly, some outcomes may be hard to standardize (e.g., periprocedural MI), but there is little ambiguity when outcomes for PCI are either consistently superior (e.g., <2% major complication rate) or consistently suboptimal (e.g., >5% major complication rate). At present, with overall in-hospital mortality averaging 1% and rates of emergent CABG averaging <1%, a composite major complication rate of <3% to 4% (95% confidence interval: 1.9% to 4.1%) for non-emergent PCI is to be expected (Tables 1 and 8, Fig. 1).

Since the 2001 "ACC/SCAI Clinical Expert Consensus Document on Cardiac Catheterization Laboratory Standards" (1), much information has been added to the literature on PCI outcomes and complication rates in increasingly high-risk populations (e.g., advanced age, patients with CKD or ACS). Table 9 provides specific complication rates following PCI from large-scale clinical trials and "real-world" registries; Table 1 outlines data from a voluntary registry, the ACC-NCDR database. Each series includes patients undergoing PCI for a variety of indications under widely varying clinical conditions. The definitions of *elective*, *urgent*, and *emergent* vary among studies. Complication rates (especially bleeding and access site complications) in the GP IIb/IIIa inhibitor era vary, not only according to the definition applied, but in the rigor with which these outcomes are ascertained. For this reason, in-hospital complication rates in nonclinical trial, "real-world" settings remain a challenge in interpretation, given the unverified (nonadjudicated) and likely biased nature of such reporting. These results, however, can provide approximate boundaries for expected complication rates ("performance benchmarks") in "all-comers" undergoing PCI. The use of 30-day event rates to more completely assess PCI outcomes (86,87) and, by inference, benchmark operator performance (88) has also been proposed.

Mortality, the least frequent but the most dire adverse outcome within the composite MACCE outcomes following PCI, has been the subject of intense interest since the early days of PCI (89). Efforts to predict its occurrence have been limited by its infrequency, resulting in studies of low statistical power and poor predictive ability. Accordingly, composite outcome variables, all of which included death, have been constructed and allow for improved precision in the estimate of an overall frequency of major complications following PCI (82,90,91). However, there are numerous limitations to the use of such composite variable constructs, particularly when inferences regarding an element (e.g., mortality) may be misinterpreted (92). As in-hospital mortality rates following PCI have declined in parallel with the many positive advances in interventional cardiology (93), larger sample sizes are necessary to estimate its frequency and to meaningfully predict its occurrence. The most robust estimate of the overall risk of in-hospital mortality, culled from large-scale, nonclinical trial registries published after 2001, ranges from 0.7% to 1.8% (94–96). These same studies are also in general agreement regarding the risk factors predictive of in-hospital mortality: age, gender, CKD, left ventricular ejection fraction (LVEF), antecedent MI, shock, prevalent heart failure, and peripheral vascular disease. Anatomic features (i.e., left main disease), procedural indication (i.e., urgent versus emergent), and intraprocedural variables (i.e., the number of lesions attempted and total occlusion attempted) are less agreed upon as predictors of mortality in these models.

3.2.1.1. PCI IN THE SETTING OF ST-ELEVATION MYOCARDIAL INFARCTION

Table 10 summarizes outcomes from the latest published literature on PCI for STEMI—decidedly the highest-risk group of patients undergoing PCI. Event rates are unadjusted, and rates of access site and bleeding complications reflect a complex mix of systemic anticoagulation, systemic lytic activity, adjunctive use of platelet antagonists, and varying definitions and rigor of ascertainment. Nevertheless, some themes are evident across these diverse studies (e.g., the relative constancy of the risks of in-hospital death, stroke, and significant bleeding).

3.2.2. Ad Hoc PCI Issues

The performance of a coronary interventional procedure at the same laboratory visit as the diagnostic procedure is a strategy referred to as "ad hoc" PCI (97). If this is to be used, then it is important the discussion occurs with the interventionalist prior to entering the catheterization laboratory room. Ad hoc PCI should be discouraged in cases where the patient would benefit from a multidisciplinary discussion. Patients presenting with a STEMI or ACS, where the culprit vessel is readily identifiable, generally require an interventional procedure in conjunction with the diagnostic procedure for expeditious patient care and to reduce recurrent in-hospital ischemic events. However, when "routine" diagnostic procedures are immediately followed by "routine" coronary intervention, the considerations are more complex from a risk–benefit perspective. Considerations for when ad hoc procedures are encouraged include patient and physician convenience, the potential for a decrease in vascular access complications, a desire to avoid higher contrast load in patients with chronic kidney disease, and cost reduction.

Using the ACC-NCDR database, Krone et al. (98) published the outcomes of 68,528 patients undergoing PCI with the diagnosis of stable angina from 2001 to 2003, 60% of whom underwent ad hoc PCI. A multivariate analysis was performed to determine whether the performance of an ad hoc PCI had an independent association with procedure success or an adverse event. Patients categorized as high risk and those with significant renal disease were less likely to undergo PCI at the time of the diagnostic procedure. There was no difference in mortality, renal failure, or vascular complications when ad hoc patients were compared with patients undergoing staged procedures at a separate setting from the diagnostic case, so there appears to be no evidence that patient outcomes are affected.

When tracking outcomes for ad hoc versus separate setting PCI, important issues for the assessment of quality must be addressed. Complications encountered during the diagnostic catheterization and angiography (e.g., coronary dissection or abrupt occlusion) may be treated with prompt intervention but should not be considered ad hoc interventions. This leads to coding issues, as does the success of the

intervention mitigating the inciting event. Although the composite procedure was "successful," how is the original complication recorded? Complications encountered during the interventional portion of the procedure should be attributed to the interventional procedure and not to the antecedent diagnostic study. Given the increasing use of the ad hoc approach, it will be important to continually and carefully define the indications, clinical outcomes, and overall cost effectiveness of this practice pattern (99).

3.3. Peripheral Vascular Intervention

The development of vascular medicine as a specialized discipline, which overlaps "traditional" medical, cardiological, radiological, and surgical disciplines, has led to the expansion of the types of angiographic procedures performed in cardiac catheterization laboratories. Laboratories historically dedicated to coronary angiography and cardiac diseases have had to transform themselves technically, logistically, and administratively in order to provide optimal care for a patient with cardiac and vascular disease. Large image intensifiers for vascular rooms are not optimal for coronary angiography. Performance criteria for training and credentialing in vascular medicine have been adopted by key stakeholders (100), and guidelines for maintenance of competence and technical proficiency have also been developed (101). Although minimum caseload volumes have been suggested, there currently is insufficient literature regarding performance metrics and outcomes analogous to coronary intervention (e.g., procedure-specific complication rates, patient-specific complication rates, and target organ or vascular bed versus overall clinical outcomes). From a catheterization laboratory standards standpoint, comparative outcome data are presently absent but are much needed in order to establish performance benchmarks and appropriate use criteria. The issue is further complicated by the fact that noncardiologists (e.g., vascular surgeons or interventional radiologists) are now participating in some of these studies, and guidelines regarding training and ongoing credentialing for these groups often differ from those of the invasive cardiologist. Laboratory participation in a centralized data repository is currently being developed by the NCDR. Data from resources as these will help define the ongoing changes in how the traditional cardiac catheterization laboratory is being used.

3.4. Peer Review Continuous QA/QI Program

A continuous QA/QI program is an essential component to the cardiac catheterization laboratory and must be in place for all laboratories. This should be a dedicated program to address the specific issues of the catheterization laboratory, but it need not be independent from other hospital QI programs. The peer review component for this process is designed to promote clinical proficiency under the broad rubric of system-level performance analyses, which should connote a more constructive (rather than punitive) context (102).

The core components of the Continuous Quality Improvement (CQI) program are data collection, feedback, and intervention (103). Table 11 outlines the essential components of the process. The CQI committee should be adequately staffed and resourced by the facility. It should be chaired by the medical director of the cardiac catheterization laboratory because he/she should be the individual primarily responsible for quality within the facility. The administrative co-chair should be a required staff position for this committee with specific job description assignments to QA/QI. Additional membership should include invasive/interventional physicians with nonpartisan representation from all physician groups. Finally, noninvasive cardiologists, noncardiology physicians, and support personnel from hospital administration may or may not be included, based on what the committee chairman deems appropriate for committee effectiveness. Though individual physician performance is being reviewed, the results of the entire process apply to the performance of the laboratory as a whole.

The peer review component of the QA program includes the challenge of assessing clinical proficiency of the operators in the cardiac catheterization laboratory and should not be limited to a simple "scorecard" analysis (102). Issues of cognitive knowledge, procedural skill, clinical judgment, and procedural outcomes are best assessed by a composite of a series of variables that reflect the overall quality of care (6). This information must be collected in a systematic manner and analyzed appropriately. Finally, an approach must be developed for quality improvement that involves not only a process for change but also a measure for feedback on the effectiveness of the solutions as well as educational opportunities for all involved (103).

Table 11. Basic Components of the Continuous Quality Improvement Program for the Cardiac Catheterization Laboratory

Committee with chairman and staff coordinator
Database and data collection
Data analysis, interpretation, and feedback
QA/QI implementation
Goals outlined to eliminate outliers, reduce variation, and enhance performance
Tools available to accomplish data collection and analysis
Feedback mechanisms in place
Educational provisions for staff and operators
Incorporation of practice standardization/guidelines
Professional interaction and expectation
Incentives for high-quality metrics
Adequate financial support for QI personnel
Administrative oversight and action plans
Thresholds for intervention
Appropriate use assessment

QA = quality assurance; QI = quality improvement.

3.4.1. Overview of the Peer Review Process: Quality Indicators, Data Collection and Analysis, and QA/QI Interventions

A review of cardiac catheterization laboratory settings has outlined certain practical lessons learned by the Laboratory Survey Committee of the SCAI (104). This committee noted that the major QA problems were not usually related to equipment but rather to inadequate laboratory space, lack of a physician medical director, lack of specific operating rules for the laboratory space, and lack of a functioning QA program (104). Not only must a QA program provide procedural complication information, but the committee emphasized that a feedback mechanism to modify behavior must be in place.

A QA program is only as effective as the commitment of all involved in the process of healthcare delivery, with the most conspicuous components being the assessment of procedural outcomes and individual operator proficiency (6). It is the responsibility of each individual operator to actively participate in the QA process along with other team members as well as actively participate in both CME and maintenance of competence activities on a regular basis. Each interventionalist should be aware of his/her own volume, complications, and outcomes. These data should be used to direct personal improvement. However, a procedure must be in place to assure this information is both accurate and complete. Utilizing "indicators" to help quantify the quality of the physician's performance may be beneficial. The indicators for organizational purposes include structural, process, and outcomes (105).

Structural indicators are those often considered by the hospital credentials committee and include staff credentialing/re-credentialing. This committee must assess medical training, licensure, board certification, procedure volume, and CME. Additionally, the committee/hospital may require, or consider appropriate, specific training courses/CME for a given procedure, society membership/offices held, awards/honors, and publications/presentations. Establishing a transparent standard for a given facility limits confrontation when physicians are either inadequately trained or fail to maintain required qualifications. The committee must be empowered to withdraw credentials when individuals fail to meet written minimum standards.

Process indicators refer to patient management regarding evaluation and treatment. Table 12 lists examples of procedural or process indicators. Since these are less objective and potentially amenable to observer bias as opposed to "hard" clinical outcomes, they are more difficult to measure and validate. These indicators are, however, helpful in working through the entire process from protocols and staffing to the rapidity of room turnover and patient length of stay. By tracking these indicators, analysis of outcomes issues an assessment of cost containment can be addressed within the QA process (106).

PCI appropriate use indicators are also important. The latest suggestions from the ACCF/SCAI/STS/AATS/AHA/ASNC/HFSA/SCCT should be valuable in ensuring that only appropriate patients are undergoing interventional procedures, and these guidelines can be used to help monitor appropriate use activity (107).

Table 12. Examples of Patient Management/ Process Indicators

Direct patient care–related indicators
Quality of angiographic studies
Radiation utilization (e.g., dose per procedure)
Report generation/quality of interpretation
Appropriateness
System-specific indicators
Patient transport/lab turnover/bed availability
Preprocedure assessment process and adequacy
Emergency response time
Cardiovascular surgery/anesthesia/respiratory care/perfusion performance
Guidelines-driven indicators
Infection control
Patient radiation dose (use of all available dose indicators, not only fluoroscopy time)
Treatment protocols (radiographic contrast issues, drugs usage)
Procedure indications
New device use
Cost-related indicators
Length of stay pre-/post-procedure
Disposables needed
Quality and adequacy of supplies
Number and qualification of personnel/staffing

Modified with permission from Heupler et al. (102).

Outcome indicators are outlined in Table 13. These are now often publicly available, and they are the most recognizable. Risk adjustment is the essential component to outcomes reporting and, therefore, dictates the need for detailed databases (7). Benchmarking individual physician and laboratory performance against national standards (e.g., the ACC-NCDR database) is an important component to this process (108). Though risk adjustment is essential to this process, awareness of the potential public health hazards with public reporting of inadequately risk-adjusted outcomes is of great concern (109). Although individual physician and hospital scorecards provide information on performance, they are not sufficient when used alone. Outcome data should not be used to punish an outlying practitioner but rather to search for causes that can be remedied and processes that can be improved (102,103).

Effective data collection requires a data repository and dedicated personnel for data acquisition. Information technology systems for the cardiac catheterization laboratory and the hospital should be integrated to allow for information transfer regarding patient demographics, catheterization data, and hospital laboratory data, thereby decreasing personnel data entry time. Hospital administration must be actively involved in this process to provide the needed staff support. Though identification of the most appropriate data collection instrument is still not standardized, an under-

MACCE = major adverse cardiac and cerebrovascular events; MI = myocardial infarction.

standing of entire catheterization laboratory process is essential for accurate and complete data acquisition with data entry verified for accuracy.

Data analysis requires a review of specific adverse events, as well as risk-adjusted event rates, for the facility/operator. Specific adverse events should be identified, and an individual case review should be performed. A potential list of case examples that should be reviewed might include those listed under clinical outcomes in Table 13 (102). Table 14 represents an example of an adverse event case report form. Such case reports should be completed by a "neutral" observer whenever possible to avoid confrontation. Results should be reviewed and discussed as indicated at regularly scheduled CQI meetings. In the case of possible litigation, the cardiac catheterization laboratory CQI process should work with the hospital risk management department and not be driven by the latter.

Interventions to improve performance should be the goal of the peer review process. The CQI process should focus on improving the performance of the "low-end physician" and not the elimination of this person, unless the performance is repeatedly below minimum standards and the individual is recalcitrant to positive suggestions. Once performance variance has been identified, programs should be established to correct these variances and address specifics issues to improve the total laboratory performance (102). Continuing employment of physicians not performing appropriately, despite efforts from the CQI process, should be the responsibility of hospital oversight committees, group practices, or departmental leadership.

The tools available for the CQI process are many. Establishing practice protocols and order sets helps standardize practice and reduce variation in individual performance. Appropriately used in a nonpunitive forum, scorecard benchmark performance can provide feedback that may allow outliers to see where potential areas of improvement are required. Identifying the need for an intervention is a clear component of this process. Counseling may be required with confidential but swift correction of unprofessionalism. Education, either with in-lab proctoring or external CME, can allow for any potential knowledge gap to be narrowed. Laboratory surveys provide feedback for both individuals as well as overall laboratory process performance. Working with hospital administration to consider incentives to improve performance and enhance educational opportunities may prove beneficial. Finally, administrative policy for intervention must be established to address the potentially "uncorrectable" outlier. SCAI has provided an outline of the components of an ideal quality control and inspection program and a Quality Improvement Toolkit (QIT) that is now available on their Web site (http://www.scai/QIT). Subspecialty "boards" in adult interventional cardiology are properly focused on proficiency, both cognitive and technical (6). For coronary interventional procedures, proficiency is most easily related to procedural volume, although proficiency and volume are only loosely associated. Some quantitative evidence now exists for selected volumetric cut points for interventional procedures (55) though controversy remains and enforcement is basically nonexistent, except at the credentialing committee level at each facility. The recent PCI guidelines acknowledge the controversial relationship between quality and volume. Risk-adjusted outcomes remain preferable to institutional and individual operator volumes as a quality measure (55). This issue is currently being addressed by the ACCF/AHA/SCAI Writing Committee to Update the 2007 Clinical Competence Statement on Cardiac Interventional Procedures. The situation is even less clear with respect to diagnostic catheterization. Given the absence of similar quantitative data for diagnostic procedures, as well as the significantly decreased associated morbidity and mortality associated with diagnostic catheterization, operator proficiency may be better assessed in a larger overall context. Rates of normal studies, peer review of the diagnostic quality of studies, rates of referral for intervention, and perhaps development of criteria for the appropriateness of these studies have all been suggested as methods of incorporating physician practice into the QI process for diagnostic procedures. The quality and the timeliness of catheterization reports should also be part of the QI process. A preliminary report should be immediately available and a final report completed within 24 hours. However, processes for credentialing and the assessment of proficiency must be developed in accordance with both local governance policies, as well as professionally developed

standards. In particular, the granting of privileges by healthcare systems should fall within the legal purview of these institutions. It is hoped that these systems use criteria similar to those outlined in this document in association with the major cardiovascular societies to support the decision to credential physicians and monitor system performance.

Over a 10-year period, improvements in instrumentation, imaging, data recording, and procedural outcomes have proceeded rapidly. Consequently, continuing education for practitioners beyond the standard level of training programs has become the norm for the acquisition of many of these advanced skills. Training programs themselves are also changing from the traditional 1-year program in interventional cardiology to 2-year programs in some institutions. Subspecialty certification "boards" in interventional cardiology reflects this burgeoning knowledge base (6,110). All of this translates into the need to provide continuing education to all members of the team. The implementation of new technology requires a critical evaluation of both the experience in the literature as well as the experience within individual institutions. An organized didactic program coupled with cautious early clinical experience is an ideal mechanism for the introduction of new therapies. These types of programs, in conjunction with attendance at regional or national scientific meetings devoted to the unbiased presentation of new data, provide a solid infrastructure for credentialing purposes. Attention to this aspect of laboratory QI is critical to maintaining expertise.

3.4.2. Noncardiologists Performing Cardiac Catheterization

An independent operator in the cardiac catheterization laboratory must be proficient, not only in the technical aspects of the invasive procedure, but also in the cognitive aspects, including preprocedural evaluation, indications, cardiac physiology and pathophysiology, emergency cardiac care, radiation safety, and interpretation and clinical application of the cardiac catheterization data. ACCF has developed recommendations for training in diagnostic cardiac catheterization, as well as specific technical skills, including both education and case volume (111). Cardiology fellowship training requires completion of a 3-year program in order for the operator to be considered competent to perform diagnostic angiography and an

Downloaded from content.onlinejacc.org by on May 16, 2012

additional year of dedicated training for coronary interventions (76).

The spectrum of participation in cardiac catheterization is broad and includes physician-supervised assistance by nonphysicians, independent nonphysician performance, and noncardiologist performance of cardiac catheterization. Nonphysicians serving in an assistant role during the catheterization with a cardiologist present are standard practices in most training and teaching programs and not the issue here. There is limited literature regarding safety/outcomes of nonphysicians independently performing cardiac catheterization. This topic was reviewed by SCAI in a statement regarding nonphysicians performing cardiac catheterization as independent operators (112). No relevant data are currently available establishing either the safety or the healthcare manpower requirement for nonphysicians performing as independent operators in the cardiac catheterization laboratory, and this practice is not appropriate. Some exceptions to this policy include right-heart catheterization procedures performed by competent operators from intensive care units or electrophysiologists utilizing the cardiac catheterization facility.

Medical and surgical subspecialties create training requirements to establish and maintain patient safety and quality of care (76,100,111). Hospital privileges for specific procedures are based upon training requirements. It is an ethical obligation to honestly disclose relevant information to the patient (e.g., the training credentials of the primary operator for any procedure, including cardiac catheter procedures). Beneficence is the ethical obligation to act in the patient's best interest (112). Patients, the public, and the government are rightly seeking greater assurance that physicians hold the interests of their patients above their own. Diagnostic cardiac catheterization and percutaneous coronary intervention should be performed by trained cardiologists, or comparably trained noncardiology physicians, who have been trained specifically for this procedure (110,111). It is not appropriate for noncardiologists to perform percutaneous coronary interventions.

3.4.3. National Database Use

In assessing quality, adverse outcomes are often equated to a lack of quality which, in turn, is related to performance. However, it is obvious that adverse events will occur, even in the best hands and at the best centers (113). The frequency of these events is, in large part, related to the condition of the patient and experience of the operator and center. Volume alone may not be the best barometer of quality (114).

The SCAI Registry was developed to offer individual centers an opportunity to assess their results relative to the national reporting network of catheterization laboratories on a voluntary basis. This registry tracked both diagnostic and interventional procedures and was the standard for assessing quality in the 1980s and 1990s, though the information was not risk adjusted and the number of variables was limited. This database is no longer being supported. With the termination of this database, no effort, to date, has been attempted to track and risk adjust diagnostic adverse outcomes on a national basis. State Health Departments require low-volume diagnostic laboratories to complete a data form on all patients. However, comparative national data for diagnostic catheterization have not been available since the 1990s.

ACC-NCDR is a voluntary national registry that currently receives data from approximately 1,300 participating hospitals. The purpose of this registry is to provide risk-adjusted outcomes to individual institutions and their physicians. Such risk-adjusted outcomes are considered the most appropriate measure of quality (108). The data collection processes as well as the details regarding the dataset have been described in detail (7). Each data element is predefined, linked to ACCF/AHA PCI Guidelines, and available at www.cardiosource.org. Data at each participating facility are entered locally into ACC-NCDR–certified software. Compatibility with individual laboratory reporting systems and ACC-NCDR, or any regional/national database such as the Northern New England Cardiovascular Disease Study Group or the New York State Department of Health Database, is essential to allow for complete data entry and minimize duplication. Many local QA programs are based on these data, and the sites themselves are responsible for auditing the data for completeness and accuracy. In addition, the ACC-NCDR has a limited national audit system of approximately 5% of the data. This registry has developed and validated a number risk adjustment models for specific adverse outcomes (7,108,113,115). An example of the output from the ACC-NCDR Cath PCI dashboard is shown in Figure 2.

This writing committee strongly encourages all laboratories to participate in a national or regional registry to benchmark their results and provide an ongoing system for tracking complications. Benchmark data are important, and because the validity of these data are dependent on a high number of participating laboratories, this committee strongly recommends that all cardiac catheterization laboratories actively participate in such a data registry.

3.4.4. Catheterization Laboratory Reporting Requirements

The catheterization report should be individualized to a particular institution depending upon the recommendations of the medical director and participating physicians, the administrative and informational infrastructure of the institution, and the requests of the referring physicians. Table 15 presents standard information required in such a report (116). A complete procedural report, finalized within 24 hours of a procedure and inclusive of content in Table 15, is a requisite and standard of care. Furthermore, structured reporting using standardized data elements captured as discrete data is highly preferred to verbose (i.e., handwritten or dictated) reporting. An initiative to define best practice workflows for data acquisition, processing, and reporting is

underway to develop a standardized, structured report format for diagnostic and therapeutic cardiac catheterization procedures. Prior to this, institutional preference for the use of a vendor-based versus a "home-grown" standardized reporting system should be viewed in the context of ensuring compatibility with a national database for complete data entry while minimizing duplicated effort. Appropriate immediate post procedure chart documentation is required for inpatient procedures if the completed catheterization report is not immediately available. Notification of findings to the patient, family, and referring physician/primary care physician should be expected standard practice.

Table 15. Minimum Components of the Standard Catheterization Report

1. Indications for the procedure
   a. Patient demographics
   b. Pertinent patient history including risk factors
   c. Specific indication for each component of the procedure (e.g., right-heart and renal angiography)
2. Procedure information
   a. Primary operator and additional staff present
   b. Procedures performed
   c. Access site information
   d. Equipment utilized
3. Procedure documentation
   a. Medications, including dose and duration of antiplatelet therapies
   b. Radiographic contrast used and dose
   c. Fluoroscopic time
   d. Radiation dose (mGy and Gy × cm^2)
4. Diagnostic findings
   a. Coronary anatomy (diagram optional but ideal)
   b. Ventricular functional assessment (EF, LVEDP)
   c. Other hemodynamic information (HR, BP)
   d. Other angiography
      I. Aortography (thoracic, abdominal)
      II. Renal angiography
   e. Relevant hemodynamics
      I. Right and left heart
      II. Response to medications or maneuvers
      III. Oxygen saturations
      IV. Cardiac output-result and method
      V. Valvular assessment (gradients; valve areas when appropriate; estimation of regurgitation severity; summary of mild, moderate, and severe disease assessment)
5. Interventional procedure(s)
   a. Separate listing for each procedure including site and procedure performed
6. Documentation of equipment and medications in catheterization laboratory results (i.e., ACTs)
7. Complications encountered in lab
8. Conclusion (a diagram provides visual information and is much preferred over textual alone reporting)
   a. Summary of appropriate of findings
      I. Coronary anatomy
      II. Ventricular function
      III. Hemodynamics
      IV. Valvular pathology
      V. Interventional procedures
   b. Recommendations or patient disposition (optional) based upon physician and laboratory preference

It is suggested that a preliminary report of the findings be made available immediately and the complete report made available within 24 hours. A catheterization report should focus on the coronary tree diagram as the preliminary report. Procedural details can be reserved for a second and more complete report.

ACT = activated clotting time; BP = blood pressure; EF = ejection fraction; HR = hemodynamic response; LVEDP = left ventricular end-diastolic pressure.

3.4.4.1. STORAGE OF INFORMATION (LENGTH AND TYPE)

There are several essential components to an information storage system for the cardiac catheterization laboratory, regarding both written word and recorded images. Important considerations for an individual institution are price, performance, capacity, and function. In choosing a system, users must first be considered so as to select a system that is operator- and institution-friendly. Linking the catheterization laboratory reporting system with the hospital information system improves information availability and patient care. In-laboratory and postprocedural complications and hospital outcomes should be tracked and reported regularly by the CQI committee. If possible, 1-month and intermediate-term outcomes and readmissions should also be monitored. Staff efficiency is improved when demographics are entered once into a system that "talks" throughout the hospital and/or health system. Additionally, inventory and billing can be linked to this system. This seamless interface between report generation and the information management system, not only provides an accessible report for patient care, but also enhances inventory maintenance and verifies billing (117).

As with all information systems, compliance with the 1996 Health Insurance Portability and Accountability Act (HIPAA) must be assured. Though physician access for patient care is important, all patient information interactions must be verified as HIPAA compliant, whether that be accessing lab values or signing reports (118).

Information storage strategies may take several forms. Varying redundant array of independent disks (RAID) schemes provide different levels of data access performance and system failure protection (119). The RAID schemes divide and replicate data among multiple hard drives, writing identical data as well as splitting data on more than 1 disk. Error correction is accomplished through redundancy, allowing read/write problems to be detected and corrected. This technology is particularly useful when large files (i.e., cine images) require storage.

The more advanced the data storage system, the more data replication mechanisms and storage servers are likely to be available. Long-term archiving provides for expanded storage, data protection, or both, when the primary space capacity is reached. Disaster recovery is essential to any storage system to prevent permanent data loss. Having a disaster recovery system in a nondirect access format prevents a computer virus, for example, from infecting and erasing data. Data duplication via a mirror image server, often at a remote facility, may be

Downloaded from content.onlinejacc.org by on May 16, 2012

done in real time allowing for near instantaneous data replacement (120).

The Integrating Health Care Enterprise (IHE) was originally developed with support of the Radiological Society of North America and the Health Information and Management Society. In 2003, a cardiology domain was initiated by the ACCF, American Society of Echocardiography, American Society of Nuclear Cardiology, SCAI, and European Society of Cardiology to focus on integration of information within the cardiology department. IHE does not create standards but rather provides integration profiles from existing standards for specific clinical needs. Multiple profiles can be developed creating a cardiac catheterization laboratory workflow integrating ordering, scheduling, image acquisition, storage, and viewing (121). This can be integrated with echocardiography, electrocardiogram, and stress testing to display reports as well incorporate workflow through procedure/postobservational areas.

The transition from cine film to digital acquisition and storage in the catheterization laboratory was made possible with the creation of the Digital Image Communication in Medicine (DICOM) Standard (122,123). The DICOM Standard is a set of rules that allow medical images to be exchanged among all medical imaging devices. In the digitally enabled catheterization laboratory, digital images are stored for short-term archival on the proprietary digital storage unit of the specific imaging equipment or network servers with only limited storage capacity for immediate access.

Cine image storage in the digital imaging era is challenged by the pure volume of data (124). Various compression ratios have been employed in order to optimize storage capacity requirements, but the latter in anything greater than a 4:1 compression ratio frequently resulted in nondiagnostic images. Therefore, to preserve image quality, only lossless compression is currently used. A diagnostic cardiac catheterization with 5 to 10 cine runs of 6 to 7 seconds at a frame rate of 30 fps contains approximately 2,000 images. With minimum specifications of a 512 × 512 matrix and a pixel depth of 1 to 1.5 bytes, a standard diagnostic study results in 500 to 750 MB at 30 fps. At 15 fps, this is approximately 350 MB/case. In a facility that performs 5,000 cases per year for 7 years, this requires a storage capacity of 10.5 terabytes. This calculation does not consider the improvement in spatial resolution with a matrix size of 1,012 × 1,012 to 2.5 to 3.0 LP/mm (line pairs/mm). The latter is the preferred imaging technology to properly visualize stents in the right coronary artery in the right anterior oblique projection (125).

Long-term archival technology of these massive files has similarly progressed over time from stacked magnetic disks, to digital archival tapes, to large optical disks ("jukebox"), to current generation RAID 5 subsystems (119). Speed for recovery from long-term archival has dramatically improved. A picture archiving and communication system (PACS) is integral to hospital image storage and access. The inclusion of cardiac catheterization laboratory studies into the traditional radiology PACS system was generally precluded due to the file size requirements. Modern PACS may now comfortably accommodate catheterization laboratory images (120).

Duration of storage has been based more upon tradition than written policy. The "standard" cine film storage was 7 years. Currently, in the digital era, storage duration is based upon storage capabilities. However, the potential usefulness of adult cine storage >7 years is in question, although pediatric image storage may well require lifetime access to appreciate anatomy prior to interventions. The reality is that most laboratories provide image storage for only 7 years, even in the pediatric cardiac catheterization environment. The progressively low cost of digital image storage is making these minimum storage guidelines rather obsolete, as indefinite storage is now readily available.

3.4.5. Equipment Maintenance and Management

Equipment maintenance and management remain crucial issues from a catheterization laboratory QA/QI standpoint and specific guidelines are, therefore, provided. Each aspect of the radiographic system should be able to meet these performance expectations (126). The same is true for the physiological recorders and other specific devices used in the laboratories.

The modern diagnostic and interventional catheterization laboratory uses many sophisticated radiological, electronic, and computer-based systems, each of which requires a program of rigorous maintenance and troubleshooting. The x-ray imaging system, a crucial component of every laboratory, must be carefully assessed at frequent intervals to detect early signs of deterioration in performance. Unfortunately, this aspect of quality control is the first to be sacrificed in an era of cost constraints.

A program of periodic assessment of system performance and image quality has been recommended by SCAI (127). Additional programs, which address issues specific to digital imaging systems, are under evaluation (127). A representative outline of the performance characteristics needed to assess radiographic cardiac imaging systems is presented in Table 16.

Note that at present, the only federally mandated parameter for fluoroscopic systems is the maximum "table-top" exposure rate (see Section 9). The concept of minimum image performance standards must await universal acceptance of a suitable test instrument for cardiac fluoroscopy. Currently, there is considerable heterogeneity across laboratories in selective measurements of image quality (123,128). Such heterogeneity precludes specific recommendations with respect to what is considered "acceptable" performance. Current-generation imaging systems must be capable, at minimum, of providing images of sufficient diagnostic quality to enable decision making with respect to intervention and provide sufficient spatial and contrast resolution for the conduct of contemporary coronary intervention.

Table 16. Performance Characteristics of Radiographic Imaging Systems

Category	Example
System measure	Image quality
	Dynamic range
	Modulation transfer function
Component measures (not inclusive)	Fluoroscopy and cine spatial resolution
	Fluoroscopy field of view size accuracy
	Collimator tracking and alignment
	Low contrast resolution
	Record fluoroscopic mode and automatic exposure control under standard conditions and at maximum output
	Calibration of integrated radiation dose meters

Interventional procedures occur in environments of high information density. In the past, physiological recorders were used only for the acquisition and recording of analog signals. They are now required to serve as front ends for the increasingly complex gathering of data. These recorders have essentially been transformed into desktop personal computers capable of acquiring, storing, and transmitting data to other sites. Given the critical importance of these data for numerous administrative purposes (billing, QA, report generation), flawless transmission without data loss must take place at all times (117). Backup systems and low-cost storage media are essential (125).

The need for patient safety-related precautions is paramount (129). The operational efficiency of infrequently-used equipment (e.g., defibrillators and external pacemakers) must be assessed routinely, and the appropriate logs must be kept. Electrical isolation and grounding systems must be regularly assessed (122). The number of ancillary devices used in coronary intervention (Doppler and pressure-tipped sensor wires and ultrasound catheters) now requires that electrical safety precautions that were adequate in the past need to be revisited at periodic intervals (122).

3.5. Minimum Caseload Volumes

The cardiac catheterization laboratory previously referenced was primarily an arena for the diagnosis and treatment of coronary artery disease. However, in the last decade, there has been not only an expansion of the anatomic indications for PCIs, but also an expansion of percutaneous interventions to most other vascular beds, as well as the development of a new branch of interventional cardiology involving the treatment of numerous forms of structural heart disease.

Determining who should perform procedures based on volume remains controversial and difficult to adjudicate. The goal is to have successful procedures done on appropriate patients. There are clinical, angiographic, operator, and institutional characteristics that have been shown to influence procedural success. Operator characteristics include cognitive skills, technical skills, experience (including the latest total cases and lifetime total cases), and training (including fellowship, cardiology and interventional board certification, and CME).

Utilizing minimum case volumes for credentialing focuses on only 1 of many factors that may play a role. Case volumes are often used as a surrogate for quality on the presumption that a high volume enhances the operator skills. It is presumed that skill maintenance is also greater for both the operator and the institution if procedural volumes are high. The documented relationships between activity level and outcome are statistical associations, but they may be of limited clinical significance. The heterogeneity within hospital volume groups found by Epstein et al. (143) suggests that activity level is an incomplete surrogate for quality. High-volume operators and institutions are not necessarily of high quality, and low-volume operators and institutions are not by definition poor-quality operators. There is limited statistical power to judge the outcome results of low volume operators. Establishing appropriate oversight and QA programs is more important than volume measures alone. All major complications in any laboratory should be reviewed by the QA committee at least every 6 months, and individual operator complication rates exceeding national benchmarks for 2 contiguous 6-month periods should be reviewed by the QA director (76). Ideally an ongoing subset of cases performed by all operators should be reviewed yearly. To help facilitate the knowledge transfer that is important in continuous quality improvement, participation in catheterization laboratory conferences and a minimum of 12 hours of CME per year should be a required component for operators in the cardiac catheterization laboratory.

Simulation training offers an additional method of improving cognitive and technical skills that is increasingly being used to increase clinical competencies, including endovascular procedures (144). Simulation training is a tool that may be used for maintenance of certification in the Interventional Cardiology Board prerequisite and may be particularly useful for low-volume operators and for low-volume procedures. Simulation training of rarely performed and/or complex procedures and new protocols may be of value.

3.5.1. Operator Volumes

3.5.1.1. OPERATORS PERFORMING DIAGNOSTIC PROCEDURES

Because of the low risk of diagnostic cardiac catheterization, it is difficult to arrive at any consensus as to what would constitute a minimum caseload. There are no data supporting the prior recommendation of at least 150 diagnostic cases per year (1). Previously, this has been simply convention. The minimum laboratory diagnostic caseload may vary widely depending on arbitrary requirements such as the presence of the CON process or state department of health regulations. It falls upon the director of the laboratory to ensure that all cardiac catheterization studies are appropriately indicated, performed, and interpreted (76). A maximum number of procedures that an operator should be

Downloaded from content.onlinejacc.org by on May 16, 2012

performing is also controversial, an area where there are essentially no data. This emphasizes the dependence on the QA process to monitor physician and laboratory behavior appropriately.

3.5.1.2. OPERATORS PERFORMING INTERVENTIONAL CORONARY PROCEDURES

An annual interventional caseload of 75 procedures per year has been used for a considerable time as a standard for ensuring quality. Numerous analyses have addressed the relationship between individual operator caseload and procedural complications. Many of these studies have found an inverse relationship between volume and outcome (78,145,146) whereas others have found no relationship (147–149). Hospital volume affects the operator volume–outcome relationship (150,151). Malenka et al. (152) suggested that differences between high- and low-volume operators are minimized at a high-volume hospital. Moscucci et al. (153) examined the operator volume issue in the stent era and found no relationship between operator volume and in-hospital mortality, though the relationship between volume and any MACCE as measured by major cardiovascular event rates (death, CABG, cardiovascular accident or transient ischemic attack, MI, and repeat in-hospital PCI) was demonstrable. Although there does appear to be a statistical relationship between annual operator volume and MACCE rates, analysis of a linear plot examining these 2 variables reveals a scattergram, though the trend toward higher complication rates at lower volumes is observable (Fig. 3). In this figure, the majority of operators with procedural volumes <75 cases per year perform with excellent outcomes, whereas there are clearly operators >75 cases per year that have higher MACCE rates than expected. The value of using an annual threshold of 75 cases per year is limited when considering each individual operator.

In a report from the Cardiac Advisory Committee of New York State (58), the case volume range was dramatic, ranging from a very small number of cases (presumably only done when the physician was on call) over a 3-year period all the way up to a maximum of 3,722. No comment is made regarding any possible relationship between volumes and adverse outcomes. The report provides individual volumes for the 3-year period from 2004 through 2006, but the data are presented for each laboratory. Those that perform procedures at multiple laboratories are also noted. With those caveats, obviously creating the potential for substantial error, if it is assumed that 225 cases per 3 years should be the minimum for each operator during the 3-year period, then up to 57.9% of the listed physicians in the New York State Report (Table 3 of their report) did not meet the minimum criteria. In Table 4 of the report, 17.5% of operators performing procedures at multiple hospitals did not perform 225 procedures over the 3-year period. Even if these numbers are inaccurate by a wide margin, it does point out that there are many competent operators who do not perform the minimum of 75 PCI procedures per year.

SCAI has noted that the AHA report on the number of PCIs has been revised downward by about half, due to double counting. In the AHA Heart Disease and Stroke Update published in December 2010, the number of inpatient PCIs in 2007 is actually about 0.6 million rather than the 1.3 million in their publication (154).

As outlined earlier, performance of all interventionalists regardless of the volume of procedures performed should be assessed by a standing QA committee. There should be in place a review process to provide evidence to the appropriate oversight committee (usually the credentials committee in association with the director of the cardiac catheterization laboratory) that operators with <75 PCI procedures per year are having a random subset of their cases (at least 15%) critically reviewed each year. This should be in addition to the guidelines for the QA process for all operators as outlined earlier. The QA committee is encouraged to require within their bylaws that each operator obtain some level of PCI education every 2 years. This additional education should be mandatory for the lowest (<75 PCI per year) volume operators.

Volume requirements are of a magnitude of importance, as well as controversy, that a document specifically addressing clinical competence for cardiac interventional proce-

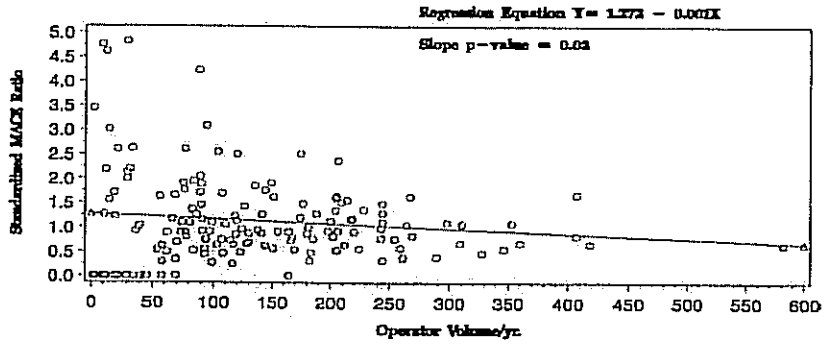

Figure 3. Linear Plot of Standardized MACE Ratios (Observed/Predicted Rates) Versus Annual Operator Volume

There remains only a general, but statistically important relationship with higher major adverse cardiovascular events (MACE) in operators doing fewer procedures. Reprinted from Moscucci et al. (153).

Downloaded from content.onlinejacc.org by on May 16, 2012

dures was developed in 1998, updated in 2007, and the issue is currently being revised. The results of that writing committee are embargoed at the time of this document's publication. The "2011 ACCF/AHA/SCAI Guideline on Percutaneous Coronary Intervention" also include the same volume requirements as herein stated, and it favors the observational evidence of a volume–outcome relationship in PCI at both the institutional and operator level (155). However, the guideline also acknowledges that the volume–outcome relationship is complicated and may be inconsistent across low-volume institutions or operators and that new data in primary PCI suggest that operator experience may modify the volume–outcome relationship at the institutional level (156,157). The ACCF/AHA/SCAI Writing Committee to Update the 2007 Clinical Competence Statement on Cardiac Interventional Procedures will review current data and environmental trends and recommend how we can best assess competence for both individual operators and institutions for PCI in the current era.

3.5.1.3. PRIMARY PCI OPERATORS

PCI for AMI (primary angioplasty) is the application of PCI to, as a group, the sickest patient population undergoing PCI. Additionally, the constraints of D2B time of <90 minutes confer additional pressures on the operator and system. Current recommendations suggest that primary PCI be performed only by higher-volume operators experienced in both elective PCI and primary PCI for STEMI. The current guidelines recommend the operator perform >75 elective PCI procedures per year and about 1 primary PCI per month (11 per year) (6,158). The reality is that this requirement is not being followed in many institutions, would likely eliminate a large number of primary PCI operators, and is likely to prevent many institutions from providing 24/7 interventional calls due to a limited number of qualifying physicians. The data concerning volume–outcome relationship for primary PCI are particularly difficult to categorize because of the relatively small volume of STEMI patients per operator per year.

Vakili and Brown (159), analyzing primary PCI procedures for STEMI, could find no relationship between physician total PCI volume and mortality. The authors also reported an association between an operator's primary PCI activity level and the outcome of primary PCI for STEMI that was independent of the operator's experience in elective PCI (160). Hannan et al. (150) analyzed the New York State angioplasty registry data, found an increased in-hospital mortality at institutions with lower volumes of primary PCI, whereas Politi et al. (161) showed no relationship between operator volume and mortality or MACCE at a high-volume PCI institution. Other studies have also shown no relationship between institutional volume of primary PCI and in-hospital mortality. It is therefore recommended that all primary PCI procedures be subject to review by a designated QA committee, regardless of the operator volume. Operators who wish to perform primary PCI must participate in these reviews if they wish to continue to perform primary PCI. Each facility's QA process must determine whether the results are acceptable for both the institution and the operators involved.

3.5.1.3.1. PCI OPERATORS IN THE FACILITY WITHOUT CARDIOVASCULAR SURGICAL SUPPORT. Data from the ACC-NCDR, the largest and most comprehensive assessment of PCI centers with and without onsite cardiovascular surgery, reveal that there are more patients presenting to lower-volume centers without cardiovascular surgery with ACS than to full-service facilities (36). In comparison to sites with onsite cardiovascular surgical back-up, sites without onsite cardiovascular surgery have similar rates of procedural success, morbidity, need for emergency surgery, and risk-adjusted mortality for all patients. Centers without onsite cardiovascular surgery have significantly shorter reperfusion times (2.1 ± 5.1 versus 2.6 ± 8.4 h). Seventy-nine percent of these sites without cardiovascular surgery provide both elective and primary PCI. Eighty-one percent of interventional operators work at both offsite and onsite surgery facilities; only 17% operate exclusively at offsite centers. No differences have been reported in outcomes (36).

Compared with full-service PCI centers, offsite PCI programs are predominantly located in nonurban areas, have lower annual PCI volume, treat a higher percentage of patients who present with subsets of AMI, and have better door-to-reperfusion for primary PCI. These same sites have, for the most part, similar observed procedural success rates, morbidity, emergency cardiac surgery rates, and mortality in cases that required emergency surgery as full-service facilities. The risk-adjusted mortality rates in offsite PCI facilities are comparable to those of PCI centers that had cardiac surgery onsite, regardless of whether PCI is performed as primary therapy for STEMI or in a nonprimary setting. These issues have been previously addressed in this document (see Section 2.4.3.).

An SCAI expert consensus document (14) emphasizes that though offsite surgical backup can be performed with acceptable outcomes and risks, the development of such programs should be based on the health needs of a local area, not on desires for personal or institutional financial gain, prestige, market share, or other similar motives. They recommend that operators performing PCI without onsite surgery should perform ≥100 total PCIs per year, including ≥18 primary PCIs per year. They also recommend that initial operators at a facility without onsite cardiovascular surgical backup should not begin performing PCI in such facilities until they have a lifetime experience of >500 PCIs as primary operator after completing fellowship. Operators in such facilities must demonstrate complication rates and outcomes equivalent or superior to national benchmarks and must evaluate their outcomes against established benchmarks.

There are obviously many operators performing primary PCI in facilities without cardiovascular surgical backup who do not meet these stringent guidelines, and these sugges-

Downloaded from content.onlinejacc.org by on May 16, 2012

tions have not been enforceable. The role of PCI without onsite cardiovascular surgical backup continues to evolve as a strategy for the delivery of care in patients with MI. Systems of care within a community should generally direct STEMI patients to facilities that are able to achieve a D2B time of <90 minutes and have a laboratory available on a 24 hours a day, 7 days a week basis. As pointed out earlier, the committee cannot recommend elective PCI programs without cardiovascular surgical backup that only provide primary PCI coverage during daytime and weekday hours.

It is the consensus of this committee that operators able to achieve successful primary PCI within the established guidelines may perform these procedures if there is a medically obvious advantage to the patient and the community. The decision must not be based on financial or prestige gain to the disadvantage of patient care. It should only be made available where there are written and enforceable guidelines from a full-service facility willing to accept patients should complications arise. Partnership with an experienced tertiary care hospital with a PCI program supported by cardiovascular surgery is mandatory. The organization of a primary PCI program and the patients eligible for primary PCI procedures in sites without onsite cardiovascular surgery have been discussed earlier and the highlights are outlined in Tables 2, 3, 4, 5, 6, and 7.

3.5.2. Institutional Minimum Caseloads

3.5.2.1. DIAGNOSTIC CATHETERIZATION INSTITUTIONAL VOLUME

The minimum diagnostic caseload for the entire laboratory facility varies widely from state to state, often depending on the presence of the CON process or other frequently arbitrary requirements. It falls upon the director of the laboratory to ensure that all studies in the cardiac catheterization laboratory are of the highest quality. In general, high-volume laboratories have consistently been shown to have fewer complications than low-volume facilities, although quality cannot be presumed by analysis of the total laboratory volume alone. Minimum laboratory diagnostic volumes are generally about 600 cases per year for financial viability, and that figure is often used as a cutoff minimum value with no strong data to support that it is the minimum number for highest quality. In some states, a minimum volume of 200 diagnostic cases per year has been found acceptable. All of these minimum volume numbers appear arbitrary to the writing committee, and there is concern that very low-volume laboratories may be poorly equipped or poorly maintained because of cost constraints. Just as in PCI programs, facilities performing only diagnostic cardiac catheterization must have an ongoing QA program that functions to ensure that the procedures being done are appropriate and that there are no quality issues with the procedure, the reporting system, or the decision making based on the procedural results.

3.5.2.2. INTERVENTIONAL CORONARY CATHETERIZATION INSTITUTIONAL VOLUME

In many states, the State Board of Health or the CON process will stipulate a minimum institutional PCI volume. McGrath et al. (145) examined institutional volume and outcome relationships. They noted an increased 30-day mortality rate of 4.29% for low-volume PCI programs performing <80 Medicare-reimbursed procedures per year versus high-volume programs that performed >160 Medicare procedures per year (3.15%). It should be noted that higher-volume facilities generally have the capacity to provide more extensive supplies and specialized equipment for PCI procedures, an immeasurable advantage in complex interventions and during unanticipated in-lab complications.

Kimmel et al. (78) using data from SCAI, found an inverse relationship between the number of PCI procedures a hospital performed and the rate of major complications. These results were risk stratified and independent of the patient-risk profile. There were significantly fewer complications in institutions that performed at least 400 PCIs yearly.

Jollis et al. (146) similarly found that low-volume hospitals were associated with higher rates of emergency coronary artery bypass surgery and death after PCI. Improved outcomes were identified at a threshold of 75 Medicare PCIs per physician and 200 Medicare PCIs per hospital. Using a 50% ratio of Medicare patients, the threshold value was estimated to be 150 to 200 PCIs per cardiologist and 400 to 600 PCIs per institution.

Epstein et al. (143), using an administrative dataset, analyzed risk-adjusted mortality in 362,748 admissions to 1,000 U.S. hospitals between 1997 and 2000, during which a PCI was performed. They found a consistent trend of decreasing risk-adjusted mortality with increasing hospital volume. The differences among groups were small, though. There was considerable heterogeneity within groups, suggesting that hospital volume was not the sole determinant of outcome. There are other studies that support the relationship of complication rate to institutional procedural volume (80,162,163). However, some investigators have pointed out that despite data that low procedure volume is poorly related to outcomes (164), many of these studies are small in number and underpowered (165). The National Health Service in the United Kingdom recently published the MACCE for each U.K. facility with data from 2007 and 2008 (Fig. 4) and found no linear relationship between MACCE and institutional volume (166), though improved outcomes were suggested when the institutional volume was >400 cases per year. These data form the basis for the recommendations of the Joint Working Group of PCI of the British Cardiovascular Society (167).

Based on data accumulated in the current stent era, a general volume–outcome relationship appears to exist. For example, Brown and coworkers (168) evaluated the out-

Downloaded from content.onlinejacc.org by on May 16, 2012

comes of PCI at all hospitals in California in 1997. Mortality and emergency CABG rates for PCI in which a stent was used was 1.5% and 1.2%, respectively, in hospitals performing <400 procedures per year compared with 1.1% and 0.8% in hospitals performing >400 procedures per year (110). Taken as a whole, an institution should be considered low volume if <400 PCI procedures are performed each year. The 2011 ACCF/AHA/SCAI guidelines consider a low laboratory volume of PCIs to be from 200 to 400 per year (158).

For both institutional and individual volume assessments, ongoing 2-year volumes should be measured then averaged to arrive at annual statistics. It is recommended that lower-volume institutions (<400 per year) must hold conferences with a more experienced partnering institution, with all staff expected to attend on a regular basis. Weekly cardiac catheterization laboratory conferences should be a mandatory aspect of the quality control and inspection program. It is also recommended that any institution that falls >2 standard deviations outside the risk-adjusted national benchmarks in mortality or emergency same-stay CABG during 2 of 3 contiguous 6-month periods have an external audit looking for opportunities to improve quality of care. The appropriateness of continuing to perform PCI procedures in an institution with low volume and unsatisfactory outcomes should be directly addressed from a medical standpoint and not from a financial or marketing standpoint.

3.5.3. Training

The cardiac catheterization laboratory represents a platform for training in invasive cardiovascular procedures. The goal of training programs is to teach the cognitive knowledge as well as the technical skills used in invasive cardiology. This includes indications and contraindications for the procedures, pre- and postprocedure care, management of complications, and the analysis and interpretation of hemodynamic and angiographic data. The trainee's professional goals determine the knowledge and skill set to be acquired during their time in the catheterization laboratory (169). The ACCF COCATS requirements differentiate among 3 levels of training based on distinct career goals (169). Level 1 training is designed for noninvasive cardiologists, whose invasive activities will be confined to critical care unit procedures. The goal of their catheterization laboratory experience is to learn the indications for procedures as well as how to interpret the data obtained in the laboratory. Level 2 training is for invasive cardiologists who will practice diagnostic, but not interventional, cardiac catheterization. Level 3 training is for interventional cardiologists who plan to perform both diagnostic and interventional cardiac catheterization (169).

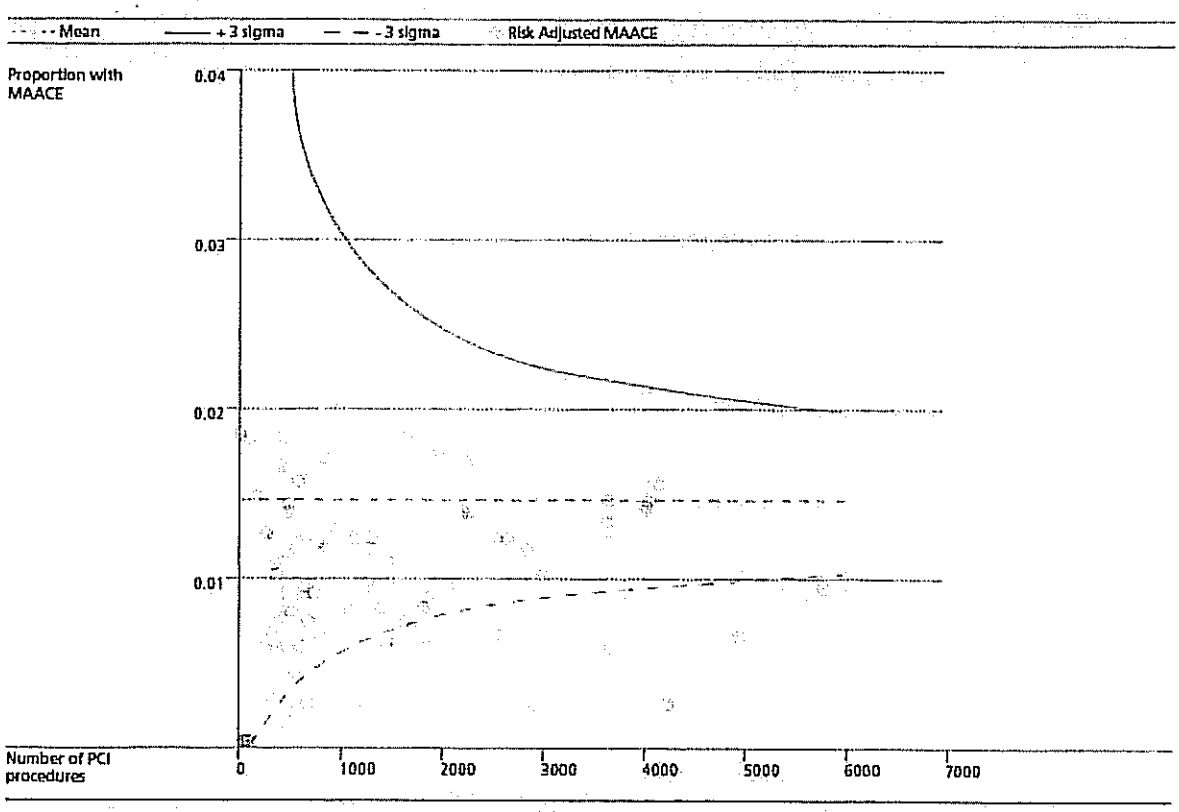

Figure 4. Relationship Between MACCE and Institutional Volume

No clear relationship is observable in this assessment of data from a national audit of PCI procedures in the United Kingdom (2007 and 2008). Reprinted from NHS Information Centre for Health and Social Care (166). MACCE = major adverse cardiac and cardiovascular events.

Table 17. Summary of Training Requirements in Diagnostic and Interventional Cardiac Catheterization

Area	Level of Training	Minimum Number of Procedures	Cumulative Duration of Training (Months)
Diagnostic catheterization	1	100	4
	2	200 (300 total)	8
Interventional catheterization	3	250	20

Modified from Jacobs et al. (169).

3.5.3.1. DIAGNOSTIC CARDIAC CATHETERIZATION AND PCI

A minimum of 4 months experience with at least 100 diagnostic catheterizations is required for Level 1 training, with 8 months experience and at least 200 additional cardiac catheterizations required for Level 2 (Table 17).

In contrast to diagnostic cardiac catheterization, training in PCI requires enrollment in an additional fellowship year in interventional cardiology in an Accreditation Council for Graduate Medical Education (ACGME)-accredited program (169). The trainee should participate in a minimum of 250 coronary interventional procedures during this year. In addition, the trainee should be proficient with the use of associated PCI procedures, such as IVUS and fractional flow reserve. Newer procedures, such as optical coherence tomography, may also find a role, and adequate training in such procedures should be anticipated. Completion of such a program leads to eligibility to sit for the American Board of Internal Medicine interventional cardiology examination. The goal should be that board certification is accomplished for everyone completing an accredited training program who wishes to actively participate in a coronary interventional practice. During fellowship training, all diagnostic and interventional cases should be performed under the direct supervision of a faculty member. Details of the cognitive knowledge and technical skills required for all 3 levels are outlined in the ACCF COCATS 3 training statement. Participation in cardiac catheterization conferences and exposure to cardiac catheterization research must be part of the training of all cardiology fellows.

3.5.3.2. PERIPHERAL VASCULAR PROCEDURES

At present, catheter-based peripheral vascular interventions are performed by subspecialists with diverse formal training including interventional radiology, interventional cardiology, and vascular surgery. Although guidelines of each subspecialty society include endovascular procedures within their training curricula, there is a lack of uniformity regarding the amount of patient exposure required and the precise mechanisms for evaluation of the experience (101,170).

Specific knowledge required for safe and effective performance of peripheral interventions includes the pathophysiology, clinical manifestations, as well as the evaluation and treatment of diseases for a variety of vascular territories. The training requires knowledge of peripheral arterial disease, renal artery stenosis, extracranial cerebrovascular disease, vascular aneurysms and arterial dissections, mesenteric ischemia, and both arterial and venous thromboembolism (101). The ACCF COCATS 3 training statement suggests that for vascular medicine and peripheral catheter-based intervention, training be a minimum of 12 months for both Level 2 (vascular medicine specialist) and Level 3 (peripheral vascular intervention) competence (100). Level 3 peripheral vascular training may be undertaken concurrently with advanced training for coronary interventions, but it must include a minimum of 100 diagnostic peripheral angiograms and 50 noncardiac peripheral vascular interventional cases evenly distributed among the different vascular beds (100).

The fellowship training requirements for performing peripheral vascular interventions are detailed in Table 18. Simulation training has been shown to improve performance of carotid angiography (171). Lower-volume established operators may also benefit from including simulation training as part of their CME.

The ACCF/ACP/SCAI/SVM/SVS Writing Committee on Clinical Competence on Peripheral Vascular Disease suggests that in order to achieve a balanced experience required for competence, the trainee's experience should include no fewer than 20 diagnostic and 10 interventional

Table 18. Formal Training to Achieve Competence in Peripheral Vascular Catheter-Based Interventions

Training requirements for cardiovascular physicians
• Duration of training*—12 months
• Diagnostic coronary angiograms†—300 cases (200 as the supervised primary operator)
• Diagnostic peripheral angiograms—100 cases (50 as supervised primary operator)
• Peripheral interventional cases†—50 cases (25 as supervised primary operator)
Training requirements for interventional radiologists
• Duration of training‡—12 months
• Diagnostic peripheral angiograms—100 cases (50 as supervised primary operator)
• Peripheral interventional cases†—50 cases (25 as supervised primary operator)
Training requirements for vascular surgeons
• Duration of training—12 months§
• Diagnostic peripheral angiograms‖—100 cases (50 as supervised primary operator)
• Peripheral interventional cases¶—50 cases (25 as supervised primary operator)
• Aortic aneurysm endografts—10 cases (5 as supervised primary operator)

This table is consistent with current Residency Review Committee requirements. *After completing 24 months of core cardiovascular training and 8 months of cardiac catheterization. †Coronary catheterization procedures should be completed prior to interventional training. ‡After completing general radiology training. §In addition to 12 months of core vascular surgery training. ‖In addition to experience gained during open surgical procedures. ¶The case mix should be evenly distributed among the different vascular beds. Supervised cases of thrombus management for limb ischemia and venous thrombosis, utilizing percutaneous thrombolysis or thrombectomy, should be included.

Downloaded from content.onlinejacc.org by on May 16, 2012

individually supervised cases in each of the major vascular territories, including aortoiliac and brachiocephalic, abdominal visceral, renal, and infrainguinal (101). The 12-month training period is in addition to the 24 months required for clinical core cardiology training and at least 8 months acquiring experience in diagnostic cardiac catheterization in an ACGME-accredited fellowship program. It is recommended that the trainee perform a minimum of 300 diagnostic coronary procedures, including 200 procedures with supervised primary responsibility prior to beginning interventional training. The trainee should also participate in a minimum of 100 diagnostic peripheral angiograms and 50 noncardiac peripheral vascular interventional cases during the interventional training period. At least 50 of the diagnostic angiograms and 25 of the interventional cases should be as supervised primary operator. The case mix should be evenly distributed among the different vascular beds. Supervised cases of thrombus management for limb ischemia and venous thrombosis that utilizes percutaneous thrombolysis or thrombectomy should be included.

3.5.3.3. STRUCTURAL HEART DISEASE

The inherent problems in setting threshold volumes in structural intervention is that the procedures—as compared to coronary artery interventions—are more diverse, of higher complexity, of lower frequency, and often require a multidisciplinary approach. Many of these procedures require multiple imaging modalities during the procedure (fluoroscopy and echocardiographic imaging). In addition, most of these procedures are in evolution in terms of indications, procedural issues, devices, and outcomes (172). The current guidelines on congenital heart disease do not offer volume guidelines (173). SCAI is actively addressing this issue and has recently published initial guidelines regarding training (174) as well as a survey of physicians to gain a better understanding of how best to establish competence (175).

Percutaneous noncoronary cardiac interventions for structural heart disease, including ASD and PFO closure, alcohol septal ablation therapy, and valvuloplasty represent growing and important components of the field of interventional cardiology. In addition, newer methods are being investigated for percutaneously approaching closure of other congenital vascular defects and connections as well as repairing or replacing cardiac valvular abnormalities. Although it is recommended that trainees in interventional cardiology programs get exposure to these procedures (169,176), at present, there are few official guidelines for training in each of these interventions. Guidelines for alcohol ablation for hypertrophic cardiomyopathy suggest a minimum of 20 procedures is required for proficiency. The "ACCF/AHA/SCAI 2007 Update of the Clinical Competence Statement on Cardiac Interventional Procedures" provides a review of the additional knowledge skills and training that are necessary for gaining competence in structural heart interventions (6). Due to the small number of these procedures performed, and the specialized knowledge and skills required, it is recommended that both training and practice activity be concentrated among a limited number of operators to allow for adequate expertise to be obtained (169).

For PFO and ASD closure or for the use of alcohol septal ablation in the treatment of the outflow tract gradient in hypertrophic cardiomyopathy, a minimum of 10 procedures each during training is recommended for trainees whose goal is to perform these procedures independently. Alcohol septal ablation should be offered only in those institutions that can employ a multidisciplinary program for pre- and postprocedural evaluation, careful case selection, and assessment of clinical outcomes. If available, partnership with a pediatric interventionalist should be considered when performing septal closure with the available percutaneous devices. In almost all situations the proper performance of interventions in structural heart disease requires a multidisciplinary team of cardiologists, cardiothoracic surgeons, vascular specialists, noninvasive imaging specialists, and radiologists.

Percutaneous aortic and mitral valvuloplasties are among the most complex and challenging interventional procedures. The importance of an operator learning curve has been well described for both of these interventions (177–179). Therefore, it has been recommended that 5 to 10 cases be performed with an experienced colleague, before performing balloon valvuloplasty independently (6). The significance of a learning curve is even more applicable for novel techniques such as percutaneous mitral valve repair, the closure of prosthetic paravalvular regurgitation, or transcatheter valve replacement. At the time of this document, most of these latter procedures remain primarily within clinical trials (177). In order for laboratories to become competent in the performance of structural heart procedures, the supervising or performing operator should be fully credentialed by the local facility in the procedure. Initially, this may require offsite training, simulation training, a visiting proctor, or a combination of these approaches. These procedures should only be done in a full-service hospital facility (Table 2). The operator responsible for the performance of the procedure in the catheterization laboratory should educate and supervise the staff in acquiring the necessary skills for the particular procedure. Since these are essentially always lower-volume procedures, there should be a small number of dedicated staff members and operators trained to perform structural heart procedures. For adult cardiologists performing these studies, a close working relationship with pediatric invasive cardiologists is also critical to ensure optimal performance in addressing percutaneous approaches to adults with congenital heart disease.

4. Procedural Issues in the Cardiac Catheterization Laboratory

4.1. Safety in Patients With Communicable Diseases

Screening for blood-borne pathogens is not routinely performed before referral to the cardiac catheterization laboratory. Therefore, it should be assumed that every patient has the potential to transmit an infectious agent. This reinforces the need to apply Universal Precautions in the cardiac catheterization laboratory. However, some patients referred for cardiac catheterization laboratory will be known to carry the HIV or the hepatitis virus (180). Heightened protective care should be taken in any case in which a communicable disease such as hepatitis or HIV positivity is present. Every cardiac catheterization laboratory should have an approved additional sterile technique protocol for known highly infectious cases. This protocol should include the use of surgical caps and masks as well as eye protection. Double gloving has been shown to reduce the chances of a puncture and to better clean an inadvertent needle that has punctured the gloves. In a study by Gerberding et al. (181), 17.5% of gloves developed a perforation during surgery. Wearing 2 pairs of gloves reduced the chances of a puncture hole in the inner glove by 60%. Though this practice has not proven to prevent transmission of hepatitis or HIV, it seems prudent to use this technique when the operator is working with high-risk patients. In case of blood-borne pathogen exposure to personnel, the catheterization laboratory should have in place ready access to hospital occupational health resources to rapidly address the risk of exposure to the staff along with the appropriate treatment, if indicated. For example, timely assessment and treatment of HIV-exposed personnel can reduce the risk of HIV-seroconversion. In addition to the usual surgical gown, disposable shoe covers for the cardiologist and all technicians and nurses in the room should be considered. Protective eyewear should be worn by all in-room personnel to prevent accidental blood exposure to the operator's eyes. The careful disposal of all needles, catheters, sheaths, tubing, and other instruments, as well as fluids that come in contact with the infected patient, is obviously important. Disposal of protective gear and all contaminated equipment at the end of the procedure as well as proper disinfection for nondisposable equipment is also important, especially for blood-borne pathogens that are communicable by contact (e.g., methicillin-resistant *Staphylococcus aureus*).

Vaccination for hepatitis B virus should be strongly considered, if not mandatory, for all operators and other personnel who work in the cardiac catheterization laboratory (182).

4.2. Patient Preparation

Many laboratories use a checklist to ensure that all relevant data are available prior to a procedure. Although this can be individualized, the checklist should at least include the patient name and hospital number, birth date, the procedure being planned, the status of the consent form signing, the core physical exam features, the indications for the procedure, the American Society of Anesthesiologists classification, the planned site of entry, medications and any allergies, pertinent laboratory findings (including creatinine clearance), and proposed contrast media limit.

Prior to any procedure, appropriate informed consent must be obtained. Discussing the risks and benefits of the procedure, as well as the alternatives to the procedure, must be done. Each facility must have an approved consent form that includes risks of the procedure in terms the patient can understand. For most coronary procedures, the potential need for ad hoc PCI should be included along with the adherent additional risks reviewed. All elective PCI procedures must mention the possible need for surgical intervention. The written informed consent may be obtained by trained secondary operators or physician extenders, but the major concerns should be reiterated when the primary operator discusses the procedure with the patient. Risks of PCI should be explained at the same time as the diagnostic catheterization risks, if the case has the possibility of requiring PCI immediately following the diagnostic procedure.

Educating each patient about the procedure and explaining in detail what they should expect allays patients' anxiety and ensures patients are fully informed. Additional procedures that the patient has not consented to must not be performed unless a life-threatening emergency develops. Written informed consent should be obtained in all elective cases, and ideally in emergency cases. However, in cases that are emergent, it is recognized that written informed consent may not be feasible. In these cases, local standards for documentation of necessity should apply, and documentation should be clearly written in the patient's record.

Prior to the start of the procedure, calling a time-out assures that the appropriate procedure is being performed on the correct patient. This is now a Joint Commission on Accreditation of Healthcare Organizations requirement. The time-out period must occur before the patient is sedated at the start of the procedure. The time-out participants include the attending physician, any trainees or other participating secondary operators, and the procedural staff. The patient should participate if awake to confirm the information. A member of the procedural staff or the attending physician should initiate the time-out period. The elements of the time-out must include, but are not limited to the following: 1) correct patient name; 2) correct procedure being performed; 3) consent signed; 4) confirmation of any allergies; 5) any antibiotic administration; 6) correct site and side is being used; 7) confirmation of pre-wash performed, if indicated, and/or double prep, if necessary; and 8) availability of any special equipment and/or imaging studies that will be used during the procedure.

Downloaded from content.onlinejacc.org by on May 16, 2012

4.2.1. Minimum Laboratory Data in Preparation for the Procedure

Within 2 to 4 weeks prior to any cardiac catheterization procedure, a hemoglobin, platelet count, electrolyte panel, and creatinine should be obtained on all patients. If the patient arrives and has had any significant clinical change or recent contrast exposure since the laboratory tests were obtained, the studies should be repeated on the day of the procedure and prior to the catheterization.

Unless the patient has a known liver disease or a hematologic condition that might affect hemostasis or is on antithrombin therapy, the consensus of the committee is that the routine acquisition of a protime/INR procedure is optional and no longer necessary before the cardiac catheterization in most cases.

In addition, the committee feels that the patient's need for overnight NPO is not always in the best interest of patient hemodynamics, and only a minimum NPO period of 3 hours is sufficient, unless conscious sedation will clearly be required. If conscious sedation is required, the NPO period is suggested to be at least 4 hours. The American Society of Anesthesiologists last published NPO guidelines in 1999, at which time they suggested 2 hours of fasting after clear liquids and 6 hours after a light meal (183). Adequate hydration remains an overlooked but is an important preparatory feature.

Women of child-bearing age should have a urine beta-HCG level or a serum beta-HCG checked within 2 weeks prior to the procedure to exclude pregnancy. During the initial 2 weeks of gestation, the embryo has little risk from ionizing radiation unless a large dose is received (>100 mGy). At that exposure, there is a higher likelihood of fetal death or failure of the blastocyst to implant. The uterus provides considerable protection. Since only a few cells make up the embryo during that period, embryo cells that survive are progenitors of many other cells and exhibit no ill effects from the radiation exposure (206a). The data thus appear to justify the 2-week margin before any woman of child-bearing age receives ionizing radiation.

The presence of a nickel allergy has also been a concern for patients in whom a nickel-containing device may be implanted. It is estimated that about 15% of the population has a skin nickel allergy (184). Nitinol is a nickel/titanium alloy used in self-expanding devices. One report suggests nickel allergy may result in an increase in migraine headaches after ASD or PFO closure with large occluder devices made from nitinol (185). Another report suggested the use of the Helex device rather than the Amplatzer to prevent any nickel allergic reactions (186). The Helex device minimizes the nitinol exposure as its circumferential support is enclosed in an ePTFE membrane. Coronary stents are made of stainless steel, which is biologically inert but may contain as much as 5% nickel. Although there are anecdotal data regarding early stent closure in nickel-allergic patients, there are no data to support routine skin testing for nickel allergy before the use of either occluder devices, or of coronary or vascular stents at the present time.

4.2.2. Patients Receiving Antiplatelet and Antithrombin Agents

Aspirin is not stopped or held prior to cardiac catheterization, and if patients have not been taking aspirin, it should be started prior to the procedure. Many patients are loaded with or started on thienopyridines prior to cardiac catheterization if there is a high likelihood of PCI and low likelihood of CABG. Ticlopidine is generally no longer used (except in the rare clopidogrel-allergic patient), and newer antiplatelet agents are becoming increasingly available and may be substituted when medically indicated.

Patients taking warfarin should be instructed to stop taking it at least 3 days prior to the catheterization, and their INR should be checked prior to the procedure. An acceptable INR to perform femoral artery cardiac catheterization procedure is <1.8.; an INR of <2.2 is acceptable for radial access. These thresholds are rather arbitrary and based on scant data. Of note, a new study of fully anticoagulated patients undergoing PCI from either the radial or femoral access site suggests a major advantage to the use of radial access regarding periprocedural bleeding (187). Overuse of parenteral vitamin K may make it difficult to re-establish an antithrombin effect following the procedure, therefore allowing the patient's INR to drift downward after stopping the medication is preferred. In high-risk groups, especially those with mechanical heart valves, a bridging protocol is generally followed (188).

Patients receiving heparin, low-molecular-weight heparin, or glycoprotein IIb/IIIa inhibitors undergo cardiac catheterization safely with only a minimum increase of bleeding risk, particularly in the setting of an ACS. A longer time to hemostasis may be required postprocedure, and the combination of aspirin, heparin, and other antiplatelet agents increases the risk of bleeding. Newer non-heparin anticoagulants may require a change in practice regarding the timing of performing cardiac catheterizations and subsequent angioplasty procedures. Following activated clotting times (ACTs) for patients on IV heparin has been the standard for years. With newer low-molecular-weight heparins, factor Xa inhibitors, and direct thrombin inhibitors (e.g., bivalirudin [Angiomax]), ACTs are often not appropriate. Knowledge of the time when the last dose of the low-molecular-weight heparin or factor Xa inhibitor will dictate further anticoagulant therapy during PCI procedures, risk of bleeding, and the timing of sheath removal. The half-life of bivalirudin is short, 25 minutes in patients with normal renal function.

Dabigatran etexilate (188a) is a small nonpeptide molecule that reversibly inhibits both free and clot-bound thrombin (factor IIa) and has been approved for stroke prevention in patients with atrial fibrillation. At the time of this writing, it is being actively investigated for other indica-

Downloaded from content.onlinejacc.org by on May 16, 2012

tions. It has a predicable pharmacokinetic profile that allows for a routine dosing regimen without need for routine coagulation monitoring. Peak effect occurs in 2 to 4 hours after administration. Its estimated half-life is 15 hours with normal renal function. Testing for its effect provides a qualitative and not quantitative measure. It does not alter the INR. The activated partial thromboplastin time (aPTT), although not sensitive to the effects, can provide negative predictive value; an aPTT <30 seconds suggests no effect, whereas the median peak aPTT level is about 2 times control. The thrombin time for direct thrombin inhibition is sensitive, though it is still most useful to exclude an anticoagulant effect as other anticoagulant agents can affect its value. The ecarin clotting time has a linear relationship with dabigatran levels, but at present, it is not widely available. Drug levels are affected by renal function. Based on the pharmacokinetics, in patients with normal renal function (eGFR >50 mL/min), discontinuation of 2 doses results in a decrease in the plasma level to about 25% of baseline, and discontinuation of 4 doses will decrease the level to about 5% to 10%. Some reversal of the effects can be achieved by the use of recombinant activated factor VII and prothrombin complex concentrates. It can also be removed with dialysis. About 60% is removed after 2 to 3 hours of dialysis. From a practical standpoint, the drug should be stopped 24 hours (2 doses) prior to cardiac catheterization if the eGFR is >50 mL/min and for 48 hours if the eGFR is 30 mL/min to 50 mL/min. The drug should not be used in patients with eGFR <30 mL/min. The anticoagulant effect in patients with such chronic kidney disease (eGFR <30 mL/min) may persist for 2 to 5 days (189).

Rivaroxaban, a factor Xa inhibitor that is structurally similar to the antibiotic linezolid, has now been approved by the Food and Drug Administration (FDA) as a once-a-day alternative to warfarin. Apixaban, a factor IIa inhibitor similar to dabigatran, is likely to be available soon. A review summarizes their potential advantages and uses (190).

4.2.3. Chronic Kidney Disease/Renal Insufficiency

Though there is some controversy regarding the classification of patients with CKD, groups can be divided by glomerular filtration rate (GFR) into 5 categories (based on the Modification in Diet in Renal Disease [MDRD] GFR calculation method). The stages are outlined in Table 19.

Table 19. Progressive Stages in Renal Dysfunction Utilizing the GFR via the MDRD Method

Stage	Severity	GFR (mL/min/1.73 m²)
I	Slight	<90
II	Mild	60 to 89
III	Moderate	30 to 59
IV	Severe	15 to 29
V	Severe and established	<15

Reprinted with permission from Levey et al. (191).
GFR = glomerular filtration rate; and MDRD = Modification of Diet in Renal Disease.

The occurrence of contrast-induced nephropathy (CIN) correlates directly with the severity of chronic kidney disease, contrast volume, and the combination of chronic kidney disease and diabetes mellitus. CIN carries a poor prognosis, particularly if patients become dialysis dependent; however, the occurrence of CIN varies widely depending on the definition used (192). Two definitions (an incremental increase in creatinine >0.5 mg/dL and >25% rise in serum creatinine) are now accepted as a measure of CIN occurrence (193). A multitude of studies have been performed using different iodinated contrast agents, gadolinium, and various modalities to try and prevent contrast nephropathy.

4.2.3.1. ATTEMPTS TO REDUCE THE RISK OF CONTRAST NEPHROPATHY

The cause of nephropathy following radiographic contrast is unknown. There are data that suggest both renal vasoconstriction and direct (possibly free-radical injury) play a role. Some reduction of contrast nephropathy can be accomplished by minimizing contrast volume (194). Iso-osmolar or low-osmolar contrast agents are preferred. One report suggests the volume threshold can be estimated by using the ratio of contrast volume to creatinine clearance. Nephrotoxicity is more likely when the contrast volume/creatinine clearance ratio exceeds 3.7:1 (195).

Biplane coronary angiography should be utilized to reduce the contrast load if the equipment is available. Avoiding unnecessary "test" or "puff" injections, eliminating ventriculography and aortography, and taking the least number of angiograms can limit contrast volume. Careful fluoroscopy setup to reduce panning and use of a higher frame rate may also reduce the volume of each contrast injection per image acquisition. Performing ad hoc interventions and combined coronary and peripheral procedures should be carefully reviewed. There should be a low threshold to have the patient return for a repeat procedure to avoid large volumes of contrast during a single procedure. A discussion of maximum contrast limits should be part of the initial "time-out" before the procedure. N-acetylcysteine has been extensively studied, but the latest randomized data from the Acetylcysteine for Contrast-Induced Nephropathy trial evaluated the effectiveness using large doses of acetylcysteine in 2,308 patients before and after the use of contrast media, and the authors found no evidence for prevention of CIN (196). Its use is no longer recommended. Vitamin C has also been used with some favorable effect to reduce free-radical injury, as has sodium bicarbonate. None have been consistently useful, though, and none proven in any large randomized trial. Fenoldapam and theophylline, agents used to reduce the vasoconstrictive component, have not been found effective (192), and the use of gadolinium is not recommended for coronary angiography but has been used in renal and peripheral angiography (197).

Prehydration and posthydration with normal saline or sodium bicarbonate has been the gold standard for reducing the incidence of contrast nephropathy and the only modality

Downloaded from content.onlinejacc.org by on May 16, 2012

that has consistently been shown to be of some value. This is generally easy to accomplish in an inpatient setting; however, it is more difficult in an outpatient setting. The use of sodium bicarbonate infusion 1 hour prior to and 6 hours after angiography has been shown to decrease contrast nephropathy in some studies and might have an advantage compared to normal saline hydration, though the advantage is very modest (198).

Continuous veno-venous hemofiltration and hemodialysis have been tested and the benefits remain unclear. It may be considered in the very high-risk patients (199). There are also data suggesting an advantage with the use of statins (200) and the use of iso-osmolar contrast (201). However, the latest data do not suggest an advantage of iso-osmolar contrast over low-osmolar agents (202). Guidelines to reduce contrast nephrotoxicity have been developed by SCAI (203) and the Contrast Nephropathy Working Group that met in 2006 (204). At this juncture, the only recommendations the writing committee suggests are outlined in Table 20. These are consistent with the "2011 ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention" as well (158).

4.2.4. Other Contrast Media Reactions

Identifying patients at risk for a reaction to iodinated contrast remains a cornerstone of the preprocedure history. Besides the nephrotoxicity issues noted above, contrast media reactions include 1) acute hypersensitivity (anaphylactoid reactions—non-IgE mediated); 2) delayed hypersensitivity (IgE mediated and often resulting in rash or fever up to 48 hours after the procedure); 3) acute hemodynamic or electrophysiological consequences during the procedure (now less common with low-osmolar and iso-osmolar contrast); 4) possible hypercoagulation (e.g., stressing the importance of minimizing the contrast media–blood interface in syringes); and 5) hyperthyroidism (the only real side effect due to the iodine in the contrast media—seen usually in elderly patients with history of thyroid nodules).

A previous anaphylactoid reaction and a history of atopic conditions such as asthma are the most significant risk factors for acute hypersensitivity reactions (205). It should be recognized that contrast reactions can be idiosyncratic so that a history of any past reaction (regardless of subsequent reactions) should be treated. Patients with other food or medication allergies, those of an advanced age, and women are at higher risk. It has never been shown that patients with a history of shellfish allergy have a higher risk of a reaction to radiocontrast media and, in fact, the allergen is actually in the tropomysin protein and appears unrelated to iodine. Pre-medication is recommended for those with a strong atopic history and for patients with a known prior allergy to contrast. It appears that anaphylactoid reactions are much more common when contrast is administered in the venous rather than the arterial circulation, so these types of potentially life-threatening reactions are much more common with computed tomography (CT) angiography or IV pyelography use than during cardiac angiography. Premedication regimens with H2 blockers and steroids are recommended for the highest-risk atopic patients, particularly those with known prior reaction. Current options include giving 50 mg oral prednisone 13 hours, 7 hours, and 1 hour prior to the procedure or 200 mg IV hydrocortisone 2 hours before the cardiac catheterization with or without H2 blockers (205). Anaphylaxis results in profound vasodilation, bronchospasm, and circulatory collapse. Treatment not only includes epinephrine but requires circulatory support with large doses of IV fluids and other inotropic agents.

The importance of recognizing delayed hypersensitivity due to contrast is important to avoid stopping appropriate medications, such as clopidogrel, on the assumption the transient fever and rash may be due to a new medication started after the procedure rather than simply due to the contrast media.

Table 20. Suggested Protocol to Reduce the Incidence of Contrast-Associated Nephropathy Following Cardiac Catheterization

1. Identify risks
   a. Highest risk—eGFR <60 mL/min/1.73 m²
   b. Diabetes
2. Manage medications
   a. Hold nephrotoxic drugs (e.g., NSAIDS)
3. Manage intravascular volume
   a. Hydrate with either normal saline or sodium bicarbonate (either acceptable)
   b. Hydrate with 1.0 to 1.5 mL/kg/min for 3 to 12 hours before and 6 to 12 hours post
4. Radiographic contrast
   a. Minimize contrast volume
   b. Use either low-osmolar or iso-osmolar contrast
5. Follow-up data: obtain 48-hour creatinine

eGFR = estimated glomerular filtration rate; NSAIDS = nonsteroidal anti-inflammatory drugs.

4.2.5. Diabetes Mellitus

Patients with diabetes mellitus require precautions to prevent hypoglycemia. Insulin doses the night before are generally cut in half, and in the morning oral hypoglycemic and insulin are held. These patients should be scheduled early in the morning to avoid prolonged fasting. Blood glucose levels should be checked upon arrival in the precatheterization staging area and treated accordingly. Patients with normal renal function taking metformin are instructed to not take the metformin the day of the procedure and not to restart it for at least 48 hours afterwards and until an assurance of no contrast-related nephropathy (206). The danger of metformin and contrast media is the clinical syndrome of severe and persistent lactic acidosis. This syndrome invariably occurs in patients with renal insufficiency, and metformin should not be used in this group anyway. Because diabetes mellitus itself is an independent

Downloaded from content.onlinejacc.org by on May 16, 2012

risk factor for contrast nephropathy, the current recommendations are to stop the metformin the day of the procedure and not resume (usually 48 hours) until a normal creatinine level has been documented (see Table 20).

4.2.6. Sedatives and Relaxants

Conscious sedation is most commonly used for the majority of procedures performed in the catheterization laboratory. Appropriate sedation is imperative and ensures patient comfort. Pre-medication with oral diphenhydramine and diazepam is common. IV sedative hypnotics and analgesic regimens vary. A combination of midazolam and fentanyl citrate is very popular. IV morphine, diphenhydramine, and hydromorphone hydrochloride are also used. Conscious sedation protocols must be strictly adhered to and excessive sedation should be avoided. All patients should have baseline blood pressure (BP), oxygen saturation, and heart rate and rhythm documented. These vital signs must be monitored closely throughout the procedure and in recovery. Reversal agents should be readily accessible in the laboratory.

General anesthesia is often used if transesophageal echocardiography is required for a procedure. Many patients undergoing valvuloplasty, percutaneous aortic or mitral valve procedures, and ASD and PFO closures are managed, with the assistance of an anesthesiologist, under general anesthesia.

4.2.7. Heparin-Induced Antibodies

Great precautions must be taken in patients with known antibodies to heparin. Heparinized flush is not to be used in the manifold system. Therefore, great care must be taken between catheter exchanges with wiping wires thoroughly, and extra attention to flushing the sheaths and catheters must be performed. If patients require anticoagulation, then direct thrombin inhibitors are used.

4.2.8. Pregnant Patients

Radiation exposure should be avoided as much as possible in pregnant patients. The concept of ALARA (As Low As Reasonably Achievable) in regard to radiation dose should always be followed. Despite the fact that direct x-ray targeting during the procedure mostly affects the upper torso, Compton scattering within the body results in indirect x-ray exposure to the developing fetus. Efforts to minimize x-ray dose should also include using low fluoroscopy settings or in-laboratory echocardiography rather than cineangiography, limiting total exposure time, using reduced framing rates, using the minimum number of contrast injections, and avoiding angulated or magnified views when possible. A lead apron between the x-ray tube and abdomen is recommended. The fetus is less vulnerable during the first 2 weeks of gestation but becomes especially vulnerable during the duration of the first trimester (206a).

4.3. Access Site (Femoral, Radial, Brachial)

The most common site for percutaneous arterial access for both diagnostic and interventional cardiac procedures is the common femoral artery. Localization of the appropriate access insertion using the radiographic femoral head as a marker has been popular and found helpful. The sheath entry should be located within the femoral artery at the medial third of the femoral head (207). The radial artery approach is gaining more and more popularity, especially for obese patients and outpatients. The use of the radial approach in the United States remains much lower than many other countries, despite fewer bleeding complications using the radial approach compared with the femoral artery approach in the elderly and those undergoing PCI for ACS (208). Brachial access is rarely used. Brachial cut-downs are, at this point, of historical interest only. Femoral cut-downs for large abdominal aortic aneurysm stent grafts or for percutaneous aortic valve replacement are still required at times. In cases where greater wound exposure is necessary, such as in pacemaker implantation or femoral cut-downs, a full surgical sterile technique should be used. A vascular sheath should be used to minimize vascular trauma, especially when multiple catheter changes are anticipated. Each percutaneous vascular site (femoral, brachial, radial, subclavian, or internal jugular) requires that the operator have specialized training. Although some aspects of percutaneous vascular access are similar for all sites, certain issues (e.g., compression and/or administration of heparin or intravascular verapamil or nitroglycerin) are unique to each site. If venous access is required, in most cases it should be performed using the femoral vein or the internal jugular vein. The use of ultrasound to localize and facilitate cannulation, particularly of the internal jugular and subclavian veins has become routine in many institutions. Multiple venous catheters can be safely inserted in the same femoral vein; multiple arterial catheters require separate arterial access sites. In radial artery access cases, it is routine and acceptable to obtain venous access via the femoral vein. Strict sterile procedures should be followed at each site.

4.4. During the Procedure

4.4.1. Medications

Adequate hydration, appropriate for the patient's underlying condition, is important before the procedure. Drugs, such as long-acting phosphodiesterase inhibitors (e.g., tadalafil) should be held in case nitrates would be needed. Chlorhexadine is now the preferred prep solution over the use of betadine.

Multiple medications can be administered during the catheterization procedure. These are related to sedation, procedural performance, and BP or heart rate changes. Anticoagulants, antiplatelet adjuncts, and emergency-related medications may also be used. Vasoactive medications for either high or low BP may be required depending on the clinical situation. The selection of the appropriate agent should be based on the

Downloaded from content.onlinejacc.org by on May 16, 2012

individual patient, clinical setting, and etiology of the abnormal hemodynamic state. Hypertension is common, in part because of the heightened adrenergic tone from anxiety, as well as from the underlying condition. Treating high BP during a procedure (after adequate sedation) can be accomplished with IV boluses of hydralazine, labetalol, nicardipine, or metoprolol. Nitroprusside and nitroglycerin continuous infusions may also be of benefit. Caution should be exercised in patients with certain conditions, such as severe pulmonary hypertension or critical aortic stenosis. Hypotension must be diagnosed and managed aggressively, and management is critically dependent on the etiology. Vagal episodes are characterized by an inappropriately low heart rate in association with hypotension, whereas other causes of hypotension are generally associated with a high compensatory heart rate. IV fluid boluses with normal saline are often first-line therapy for hypotension from any cause. Patients are commonly dehydrated from having food and drink withheld for many hours prior to the procedure. If volume resuscitation is unsuccessful, dopamine, norepinephrine, and phenylephrine infusions can be started to maintain adequate BP. Specific conditions that need to be considered and treated include vagal reaction, hemorrhage, allergic reaction (anaphylaxis), cardiac tamponade, or cardiogenic shock.

During both diagnostic angiography and percutaneous coronary interventions, a variety of vasodilator agents may be required. These agents include intracoronary nitroglycerin, nitroprusside, verapamil, nicardapine, adenosine, and other vasodilators. There is a significant variation regarding the use of intracoronary vasodilators among hospitals. Cardiac catheterization labs should have standard medication doses and procedures regarding the use of these medications so that all personnel are familiar with the most commonly used and requested vasodilators in their region.

4.4.2. Sterile Techniques

Infection is rare after invasive cardiovascular procedures. The Occupational Safety and Health Administration recommends that preparation of all patients include the removal of hair from the site (electric clippers are preferred over typical razor-blade shaving to avoid skin abrasion), application of antiseptic to the skin, and the use of sterile drapes. Sterile covers for the image intensifier and protective operator shielding should be placed when these are used over or next to the sterile field. Systemic antibiotics are not required, although some operators use them with large-vessel noncoronary stents or other devices that will be left in the body. A generally sterile environment should be maintained during the procedure. Disposal of all materials should also follow local safety and infection control guidelines.

Although the strict sterile techniques used in the operating room are not necessary for most cardiac catheterization laboratory procedures, operators should use appropriate hand washing and wear a sterile gown and gloves. Personnel should wear hospital-based scrub attire. Occupational and Health Safety Guidelines (180) and Usual Precaution Guidelines suggest that masks, an eye shield, and protective caps should be worn during cardiac catheterization. These protect from accidental blood exposure to the operator as well as help preserve the sterile access field. Strict adherence to aseptic techniques are mandatory when devices are being implanted, such as those used in the treatment of structural heart disease.

4.4.3. Technical Issues

4.4.3.1. CORONARY ANGIOGRAPHY

The safe injection of a contrast agent into coronary arteries is predicated on the coaxial placement of the coronary catheter in the coronary ostium and the correct positioning of the tip of the catheter in the coronary artery. Assurance of an air-free connection between the contrast manifold port or syringe and the catheter must be established. To avoid red blood cell clumping and potential thrombus formation, the syringes should be flushed clear of blood. Careful replenishment of contrast in the injection syringe and the maintenance of an air-free environment is the responsibility of the operating cardiologist. Most invasive cardiologists inject the coronary arteries manually themselves or use support personnel to perform the injection. Specialized mechanical injectors can be used with appropriate equipment and training. Coronary injections should include a tiny test dose of contrast once the catheter tip is in position. This ensures that the catheter is not subintimal or under a plaque that might result in an extensive coronary artery dissection if a full injection of contrast were administered. Monitoring catheter tip pressure is obligatory. A "flush" injection into the respective coronary sinus may help define ostial coronary disease.

It remains the responsibility of the individual invasive cardiologist to ascertain whether nonphysician personnel or power injectors are capable of administering contrast into the coronary arteries. Physician extenders should never be primary operators. They can be secondary operators but should always be viewed as extensions of the primary operator's hands, with the responsibility for safety ultimately residing with the invasive cardiologist.

In the majority of cases, the use of single-plane x-ray imaging is satisfactory, recognizing that most laboratories do not have biplane capabilities. It is desirable for laboratories contemplating angiographic evaluation of patients with congenital heart disease, however, to have biplane capabilities. A biplane option also is useful to keep contrast volume at a minimum in patients with renal failure. In the case of left ventriculography in patients with coronary artery disease, an appropriate view should be selected to gain the most information regarding LV function. This may include a left anterior oblique view if left circumflex disease is discovered, and there is interest in observing lateral ventricular wall motion. The use of noninvasive modalities to assess wall motion and ejection fraction prior to the cathe-

Downloaded from content.onlinejacc.org by on May 16, 2012

terization procedure has reduced the frequency with which LV angiography is now required.

The use of multiple orthogonal views of the coronary arteries is of obvious importance, as coronary lesions are defined by "worst view." The invasive cardiologist must be certain that appropriate information is obtained and recorded in order to make an accurate diagnosis and to determine suitability for PCI or CABG. Each segment of the coronary artery should be seen in at least 2 orthogonal views. Although it may be helpful and expeditious to have routine views performed on each coronary study, additional views should be obtained if the anatomy is not clearly presented or there are overlapping structures. The knowledge and application of additional views is the hallmark of excellence for angiographers.

In the case of right-heart and pulmonary angiography, it is important that the appropriate views be obtained to demonstrate the anatomy being interrogated. Because most cardiac catheterization laboratories have only a maximal 9-inch image intensifier, multiple images of the lung are usually required to interrogate the entire lung fields. If the aorta is to be investigated, cine aortography can be performed in the catheterization laboratory to ascertain the size of the aorta (in cases of aortic stenosis with anticipated aortic valve replacement) and to visualize the arch vessels. If detailed examination of the lung and aorta and arch vessels is required, it is often better to use a system with a larger-size image intensifier field of view designed for that purpose. It should be recognized that angiography in the catheterization laboratory is limited by 2-dimensional imaging, hence complete evaluation of the aorta and pulmonary arteries (PAs) may be difficult, and the potential use of alternative imaging modalities (i.e., CT or magnetic resonance imaging [MRI]) should be considered if clinically important.

4.4.3.2. VENTRICULOGRAPHY AND VASCULAR ANGIOGRAPHY

Power injectors are recommended for optimal opacification and visualization during ventriculography and large vessel angiography, such as aortography. Hand injection can be performed for selective subclavian, carotid, or renal angiography. Using a pigtail catheter appropriately placed in the mid–left ventricle usually avoids or minimizes inducing premature ventricular contractions or ventricular tachycardia. End-hole catheters should generally not be used for ventriculography power injections because of the risk of perforation or an intramyocardial contrast injection. At times, visualization of the pulmonary veins can be obtained by wedge angiograms (the injection of contrast into a pulmonary wedged balloon catheter then release of the balloon to observe the pulmonary veins during the washout period).

4.4.3.3. PRESSURE MEASUREMENT

During a routine left heart and coronary arterial catheterization, a preprocedural and postprocedural aortic pressure tracing, as well as the recording of the LV systolic and end-diastolic pressure should be obtained. Some laboratories find it useful to repeat the LV pressure after the left ventriculogram to report the LV end-diastolic pressure after contrast, although the clinical value of this exercise is questionable. During right-heart catheterization, the acquisition of right atrial (RA), right ventricular (RV), PA, and PA wedge tracings is routine, and sufficiently long strips of phasic recordings should be obtained to account for respiratory variation. Obtaining the end-expiratory pressure helps reduce the respiratory variation, although some patients are unable to hold their breath without performing a Valsalva maneuver, and thus the pressures are influenced by the resultant high intrathoracic pressure generated. The mean pressure in atrial and pulmonary chambers should be obtained over 10 beats to allow for correction of respiratory changes. A 10-beat average should also be reported in patients having atrial fibrillation.

If pullback pressures are used to measure valvular gradients, the patient should be in as steady a state as possible to diminish the likelihood of any respiratory variation between pressure measurements from 1 chamber to another. Simultaneous pressures to gauge gradients across valvular lesions are preferred to pullback pressures when feasible. Care should be taken if the femoral artery pressure is used as a substitute for aortic pressure in younger patients, as normally the femoral pressure is higher than the central aortic. If femoral pressure is to be used as the aortic pressure surrogate, documentation should be obtained that the pressures between the 2 sites are similar. Newer dual lumen catheters should generally be used for the measurement of aortic or pulmonic gradients.

On occasion, the pulmonary capillary wedge pressure will also not correspond well with the LA pressure (especially after mitral valve replacement), and a transseptal puncture with simultaneous measurement of the LA and LV pressure may be required for an accurate transmitral gradient. With the improvement in noninvasive assessment of valvular gradients, it is not uncommon that cardiac catheterization hemodynamics focus only on the pulmonary pressure, outputs and coronary anatomy and the valvular gradients are not directly assessed. Pressure wires are of small enough caliber that they can be used to cross even mechanical prosthetic valves safely.

4.4.3.3.1. HEMODYNAMICS. The importance of high-quality pressure measurements has unfortunately been deemphasized in most laboratory facilities. The availability of numerous types of hemodynamic equipment precludes detailed description here. Appropriate filtering of the pressure signal is important for adequate interpretation of individual waveforms. Careful balancing and zeroing of the system at the level of the mid-atria are necessary for each procedure. Often, simultaneous pressures are important, and frequently higher-speed recordings (100 mm/s) are needed to obtain adequate data for waveform analysis. It is the responsibility of the laboratory director to ensure that the equipment available produces the information desired. Detailed knowl-

Downloaded from content.onlinejacc.org by on May 16, 2012

edge of each laboratory's transducers and recorders should be part of the orientation and a requirement for credentialing of invasive cardiologists in a particular catheterization laboratory. It is each invasive cardiologist's responsibility to direct the acquisition of appropriate pressures so that key hemodynamic data are obtained and not overlooked. Invasive cardiologists using the laboratory should review the quality of the pressure recordings obtained, and any deficiency should be corrected.

Accurate hemodynamic measurements aid in sorting out constrictive pericarditis from restrictive cardiomyopathy. In either instance, it is important that simultaneous measures of both LV and RV pressure during respiration are recorded to assess for ventricular interdependence (209). In patients with dyspnea, both a superior vena cava and PA oxygen saturation may be useful to exclude an unanticipated left-to-right shunt.

4.4.3.3.2. INTRACORONARY HEMODYNAMICS. Measuring the pressure gradient across a lesion in a coronary vessel may provide information regarding the hemodynamic significance of that lesion (210). Multiple studies have confirmed the use of pressure wires to assess pressure gradients across an intermediate angiographic stenosis (211–213). This information can now be used to guide whether or not stents should be placed (214,215). These studies have shown excellent outcomes in patients who have had insignificant gradients who did not have stents placed (216). The fractional flow reserve (FFR) is measured after the pressure sensor tip wire is placed distal to the lesion in question. Adenosine is administered intravenously or intracoronary to dilate the microvascular coronary circulation. An FFR measurement of >0.75 was initially used as the standard cut off to defer stent placement. The latest studies suggest an FFR >0.80 can be used with excellent long-term outcomes (212,213).

4.4.3.4. CARDIAC OUTPUT AND VASCULAR RESISTANCE MEASUREMENTS

Cardiac output measurements commonly used in the cardiac catheterization laboratory include the use of indicator dilution methods (typically thermodilution), the Fick method (use of pulmonary and arterial blood oxygen saturations and oxygen consumption), angiographic methods, and impedance estimates. Indocyanine green dye is no longer used as the indicator. As a consequence, most cardiac catheterization laboratories rely on either thermodilution methods or the Fick method for determination of cardiac outputs. Thermodilution methods use a thermistor on the end of a right-heart catheter. As a proximally injected bolus of saline traverses past the thermistor, the temperature change results in a curve similar to that observed with dye dilution methodology. Analysis of this curve allows determination of cardiac output by a variety of methods. Accurate measurement requires a concentrated bolus of saline. Thus, tricuspid or pulmonary insufficiency may significantly alter the results obtained. Fick cardiac outputs require measurement of oxygen saturation, hemoglobin, and oxygen consumption. Oxygen consumption is the most difficult variable to obtain. Most laboratories use an assumed value from an established reference table or an established formula. Direct measurement of oxygen consumption provides a more accurate assessment using a variety of instruments, but the unstable nature of some of these devices and the expense and time involved have discouraged direct oxygen consumption measurements in most catheterization laboratories. Angiographic cardiac output using area-length assumptions or Simpson's rule provides LV volumetric data useful for estimating valvular stenosis severity in the presence of valvular regurgitation (assuming only 1 left-sided valve demonstrates regurgitation). The regurgitant fraction can also be derived. Angiographic methods suffer from vagaries in the accuracy of shape assumptions and from the determination of the requisite correction factors needed because of x-ray divergence. Whatever method is used for determining cardiac output should be well understood by all personnel. Each cardiac output method has limitations and errors that can be minimized with careful attention to the inherent vagaries of each technique. Similar data are often obtained now from noninvasive methods.

Vascular resistance calculations require knowledge of the mean pressure before and after the resistance of interest and a measure of the flow through the area. Thus, for pulmonary vascular resistance, the pulmonary blood flow and the mean PA and the mean pulmonary capillary wedge pressure (or LA pressure if no pulmonary venous disease) must be recorded.

4.4.3.5. SHUNT MEASUREMENT

Important information regarding physiology of congenital heart disease is gathered from measurements of intracardiac shunts. Both right-to-left and left-to-right shunts must be able to be quantitated during the catheterization. Because of the need to determine intracardiac shunting, oxygen saturation samples are drawn from many sites rather than simply from the PA for mixed venous oxygen level and from the systemic artery for arterial oxygen level. The availability of oxygen saturation measurements and arterial blood gas determinations within the catheterization laboratory is useful for the efficient performance of the typical congenital cardiac catheterization. The availability of blood gas measurements also allows for the inclusion of dissolved oxygen in the determination of oxygen content.

4.4.4. Other Diagnostic and Therapeutic Procedures in the Cardiac Catheterization Laboratory

4.4.4.1. PULMONARY VASODILATORS IN THE EVALUATION OF PULMONARY HYPERTENSION

The World Health Organization classifies pulmonary hypertension into 4 categories (217). Pulmonary arterial hypertension, or "idiopathic" pulmonary hypertension, is associated with a normal pulmonary capillary wedge pressure and elevated pulmonary vascular resistance. The normal pulmonary pressure is generally considered to be 25/10 mm

Downloaded from content.onlinejacc.org by on May 16, 2012

Hg with a mean of 15 mm Hg (range from 12 to 16 mm Hg). Pulmonary hypertension is considered present when the mean PA pressure is >25 mm Hg at rest or >30 mm Hg with exercise. The pathophysiology of pulmonary hypertension involves a reduction of flow through the lungs due to pulmonary vascular remodeling and vasoconstriction. Remodeling involves endothelial, smooth muscle, and fibroblast cell types, as well as inflammatory cells and platelets (218). Vasospasm plays a greater role early in the disease, and its presence can be assessed in the cardiac catheterization laboratory using 100% oxygen, adenosine, and epoprostenol and inhaled nitric oxide (usually 40 to 80 ppm). A 10 mm Hg fall in mean PA pressure and a final mean PA pressure of <40 mm Hg is considered a positive vasodilator response. Therapy for pulmonary arterial hypertension is then dependent upon the response to these vasoactive agents (219). In general, responders are treated with calcium channel blockers and phosphodiesterase inhibitors whereas nonresponders are considered candidates for endothelial-receptor blockers and prostacyclin analogs. The clinical functional class also plays a role in the aggressiveness of therapy (219).

Response to vasodilators has also been used to decide on surgical suitability for patients with congenital heart disease or transplantation. In those instances, the change in the resistance in the pulmonary circulation (Rp) over the systemic resistance (Rs) is often used, with high risk associated with an Rp/Rs ratio >0.7. One study shows the achievement of an Rp/Rs ratio of <0.33 and a 20% decrease in the ratio with vasodilators allowed for safe surgical intervention (220).

Of note, in pediatric catheterization laboratories, the pulmonary vascular resistance is calculated using the cardiac index rather than the cardiac output alone. Despite this correction making sense, the practice has unfortunately never been adopted in the adult cardiac catheterization laboratory.

4.4.4.2. VASODILATOR OR INOTROPIC STRESS TESTING IN AORTIC STENOSIS

Patients with aortic stenosis (AS) and depressed ejection fraction may have low valvular gradients despite significant AS by aortic valve area (<1.0 cm^2). Whether to replace the aortic valve in this situation is often a difficult clinical question. When data from noninvasive studies using dobutamine are not available or are equivocal, the use of either dobutamine or nitroprusside during cardiac catheterization to assess the response of the aortic valve area, gradient, and stroke volume has been used to help decide whether the stenosis is an actual or a pseudo-stenosis due to low output. An increase in the aortic valve area and a little increase in the aortic valve gradient suggest the primary problem is myocardial and not valvular stenosis. Graded doses of dobutamine (5 mg/kg/min, 10 mg/kg/min, 20 mg/kg/min) to test whether there is "contractile reserve"—a >20% increase in stroke volume—have been used to separate those who are candidates for surgical intervention from those who are believed to be too high risk (221). Nitroprusside may be used to improve cardiac output in patients with atrial fibrillation to help prevent the rapid ventricular response often seen with the administration of dobutamine. Patients in atrial fibrillation with a wide variability in the ventricular response are best studied with RV pacing greater than baseline to control the heart rate before and after the infusion. There are data that suggest the use of brain naturietic peptide (BNP) may influence whether the results truly separate the operable candidate out from the inoperable candidate, with poor outcomes regardless of the result in those with BNP levels >550 pg/mL (222). In addition, using contemporary surgical methods, some have demonstrated excellent surgical results despite failure to demonstrate any contractile reserve in this patient population (223). The threshold for therapy in these difficult patients may also be changing with the availability of the percutaneous aortic valve replacement procedure.

4.4.4.3. TRANSSEPTAL CATHETERIZATION

Transseptal catheterization is performed from the femoral artery by placing a long, pointed, sheathed introducer with a hollow Brockenbrough needle first into the superior vena cava then rotating into the foramen ovale. The stiff system is "locked" into the foramen ovale and pressure applied to the foramen ovale. In about a third of cases, the system will push open the septum primum in the foramen ovale. If the system does not cross, then the needle is extended just past the introducer tip and the interatrial septum is punctured. A change in the waveform reflecting LA pressure should be evident before advancing the catheter and sheath. Once LA pressure is obtained, the needle is withdrawn and a guidewire inserted into the LA. The sheath and transducer are advanced into the LA and once inside, the introducer is withdrawn and the sheath remains. Catheters can then be inserted through the sheath into the LA. Transseptal catheterization to obtain LA pressures is primarily used in the adult catheterization laboratory during the performance of balloon mitral valvuloplasty or mitral repair using the eValve mitral clip. It is required to perform stenting of pulmonary vein stenosis or in the EP laboratory during atrial fibrillation ablation. Hemodynamically, the LA/LV pressure gradient may be different from the pulmonary capillary wedge/LV pressure gradient, especially in patients with mitral valve replacement, and it is useful to document the difference. Entry into the LA allows entry into the LV when crossing the aortic valve retrograde is not feasible or desirable and LV pressure is necessary. Percutaneous aortic valvuloplasty or valve replacement can be performed in this manner. In congenital heart disease, at times the only access to the pulmonary arterial pressure is retrograde through the pulmonary veins and both hemodynamics and pulmonary angiography can be performed via a reverse wedge in most patients when this is the case. The procedure is also required for the placement of an LA appendage occluder. Complications related to transseptal puncture include perforation of

Downloaded from content.onlinejacc.org by on May 16, 2012

the RA or LA with subsequent pericardial effusion or tamponade, pain perception by the patient while crossing the septum, vagal stimulation, or inadvertent entry into the ascending aorta. Care must be taken to avoid air entry into the LA or thrombus formation. Recently, the addition of intracardiac echocardiography/Doppler methods can be used to help guide the transseptal procedure.

4.4.4.4. LV PUNCTURE

There is essentially no longer any indication for percutaneous LV puncture to assess the LV pressure. Echocardiography/Doppler methods and MRI are adequate to evaluate combined mitral disease and a mechanical aortic prosthesis. Fine pressure wires have also been used to cross even bileaflet mechanical aortic valves or the Starr-Edwards aortic prosthesis with little risk. Surgical LV puncture may be used for the placement of the percutaneous aortic valve and to stabilize guidewires when attempting to plug paravalvular leaks in a hybrid room situation.

4.5. Therapeutic Interventions for Hemodynamic Compromise

4.5.1. Improving Cardiac Output

4.5.1.1. INTRA-AORTIC BALLOON PUMP

The intra-aortic balloon pump (IABP) improves cardiac output, improves myocardial perfusion and reduces myocardial demand by maintaining diastolic pressure and reducing afterload. This is because maintaining diastolic pressure improves coronary and systemic perfusion, whereas the afterload reduction reduces myocardial demand. It is particularly useful in situations of hypotension due to low cardiac output and in patients with refractory unstable angina. The intra-aortic balloon pump is a thin synthetic balloon positioned within the descending thoracic aortic about 2 cm below the normal takeoff of the left subclavian artery. It is inflated with helium during ventricular diastole and deflated during ventricular systole. Cyclic obstruction of the aorta in this manner increases diastolic aortic pressure and helps maintain coronary perfusion (primarily an early diastolic phenomenon, especially in the left coronary). Systolic deflation of the balloon unobstructs the aorta, and cardiac ejection occurs against a markedly lower aortic impedance and peripheral vascular resistance, improving stroke volume. The physiology is ineffective if significant aortic regurgitation, excessive tachycardia or other arrhythmias are present. The latest meta-analysis of the use of IABP therapy in STEMI suggests, however, that there was no impact on mortality (224) despite short-term hemodynamic improvement.

Balloon placement is not feasible unless the aortoiliac vessel lumens are large enough (>7 mm) to accommodate the device. Aortic dissection and extreme tortuosity may not allow for the IABP placement. Because the device is placed in the femoral artery and aorta, it could obstruct flow to the limbs, and lead to limb ischemia and even a compartment syndrome. Renal failure can occur if placed too low in the aorta over the ostia of the renal arteries. Other possible complications include cerebral embolism during insertion, infection, dissection, or perforation of the aorta or iliac artery, and hemorrhage into the mediastinum. The balloon may fail to deflate or may rupture, requiring surgical removal. Showering of aortic atherosclerosis particles can lead to leg ischemia from cholesterol embolization or from thrombi originating on the balloon's surface—this is especially a risk during balloon removal. Mechanical failure of the balloon may require vascular surgery for removal.

4.5.1.2. OTHER CATHETER DEVICES TO IMPROVE CARDIAC OUTPUT

Several newer percutaneous devices have become available to augment cardiac output during high-risk cardiac catheterization. These include the Impella device (Abiomed, Inc., Danvers, MA) and the TandemHeart (Cardiac Assist, Pittsburg, PA). Both have been used in a variety of situations. The Impella device is a 12-F rotary micropump catheter able to produce continuous flow up to 2.5 L/min. It is placed across the aortic valve and augments LV output directly into the aorta. The TandemHeart is placed into the LA via a transseptal puncture using a 21-F venous catheter. It pulls oxygenated blood from the LA and returns it to the femoral artery via a 15-F catheter. It is capable of continuous flows up to 5 L/min. Early studies comparing the results with that of an IABP suggest that the acute hemodynamics are superior, but there is no difference in early survival (225). ECMO can also be used to provide both cardiac and respiratory support via either veno-veno or veno-arterial cannulation. The role of all these types of devices to augment cardiac function during cardiac catheterization remains to be further defined.

4.6. Pericardiocentesis

The performance of pericardiocentesis is a critical skill that every invasive cardiologist should acquire. Although the methods may vary, the importance of being able to remove pericardial fluid in a patient who is experiencing tamponade physiology is critical, especially when the fluid has resulted from a complication of a catheterization procedure. All invasive cardiologists should be able to recognize the hemodynamics associated with cardiac tamponade, including equalization of the end-diastolic RA, RV, and LV pressures, and usually an associated paradoxical pulse (a fall in the pulse pressure and systolic central BP with inspiration). Emergency echocardiography is critical to define the effusion and assess for RA collapse and RV diastolic collapse. Most acute pericardial effusions are not large, and the use of echo-guided aspiration is generally preferred. A defined sterile pericardiocentesis package should be part of any cardiac catheterization laboratory so that there is no scrambling for the items required to perform an emergency tap of the pericardium. The director of the cardiac catheterization laboratory should define what equipment is in the package and ensure it is available at all times within the laboratory area. All operators should be familiar with the contents of this package for any

Downloaded from content.onlinejacc.org by on May 16, 2012

given institution and should understand how to use the equipment if the need arises.

4.7. Coronary Artery Catheter Imaging Devices

A variety of diagnostic and some therapeutic catheters are now either available or are being tested for use within the coronaries during cardiac catheterization. IVUS devices have the longest track record, and a consensus document from the ACCF still provides important information on the proper use of these tools (226). Both mechanical and phased-array catheters are available. IVUS studies have provided information regarding the unreliability of angiography to define lesion severity. IVUS studies also provide valuable information at times on plaque composition and remodeling, stenosis severity (especially in left main disease), the satisfactory deployment of intracoronary stents, and in cardiac transplant vasculopathy. It has also been a valuable tool to assess plaque burden over time in some clinical trials, to identify thrombus, and to help assess bifurcation lesions. The use of IVUS catheters in any laboratory setting is undoubtedly dependent on the skills and the enthusiasm of the operators for these procedures. Its use is not without a small risk; an early European registry found a 1.1% complication rate due to spasm, dissection, or wire entrapment (227). Competence in using these devices holds sway over any established guidelines, and all of these devices have a learning curve, not only in their placement, but more importantly in the interpretation of the images and then appropriately altering therapy based on the results.

Newer coronary imaging devices are being investigated including such devices as forward looking IVUS, plaque imaging with virtual histology, and tissue ingrowth assessment using optical coherence tomography, for instance. The proper use of all of these novel devices requires the ongoing QI program to be involved so that proper technique is followed and all complications are reviewed and discussed. If the device is still under investigation, it is vital that all local policies regarding investigational devices be followed, and appropriate oversight by the institutional review board at the facility be established.

4.7.1. Intracardiac Ultrasound and Doppler

Intracardiac echo cardiography/Doppler is now being used to visualize the atrial septum during transseptal catheterization to facilitate left-sided EP ablation studies, mitral valvuloplasty, appendage occluder implantations, and ASD or PFO occlude positioning. The devices have also been used in complex myocardial biopsy procedures. Doppler methods help define flow and are of particular value in balloon sizing of ASD defects to detect when total occlusion has occurred. There are no data specifically addressing the incidence of complications related to these devices, but the complication rate is acknowledged to be low. Known complications include cardiac tamponade from perforation, thrombus formation in the sheath, and air emboli. In the face of no established guideline, competence assessment is left to the QI process with oversight by the director of the cardiac catheterization laboratory. Similar to all the procedural methods that are used in only a small number of patients, there is a learning curve, and there needs to be a careful review of any complications associated with the use of intracardiac ultrasound.

5. Postprocedural Issues

5.1. Vascular Hemostasis

The most frequent complication of coronary angiography and coronary interventions occurs at the vascular access site. Although careful vascular entry is essential in reducing such complications, vascular hemostasis obtained after the procedure is a crucial component of the procedure. Methods to achieve hemostasis include manual compression, mechanical compression, percutaneous vascular suture, and staples or clips, vascular plugs, and topical hemostatic pads.

5.1.1. Routine

In cases of femoral puncture, where a vascular closure device is not used, it should be routine to assess the ACT value before access-site compression following interventional procedures whenever heparin has been used. Once the ACT has returned to near normal (<180 s), sheaths can be removed and manual pressure or mechanical pressure clamps applied. If lytic agents have been used, prolonged vascular compression may be necessary. The size of the sheath roughly determines the length most patients should be confined to bed after manual compression. A minimum of 1 to 2 hours after the procedure for 4- to 5-F sheaths, whereas 2 to 4 hours for 6- to 8-F sheaths is common practice. The use of the radial or brachial artery approach obviates the need for prolonged bed rest, but hemostasis must still be achieved by manual or device pressure. All patients should have the puncture site auscultated before discharge and, if a mass is palpated and/or a new bruit audible, then a vascular ultrasound should be obtained to exclude a vascular pseudoaneurysm or fistula that may need repair. Most pseudoaneurysms are now closed with percutaneous thrombin.

5.1.2. Use of Vascular Closure Devices

The last decade has seen revolutionary changes in the development of vascular closure devices. Local femoral angiography is generally performed to assess puncture site, size of common femoral artery, and extent of atherosclerosis and calcification in order to properly place these devices. Although they do not decrease all complications compared with manual compression, they have become the standard of care in many cardiac catheterization laboratories because of the convenience and economic pressures to reduce length of stay. Whether they are being placed by the invasive cardiologist or a physician extender, adequate education and hands-on training is necessary to become consistently pro-

Downloaded from content.onlinejacc.org by on May 16, 2012

ficient in utilizing these devices and achieving excellent results and very low complication rates. A bleeding risk model has been developed using data from the ACC-NCDR database. The bleeding risk score assigns points to a variety of variables including STEMI (10 points), cardiogenic shock (8 points), age ≥85 (8 points), sex (6 points), prior CHF (5 points), age 76 to 85 (5 points), no prior PCI (4 points), NYHA (New York Heart Association) functional class IV (4 points), NSTEMI (3 points), peripheral vascular disease (2 points), and age 66 to 75 (2 points). The risk of a postprocedural bleed was then 0.7% for those with ≤7 points, 1.8% for those with 8 to 17 points, and 5.1% for those with ≥18 points (136). Using similar data from the ACC-NCDR database to test the association between the use of bleeding avoidance strategies and post-PCI bleeding, Romaguera et al. found some advantage to the use of both bivalirudin and vascular closure devies (213).

The failure of these devices does occur (228), however, and not all reviews suggest a great advantage of the vascular closure devices in low-risk patients (229). Because of the expense of these devices, each laboratory should systematically review whether they are being used in a cost-effective method. In many cases, the radial approach appears to reduce the vascular risk compared with the standard femoral approach, and this may be an appropriate alternative (72). An AHA Scientific Statement on the use of vascular closure devices has been published (230). This committee reviewed those recommendations and endorse the suggestions outlined.

5.2. Medications Postprocedure

5.2.1. Pain Control and Sedation

Patients should not require substantial pain control or sedation postprocedure. If patients have access site discomfort, fentanyl hydromorphone hydrochloride, or morphine can be used. If sheath removal will require prolonged manual or mechanical compression pain management will be necessary. Patients who appear to be oversedated or are not regaining appropriate level of consciousness should be given naloxone and/or flumazenil to reverse the effects of any narcotics or benzodiazepines they received during the procedure.

5.2.2. Hypertension

Severe postprocedural hypertension can cause increased vascular site bleeding complications, myocardial ischemia, and with associated diastolic dysfunction, pulmonary edema. Postprocedural hypertension should be managed relatively aggressively. Patients can be given doses of their outpatient medications and/or can be given IV doses of antihypertensives. Hydralazine, labetalol, nicardipine, or metoprolol are commonly used as IV push medications; nitroglycerin infusions can be used as well. In general, the goal BP should be 140/80 mm Hg. More aggressive reduction in BP is not necessary. Hypertension could be a sign of an overdistended bladder; therefore, placement of a temporary Foley catheter if the patient is unable to void may resolve the hypertension. The use of bedside bladder ultrasound devices may be confirmatory.

5.2.3. Vagal Complications and Hypotension

Vagal responses occur most commonly after sheath removal. The pain, from manual or mechanical compression, generally triggers this response. Pre-medication of patients with subcutaneous lidocaine or the use of fentanyl or morphine prior to sheath removal may diminish vagal reactions. The hypotension and bradycardia must be recognized promptly. Rarely, severe vagal complications result in asystole and the need for CPR. Treatment with boluses of normal saline followed by a saline infusion plus the use of atropine 1 mg IV help counteract this complication, since vagal reactions usually include both vasodilatory and a cardiodepressor component. Nurses who care for post-cardiac catheterization patients must be trained to recognize this and treat it promptly and aggressively. Vagal responses can also occur with loss of hemostasis and abrupt hematoma and pseudoaneurysm formation as well as pseudoaneurysm rupture. A retroperitoneal bleed can often be confused with a vagal reaction and must be considered, particularly if patients are complaining of flank pain and are not responding rapidly to treatments. A mass may be perceived, and usually the heart rate is increased (unless the pain has resulted in a vagal component). In many situations, the most rapid and appropriate diagnostic procedure is to return to the cardiac catheterization laboratory for contralateral access and identification of any bleeding site angiographically. Balloon occlusion may then prevent further bleeding until a more definitive procedure can be carried out. Abdominal noncontrast CT is usually definitive in assessing the presence of a retroperitoneal bleed when there is no sense of urgency or hemodynamic compromise.

6. Personnel Issues

6.1. Personnel

A cardiac catheterization laboratory requires a critical mass of interdisciplinary personnel to allow safe and optimal performance of catheterization-based procedures, including minimum key personnel. Most of the technical staff should be certified by the appropriate certifying body. The laboratory staff should meet ongoing continuing education requirements for current registration and institutional employment. The following is an outline of pertinent personnel requirements, roles, and obligations.

6.1.1. Attending Physician

The attending physician is the physician in charge of the procedure. The attending physician is considered the primary operator for the procedure. He or she must hold a valid medical license and be credentialed by the institution.

Downloaded from content.onlinejacc.org by on May 16, 2012

He or she must be experienced in all aspects of the performance of the procedure, including procedural indications or contraindications, preprocedural and postprocedural evaluation and care of the patient, and the management of periprocedural complications. If 2 attending physicians participate in the procedure, only 1 may be the attending of record for the purpose of billing. Adjunct attending physicians may be responsible for specific aspects of the procedure, such as the performance of transesophageal echocardiography or general anesthesia, and they may bill appropriately for the additional services provided, if these services are required for the proper performance of the catheterization procedure.

6.1.2. Teaching Attending Physician

A teaching attending physician meets the requirements of an attending physician in a program instructing graduate physicians in the performance of the procedure and transmission of information to the trainee physician(s). A teaching attending physician must be present for all critical aspects of the cardiac catheterization procedure, and should be board certified or eligible. Attending physicians directly supervising fellows in the performance of interventional procedures should perform a minimum of 75 interventions per year at the primary training institution and meet all other hospital credentialing requirements for the performance of the procedure.

6.1.3. Secondary Operators

Secondary operators are additional "attending" physicians, physician extenders, or cardiovascular trainees who assist the primary attending physician. These physicians may fulfill the some of the requirements for an attending physician, but they are not in charge of the procedure at hand and are not considered the primary operator. Cardiology fellows are secondary operators but may be considered supervised primary operators for the purpose of the ACGME requirements. Secondary operators should not take credit for the case for the purpose of fulfilling minimum performance volume physician requirements or for billing.

6.1.4. Laboratory Director

The laboratory director should be a physician with the experience and leadership qualities needed to monitor and control the laboratory environment. The director is charged with the responsibility for policy development, quality control, and fiscal administration. Depending on the type of laboratory and type of patients studied, the director may be either an adult cardiologist or a pediatric cardiologist and may have special interests such as in interventional cardiology or electrophysiology. The director should be an attending physician who is board certified and thoroughly trained in cardiac radiographic imaging and radiation protection. The director must be proficient in performing procedures specific to the laboratory and supportive to the needs of the operating physicians. Ideally, the director should be knowledgeable of all the major procedures being performed in the catheterization laboratory; however, with emerging technologies and the evolution of subspecialty areas (e.g., labs that offer a large range of interventional, peripheral, and EP services), the director may necessarily collaborate with other attending physicians for management regarding specialized procedures. He or she must have the necessary skills to address emergent complications.

It is the director's responsibility to ensure the laboratory has the equipment necessary to competently perform the catheterization or interventional procedures, as well as the tools and personnel required to address complications should they occur. The director's qualifications should include at least 5 years of cardiac catheterization experience and possess recognized skill in the laboratory. He or she should be board certified in interventional cardiology if interventional procedures are performed in the laboratory, though exceptions may occur in special instances with approval of the facility leadership and the credentials committee at the specific institution. Directors that have not had time to accumulate 500 PCI cases should have a QA system in place, as noted previously, wherein a random number of cases are reviewed by a large-volume PCI center. This should be on a continuing basis until the minimum 500 PCI cases have been satisfactorily achieved and competence established.

For centers with cardiovascular, interventional, or EP fellowship training programs, the catheterization laboratory director must work in collaboration with the training program director (if different) to assure the proper training and supervision of the trainees. The interventional program director must also be board certified in interventional cardiology. This assures that the laboratory provides an environment conducive to teaching the requisite knowledge and skill sets, and that teaching attending physicians meet the volume and professional standards necessary to qualify them as educators.

The director is responsible for a wide range of personnel management. The director shall set criteria for granting privileges to physicians and then review and make recommendations about applications for those privileges. The director must periodically review physicians' performance, make recommendations for renewal of laboratory privileges, review performance of trainees and nonprofessional staff, and provide necessary training to personnel. The director shall establish and monitor quality control, including morbidity and mortality, and program and policy development, including incorporation of guidelines and defining monitoring plans for guideline compliance. He or she must be an active proponent of a CQI and QA program for the laboratory, as established earlier in this document.

In addition, the director should have the responsibility of advocating and ensuring adequate healthcare resources (devices, equipment, and supportive personnel) for the catheterization laboratory. Necessary emergency equipment must be available in the lab. Other important equipment might

Downloaded from content.onlinejacc.org by on May 16, 2012

include new devices, x-ray or imaging equipment, information technology resources, integrated imaging resources, nurse or technical specialists, diagnostic technology, point of care testing, patient transport resources, or other healthcare resources.

The director must work in collaboration with the institution (including occupational and radiation safety) and with a qualified medical or health physicist to ensure personnel safety and compliance regarding the use of x-ray–generating equipment, including compliance with local regulations and laws. This includes advocating for adequate radiation safety training and protective equipment for catheterization laboratory personnel, patient and personnel monitoring for radiation exposure, and a system to address occupational exposures and injury.

The duties and responsibilities of the director are thus multiple and wide-ranging and demand strong management skills. The role should be appropriately compensated by the hospital, group, or health system in charge of the laboratory as these responsibilities are always in addition to other clinical duties. Adequate time should be provided along with adequate financial compensation.

Other responsibilities include oversight of patient scheduling, referral services, postprocedure reporting and tracking of quality measures (including complications), establishing quality improvement programs, procurement and maintenance of equipment and supplies, budget preparation and monitoring, organization of regular conferences for laboratory personnel, and regular reports on laboratory activity. The director shall maintain communication and cooperation among laboratory staff, clinicians, and the hospital administration to ensure that the patient is best served. The director must designate a substitute who will act in his or her absence.

6.1.5. Operating Physicians

All physicians credentialed to operate in the catheterization laboratory must have proper training and meet all credentialing requirements for the facility. This includes those classified as the attending physician and those functioning as teaching attending or secondary operators. This training may be in adult or pediatric cardiology. Clinical training in any of these fields should fulfill requirements for that specialty board and preferably from an ACGME-certified program. The physician should be deemed competent to perform the procedures by the program director of his or her training institution. A laboratory physician should be a fully accredited member of the hospital staff and ideally be specialty certified or have completed formal training in the area he or she practices. An operating physician who provides only laboratory service without being a full member of the hospital staff should not be the attending of record. The physician must also be trained in general emergency and critical care, which includes a minimum of current advanced cardiac life support certification. This should also include training and competence in emergency scenarios that commonly occur in the specific procedural setting (diagnostic or interventional). Operating physicians must also be trained in patient and staff radiation safety, and meet the institutional standards for the operation of fluoroscopic/x-ray equipment that pertains to the procedures performed. Finally, the physician should meet the institutional requirements for the administration of conscious sedation. Operating physicians must participate in the laboratory's QA program, including peer review. Physicians performing electrophysiological procedures should have completed formal training or be certified in electrophysiology. The performance of complex electrophysiological procedures, such as atrial fibrillation ablation, requires additional training and experience, and the credentials committee must certify anyone contemplating these procedures is adequately trained.

6.1.5.1. CARDIOVASCULAR TRAINEE (FELLOW)

The primary role of the cardiovascular trainee is to obtain the cognitive knowledge and technical skills necessary to competently perform cardiac catheterization procedures. This includes the indications, contraindications, and limitations of the procedures; pre- and postprocedure patient care; analysis, interpretation, and reporting of hemodynamic and angiographic data; and management of complications related to procedure performance (111). Combined with the core training that occurs within a cardiovascular training program, trainees obtain the critical skills necessary to become qualified attending physicians. Trainees may perform all functions of the procedure as the primary operator would, but only under the direct supervision of a credentialed attending physician who assumes responsibility for the procedure. In this capacity, the use of house staff not directly engaged in a formal cardiovascular training program is inappropriate. Outlines for current volume recommendations for the various levels of training are addressed in Tables 17 and 18.

6.1.6. Use of Physician Extenders (Physician's Assistants and Nurse Practitioners)

Increasingly, "physician extenders" (e.g., physician's assistants and nurse practitioners) are being used clinically as patient care assistants in the provision of medical services within the field of cardiology. In regard to cardiac catheterization and intervention, trained and credentialed physician extenders may perform preprocedural evaluation and postprocedural follow-up of cardiac catheterization patients. In some medical centers, specially trained and qualified physician extenders may have an expanded role to assist the physician with the invasive or interventional procedure itself (231).

It should be recognized that extenders can never be primary operators and should work only under the direction of an attending cardiologist. The physician extender should be proficient in both the technical and cognitive aspects of cardiac catheterization, including 1) preprocedural evalua-

Downloaded from content.onlinejacc.org by on May 16, 2012

tion; 2) indications; 3) cardiac physiology and pathophysiology; 4) emergency cardiac care; 5) radiation safety; and 6) application of diagnostic catheterization data regarding the procedure.

The primary operating physician must be in the catheterization suite during the procedure when secondary operators are performing the procedure and direct the physician extender as well as provide all clinical decision making. Specially trained nurses/nurse practitioners may assist attending physicians in much the same role as physician's assistants in the performance of procedures. They may be able to assist in place of cardiovascular trainees, but they require even greater supervision during all aspects of the procedure.

6.1.7. Nursing Personnel

The type and number of nursing personnel required in the catheterization laboratory depend on the laboratory caseload and types of procedures performed. This support group may include nurse practitioners, registered nurses, licensed vocational or practical nurses, or nursing assistants. In most laboratories, the laboratory supervisor is a registered nurse. This nurse must be familiar with the overall function of the laboratory, have strong management skills, help set the tone of patient surroundings, and influence the efficiency and safety of procedures. The nurse supervisor may also directly participate in observation and nursing care of the patient during catheterization and should be ready to respond to any emergency. The nursing supervisor should be in charge of the preprocedure and postprocedure holding areas. Although variation exists among institutions, in general, the nurse supervisor should ensure that institutional guidelines for patient monitoring, drug administration, and protocols for patient care (including protocols for handling potential complications) are established, and that all catheterization laboratory nurses are properly trained) for the level of patient care that they deliver. The nurse manager, in collaboration with the hospital pharmacy and other clinical managers, should work to ensure appropriate medications are immediately available for administration in the catheterization laboratory, particularly those needed in emergency situations. In laboratories in which nursing personnel administer conscious sedation (under physician direction but in the absence of an anesthesiologist), the training, qualifications, and safety of conscious sedation should be in accordance with hospital policy, with compliance monitoring by the nurse supervisor.

The background of a catheterization laboratory nurse preferably includes critical-care experience, knowledge of cardiovascular medications, the ability to start an IV infusion and administer drugs, and experience in sterile techniques. Ideally, there should be some formal training, though certification programs have yet to be a prerequisite. The committee would endorse a movement toward such certification measures. Experience with vascular catheter instrumentation, especially with identification, cleaning, sterilization, and storage, is helpful and should be part of training. Knowledge of vascular catheter materials and the proper catheter size, appropriate guidewire, and adapters is also valuable. Some familiarity with the manipulation of manifolds, injection of contrast, and changing of guidewires and catheters is important. The catheterization laboratory nurse must have a thorough understanding of the flushing of catheters and syringes to prevent clots or air emboli. The nurse in the catheterization laboratory must also have essential skills to monitor the patient's vital status, including BP, heart rate, oxygenation, general neurological function, and pain. For nurses administering conscious sedation, institutional training and guidelines for patient monitoring and drug administration protocols must be followed. A nurse with the primary responsibility of the patient should be able to assist in acute cardiac care, including resuscitation and related therapeutic efforts.

A licensed practical nurse with the proper background and experience may have duties similar to those of the registered nurse. However, a licensed practical nurse should not supervise laboratory nursing. In some laboratories, an appropriately trained nursing assistant may be responsible for some duties. The nursing assistant may be a cardiopulmonary technician who is familiar with procedures in associated disciplines and is thereby able to function in the dual capacity of cardiopulmonary technician and nursing assistant.

Nursing personnel (registered nurse or licensed practical nurse), when properly trained, can manage blood samples, perform point-of-care testing (such as ACTs), and perform blood gas measurements and saturations. In addition, team training on simulators, especially for rarely done or more complex procedures, may help ensure an understanding of the optimal techniques and management issues.

6.1.8. Non-Nursing Personnel

Several kinds of technical knowledge are required in the cardiac catheterization laboratory, and a single person may not possess all the different types of technical expertise. At least 1 technologist, preferably a certified radiological technologist, should be skilled in radiographic and angiographic imaging principles and techniques. This technologist should be experienced in the proper performance of x-ray generators, cine pulse systems, image intensification, pressure injection systems, video systems, cine and digital imaging and storage, and radiation safety principles. He or she, in cooperation with electronic and radiological service engineers, should be responsible for routine care and maintenance of the radiological equipment. A basic ability to troubleshoot this equipment is advantageous. This technologist, in cooperation with a qualified medical physicist, should monitor radiation safety techniques for both patients and laboratory personnel. Immediate availability of a radiological engineer in the event of equipment failure is highly desirable. The technologist, with the service engineers and

Downloaded from content.onlinejacc.org by on May 16, 2012

qualified medical physicist should ensure optimal image quality while limiting radiation exposure to staff and patients. This technologist may also assist with the data storage and report generation system.

Each laboratory should also be reviewed and managed by a qualified medical physicist in order to provide appropriate teaching, to ensure optimal monitoring equipment is being used and to assist with the actual monitoring of radiation exposure to patients and laboratory personnel. A program of radiation safety should be in place in every cardiac catheterization laboratory.

Laboratory technologists should be skilled in managing blood samples, and performing blood gas measurements and calculations. They should be qualified to monitor and record electrocardiographic and hemodynamic data and have enough skill and experience in interpreting these data to report significant changes immediately to the physician responsible for the patient. During any single procedure, the monitoring technician or nurse must have no responsibility other than monitoring and observing patient status. It is encouraged that during each procedure at least 1 technologist (and/or physician) should be skilled in radiographic and angiographic imaging techniques. In facilities performing interventions, other equipment related to imaging, diagnosis, and treatment is generally available. This ancillary equipment necessitates at least 1 available technologist within the laboratory to be proficient in the equipment use, maintenance, and general troubleshooting. These technologies may include the use of digital subtraction angiography, intracoronary ultrasound, FFR or Doppler coronary velocity, intracardiac echocardiography, optical coherence tomography, atherectomy, rotational atherectomy, angioscopy, intra-aortic balloon counterpulsation, and percutaneous mechanical cardiopulmonary support devices. In addition, an increasing number of laboratories, particularly those performing EP procedures, are integrating noninvasive imaging directly into the catheterization lab suite for use during the invasive procedure. The technologist should be familiar with these multimodality integrative technologies so as to be able to help troubleshoot when issues arise.

For technologists participating directly in patient care, skills are necessary in patient preparation and for assistance in acute cardiac care, including resuscitation and related therapeutic efforts. Technologists at diagnostic and interventional labs should be trained in the sterile techniques as well as emergency procedure (basic and preferably advanced cardiac life support) and in the use of onsite equipment, such as intra-aortic balloon counterpulsation and temporary transvenous pacemakers, defibrillators, and mechanical cardiopulmonary resuscitative vests if these are available. Technologists often directly assist the primary operator with the procedure.

A technician with expert computer skills is a very valuable addition to the team to assist with the handling of image transfer methods and archival storage devices, image compression, and to maintain the digital libraries. Because of the complexity of digital archival storage and database management many catheterization laboratories will also require dedicated information technology support.

On occasion, additional administrative personnel may assist in the optimal functioning of the cardiac catheterization laboratory. Such personnel may include a dedicated case manager, scheduler, inventory manager and related staff, compliance monitor, and database or administrative staff for CQI and QA. In addition, some laboratories have dedicated employees that apply groin compression devices and report follow-up groin and other complications.

6.2. Staffing Patterns

A credentialed attending cardiovascular physician must be present in the laboratory during each procedure and must be responsible for the outcome as the primary operator. To maintain effective and safe laboratory operation, each basic support function should be performed by adequately trained personnel who constantly maintain their skills and credentials. There should be adequate cross-training among laboratory staff so that personnel can rotate responsibilities and provide 24-hour coverage of essential team functions.

Complex studies, especially those of children and acutely unstable patients, require personnel with special training. In complex cases and procedures, the presence of a second physician may be needed for optimal care. The requirements for a full-service facility are listed in Table 2.

6.3. Cardiopulmonary Resuscitation

All members of the catheterization team (physicians, nurses, and technologists) should complete a basic course in CPR. Certification in advance cardiac life support is also strongly urged, especially for all members that are part of the actual procedure. Recertification is to be expected every 2 years.

7. The Hybrid Cardiac Catheterization Laboratory

7.1. Overview and Patient Selection

The hybrid cardiac catheterization/operating room represents an integrated procedural suite that combines the tools and equipment available in a catheterization suite with anesthesia facilities and sterility of a fully equipped operating room. A key feature is that the suite meets all the standards of an operating room as well as all the standards of a catheterization laboratory. Although the hybrid suite is designed to meet the needs of an increasingly complex patient population, it also serves as a platform for collaborative work between subspecialists. In some hybrid suites, operators can perform cardiovascular procedures ranging from the most straightforward PCI to aortic arch reconstruction. As a result, different teams across different subspecialties can benefit from the hybrid suite.

Downloaded from content.onlinejacc.org by on May 16, 2012

Hybrid catheterization laboratories require fixed imaging equipment that has greater resolution and better image storage capacity compared with mobile C-arms previously used in some operating rooms. Higher-quality imaging is required for many new techniques such as hybrid coronary stenting and CABG and percutaneous aortic valve placement.

Hybrid suites must also meet the strict environmental standards of state-of-the-art open operation rooms to reduce the risk of wound infection associated with surgical cut-down for vascular access, large prosthetic devices (e.g., valves and stent grafts), and open cardiac surgical procedures. These standards include a closed environment, traffic control specifications, specific HVAC requirements, the availability of vacuum equipment, and structural designs to promote a sterile environment. Because many will be placed in the traditional cardiac catheterization suites, special attention to converting a portion or all of the catheterization area into a sterile environment is often required.

Procedures best suited for the hybrid laboratory include those where surgical vascular access is required for large endovascular devices that are deployed using high resolution imaging (e.g., percutaneous aortic valves or aortic stent grafts), where conversion to open surgery may be required if endovascular procedures are unsuccessful (e.g., aortic stent grafts), or for hybrid treatments such as PCI with minimally invasive valve or CABG (Table 21).

Table 21. Examples of Procedures for a Hybrid Catheterization Laboratory

Surgical vascular access required for large endovascular devices
Percutaneous aortic valves
Thoracic and abdominal aortic stent grafts
Large-bore percutaneous ventricular assist devices
Conversion to an open surgical operation may be required
Percutaneous aortic valves (apical approach or bailout)
Thoracic and abdominal aortic stent grafts
Percutaneous ventricular septal defect closure
Hybrid treatments
Combined percutaneous coronary intervention and minimally invasive or open coronary bypass grafting
Combined percutaneous coronary intervention and minimally invasive cardiac valve surgery
Combined iliac stenting and distal bypass grafting
Endomyocardial/epicardial atrial fibrillation ablation
Apical access to assist in percutaneous closure of paravalvular leaks
Electrophysiology device placement
Implantable defibrillators
Temporary rhythm recorders (e.g., loop recorders)
Removal of pacemaker leads
Emergency procedures
Extracorporeal membrane oxygenation
Emergent thoracotomy

Modified with permission from Hirsch (232).

7.2. Special Considerations

7.2.1. Staffing

The hybrid laboratory must serve as both a surgical suite and cardiac catheterization laboratory facility. The operation can only be done properly if there is a team approach, with each team member contributing differing expertise. As a generality, a specific team of nurses, technicians, and clinical staff familiar with the room and the goals of the procedure being performed is necessary for optimal care. These staff should be selected and trained for use in this room rather than rotating individuals unfamiliar with the stringent sterile requirements and diverse nature of the procedures to be performed. As each institution will use the hybrid room for different procedures, a definitive staffing pattern is facility- and procedure-dependent. Laboratory staff must understand there can be no compromising either the surgical procedure or the cardiac catheterization if the laboratory is to be used safely and effectively.

7.2.2. Location

The location of the hybrid suite is related to the availability of space and to the training and experience of those who will primarily use the facility. Some are located in the cardiac catheterization (232) or interventional suites, while others are upgraded operating rooms (233,234). Ideally, the hybrid suite would be located in a single cardiovascular procedural area, where standard catheterization laboratories are in the same general area as open heart surgical suites, so that the people (cardiologists, surgeons, catheterization technicians, operating room technicians, perfusionists) and equipment (catheters, stents, cardiopulmonary bypass, perfusionist equipment, surgical equipment) are readily available for all conventional catheterization laboratories, operating rooms, or hybrid suites.

Hybrid suites are designed to maximize sterility and conform to operating room guidelines that may differ state to state. These include laboratories located off a clean core or semirestricted corridor where staff are required to wear scrubs, hats, and masks. Scrub alcoves are located outside the hybrid laboratory with a window into the laboratory to observe patient and staff movement. A separate control room with wide windows permits technicians to observe the procedure and assist running the x-ray equipment without jeopardizing the sterility of the hybrid room. Alternatively, a monitor station can be used within the hybrid suite. Audio and video monitoring assists communication between operators and other staff (see Section 7.2.8).

Although design standards for hybrid catheterization laboratories are evolving, operating room standards serve as a guide for hybrid suites. Veterans Affairs standards suggest cardiac surgical operating rooms be a minimum of 65 m^2 (700 ft^2), with an upper limit for special purpose operating rooms being 75 m^2 (800 ft^2) (235). Given the extra space requirements for x-ray imaging, anesthesia equipment, the additional staff and equipment compared with con-

Downloaded from content.onlinejacc.org by on May 16, 2012

ventional cardiac catheterization laboratories and operating rooms, 70 m^2 (750 ft^2) may be a reasonable minimum guideline for the hybrid suite. We believe that 90 m^2 (1,000 ft^2) will provide the needed space for safe performance of hybrid procedures.

7.2.3. Room and Floor Design

Walls and flooring should generally follow seamless designs prevalent in operating rooms to avoid joins and cracks that may trap blood and other body fluids that can form a nidus for bacterial growth.

The hybrid laboratory requires x-ray shielding on walls and doors and a structure that is able to support the weight of the x-ray equipment. Floor trenching is required to run equipment infrastructure such as cable and conduit from the control room and the table to the C-arm.

Power outlets should include a range of high-voltage outputs (e.g., for laser catheters and cardiopulmonary bypass), regular-voltage outputs, and emergency (backup) power outlets. These should be distributed on the walls, from pull-down columns, and under the table (235).

Each room should have wall-mounted video monitors connected to the appropriate PACS server to call up CT, MRI, and other x-ray reference images. Because hybrid procedures usually require constant reference to multiple imaging modalities (e.g., angiography, ultrasound, FFR) as well as hemodynamic monitoring (e.g., indirect and direct arterial pressure, heart rate, electrocardiogram, oxygen saturations), these should be displayed simultaneously on multiple monitors or a large flat screen mounted on a movable ceiling-mounted boom adjacent to the table.

7.2.4. Ceiling Lighting and Design

In general, dim lighting is used in catheterization procedures to help view the images on the monitors. However, surgical operations use bright lighting that includes fixed ceiling fluorescent lights and movable ceiling mounted surgical lights. Therefore, the hybrid room needs a range of flexible lighting options to accommodate the needs of x-ray guidance and the operative stages of a procedure.

Many new hybrid suites use a ceiling-mounted (rather than floor-mounted) C-arm gantry. Ceiling mounted C-arms can be moved further away from the table during surgical procedures and are arguably easier to clean as they are less likely to have crevices where blood or bacteria can accumulate. However, ceiling mounted C-arms have tracks that protrude over the table, and track placement must not interfere with lighting or with laminar airflow. The C-arm needs to move in and out of the operating field and allow angulations (cranial–caudal and oblique angles) without interfering with anesthesia needs. Some operators prefer floor-mounted C-arms despite these issues.

In general, the mounts for the surgical lights are not directly over the table as this zone is preserved for the supply air outlet. However, these need to avoid the ceiling track of the C-arm and not interfere with angulations of the C-arm. Fifty percent of fluorescent lighting should be on emergency power with battery backup (235). Dimmable recessed lighting is distributed around the ceiling over the table for the x-ray procedure.

7.2.5. Anesthesia Requirements

General anesthesia requires greater space at the head of the table for staff and equipment compared with conventional cardiac catheterization laboratories. This area should have dedicated medical gas supplies (vacuum, medical air, nitrogen, nitrous oxide, oxygen, and waste gas lines)... similar to an operating room, and space for the transesophageal echocardiography. Inventive solutions include incorporating these equipment into movable ceiling booms so that they may be moved in and out of place as needed (232). Monitoring cables and other equipment should be radiolucent if at all possible.

7.2.6. HVAC Standards

HVAC should meet operating room standards for the number of air exchanges per hour, laminar air flow over the operating table, positive air pressure, and optimal temperature and humidity (235). The hybrid laboratory should have thermostat and humidistats for recording temperature and humidity.

7.2.7. Table Requirements

The surgical table needs to meet the individual requirements of interventional cardiologists, surgeons, and their teams. Surgeons need a fully motorized table and tabletop. In special circumstances (such as performing an aortic valve replacement), often the best position is to have the patient "sitting up," in reverse Trendelenburg, with the head up to 30° from the horizontal. The interventional cardiologist requires a radiolucent table with a full range of motion and a floating tabletop to allow fast movements during angiography. Both requirements are satisfied by a nonmetallic, carbon-fiber surgical table, with floating table-top and lateral and vertical tilt (234). Most tables designed for hybrid suites include in their specifications adequate weight tolerance (e.g., over 450 lb), longitudinal and lateral displacement, height displacement (e.g., 28 to 48 inches [685 to 1180 cm]), lateral tilt (e.g., 20° or more), and Trendelenburg and reverse Trendelenburg tilt (20° or more). The table can be positioned horizontal or diagonal in the room, depending on the size of the hybrid suite and the location of ancillary equipment.

7.2.8. Audio Video Inputs and Outputs

As procedures in a hybrid laboratory may involve many operators, audio and video monitoring may help to orientate anesthesia staff, staff in an adjacent control room, or those outside the sterile field. It may also provide an opportunity to educate staff and students without them entering the sterile zone around the table. Multiple video cameras that

Downloaded from content.onlinejacc.org by on May 16, 2012

are remotely operated with zoom function may be mounted on a wall, the x-ray monitors, or the surgical light handle. Key operators may choose to wear microphones and headsets to request equipment or to inform or receive requests from other team members (232).

7.3. Representative Procedures Suitable to the Hybrid Room Environment

Table 21 outlines some of the types of procedures that may benefit from the use of a hybrid cardiac catheterization laboratory.

8. Ethical Concerns

A physician's primary obligation is to act in the best interest of his or her patient. Associated with this is the obligation to "do not harm," and respect patient autonomy (236–238). The respect for autonomy mandates that patients be given appropriate and uncoerced choices about their health and potential medical care and requires that physicians provide accurate and unbiased information about the patient's medical condition, and disclose all potential avenues of care. The physician is responsible for obtaining satisfactory informed consent, and delineating the potential risks, benefits, and alternatives of the agreed-upon diagnostic and/or therapeutic strategy (236). The physician is responsible for documentation of the indication for the procedure and to document review of appropriate data (e.g., noninvasive tests). In addition, the physician must be transparent concerning any and all potential ethical or financial conflicts concerning therapies or devices employed in the patient's care.

Changing practice patterns in medicine, including the increased pressure for productivity from practice and hospitals due to declining reimbursement, and other nonmonetary factors (academic promotion, etc.) have altered the relationships among physicians, patients, and payers, creating potential conflict of interest in maintaining the patient's best interest (237,239,240).

Physicians may now serve simultaneously as physician, inventor, and investigator of new therapies for vascular intervention. Similar issues exist with respect to the conduct of clinical research, in which the patient may be encouraged to participate in clinical protocols that may lead to little personal benefit (and potential risks), by physicians who may have a direct or indirect financial interest in their participation (112,239,241). This practice cannot be condoned.

8.1. Operator Assistant's Fees, Sharing of Fees, Fee Splitting, and Fee Fixing

There has been close scrutiny by third party payers and the federal government of the ethical (and financial) relationships between the referring physicians and the interventional cardiologist. Although some procedures may be optimal with the participation of 2 operators (e.g., percutaneous mitral repair, percutaneous aortic valve replacement, complex coronary procedures, or pediatric intervention), it is only ethical and legal for a cardiologist to charge an operator assistant's fee when he or she has directly participated in the procedure and was necessary for the performance of the procedure. Only 1 may be the primary attending physician as noted earlier. Furthermore, offering or providing a shared fee with another physician for the performance of cardiac catheterization is unethical and illegal.

It is also not ethical for a cardiologist to receive an admission fee, referral fee, or other "kickback" or commission for admitting or referring a patient to a hospital or cardiac catheterization facility (242). This principle applies not only to fees, commissions, and compensation received from other physicians and hospitals, but also to those received from manufacturers of catheters, medications, instruments, devices, or supplies that may be used in the catheterization laboratory. Great care must be exerted to avoid procedural incentives, as more and more cardiologists become employees of healthcare systems and hospitals, and incentives for increased productivity may be construed as violating the principles behind the Stark laws. Furthermore, such collusion may be illegal when such arrangements involve Medicare funds and are construed as inducement for referral. Collusion with other cardiologists in an attempt to fix fees for catheterization services may also violate antitrust laws.

8.2. Unnecessary Services

Duplication of services with additional charges or performance of unnecessary procedures or add-on procedures (right-heart catheterization, temporary pacemaker insertion) without specific indications and documentation of those indications is unethical and potentially illegal. A charge to over-read data by a physician who has not performed the procedure is also an unnecessary duplication of services and fees (241).

The overuse of tests as a means to protect providers from medical malpractice is an issue that needs further examination. Any unnecessary testing is discouraged and may place the patient at unnecessary risk as well as incurring unnecessary cost.

8.3. Self-Referral, Self-Ownership, and Self-Reporting

Physician self-referral is the practice of a physician referring a patient to medical facility in which the physician or an immediate family member has a financial interest. That interest may be in the form of ownership, investment, or like compensation (237,239,243–246). In response to the suggestion that self-referral unnecessarily increases the cost of medicine by overutilization of services, the Stark Laws were introduced. Stark I was introduced into law in 1989 (Omnibus Budget Reconciliation Act of 1989) (246a) and prohibited self-referrals of services of Medicare beneficiaries

Downloaded from content.onlinejacc.org by on May 16, 2012

except where provide by specific exceptions. This was expanded to include Medicaid beneficiaries in 1993 and extended in 2007 (246b).

Critics of physician-owned facilities, whether hospital or laboratory, consider them a source for overutilization and unnecessary increase in the cost of medicine, whereas backers of physician-owned facilities point out that individual procedures are cheaper, and there is a significant convenience for the patient.

A provision in the recently enacted health reform law (Patient Protection and Affordable Care Act of 2010) now places major limits on physician ownership of hospitals (246c). New doctor-owned facilities that are not certified as Medicare participants by December 31, 2010, no longer will be allowed into the program. Existing physician-owned facilities are currently being reconsidered and debated and may face restrictions on expansion.

8.4. Informed Consent

Informed consent is a legal procedure to ensure that a patient knows all of the benefits and risks involved in a treatment. The elements of informed consent include informing the client of the nature of the treatment, possible alternative treatments, and the potential risks and benefits of the treatment. The patient should be informed of the experience of the primary operator responsible for the procedure. In order for informed consent to be considered valid, the patient must be competent and the consent should be given voluntarily. In the absence of a patient's ability to understand or give informed consent, a person holding power of attorney may act as a surrogate.

Patient autonomy mandates that informed consent be obtained before performance of any invasive diagnostic or therapeutic cardiovascular procedure. Informed consent is an "ongoing process," and the education can be presented by any of the personnel involved in the procedure and may involve the use of written or video material, as well as traditional oral explanation. Although, there may be multiple people involved in obtaining informed consent, the physician is responsible for presenting him/herself to the patient and family and for the consent process. Informed consent must include an accurate description of the procedures, benefits, risks, and potential complications. Although not every eventuality can be predicted, it is adequate to present the common and usual risk and complications. The risks and complications must be presented accurately and must not be understated. They must be presented at a communication level that the patient and family can understand. If a physician extender (e.g., physician's assistant or nurse practitioner) or cardiology trainee is to perform any part of a procedure, this should be stated. If an "ad hoc" PCI procedure is anticipated immediately after a diagnostic procedure, then consent for this should be done prior to any sedation for the diagnostic procedure.

Informed consent must be obtained in a nonpressured environment when possible, but in situations (such as primary PCI for AMI) it is recognized that the environment may not allow a leisurely description, but nonetheless must be complete. Written informed consent should be obtained and documented in the medical record before the procedure.

Frequently, interventional procedures are performed as ad hoc procedures where the intervention immediately follows the diagnostic procedure. Ad hoc angioplasty has several inherent advantages; it expedites patient care, avoids a second invasive procedure with its associated risks and recognized morbidity, and reduces total x-ray exposure and therefore cost. However, it is associated with a larger volume of procedural contrast and ideally requires interventional pretreatment. A staged procedure allows ample time to review the angiogram; plan the procedural strategy; discuss the risks, benefits, and alternatives with the patient and family; and give informed consent based on the anatomy. Previous documents (110) have endorsed the recommendations from the SCAI (247) that ad hoc PCI be individualized and not be the standard or required strategy for all patients. Whenever there is a medical advantage to staging the procedures, this should be strongly considered. The convenience and cost advantage of ad hoc procedures, however, has made this practice commonplace and perfectly appropriate for most situations. The European Society of Cardiology has emphasized the importance of engaging the patient in any decision regarding an interventional procedure and making sure the patient has the final decision when there are several therapeutic options with no clear evidence for a particular strategy over another (248).

8.5. Ethics of "Teaching"

Although teaching hospitals have been essential to medical training for decades, patients admitted to a "teaching" hospital have a right to be aware of the level of training of the various physicians and related personnel involved in their care. It is ethical for the cardiologist to delegate the performance of certain aspects of the procedures to assistants, such as physician's assistants or fellows, providing that this is done transparently with the patient's consent and under the attending physician's supervision. Fellows or physician's assistants, if qualified, can also perform certain components of the invasive procedures, provided that they are supervised at all times by the attending cardiologist. It is not ethical to delegate the entire responsibility of invasive procedures to anyone not appropriately experienced and properly trained in the performance of the procedure. The attending physician must be responsible for all major decision making and must physically be present during all the critical points in the procedure.

8.6. Clinical Research Studies During Diagnostic and Interventional Cardiac Catheterization

An increasing number of teaching and community hospitals participate in clinical research protocols. Local institutional review boards now require a higher standard of disclosure for research studies than that required for clinical practice.

Downloaded from content.onlinejacc.org by on May 16, 2012

Accordingly, extra time should be taken with patients asked to participate in clinical research to ensure that all questions have been addressed. Research studies should not increase the risk of major complications disproportionally to the possible benefit when combined with diagnostic catheterization and interventional procedures. The investigative procedure should be performed after the essential information has been obtained if possible, but only if the patient's condition is stable and the diagnostic procedure has been performed in a timely fashion. Research procedures performed during the catheterization must be reviewed and approved by an institutional review committee.

Safeguards for ensuring that patients are appropriately enrolled in clinical research trials are as follows: that the clinical investigator has thoroughly reviewed the protocol for its scientific validity; the patient has met all the inclusion criteria and none of the exclusion criteria; the patient has been fully informed about the risks, benefits, and alternative therapies; and the clinical investigator follows the clinical protocol without unjustified deviation. In fact, most clinical investigators are ethical individuals whose motivations are to further scientific knowledge. Strict adherence to the clinical protocol is the best assurance that conflicts of interest will be minimized.

Although many challenges face cardiologists today, high ethical standards, including maintenance of proficiency, avoidance of real or perceived financial conflict of interest, disclosure of potential conflicts, and, most important, maintaining the patient's best interest as primary, remain of paramount importance. Only with attention to these issues will our profession continue to be viewed by the public (and our patients) as trustworthy and deserving of their respect.

8.7. Physician– and Physician Group–Industry Relations

Physicians and industry have a common interest in advancing medical knowledge. Nonetheless, the primary goal of the physician is to promote the patient's best interests, whereas promotion of profitability is a goal of industry. Although partnerships between physicians and industry can result in impressive medical advances, they also create opportunities for bias and can result in unfavorable public perceptions even if unintended. Accepting industry hospitality and gifts, even drug samples, can compromise judgment about medical information and subsequent decisions about patient care. It is unacceptable for physicians to receive gifts from industry. Physician–industry conflicts of interest can arise from other financial ties between physicians and industry, whether to outside companies or self-owned businesses. Such ties include honorariums for speaking or writing about a company's product, payment for participating in clinic-based research, and referrals to medical resources. All of these relationships have the potential to influence a physician's attitudes and practices (249). Excessive fees for speaking on behalf of industry or for participation in advisory boards are to be avoided. Most institutions have in place well-defined conflict of interest statements where gifts and income of even a modest amount from outside the respective institution are reported, and then reviewed by disinterested parties (usually a conflict of interest committee). These can then be judged whether appropriate. It is the responsibility of each physician to honestly and completely report such gratuities, honoraria, or income to these governing bodies.

Similarly, providers of medical education to interested groups of medical personnel have a duty to present objective and balanced information and should not accept any funds that are tied to industry-shaped programming. Medical educators have the sole responsibility to evaluate and control the planning, content, and delivery of education. They should disclose industry sponsorship to medical education participants and should adopt explicit organizational policies about acceptable and unacceptable interactions with industry (250).

8.8. Hospital Employment of Physicians

With wholesale changes in the U.S. healthcare system occurring currently, many cardiologists are being targeted to become employees in an effort to control costs. Physicians should never compromise patient care nor perform unnecessary procedures to satisfy a corporate or hospital "expectation." All decisions regarding the delivery of care should be focused on providing better patient results and not corporate profits.

9. X-Ray Imaging

Significant qualitative and quantitative changes in x-ray systems have transpired since the previous ACCF/SCAI consensus document on Catheterization Laboratory Standards published in 2001 (2). The qualitative changes reflect the migration to digital image acquisition, processing, and archiving, whereas the quantitative changes reflect the extent of market "penetration" of these digital systems. Consequently, the following discussion will be limited to significant advances in the field since the 2001 publication. Details of analog and digital imaging chains can be found in previous ACCF/AHA documents (1,251), past proceedings of the SCAI Melvin P. Judkins Imaging Symposia, NCRP Report 168 (252), as well as classic textbooks on the subject (253,254).

Continuing improvements in gantry design, ergonomics, and room layout belie the fundamental use of this equipment in the contemporary cardiac catheterization laboratory—the performance of potentially high-dose, fluoroscopically guided interventions. In 2000, the International Electrotechnical Commission published an interventional standards document in which a number of key technical and performance criteria were delineated (255). These standards were updated in 2010 (255). These standards are the basis of many of the FDA legally enforceable regulations (256).

Downloaded from content.onlinejacc.org by on May 16, 2012

Importantly, manufacturers of x-ray units built after this date, and designated for the purpose of high-dose, fluoroscopically guided interventions, must demonstrate compliance with these criteria. Additional criteria were added by the FDA in 2005 for all such units manufactured after that date (257). A number of these criteria are discussed below, but it is important to point out that some portions of these standards are not applicable to simple mobile gantry systems. Any x-ray unit used for high-dose, fluoroscopically guided cardiovascular interventions should be compliant with the IEC interventional standard.

9.1. Equipment and the "Imaging Chain"

9.1.1. Image Formation

The advent of digital x-ray systems has fundamentally transformed the process of image formation and, consequently, image quality (Table 22). Although "analog" and "digital" systems share a common means for generating x-rays using high-output, micro circuitry-driven generators and similar x-ray tube technologies, it is the "detector" that has fundamentally changed the way in which images are formed and processed. "Flat-panel" detectors (and their inherent charge-coupled device technology) have not only physically replaced the image intensifier and television camera in traditional analog imaging chains, but have improved the overall efficiency of the process of image formation. Although a detailed description of the physical design and electronic configuration of these detectors is beyond the scope of this document, the translation of information contained within the pattern of x-rays exiting the subject to that contained within an electrical (digital) video signal created by the flat panel detector is a major improvement over the sequential conversions (and consequent loss of information) of x-ray energy to light energy (image intensifier) and light to electrical/video signals (TV "pick-up" tubes, video scanners). Such improved process performance with flat-panel systems is measurable and expressed as greater detective quantum efficiency, or DQE (258). Flat panel detectors have enhanced image uniformity, uniform brightness, and dynamic range when compared with the image intensifier. However, there are scant objective, comparative data on other measurable parameters of digital fluoroscopic "image quality" (e.g., high-contrast spatial resolution and low-dose, low-contrast resolution) between flat panel systems and traditional image intensifier–based systems (259). The use of the National Electrical Manufacturers Association fluoroscopic phantom (260), although developed for image-intensifier–based technology, is a significant advance in this area and may allow for such cross-system comparisons. Importantly, despite initial aspirations to the contrary, the consequences of these improved performance characteristics have not been consistently shown to result in reduced x-ray dose (258).

Just as an understanding of the generation of x-rays is fundamental to the process of image formation, so is an understanding of the control of the dose-rate (strength) of the x-ray beam. The importance of dose-rate control for both image quality and patient and staff safety is discussed elsewhere in this document. However, an understanding of the characteristics of the x-ray beam, and its modification, is critical from a catheterization laboratory standards viewpoint. Although none of these factors is uniquely different in flat panel systems, they may be overlooked owing to the other (perhaps forgiving) features of flat panel detectors (e.g., greater dynamic range and improved contrast). In addition, in most flat panel systems, image, or quantum, noise may be reduced with special recursive filtering and image processing algorithms, resulting in a more attractive visual image display.

The main "beam factors" that affect image formation, and patient dose, are beam penetrating power (hardness), scatter, and signal-to-noise ratio. The current generation of x-ray tubes and generators are designed for the high-performance, high-power requirements of interventional cardiology. High heat load capacity x-ray tubes in combination with the filtering of "soft" (low-frequency) x-rays from the beam prior to patient entrance enhance the "hardness" of the beam in order to reduce patient dose and improve overall image quality. The amount of scattered radiation—the result of Compton interactions within the patient—is directly related to the primary dose. Scattered radiation not only degrades image quality and reduces contrast, but is the main source of staff exposure as well as patient exposure outside of the primary field. It is difficult to overheat state-of-the-art x-ray tubes.

In traditional "analog" catheterization laboratories with a classic image intensifier, the level of light intensity at the

Table 22. Summary of Major Changes in the Contemporary Catheterization Laboratory Imaging Chain Over the Last Decade

X-ray generator: electronic control/high-frequency/high-output; automatic dose control; pulse and continuous modes of operation with a large selection of "stations" corresponding to different procedure types, as well as multiple dose/exposure settings for each procedure.

X-ray tube: high-heat capacity tubes with more efficient anode cooling mechanism; more effective collimation (automatic); more effective spectral filtration ("beam hardening"); use of wedge filters.

Flat panel detector: improved "dynamic range"; improved uniformity of image/brightness; improved contrast; improved detective quantum efficiency.

Image processing: recursive filtering; edge enhancement/"smoothing" algorithms.

Image display: in-room liquid crystal display flat panel monitors; improved dynamic range.

Dose monitoring: dose-area product monitoring/display/reporting (suggested); interventional reference point cumulative dose monitoring/display (FDA mandated since 2006).

Dose management: virtual collimation permitting collimator settings without fluoroscopy, fluoroscopic last-image-hold; retrospective storage of fluoroscopy data.

Downloaded from content.onlinejacc.org by on May 16, 2012

output phosphor was fed back to the generator in order to maintain a preset, calibrated level of intensity on the phosphor (automatic brightness control, or ABC). In "digital" catheterization laboratories with flat panel detectors, the flat panel–produced digital video signal is fed back to the generator in order to maintain the preset, calibrated voltage output from the detector (automatic dose-rate/exposure control, or ADC). Variability in patient body habitus or angled gantry configurations will be sensed by the generator/x ray tube unit as conditions requiring greater beam penetrating power (increasing kVp and/or increasing mA) and subsequently increased dose-rate.

Unavoidable variability in the construction of the detector itself may result in an inherently "noisier" image, particularly at the lower dose rates employed during fluoroscopy, thereby necessitating a higher dose- rate of x-ray. While the higher dose-rate may result in an "improved image," the need for total dose monitoring under such conditions should be obvious. Thus, U.S. federal and international standards for dose monitoring and dose limits are important additions to catheterization laboratory safety and performance standards. Operators need to be aware of the dose-monitoring capabilities of newer x-ray systems as this information can be used to minimize patient radiation exposure.

9.1.2. Digital Storage and Display

The increase in information content and flux that occurs with digital imaging requires a commensurate increase in storage capacity and system "bandwidth" to facilitate "online" and postacquisition review and archiving of studies. "In-room" central processing units with storage capacity in the terabyte range are not unusual nor are archiving systems with multiterabyte capacity. The fundamental requirement for online, immediate review of portions of a coronary interventional procedure mandate fast Ethernet-transmission speeds for the acquired images at mega-pixel resolution that are then "processed," "filtered," and presented for review. The importance of high-resolution, in-room, table-side monitors cannot be overstated. Although the latter are often incorporated into the entire "package" of a newly purchased x-ray system, "retrofitting," "upgrading," and "refurbishing" of extant in-room monitors are still frequently encountered and may be primarily responsible for less-than-expected improvement in fluoroscopic image quality. Careful attention must be paid to the calibration, resolution (contrast and spatial), and dynamic range of these monitors, including those installed as part of a new system.

9.1.3. Quantitative Measures

Although multicapability "software" packages and modules are now universally available with the purchase of a new x-ray system, the full extent of use of such capabilities is unknown. In contrast to the near-universal use of administrative and logistical (scheduling, billing, coding, etc.) software modules—all provided in one form or another with the purchase of a new catheterization laboratory—the quality-assured, routine use of quantitative ventriculographic, hemodynamic, and/or coronary angiographic software is less widespread. Even less frequent is onsite validation of the information provided by such user-interfaced software. This is particularly important in instances of "lesions of borderline significance" and likely contributes to the still widespread practice of ad hoc PCI (99). Similar issues abound with incorrectly obtained hemodynamic information "processed" with such software, the consequences of which may lead to erroneous conclusions regarding condition severity (261). The importance of "acceptance testing" or onsite validation of such software cannot be overemphasized, and physician diligence and clinical judgment is always critical for the proper interpretation of these data.

9.2. Radiation

9.2.1. Biological Risks

The biological risks of x-radiation have been discussed in great detail in The NCRP Report 168 and in standard texts (262) in addition to recently updated reports and expert consensus documents (251,263–267). X-rays produce cellular injury primarily by causing fractures in the DNA backbone. X-ray radiation risks can be broadly categorized as 1) deterministic—that for which a "dose–injury" relationship exists and for which a threshold dose has been determined and 2) stochastic—that for which the probability of injury is related to dose and for which no threshold dose has been defined ("linear–no-threshold" hypothesis). The former relates most importantly to the risk of skin injury and possibly cataract formation whereas the latter relates to the long-term risks of radiation-related cancer. When enough cells of a particular organ (such as the skin) are injured so that its function is impaired, that defines a deterministic risk, and the dose when that occurs is the threshold dose. In contrast, a stochastic injury occurs when there is injury to the DNA backbone that does not properly heal itself, and the result is not cell death but a mutation leading to either a cancer or a genetic abnormality. A single x-ray photon may cause this change and is not directly dose related, though the risk of acquiring such injury increases with dose. Risks to the germ plasm, and offspring of the x-radiated subject are stochastic in nature albeit substantially lower than the risk of cancer development to the subject. Although the clinical manifestation of deterministic injury is seen in characteristic skin lesions (268–270), there is, at present, no validated or reliable "biomarker" for stochastic risk. Risks to the irradiated fetus can be considered deterministic (a defined threshold dose), although periods of highest vulnerability to radiation-related effects are time dependent and confined to the first trimester. Doses to the fetus of >100 mGy may result in mortality or failure to implant during the first couple weeks, but it is unlikely a fetus would receive this amount from cardiac catheteriza-

Downloaded from content.onlinejacc.org by on May 16, 2012

June 5, 2012:xxx

tion. Surviving fetuses during this initial period of exposure have few lasting effects due to the fact that the embryo is composed of only a few cells that will eventually differentiate into multiple organs (206a). The stochastic risk of cancer induction in a fetus is considered similar to that of a newborn.

9.2.2. Measuring Radiation Exposure and Radiation Dosimetry

Monitoring of personnel in the cardiac catheterization laboratory is important to detect potentially unsafe working practices and to remediate them whenever possible. It is the individual's legal and ethical responsibility to wear radiation badges to monitor their exposure to ionizing radiation. If specific individual records reveal unusual dose exposure, a review of the individual practice is warranted (252) and corrective action should be undertaken.

The International Commission on Radiation Protection recommends 2 monitoring badges, 1 under the radiation protection garment (between the waist and chest) and 1 on the collar (271). The NCRP accepts a single outside collar monitor, though prefers the 2 monitor suggestion (272). The SCAI suggests a single monitoring device worn on the collar is acceptable. If a worker declares she is pregnant, a fetal monitor under the lead apron is required at waist level (273).

Table 23 provides the standard terminology and definitions for catheterization laboratory–based considerations of radiation exposure.

Further, and more detailed, explications of the terminology employed can be found in authoritative review articles on the subject (271). Importantly, although "exposure" to x-radiation can be directly measured, the dose to internal organs cannot be directly measured and must be estimated. Thus, the measure of risk is imprecise, subject- and procedure-dependent, and ultimately, obtained from epidemiologically derived associations of such estimated absorbed doses with long-term, clinically manifest disease. A detailed discussion of this subject is beyond the scope of this document, but the interested reader is referred to the latest publication of the BEIR VII report (264).

Of most relevance to the catheterization laboratory environment is the derivation, and meaning of, the effective dose (ED), as it is the latter that encompasses the stochastic risk associated with ionizing radiation. ED, a quantity derived from the weighted sum of Monte Carlo–derived estimates of individual organ doses, should more properly be viewed as a metric of radiation safety and used for interprocedural comparisons rather than a unique "dose" of radiation to a given individual (275). Given the above-noted complexity in the assessment of ED, an approximation of the stochastic risk associated a given x-ray procedure can be estimated by multiplying the DAP—the product of the air kerma at any point along the center axis of the x-ray beam and the beam cross-sectional area at that point—and an anatomically based and empirically derived conversion factor reflecting the conversion from DAP (Gy-cm^2) to ED (Sv) (276). The DAP is derived from a transmission chamber fitted to the output of the x-ray tube. It represents total x-ray energy directed toward the patient. The accumulated reference point air kerma when combined with gantry position and patient geometry provides a rough idea about how much x-ray dose the patient's skin received. The association between the risk of radiation-related cancer mortality and exposure is derived mainly from the atomic bomb survivor experience where exposure was whole-body (in contrast to localized, as in invasive procedures), averaged over a population of varying ages and gender (hence the need to specify age- and sex-specific risks of cancer mortality) and cancer-related deaths in individuals with exposures below 100 mGy. However, this latter dose is well above the reported range for EDs associated with most but not all fluoroscopically guided interventional procedures. Furthermore, the risk of radiation-related cancer development and mortality must be placed in perspective with respect to the overall lifetime risk of cancer mortality (~25% overall). Currently, the overall lifetime incremental risk of cancer-related mortality attributable to radiation exposure is estimated at 4% to 5% per Sv (264,277). A dose–response relationship between occupational exposure and posterior lens changes in the eyes has also been suggested recently (278).

Table 23. Relevant Nomenclature for Radiation Exposure and Dosimetry

Term	What Is Being Measured	Unit of Measure	Conversion
Exposure	Ionization produced in air by x-rays	Roentgen, R, or coulomb/kg air	1 R=2.58 $\times 10^{-4}$ coulomb/kg air
Air kerma	The sum of the initial kinetic energies of all the charged particles liberated by uncharged particles	Rad, or gray (Gy)	100 Rad=1 Gy
Absorbed dose	The energy imparted to matter by ionizing radiation per unit mass of irradiated material at the point of interest	Rad, or gray (Gy)	100 Rad=1 Gy
Effective dose	Estimated total body dose	REM or sievert (Sv)	1 Rad=10 mGy

Downloaded from content.onlinejacc.org by on May 16, 2012

9.2.2.1. PATIENT EXPOSURE

There is an extensive literature on patient exposure during coronary angiographic procedures. The majority of this literature was generated in the "pre-flat panel" era, but remains applicable. Overall, estimated patient ED for diagnostic coronary angiographic procedures ranges from 2.3 to 22.7 mSv with a mean of 7 mSv (279,280), whereas EDs for simple coronary interventional procedures range 50% to 100% higher than those for diagnostic studies and, on average, are approximately 15 mSv (281). To put this into some kind of perspective, the average nonmedical background radiation dose in the United States is about 3.0 mSv per year, and the average dose from a routine chest x-ray is about 0.02 to 0.10 mSv. Manufacturer-originated claims have suggested reduced patient exposure with flat panel systems, although these claims are likely confounded by secular trends in enhanced awareness of radiation safety and improved operator technique. The need for vendor-independent, geographically disperse data in this regard is significant.

The increased complexity of interventional procedures—coronary as well as peripheral vascular, valvular, and congenital heart disease—is of increasing relevance in any contemporary consideration of patient exposure. A median ED in the pediatric diagnostic catheterization experience has been reported at 4.6 mSv and that for therapeutic procedures at 6.0 mSv (282). Similarly, estimated EDs for complex electrophysiological procedures have been reported to average 50 mSv in men and 32 mSv in women (283). Limited data in the setting of complex structural heart disease interventions in adults suggest that, on average, ED exceeds that for coronary intervention by 25% to 50% (284).

A more immediate concern with increasingly complex and lengthy high-dose fluoroscopically guided interventional procedures is that of radiation-related skin injury (269,270,285). The awareness and likelihood of skin injury with increasing dose has focused attention on its recognition and prevention. The skin dose metric that is believed to best capture this deterministic risk is the peak skin dose. However, such a determination requires the placement of numerous dosimeters over, or adjacent to, the irradiated area—a cumbersome and infrequently performed routine. Analogous to the use of the DAP as an estimate of stochastic risk, the cumulative dose at the IRP—15 cm below isocenter—has been suggested as an alternative measure of deterministic risk (255). The 15 cm distance from the patient's isocenter is about the distance one would expect the skin to be located. Note that the displayed cumulative value of air kerma is not skin dose. It does provide a starting point for calculating skin dose. Other factors, including beam motion during the procedure, patient–gantry geometry, and backscatter from the patient, affect the amount of radiation received by the skin as well. A clinically useful simplification is to regard cumulative reference point values above 5,000 mGy as the threshold of a substantial dose (252,255). This is an amount that would be quite rarely received during cardiac catheterization but is not uncommon in complex interventions. Tissue skin reaction for various parts of the body is outlined in Table 24. Ideally an estimate of the patient radiation dose should be a part of every clinical report, and if a substantial dose has been delivered, the patient should be appropriately informed prior to discharge.

9.2.2.2. OCCUPATIONAL EXPOSURE

The major source of exposure to catheterization laboratory personnel is scattered radiation from the patient, with the latter strongly dependent on procedural length and complexity, operator technique, and gantry configuration (263,286). The extent of scatter radiation is closely associated with the DAP. In a review of the literature on occupational exposures in cardiac catheterization laboratories over the past 30 years, the authors identified primary operator EDs ranging from 0.02 to 38.0 μSv and 0.17 to 31.2 μSv, for diagnostic and interventional procedures, respectively (287). Exposure of support personnel working in catheterization laboratories, but not in immediate proximity to the tableside or image detector, receive the lowest exposures (272).

9.2.3. Minimizing Radiation Exposure

Professional societal guidelines directed towards radiation safety and the minimization of patient and personnel exposure have been available for 25 years (263,288,289) and have been recently summarized and updated (251). The mechanics of reducing patient exposure require proper use of the equipment itself (e.g., gantry positioning, degree of magnification, detector input dose, x-ray tube output dose rate, collimation and beam filtration; recognition of patient-specific factors; procedure-related factors, length and complexity of procedure, and proper use of control mechanisms).

The mitigation of patient exposure translates directly to mitigating the exposure of operator and staff because scatter radiation increases (decreases) as beam intensity increases (decreases). The driving principle behind reducing occupational exposure is the ALARA principle (290). Attention to "time" (beam on-time or the period in which x-rays are emitted from the x-ray tube), "shielding" (the use of lead-or its equivalent-lined aprons for the torso and waist, as well as thyroid collar and protective eyewear), and "distance" (establishing a safe working distance from the patient as well as image detector, utilizing the "inverse square law") are the most effective means of reducing occupational exposure. Tables 25 and 26 highlight the major means of reducing exposure to patients and staff, respectively.

9.2.4. Quality Management and Measurement of Radiation Exposure in the Cardiac Catheterization Laboratory

An effective QA/QI program in the cardiac catheterization laboratory must be centered on patient and staff safety.

Table 24. Tissue Reactions From Single-Delivery Radiation Dose to Skin of the Neck, Torso, Pelvis, Buttocks, or Arms

Band	Single-Site Acute Skin-Dose Range (Gy)*	NCI Skin Reaction Grade†	Approximate Time of Onset of Effects			
			Prompt	Early	Midterm	Long Term
A1	0–2	NA	No observable effects expected	No observable effects expected	No observable effects expected	No observable effects expected
A2	2–5	1.	Transient erythema	Epilation	Recovery from hair loss	No observable results expected
B	5–10	1–2	Transient erythema	Erythema, epilation	Recover; at higher doses, prolonged erythema, permanent partial epilation	Recovery; at higher doses, dermal atrophy or induration
C	10–15	2–3	Transient erythema	Erythema, epilation; possible dry or moist desquamation; recovery from desquamation	Prolonged erythema; permanent epilation	Telangiectasia; dermal atrophy or induration; skin likely to be weak
D	>15	3–4	Transient erythema; after very high doses, edema and acute ulceration; long-term surgical intervention likely to be required	Erythema; epilation; moist desquamation	Dermal atrophy; secondary ulceration due to failure of moist desquamation to heal; surgical intervention likely to be required; at higher doses, dermal necrosis, surgical intervention likely to be required	Telangiectasia†; dermal atrophy or induration; possible late skin breakdown; wound might be persistent and progress into deeper lesion; surgical intervention likely to be required

Note: Applicable to normal range of patient radio-sensitivities in absence of mitigating or aggravating physical or clinical factors. Data do not apply to the skin of the scalp. Dose and time bands are not rigid boundaries. Signs and symptoms are expected to appear earlier as skin dose increases. Prompt is <2 weeks; early, 2 to 8 weeks; midterm, 6 to 52 weeks; long term, >40 weeks. *Skin dose refers to *actual* skin dose (including backscatter). This quantity is not the reference point air kerma described by the Food and Drug Administration (256) or International Electrotechnical Commission (255). Skin dosimetry is unlikely to be more accurate than ±50%. †Refers to radiation-induced telangiectasia associated with area of initial moist desquamation or healing or ulceration may be present earlier. Reprinted with permission from Balter et al. (285).

NA = not applicable; NCI = National Cancer Institute.

Building on a 20-year tradition of such efforts, SCAI published a monograph in 1999 in which seminal and relevant publications addressing the many dimensions of catheterization laboratory standards for the assessment of quality and safety can be found (291). A broader discussion of the assessment of procedural quality and outcomes is found elsewhere in this document. The ongoing assessment of quality and outcomes in the catheterization laboratory, a fundamental aspect of any continuous quality improvement process (292), must include dose monitoring for both patients and personnel. Although personnel exposure always needs to be monitored in the catheterization laboratory (293), there are surprisingly fewer sets of guidance data for patient exposure. Maximum allowable exposure limits for medical radiation workers exposed to various sources of ionizing radiation are explicitly described in Table 27 (272,288).

The FDA has set an upper limit to "tabletop" fluoroscopic exposure rate of 10R/min for systems with automatic exposure control (256); however, there are no regulatory limits on cine exposure rates. The fluoroscopic guideline, however, serves more as an indicator of x-ray generator and overall imaging chain function (294) than a direct measure of skin dose (and, therefore, deterministic risk). As noted earlier, differences exist between the FDA-specified air kerma determination 30 cm in front of the detector versus the IEC-recommended (cumulative) air kerma determination at the IRP 15 cm from middle of the patient to the source along the isocenter line (assuming that equates to where the skin lies). Unfortunately, neither measurement is an accurate indicator of stochastic (earlier) or deterministic (later) risk. However, all catheterization laboratory x-ray systems manufactured after 2005 and sold in the United States are now required to provide real-time information regarding total radiation exposure time (fluoroscopic and acquisition mode) and reference point air kerma; many systems also measure and display DAP. These data provide patients and physicians more meaningful estimates of risk. This information should be included in the procedural report. A summary of these records should be incorporated into the catheterization laboratory's performance improvement process logs. All of this information should be reviewed for internal consistency within the lab and in comparison to published external guidance data (252).

The measurement and management of radiation exposure in the catheterization laboratory environment cannot be divorced from the issues of competence, credentialing, and proficiency. Accordingly, physicians (and staff) must be knowledgeable in matters of radiation physics, radiation biology, and technological developments in x-ray imaging systems and x-ray dose management (251). A rigorous curriculum for the latter should be an integral part of every

Table 25. Reducing Exposure to Patients

Minimize beam "on-time"
Minimize framing rates
Minimize total fluoroscopy time
Use pulse fluoroscopy whenever possible with frame rates <15 fps
Minimize use of "high dose" rate fluoroscopy
Minimize number of acquisition runs
Minimize use of geometric/electronic "magnification" modes
Keep tube current (mA) low
Keep tube potential (kVp) as high as possible without washing out image
Use collimation to irradiate only the area of interest
Use copper and other filters at the x-ray tube output to reduce unnecessary x-ray photons
Appropriate use of gantry configuration
Optimize the source-to-skin distance
Minimize the source-to-detector distance ("air gap") (source-to-image distance)
Minimize extreme compound angulations to reduce the x-ray beam path in the patient
Use multiple rotational and axial skew configurations
Do not work in 1 view exclusively to vary radiation distribution on the skin (if so, minimize need for extreme compound angulation (e.g., left anterior oblique projection)
Limit cineangiography acquisition and save fluoroscopic image data in its place when possible.

interventionalist's training and should comprise an important segment of the certifying examination. The increasingly complex clinical conditions seen in catheterization laboratories today require a more sophisticated understanding of, and approach to, the technical, pharmacological, and radiologic aspects of interventional cardiology. Rigorous training and ongoing assessment of each of these 3 "pillars" is, ultimately, the responsibility of each practitioner. Numerous excellent training and "refresher" curricula are currently available from authoritative sources (295,296) and are recommended readings.

10. Special Concerns for the Pediatric Cardiac Catheterization Laboratory

Routine cardiac catheterization of children is performed in most of the 120 children's hospitals in the United States. In general, these hospitals also provide the infrastructure for comprehensive pediatric cardiovascular centers, which support pediatric open-heart surgery, pediatric ECMO, advanced pediatric and neonatal intensive care, as well as noninvasive pediatric cardiology diagnostic services. Basically all facilities that perform cardiac catheterization on children must be full-service facilities as defined earlier.

Table 26. Reducing Occupational Exposure

Control dose to patient (see Table 27)
Implementation of time/shielding/distance
Correct positioning of staff relative to gantry
Staff education and training

Table 27. Maximum Allowable Radiation Limits for Medical Workers

Whole body	5 REM/y (50 mSv/y)
Skin	50 rad/y (500 mGy/y)
Lens of eye	2 rad/y (20 mGy/y)
Fetus (for pregnant worker)	0.5 rad (5 mGy) for the total pregnancy or 0.05 rad/month (0.5 mGy/month) (estimated by abdominal badge under lead apron
Cumulative exposure (lifetime)	1 REM × age (10 mSv × age)

In the context of the catheterization laboratory: National and international general recommendations have been reformatted to better distinguish between local dose (measured in rad or mGy) and effective dose (measured in REM or mSv).

Pediatric catheterizations are performed either in dedicated pediatric cardiac catheterization laboratories (PCCLs) or in catheterization laboratories used for both children and adults. Dedicated pediatric laboratories are most often components of free-standing children's hospitals. Joint-use laboratories are most often located in general hospitals that have either a large inpatient pediatric service or a closely affiliated neighboring children's hospital that shares core infrastructure with the general hospital.

Whether children have catheterizations in dedicated or in joint-use laboratories, it is appropriate for both catheterization laboratory environments to adhere to applicable guidelines of all catheterization laboratories outlined earlier in this Statement. Furthermore, additional PCCL guidelines and best practices designed to address the unique challenges and issues related to pediatric patients and to congenital heart disease should be instituted. These additional PCCL guidelines and best practices are the focus this section of the document.

10.1. Differences in Goals

The PCCL should function as one of the critical elements within a pediatric cardiovascular center. The goals of the PCCL within a center should be to provide the diagnostic information needed to support medical, interventional, hybrid, and surgical treatments, as well as to provide the full range of interventional and hybrid treatments needed to achieve high-quality outcomes in pediatric patients with congenital and acquired heart diseases (297). Diagnostic catheterizations in children and adults with congenital heart disease are distinct from typical adult catheterizations, because, by definition, they are designed to evaluate structurally abnormal hearts. Catheterizations usually include right (and left) heart catheterization, quantification of cardiac index, multichamber oximetry assessments, calculations of left-to-right and right-to-left shunts, and pulmonary and systemic vascular resistance. Cardiac index may be measured by thermodilution, but because of the presence of shunts, the Fick principle is more commonly employed, and oxygen consumption is usually assumed. Because of dramatic growth-related changes in pediatric body surface area and the need for comparative hemodynamic data, flow and resistance values are usually indexed for body surface area.

Downloaded from content.onlinejacc.org by on May 16, 2012

Furthermore, in addition to demonstrating all aspects of coronary arteries, pediatric angiographic studies are usually intended to define and display complex intracardiac anatomy as well as pulmonary and systemic vessels. These imaging data may supplement or complement other common imaging modalities such as echocardiography, CT angiography, and MRI. A wide variety of congenital and acquired heart and great-vessel defects and abnormalities are investigated in the PCCL.

Interventional procedures are the primary or a secondary objective in up to three fourths of all catheterizations performed in the PCCL. A substantial number of unique interventional procedures are performed. Most of the individual procedures are performed in relatively small numbers. These procedures include atrial septostomy, valvuloplasty, angioplasty, stent implantation in large vessels, vascular closure (patent ductus arteriosus, other anomalous vessels, and fistulae), device closure of atrial communications and ventricular septal defects, transcatheter valve implantation, endomyocardial biopsy, foreign-body retrieval, pericardiocentesis, and a range of electrophysiological procedures (298,299). Expertise in these procedures is acquired during pediatric cardiology fellowship training and in pediatric cardiology post-fellowship training in the interventional cardiac catheterization laboratory (often during an additional training year) (300).

Hybrid procedures are an important activity in many PCCLs. These procedures are performed jointly or cooperatively by an interventional cardiologist and a cardiac surgeon. They are often performed in infants who have a thoracotomy exposing the surface of the heart. Interventional catheterization procedures are performed with access provided directly through the anterior wall of the right ventricle or the main PA. The most common interventions are Stage I palliation of hypoplastic left heart syndrome (stenting of the patent ductus arteriosus), angioplasty and/or stenting of PAs, and closure of muscular ventricular septal defects (301,302).

10.2. Who Should Perform Catheterizations in the Pediatric Cardiac Catheterization Laboratory?

PCCLs, whether dedicated or shared with adult cardiologists, should have a pediatric director. The director should be board certified in pediatric cardiology and should have additional training in pediatric cardiac catheterization and intervention (or qualifying experience). The director should be responsible for all aspects of the administration and function of the PCCL (including backup of other pediatric operators with less training or experience). In addition, QA and QI activities related to pediatric studies should be under the director's guidance.

Other attending physicians who perform cardiac catheterization in children are generally board eligible or board certified by the American Board of Pediatrics, Subspecialty Board of Cardiology. There may be exceptional cases in which a competent physician has gained extensive experience without formal board certification, but these physicians usually have been allowed privileges by a "grandparent" clause. Whether privileges for non–board-eligible physicians may be granted is left to the discretion of the individuals involved and the hospital credentialing process.

The pediatric age range is usually considered to be from birth through 18 (or 21) years of age. It is recommended that pediatric cardiologists perform catheterization on patients under the age of 18 years who require cardiac catheterization for congenital cardiac problems. Adult patients with previously diagnosed (repaired or unrepaired) congenital heart disease or with native congenital heart problems requiring cardiac catheterization should have the procedure performed 1) by a pediatric cardiologist; 2) by an adult cardiologist and a pediatric cardiologist collaborating during the procedure; or 3) by an adult cardiologist with an established special interest and expertise in adult congenital heart disease.

10.3. Quality Assurance Issues in the Pediatric Cardiac Catheterization Laboratory

New methodologies have recently been developed and applied to assessing adverse events occurring in the PCCLs (303). Contemporary complication rates for pediatric cardiac catheterizations have been defined in a large, well-structured, and controlled prospective multicenter catheterization laboratory registry study utilizing these methods (304). The median rate of overall adverse events is 16%: 10% for diagnostic cases and 19% for interventional cases—considerably higher than adult laboratories due to the marked difference in the patient population. Moderate severities to catastrophic adverse events are less common, occurring in 1% of endomyocardial biopsies, 5% of diagnostic cases, and 9% of interventional cases. Death occurred in 0.3% of cases. Previous studies reporting adverse events in the PCCL had been uncontrolled, retrospective, single-center studies, and/or reflected practice patterns and technologies from the 1980s and 1990s (305–307). These studies report lower rates of adverse events and are not so reflective of the contemporary era. Further prospective adverse events data in the PCCL are being collected by the IMPACT Registry.

The Bergersen et al. study (304) suggests that catastrophic complications (those resulting in death, rescue ECMO, or emergency surgery) should occur in well under 1% of all cases and in under 1% of interventional cases in a PCCL. Major complications (those requiring admission to the intensive care unit, emergent readmission to the hospital, a major nonsurgical intervention) should occur in <2% of all cases and in <4% of interventional cases. Informed consent for PCCL procedures is usually obtained from the patient's parents or guardians. This consent includes the physician's (or his or her designees, such as the cardiovascular fellows) explanation of the risks, benefits, and alternatives related to the procedure, with documentation of the explanation and of the parent/guardian understanding

Downloaded from content.onlinejacc.org by on May 16, 2012

shown by a signature. In urgent or emergent cases, such as when a transferred patient requires emergency balloon septostomy and the parents are in transit, consent may be obtained by telephone or even assumed and the procedure performed. The committee recognizes that there are consent and assent procedures and guidelines that vary by jurisdiction (hospital, state, county) and defers to those where applicable. Age or other circumstances that afford competence to the patient vary as well. These will determine whether it is acceptable to obtain the patient's "assent" or whether formal consent is required.

10.4. Inpatient Versus Outpatient Setting for Procedures

Although outpatient procedures have become common in the PCCL, there is less uniformity in patient and parent suitability for hospital discharge shortly after catheterization than in adult patients. Infants and young children cannot be instructed or expected to remain still without moving their legs for a period after a procedure. Any volume of blood lost into the subcutaneous tissue or retroperitoneum or onto the bandage or bedclothes will have more significance if the patient is smaller. Given the small number of PCCLs, pediatric patients and their families often have to travel farther for treatment than adult catheterization laboratory patients. The pediatric patient may also be farther from appropriate medical attention after returning home. Despite the smaller size of the patient, the sheath sizes used in pediatric cases may be nearly the same size (5-F to 8-F) as those used in adults. For these reasons, it is suggested that overnight observation be anticipated and allowed whenever there is any concern about patient safety. Nonetheless, a set of written criteria should be established for same-day catheterization and discharge by each PCCL. These criteria would account for differences in procedure type, patient age and expected compliance, parent or guardian reliability, travel distance, procedure duration and time-of-day completion, and the cardiac physiology in determining which patients are eligible for discharge on the day of catheterization. These guidelines should establish discharge criteria such as absence of bleeding, presence and adequacy of pulses and perfusion, access to medical evaluation and care after discharge, and parental understanding and ability to observe overnight.

10.5. Operator and Laboratory Volumes

Although the committee recognizes that access to services is important, there is also the valid impression that an adequate and maintained level of experience is required for the cardiologist and staff to obtain and preserve proficiency. In its 2002 "Guidelines for Pediatric Cardiovascular Centers," the American Academy of Pediatrics elected to specify outcome benchmarks rather than to recommend minimum operator or PCCL volume (297). However, previous ACCF/SCAI statements have recommended that individual operator minimum annual caseloads to be in the range of 50 to 100 cases per year (1). The committee continues to believe that an individual cardiologist performing catheterization in the PCCL should have a minimum annual case number >50 per year. Furthermore, if a PCCL routinely performs <100 cardiac catheterizations per year, consideration should be given to whether the volume justifies the program. In addition, because the level of skill and expertise required and the complication rates are related to the type of intervention and to patient characteristics, credentialing for therapeutic cardiac catheterization should be procedure specific (308).

A number of considerations must be taken into account when a decision is made regarding the minimum operator or PCCL volumes and credentialing of operators for specific interventional procedures. Although there are ample data regarding adult interventional procedures, there are no data relating number of pediatric procedures to skill or outcomes. It is important that institutional, local, and personal factors be weighed.

Importantly, QA plans must be in effect in all PCCLs to monitor outcomes of pediatric cardiac catheterization. There are some similarities and differences between the strategies required for QA in the PCCL versus the adult cardiac catheterization laboratory. For example, there is not a prior acceptable rate of normal cardiac catheterizations. In patients undergoing cardiac catheterization for hemodynamic reasons or possible intervention, the rate of normal should be zero. Any number of patients may have electrophysiological abnormalities or acquired disease with structurally normal hearts but abnormal physiology, and these would not be considered to be in the "normal" group. The effort to operate within benchmark adverse event rates is the same in all laboratories, although the types and rates of complications in the PCCL are different from those in the adult laboratory. Although intervention procedures are usually planned well in advance, ad hoc procedures might well be required. Such procedures as coil occlusion or vascular plugging of a ductus arteriosus or an aortopulmonary collateral or balloon dilation with or without stent placement may be needed even when not previously planned. Diagnostic quality and accuracy of catheterizations and procedural outcomes should be examined, with each PCCL responsible for earmarking certain indicators and examining them with plans for improvement if warranted by the data.

10.6. Procedural Performance Differences Compared With Adult Cardiac Catheterization

10.6.1. Pre-Medication and Baseline Laboratory Data

In many pediatric laboratories, if the patient is in otherwise good health and on no medication, no preliminary laboratory tests are obtained prior to the cardiac catheterization procedure.

The choice, dose, timing, route, and overall use of pre-medication vary widely with age, size, and condition of patient and the experience and training of the operator. There is no "standard" pre-medication. Chloral hydrate,

Downloaded from content.onlinejacc.org by on May 16, 2012

diphenhydramine, and diazepam are frequently given orally for sedation. Intravenously, midazolam, morphine, fentanyl, hydromorphone hydrochloride, and other medicines can be used with good effect. The advantages of midazolam are that it can be given by continuous infusion and it can be reversed if necessary. Reversal of midazolam with flumazenil (Romazicon) does not usually precipitate the severe discomfort and agitation seen with naloxone (Narcan) narcotic antagonism. Ketamine may be used in small intramuscular or IV bolus doses for rapid-onset anesthesia. This may help during precise intervention when patient movement might be detrimental to procedure success. Meperidine (Demerol) alone or in combination with promethazine is sometimes used intravenously or by the intramuscular route for analgesia and sedation. Chlorpromazine is used less often than previously, because of the availability of and experience with other medicines.

10.6.1.1. VASCULAR ACCESS ISSUES

Techniques for venous and arterial access are similar for children and adults. Most catheterizations are performed using the femoral vein and femoral artery. However, in a significant number of cases the left heart and aorta may be accessed through the venous approach, and retrograde arterial catheterization may not be required. Furthermore, transseptal procedures are commonly performed during diagnostic and/or interventional procedures in patients of a variety of ages (including infants). Properly performed, this approach does not add significantly to the incidence of complications. In general, newborn catheterization should be performed through the umbilical vessels when possible in order to preserve femoral vessels. In addition, because of the frequency of venous catheterizations and indwelling femoral venous lines in neonates and infants, limited or absent venous access from the femoral veins is not uncommon. Therefore, venous access from the internal jugular, subclavian, basilica, and transhepatic approaches are frequent. Alternative arterial approaches are also required in some children because of occluded femoral arteries. In young infants, a hybrid approach with carotid artery cut-down may be used to access the aorta in order to perform balloon valvuloplasty in critical aortic stenosis or for stenting of the patent ductus arteriosus in cyanotic infants. In addition, percutaneous brachial artery access or axillary artery cut-down may be used as alternative approaches in some children if femoral arteries are occluded.

The use of heparin in the flush solutions is routine, but the additional use of bolus-dose heparin depends on the patient's preprocedural ACT, procedure type, and vascular approach. It is common practice, for example, to avoid use of bolus heparin for right heart catheterization or prograde right and left heart catheterization, but heparin bolus is commonly used in retrograde left heart catheterization. At the end of a procedure, an ACT may be checked, and if necessary, the heparin effect reversed with administration of protamine sulfate in much the same manner as for adults. Some laboratories no longer use heparin during the cardiac catheterization procedure. Hemostasis is usually achieved by direct manual pressure followed by placement of an adhesive or elastic tape over a gauze pad on the percutaneous access site. However, percutaneous suture closure of suitable arterial and venous sites has become relatively common among suitable patients in the PCCL.

10.6.1.2. SEDATION AND ANESTHESIA FOR PROCEDURES

Medications used during the procedures in the PCCL are essentially the same as those noted earlier for premedication. Repeated bolus doses of sedatives may be used, and/or a continuous infusion of midazolam or other drug may be instituted. It is necessary that a nurse or physician assess and document the patient's condition after each bolus dose of sedative according to the institution's conscious-sedation guidelines. Systemic arterial oxygen saturation should be continuously monitored by pulse oximetry. General anesthesia is performed by an anesthesiologist or nurse anesthetist under supervision for all or most patients in many PCCLs. Indications for anesthesia include patient considerations and procedure characteristics. For example, a developmentally delayed teenager who is fearful may be unable to be sedated without general anesthesia. Patients who are critically ill or in pain will benefit from anesthesia. Prolonged procedures such as those that require transesophageal echocardiography may be greatly facilitated with general anesthesia. Certain interventional procedures such as aortic or mitral valve dilation, ASD occlusion, and others may be made significantly easier, safer, and more effective when performed with general anesthesia. The use of anesthesia is a judgment made by the attending cardiologist in consultation with the anesthesiologist, just as it is in surgery.

In the current era, the PCCL has become the site for more invasive percutaneous interventions as well as hybrid procedures. The opportunity for catastrophic or critical events is thereby heightened. Therefore the committee believes that the PCCL should have plans for and access to rescue ECMO, in addition to standard resuscitation methods and technologies, in order to provide definitive resuscitation of patients having such events in the laboratory (308).

10.6.2. Single-Plane Versus Biplane Angiography

The standard equipment in a PCCL includes biplane radiographic equipment. In general, pediatric and congenital cardiac catheterizations are performed using biplane fluoroscopy and angiography. This is important both for localizing the catheter in space within the heart and great vessels and for reduction in contrast dosage administration. Certain procedures can be routinely performed with single-plane fluoroscopy, including (in many laboratories) electrophysiological study and radiofrequency ablation, some types of ASD occlusion, and others. ASD occlusion is often performed with localization and positioning of the device using transesophageal or intracardiac echocardiography as

Downloaded from content.onlinejacc.org by on May 16, 2012

well as fluoroscopy. Coronary arteriography in children may be performed with single-plane use, especially if it is assisted or performed by an adult cardiologist for whom performance of single-plane fluoroscopy/angiography might be standard.

10.6.3. Hemodynamics

As noted, right and left heart catheterizations are performed in combination in many pediatric and congenital heart catheterization procedures. In addition to the LV systolic and end-diastolic pressures and aortic or arterial pressures normally obtained in the adult cardiac laboratory, right-heart pressures are standard. Pressure waveforms and determinations of oxygen saturations are generally obtained from each chamber of the heart entered and from the PAs or veins, aorta, or systemic veins as indicated during any particular procedure. The routine pressure measurements and recordings necessary are difficult to specify, because they vary widely depending on the anatomy and physiology involved. For example, in a patient with pulmonary valve stenosis, an LV pressure may not be obtained at all, whereas an RV systolic and diastolic pressure recording is mandatory. On the other hand, PA pressure, routinely obtained in a right-heart catheterization, may be ill advised in a patient with severe tetralogy of Fallot. Even an invasive arterial or aortic pressure might not be obtained in the setting of a cardiac transplant repeat biopsy or other limited right-heart procedure. Pressures should be able to be recorded with excellent and reliable fidelity on scales, which range from a full scale of 10 mm Hg to 400 mm Hg. Rapid availability of oxygen saturations and blood gas determination is essential for interpretation of shunt physiology and for patient safety.

10.6.4. Angiographic Acquisition Differences

Angiograms are routinely performed with framing rates ranging from 7.5 to 30 fps (60 fps are rarely needed). The frame rate depends on the patient's heart rate and the types of images to be acquired. For example, during balloon dilation, images may be acquired at 15 (or 7.5) fps, whereas a ventriculogram in an infant with a high heart rate may require imaging at 30 fps. A wide variety of catheters, appropriate contrast materials, and injection techniques and parameters are available. Contrast is often injected at a faster rate in the PCCL compared with the adult laboratory, because fine details of the anatomy are sought rather than global function or regional wall motion abnormalities. In selected patients, 30 to 40 mL of contrast may be injected over 1 to 2 seconds, for instance. In addition, in most cases, premature ventricular beats or even ventricular tachycardia are better tolerated in younger patients with no ischemic heart disease. Angiograms should be available for immediate review after acquisition with instant-replay digital playback. Short- and long-term archival of digital data or cineangiograms does not differ from that described in prior sections.

10.6.5. Radiation Protection and Pregnant (or Potentially Pregnant) Patients

The same principles of radiation protection applied in the adult cardiac catheterization laboratory apply in the PCCL. In addition, girls and young women of child-bearing age should undergo beta-HCG testing to ensure that they are not pregnant before having a cardiac catheterization. This might be based on history in some cases (e.g., if a patient has an implanted chronic chemical contraceptive or if she has had a bilateral tubal ligation or hysterectomy), but it should otherwise include a serum or urine HCG level obtained within 2 weeks of the procedure. If a pregnant patient must be studied, the abdominal and groin areas should be shielded to help reduce any direct x-ray exposure, acknowledging that most of the fetal exposure is from scatter radiation. Efforts to minimize exposure should include using fluoroscopy or in-laboratory echocardiography rather than cineangiography and include all of the suggestions noted in Tables 25 and 26.

10.6.6. Shunt Measurements

Important information regarding physiology of congenital heart disease is gathered from measurements of intracardiac shunts. Both right-to-left and left-to-right shunts must be able to be quantitated during the catheterization. Because of the need to determine intracardiac shunting, oxygen saturation samples are drawn from many sites rather than simply from the PA for mixed venous oxygen level and from the systemic artery for arterial oxygen level. Therefore, the availability of oxygen saturation measurements and arterial blood gas determinations is essential for the efficient performance of the typical congenital cardiac catheterization. The availability of blood gas measurements also allows for the inclusion of dissolved oxygen in the determination of oxygen content.

10.7. Laboratory Personnel Issues

The laboratory staff in the PCCL should be specifically trained and experienced in the care of sick infants and children during performance of cardiac catheterization. The responsibilities within the laboratory may necessitate the services of 1 or more registered pediatric-trained nurses, a radiography technician, a certified catheterization technician, or others. It is the responsibility of the director and supervisor of the PCCL to ensure adequate staffing on a case-by-case basis. On-call cases must be considered, and a call schedule available in order to provide adequate staffing and anesthesia support in the PCCL for emergent and urgent pediatric catheterizations at all times. Timeliness of cases must also be part of the on-call planning.

This table represents the relationships of committee members with industry and other entities that were determined to be relevant to this document. These relationships were reviewed and updated in conjunction with all meetings and/or conference calls of the writing committee during the document development process. The table does not necessarily reflect relationships with industry at the time of publication. A person is deemed to have a significant interest in a business if the interest represents ownership of 5% or more of the voting stock or share of the business entity, or ownership of $10,000 of the fair market value of the business entity; or if funds received by the person from the business entity exceed 5% of the person's gross income for the previous year. Relationships that exist with no financial benefit are also included for the purpose of transparency. Relationships in this table are modest unless otherwise noted. Please refer to http://www.cardiosource.org/Science-And Quality/Practice-Guidelines and Quality-Standards/Relationships-With-Industry Policy.aspx for definitions of disclosure categories or additional information about the ACCF Disclosure Policy for Writing Committees.

According to the ACCF, a person has a *relevant* relationship IF: a) the relationship or interest relates to the same or similar subject matter, intellectual property, or asset, topic, or issue addressed in the document; or b) the company/entity (with whom the relationship exists) makes a drug, drug class, or device addressed in the document, or makes a competing drug or device addressed in the document; or c) the person or a member of the person's household, has a reasonable potential for financial, professional, or other personal gain or loss as a result of the issues/content addressed in the document.

*Recused from writing initial text and voting on document recommendations due to relevant relationships with industry in this document. †Significant relationship.

This table represents the relationships of reviewers with industry and other entities that were disclosed at the time of peer review and determined to be relevant to this document. It does not necessarily reflect relationships with industry at the time of publication. A person is deemed to have a significant interest in a business if the interest represents ownership of ≥5% of the voting stock or share of the business entity, or ownership of ≥$10,000 of the fair market value of the business entity; or if funds received by the person from the business entity exceed 5% of the person's gross income for the previous year. A relationship is considered to be modest if it is less than significant under the preceding definition. Relationships that exist with no financial benefit are also included for the purpose of transparency. Relationships in this table are modest unless otherwise noted. Names are listed in alphabetical order within each category of review.

According to the ACCF, a person has a *relevant* relationship IF: a) The *relationship* or *interest* relates to the same or similar subject matter, intellectual property or asset, topic, or issue addressed in the *document*; or b) The *company/entity* (with whom the relationship exists) makes a drug, drug class, or device addressed in the *document*, or makes a competing drug or device addressed in the *document*; or c) The *person or a member of the person's household*, has a reasonable potential for financial, professional or other personal gain or loss as a result of the issues/content addressed in the *document*.

•Significant relationship.

ACCF = American College of Cardiology Foundation; SVM = Society for Vascular Medicine; SCAI = Society for Cardiovascular Angiography and Intervention; CECD = Clinical Expert Consensus Documents; CCS = Clinical Competence and Training Statements; UA/NSTEMI = Unstable Angina/Non-ST-Elevation Myocardial Infarction; PCI = Percutaneous Coronary Intervention; NCDR = National Cardiovascular Data Registry; STS = Society of Thoracic Surgeons.

APPENDIX 3. ABBREVIATION LIST

ACS = acute coronary syndrome
ACT = activated clotting time
ADC = automatic dose control
ALARA = as low as reasonably achievable
AMI = acute myocardial infarction
aPTT = activated partial thromboplastin time
ASA = American Society of Anesthesiologists
ASE = American Society of Echocardiography
ASNC = American Society of Nuclear Cardiology
Atlantic C-Port-E = Atlantic Cardiovascular Patient Outcomes Research Team
AVA = Aortic Valve Area
BMS = bare-metal stent
BP = blood pressure
CABG = coronary artery bypass grafting
CARESS = Combined Abciximab Reteplase Stent Study in Acute Myocardial Infarction
CHF = congestive heart failure
CIN = contrast-induced nephropathy
CKD = chronic kidney disease
CME = continuing medical education
COCATS = The ACCF Core Cardiology Training Symposium
CON = Certificate of Need
COPD = chronic obstructive pulmonary disease
COURAGE = Clinical Outcomes Utilizing Revascularization and Aggressive Drug Evaluation
C-Port = Cardiovascular Patient Outcomes Research Team
CQI = Continuous Quality Improvement
CT = computed tomography
DAP = dose-area product
DQE = detective quantum efficiency
D2B = door-to-balloon times
ECMO = extracorporeal membrane oxygenation
ED = effective dose
eGFR = estimated glomerular filtration rate
FDA = Food and Drug Administration
fps = frames per second

Downloaded from content.onlinejacc.org by on May 16, 2012

GFR = glomerular filtration rate
GRACE = Global Registry of Acute Coronary Events
HCG = human chorionic gonadotropin
HIPAA = Health Insurance Portability and Accountability Act
HIV = human immunodeficiency virus
HR = hemodynamic response
IHE = Integrating Health Care Enterprise
IMPACT = Improving Pediatric and Adult Congenital Treatment
IRP = interventional reference point
LA = left atrial
LCD = liquid crystal display
LM = left main
LV = left ventricular
LVEDP = left ventricular end-diastolic pressure
LVEF = left ventricular ejection fraction
MACCE = major adverse cardiac and cerebral events
MACE = major adverse cardiovascular events
MDRD = Modification of Diet in Renal Disease
MI = myocardial infarction
MRI = magnetic resonance imaging
NCDR = National Cardiovascular Data Registry
NCRP = The National Council on Radiation Protection and Measurements
NHLBI = National Heart, Lung, and Blood Institute
NRMI = National Registry of Myocardial Infarction
NSAIDs = nonsteroidal anti-inflammatory drugs
NYHA = New York Heart Association
PA = pulmonary artery
PACS = picture archiving and communication system
PCCL = pediatric cardiac catheterization laboratory
PCI = percutaneous coronary intervention
PFO = patent foramen ovale
QA = quality assurance
QI = quality improvement
RA = right atrial
RACE = Reperfusion of Acute Myocardial Infarction in Carolina Emergency Departments

EXHIBIT 5

Effective Date: 11/04/2009
Title: Section 709.14 - Cardiac services

709.14 Cardiac services. (a) These standards will be used to evaluate certificate of need applications for Cardiac Catheterization Laboratory Center services and Cardiac Surgery Center services. All need determinations are hospital site specific. It is the intent of the State Hospital Review and Planning Council that these standards, when used in conjunction with the planning standards and criteria set forth in section 709.1 of this Part, become a statement of planning principles and decision making tools for directing the distribution of Cardiac Catheterization Laboratory Center services and Cardiac Surgery Center services. These planning principles and decision making tools build on the existing regional resources that have been developed through the regulatory planning process. The goals and objectives of the standards expressed herein are expected to promote access to Cardiac Catheterization Laboratory Center services and Cardiac Surgery Center services, maintain provider volumes associated with high quality care, and avoid the unnecessary duplication of resources while addressing the geographic distribution of services necessary to meet the needs of patients in need of emergency percutaneous coronary interventional (PCI) procedures. Additionally, it is intended that the methodology provide sufficient flexibility to consider additional circumstances that reflect on the need for cardiac services.

(b) Cardiac Surgery Centers. The factors for determining the public need for Cardiac Surgery Center services shall include, but not be limited to the following:

(1) The planning area for determining the public need for Cardiac Surgery Center services shall include the applicant's designated Health Systems Agency (HSA) region and the use area of the applicant facility. For purposes of determining Cardiac Surgery Center services need, the use area of a facility is defined as the area within a 100 mile radius of the applicant facility.

(2) Planning for Cardiac Surgery Center services shall ensure that, to the extent possible, eighty percent of the total population of each HSA region resides within 100 miles of a facility providing cardiac surgical services.

(3) A facility proposing to initiate an Adult Cardiac Surgery Center must document a cardiac patient base and current cardiac interventional referrals sufficient to support a projected annual volume of at least 500 cardiac surgery cases and a projected annual volume of at least 300 PCI cases within two years of approval. The criteria for evaluating the need for additional Adult Cardiac Surgery Centers within the planning area shall include consideration of appropriate access and utilization, and the ability of existing services within the planning area to provide such services. Approval of additional Adult Cardiac Surgery Center services may be considered when each existing Adult Cardiac Surgery Center in the planning area is operating and expected to continue to operate at a level of at least 500 cardiac surgical procedures per year. Waiver of this planning area volume requirement may be considered if:

(i) the HSA region's age adjusted, population based use rate is less than the statewide average use rate; and

(ii) existing Adult Cardiac Surgery Centers in the applicant facility's planning area do not have the capacity or cannot adequately address the need for additional cardiac surgical procedures, such determinations to be based on factors including but not necessarily limited to analyses of recent volume trends, analyses of Cardiac Reporting System data, and review by the area Health Systems Agency(s); and

(iii) existing cardiac surgical referral patterns within the planning area indicate that approval of an additional service at the applicant facility will not jeopardize the minimum volume required at other

existing cardiac surgical programs.

(4) No finding of need for the addition of Pediatric Cardiac Surgery Center services will be made unless each existing Pediatric Cardiac Surgery Center service in the planning area is operating and expected to continue to operate at a level of at least 200 pediatric cardiac surgical procedures per year, and unless such existing Pediatric Cardiac Surgery Center services do not have the further capacity to meet projected need for additional pediatric cardiac surgical procedures. Where public need is established herein, a facility proposing to provide pediatric cardiac surgical services must demonstrate the ability to perform a minimum of 200 pediatric cardiac surgical procedures per year by the end of the second full calendar year of operation or demonstrate the ability to perform a minimum of 50 cases a year on-site and operate as part of a coordinated program based on a fully executed written agreement, approved by the Commissioner, with another pediatric cardiac surgery program in accordance with standards at 405.29(d)(5)(ii). For hospitals seeking approval as part of a coordinated program, the agreement must be submitted with the certificate of need application and must be approved by the Department prior to initiation of the service.

(5) A facility proposing to provide Adult and or Pediatric Cardiac Surgery Center services shall:

(i) submit a written plan to the Department of Health which, when implemented, will ensure access to cardiac surgical services for all segments of the HSA region's population. Such plan shall provide a detailed plan to reach patients not currently served within the planning area, ensure continuity of care for patients transferred between facilities, and shall otherwise promote planning for cardiac services within the region; and

(ii) propose a hospital based heart disease prevention program that, when implemented, shall include:

(a) Treatment plans for cardiac inpatients with a principal diagnosis of ischemic heart disease. These patients are at high risk for development of adverse cardiovascular events and the program shall provide for the following in a comprehensive, systematic way:

(1) protocols shall be developed and implemented for the assessment of risk factors including lipid disorders, hypertension, diabetes, obesity, cigarette smoking, and sedentary lifestyle. Such protocols shall be in keeping with generally accepted standards;

(2) The hospital shall provide patient education that shall include, but not be limited to, information on the importance of assessing risk factors for heart disease in first-degree relatives, and the importance of cardiopulmonary (CPR) training for family members and care givers;

(3) Discharge plans must include:

(i) a request for consent to allow patient medical information to be shared with the patient's primary care providers;

(ii) patient referral to their primary care provider with documentation of treatments provided by the hospital and follow-up care recommended by the hospital; and

(iii) patient referral to cardiac rehabilitation programs appropriate to their needs.

(b) professional education:

(1) The hospital shall sponsor or co-sponsor at least three professional education programs per year

related to heart disease risk assessment and control and that are open to local community based health professionals.

(c) hospital-based heart health promotion:

(1) The program shall implement policies and health programs in the hospital and establish environments that promote heart-healthy behaviors among hospital staff, employees and visitors, including:

(i) prohibiting the sale and use of tobacco products on hospital premises;

(ii) offering and promoting, on a regular basis, healthful choices in hospital cafeterias and patient menus; and

(iii) offering employee wellness and fitness programs that provide opportunities for employees to make healthy choices.

(d) community based heart health promotion:

(1) The hospital shall organize or participate in a consortium of existing community-based organizations and key community leaders to engage in activities to improve cardiac health in the community; and

(2) organize or participate in at least one major community based campaign (not including health fairs) each year related to major heart disease risk factors.

(e) program administration:

(1) Hospitals shall identify a team within their organization to coordinate heart disease prevention activities. Members of the team shall include a broad range of expertise, including but not limited to: community organization, planning, and social marketing, public health skills and health education.

(6) When considering an application to meet public need for Adult and or Pediatric Cardiac Surgery Center services, priority consideration shall be given to the expansion of an existing service as opposed to the initiation of a new Cardiac Surgery Center.

(7) Where public need is established herein, priority consideration will be given to applicants that agree to serve the medically indigent and patients regardless of the source of payment.

(8) Applicants proposing to initiate an Adult and or Pediatric Cardiac Surgery Center service must:

(i) demonstrate the ability to comply with standards set forth in 405.29 (c), 405.29(d), and 711.4(h) of this Title; and

(ii) in addition, a facility providing Pediatric Cardiac Surgery Center services also must comply with the requirements specified in section 711.4(f) of this Title.

(9) All hospitals approved as Adult Cardiac Surgery Centers shall be approved as PCI Capable Cardiac Catheterization Laboratory Centers and must meet standards in Sections 405.29(c), 405.29(e)(1), and 405.29(e)(2) of this Title. All hospitals approved as Pediatric Cardiac Surgery Centers shall be approved as Pediatric Cardiac Catheterization Laboratory centers and must meet the standards at 405.29(c), 405.29(e)(1) and 405.29(e)(4) of this Title.

(c) For the purposes of this section the terms Cardiac Catheterization Laboratory Center, Percutaneous Coronary Intervention (PCI) Capable Cardiac Catheterization Laboratory Center, Cardiac Electrophysiology (EP) Laboratory Program and Pediatric Cardiac Catheterization Laboratory Center shall have the same meanings as in section 405.29 (a)(4) of this Title.

(d) Public need for Cardiac Catheterization Laboratory Centers:

(1) PCI Capable Cardiac Catheterization Laboratory Centers. The factors and methodology for determining the public need for PCI Capable Cardiac Laboratory Centers shall include, but not be limited to the following:

(i) PCI Capable Cardiac Catheterization Laboratory Centers at hospitals with a Cardiac Surgery Center on site. Applicants approved as Cardiac Surgery Centers are approved PCI Capable Cardiac Catheterization Laboratory Centers as provided under section 709.14 (b)(9) of this Part and must meet standards at Sections 405.29(c), 405.29(e)(1) and 405.29(e)(2) of this Title.

(ii) PCI Capable Cardiac Catheterization Laboratory Centers at hospitals with no cardiac surgery on site. Factors for determining public need for PCI Capable Cardiac Catheterization Laboratory Centers at hospitals with no cardiac surgery on-site include, but are not limited to:

(a) The planning area for determining the public need for PCI Capable Cardiac Catheterization Laboratory Centers at hospitals with no cardiac surgery on-site shall be the area within a 1 hour average surface travel time, as determined by the department of transportation and adjusted for typical weather conditions, of the applicant facility, unless otherwise determined by the Commissioner in accordance with section 709.1(c) of this title;

(b) Evidence that existing PCI Capable Cardiac Catheterization Laboratory Centers within the planning area cannot adequately meet the needs of patients in need of emergency percutaneous coronary interventions due to conditions such as capacity, geography, and or EMS limitations;

(c) Documentation by the applicant must demonstrate the hospital's ability to provide high quality appropriate care that would yield a minimum of 36 emergency PCI procedures per year within the first year of operation and would yield a minimum of 200 total PCI cases per year within two years of start-up.

(1) Documentation of the number of cardiologists on staff at the proposed site who currently perform percutaneous coronary interventions at other hospital sites and a summary of experience (including the most recent 3 years of volume and outcomes) for each.

(2) Documentation in support of volume projections must include, at a minimum: discharge data indicating the number of patients with a diagnosis of acute myocardial infarction (AMI) and/or other diagnoses associated with PCI, the number of doses of thrombolytic therapy ordered for acute MI patients in the applicant hospital's emergency department (as documented through hospital pharmacy records), and documentation of transfers to existing PCI Capable Cardiac Catheterization Laboratory Centers for PCI.

(3) Additional documentation that may be submitted in support of projected volume and need for a proposed PCI Capable Cardiac Catheterization Laboratory Center include:

(i) The number of acute care beds at the applicant hospital and the range of acute care services provided;

(ii) Documentation by the applicant of barriers that impact care experienced by specific population groups within the planning area and demonstration of cultural competency at the applicant site specific to the proposed populations to be served by the applicant;

(iii) Documentation by the applicant demonstrating outreach to underserved populations that identifies potential new PCI cases within the service area;

(iv) Emergency department discharge data;

(v) Documentation by the applicant of regional demographics and transport patterns within the applicant's Emergency Medical Service (EMS) Region that impact the provision of cardiac care;

(vi) The geographic distribution of PCI Capable Cardiac Catheterization Laboratory Center services and the ability of such existing centers to serve the patients in the applicant's service area;

(vii) Letters from local physicians quantifying the number of PCI referrals from their practice and the portion of those that would have been treated at the applicant facility if PCI had been available;

(viii) Additional information that may be considered in projecting volume for an applicant from an established Article 28 network, or multi-site facility as defined at section 401.1 of this Title, with an approved Cardiac Surgery Center within its system that is seeking to add a PCI Capable Cardiac Catheterization Laboratory Center at a non-cardiac surgery hospital site within the system and for a co-applicant proposing to operate a PCI Capable Cardiac Catheterization Laboratory Center without surgery onsite, under a co-operator agreement, approved by the department, with an existing Cardiac Surgery Center. Such additional volume projection criteria include documentation by the applicant of the number of patients residing in the service area of the proposed site who have received percutaneous coronary interventions at the Cardiac Surgery Center site and who would have been candidates to receive their procedures at the proposed non-surgery site.

(d) Existing referral patterns indicate that approval of an additional service at the applicant facility will not jeopardize the minimum volume required at other existing PCI Capable Cardiac Catheterization Laboratory Centers and one of the following conditions exists:

(1) The proposed PCI Capable Cardiac Catheterization Laboratory Center is located more than one hour average surface travel time, as determined by the department of transportation and adjusted for typical weather and traffic conditions, from the nearest existing PCI Capable Cardiac Catheterization Laboratory Center; or

(2) All existing PCI Capable Cardiac Catheterization Laboratory Centers within one hour average surface travel time of the applicant facility, as determined by the department of transportation and adjusted for typical weather and traffic conditions, perform and are expected to continue to perform at a level of at least 300 PCI procedures per year after the addition of the proposed new program. Evidence for evaluating this expectation shall include, but not be limited to:

(i) Data indicating the number of patients residing in the applicant's primary service area who are currently receiving percutaneous coronary intervention procedures at existing centers and the location of the centers where patients are receiving that care;

(ii) Volume at existing PCI Capable Cardiac Catheterization Laboratory Centers within one hour of the applicant hospital;

(iii) Analysis provided by the applicant evaluating the portion of its proposed patient case load that would result in a redistribution of cases from existing centers and the portion that would represent new cases from currently under served populations. Such analysis shall include documentation of any outreach programs by the applicant facility that would support projections of new cases.

(e) A written plan submitted by the applicant that demonstrates the hospital's ability to comply with standards for PCI Capable Cardiac Catheterization Laboratory Centers at sections 405.29(c), 405.29(e)(1) and 405.29(e)(2) of this Title;

(f) A written plan submitted by the applicant that outlines staff training and demonstrates the hospital's readiness to accommodate the needs of the PCI patients;

(g) A written plan has been submitted by the applicant which would promote access to Cardiac Catheterization Laboratory Center services for all segments of the hospital service area's population. The document shall include:

(1) a description of current and proposed initiatives for improving outcomes for patients with heart disease,

(2) a plan documenting the hospital's ability to maintain a comprehensive program in which high quality interventional procedures are provided as a component of a broad range of cardiovascular care within the hospital and within the community, to include an emphasis on processes of care and a description of how a patient will traverse through the system of care to be offered,

(3) a plan for ensuring continuity of care for patients transferred between facilities,

(4) documentation of outreach to regional EMS councils served by the applicant,

(5) documentation that EMS system capabilities have been taken into consideration in the delivery of cardiac services;

(6) a description of activities that promote planning for cardiac services within the region; and

(7) a description of current and proposed initiatives and strategies for reaching patients not currently served within the area.

(h) Comments and recommendations received from community organizations;

(i) The hospital shall propose and implement a hospital heart disease prevention program as set forth at section 709.14(b)(5)(ii) of this Part;

(j) Where public need is established herein, priority consideration shall be given to applicants that agree to serve the medically indigent and patients regardless of payment and can document a history of the provision of services to populations that experience health disparities.

(k) Where public need is established herein, priority consideration shall be given to applicants that can demonstrate projected volume in excess of 300 PCI cases a year.

(l) Where public need is established herein, priority consideration will be given to the expansion of an existing service as opposed to the initiation of a new service.

(m) A written and signed affiliation agreement with a New York State Cardiac Surgery Center, acceptable to the department, has been submitted in accordance with standards at Section 405.29(c)(8)(i) of this title.

(n) In addition, hospital applicants proposing to jointly operate a PCI Capable Cardiac Catheterization Laboratory Center at a hospital without cardiac surgery on-site under a co-operator agreement with a Cardiac Surgery Center must:

(1) Submit a written and signed operational agreement between the applicant Cardiac Surgery Center and the applicant hospital without cardiac surgery on site that demonstrates there will be an integration of expertise and resources from the Cardiac Surgery Center that would support a high quality program at the proposed site and that is acceptable to the department. The agreement must specify that the department shall be provided 60 day prior written notification of any proposed change, termination or expiration of the agreement, and any changes must be found acceptable to the Department prior to implementation. The agreement shall further provide that the parties agree that termination or expiration of the agreement shall result in closure of the co-operated Cardiac Catheterization Laboratory Center.

(2) Submit documentation that demonstrates high quality cardiac care is provided at the applicant Cardiac Surgery Center site and that expanding the service to the proposed site would serve as a benefit to patients and the community.

(3) Submit written documentation of governing body approval of the co-operator contract.

(2) Cardiac EP Laboratory Programs. Factors for determining public need for Cardiac EP Laboratory Programs shall include but not be limited to the following:

(i) Each applicant for a Cardiac EP Laboratory Program shall be an approved PCI Capable Cardiac Catheterization Laboratory Center or an approved Diagnostic Cardiac Catheterization Service operating in compliance with standards at sections 405.29(c) and 405.29(e). Applicants for EP laboratory programs will also be considered in conjunction with requests for approval of PCI Capable Cardiac Catheterization Laboratory Center services.

(ii) Each applicant shall submit documentation, describing how the hospital will comply with standards at 405.29(e)(5) of this Title.

(iii) Each applicant shall submit documentation of existing referrals for cardiac electrophysiology patients treated by cardiologists on staff at the hospital.

(iv) Applicants for cardiac EP Laboratory Programs at hospitals with no Cardiac Surgery Center on-site must submit a copy of the patient selection criteria for the proposed program in accordance with the standards at section 405.29(e)(5)(iii) of this Title.

(v) Hospitals approved as Cardiac Surgery Centers shall be deemed to have demonstrated public need to perform cardiac electrophysiology.

(3) Pediatric Cardiac Catheterization Laboratory Centers. Public need for a Pediatric Cardiac Catheterization Laboratory Center shall be determined only in conjunction with an application for a Pediatric Cardiac Surgery Center and when need has been demonstrated for Pediatric Cardiac Surgery Centers in accordance with standards at Section 709.14(b) of this Part.

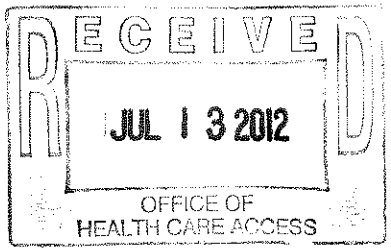
Subject: Missing Pages from TSH Pre-File
Attachments: 4 files [19 7-13-2012 09].ZIP



Steve,

Per our phone conversation, attached are revised copies of Drs. Kiely and Gray's pre-file testimonies. The only changes are found at the very end of the testimony with the insertion of **"THIS PAGE LEFT INTENTIONALLY BLANK"**. In addition to the PDFs of the testimonies, I have also PDFed only the pages that require insertion. Shall I still fax or do you prefer to print the pages from the PDF (rather than make copies of faxed pages?)?

Pages 19 and 20 should be submitted into Dr. Kiely's testimony and pages 12,13, and 14 should be submitted into Dr. Gray's testimony.

My apologies for the confusion and for the extra work this morning.

Regards,
Anna

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 12, 2012

Pre-File Testimony of Sharon Kiely, M.D.

Good morning Deputy Commissioner Davis and Office of Health Care Access ("OHCA") staff. My name is Sharon Kiely, and I am Senior Vice-President of Medical Affairs and Chief Medical Officer for The Stamford Hospital ("Stamford" or the "Hospital"). I am here today to explain the reasons why Stamford strongly believes that, at a time when elective angioplasty volumes are flat to declining in the state and with no volume growth in Applicants' proposed service area, there is no clear public need for Yale-New Haven Hospital ("Yale") and Greenwich Hospital ("Greenwich") (collectively, the "Applicants") to establish an elective angioplasty ("PCI") program without on-site surgical back-up at Greenwich.

My remarks today will focus on the following four areas: (i) the stagnant PCI volume that I just mentioned as well as similar trend in cardiac catheterization procedures; (ii) the fact that Southwestern Connecticut and Eastern Westchester County residents already have ample access to high quality elective PCI programs, including the White Plains Hospital elective angioplasty program that did not even exist three years ago when Greenwich and Yale's prior application for a five-year demonstration project of this same service was denied; (iii) the very speculative nature of Applicants' volume projections and (iv) the fact that collaboration among hospital providers to better serve the residents of the service area

should override any institution's own self-interest in establishing this unnecessary program. A copy of my Curriculum Vitae is attached as Exhibit 1 to my testimony.

Elective PCI Volumes are Flat in Both Connecticut and the Proposed Service Area

In denying Greenwich and Yale's earlier application under Docket No. 08-31210-CON, OHCA cited "declining statewide PCI volumes" as one of the primary reasons it was "unable to conclude that the proposed demonstration project would improve the quality and accessibility of care provided in the Greenwich area..." Final Decision, Docket No. 08-31210-CON ("Final Decision") p. 16. OHCA also pointed out that this was particularly true "in light of the availability of full service cardiac care programs in Fairfield County." Final Decision, p. 16. Nothing has changed in this regard.

Statewide inpatient PCI volumes, which capture both primary angioplasty and elective procedures, have continued to decline through 2010 as evidenced by hospital discharges. This trend is displayed in the graph and table below which were prepared by OHCA and posted on its website as part of its Statewide Health Care Facilities and Services Planning activities.

Please note: unduplicated counts utilizing all procedure codes

(Available on OHCA website at http://www.ct.gov/dph/lib/dph/ohca/hc_facilities_advisory_body/actcarambusrg_subcomt_cardiachandout.pdf)

In order to account for the shift to outpatient PCI procedures, Stamford also looked to the Patient Census Report produced by the Connecticut Hospital Association ("CHA") which captures both inpatient and outpatient volume.[1] This data is presented in the table below and indicates that statewide PCI volumes, inclusive of both inpatient and outpatient PCIs, have declined in recent years.

FY 2008 -2011 Total PCI Volume Statewide

Year	Volume
2008	9,039
2009	9,287
2010	9,176
2011	8,882

Source: Connecticut Hospital Association, Patient Census Report. *See* Exhibit 2.

In addition, to the extent that cardiac catheterization volume is used to predict PCI volume, statewide cardiac catheterization discharges have decreased as well. The inpatient decrease through 2010 is clearly displayed in the graph and chart on the following pages that OHCA also prepared.

[1] Among the limitations of the PCR data are the facts that: 1) data self-reported by CT hospitals; 2) no independent validation of the data using a separate source; 3) reporting subject to different interpretations by individual hospitals of the definitions; and 4) difficulty in comparing an individual hospital's experience across fiscal years due to changes, for example, in coding and billing.

ICD-9-CM Procedure Codes: 37.21-37.23

Please note: unduplicated counts utilizing all procedure codes

(Available on OHCA website at http://www.ct.gov/dph/lib/dph/ohca/hc_facilities_advisory_body/actcarambusrg_subcomt_cardiachandout.pdf)

Again, to capture any shift to outpatient cardiac catheterizations, Stamford looked to the Patient Census Reports generated by CHA.[2] Like the total statewide volume of inpatient and outpatient PCIs discussed above, this data indicates that total statewide cardiac catheterization volume (inclusive of inpatient and outpatient procedures) is flat to declining as evidenced by the chart below.

[2] Please see footnote 1 for a discussion of the limitations of the PCR data.

FY 2008 -2011 Total Cardiac Catheterization Volume Statewide

Year	Volume
2008	21,777
2009	21,606
2010	22,533
2011	21,120

Source: Connecticut Hospital Association, Patient Census Report. *See* Exhibit 2.

This data certainly does not establish the need for an additional provider in Southwestern Connecticut. As you can also see from the charts prepared by OHCA above, the decreases in inpatient PCI and cardiac catheterization volume have been felt by almost every hospital provider in the state, including each of the four existing full service cardiac programs in Fairfield County (Danbury, St. Vincent's, Bridgeport and Stamford).

As for the specific service area that Applicants have identified for their proposed elective PCI program, the trends do not appear markedly different from what they are in Connecticut statewide. The tables on the next page, evidencing discharges of residents from Greenwich's Connecticut and New York service area from Connecticut and New York hospitals, show that from FY 2009 through 2011, inpatient cardiac catheterization and PCI volumes have decreased in the service area:

FY 2009-2011 Inpatient Cardiac Catheterization Volume in Proposed Service Area

State	FY 09	FY 10	FY 11
CT Service Area*	1,000	948	808
NY Service Area**	1,443	1,355	1,353
Total	2,443	2,303	2,161

*The CT Service Area is made up of Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston and Westport. (*See* Application at p. 24)
** The NY Service Area is made up of Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneck, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Round Ridge, Purchase, Scarsdale, South Salem, West Harrison, and White Plains. (*See* Application at p. 24)

FY 2009-2011 Inpatient Coronary Angioplasty (PCI) Volume in Proposed Services Area

State	FY 09	FY 10	FY 11
CT Service Area*	598	610	429
NY Service Area**	844	775	772
Total	1,442	1,385	2,001

*The CT Service Area is made up of Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston and Westport.
** The NY Service Area is made up of Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneck, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Round Ridge, Purchase, Scarsdale, South Salem, West Harrison, and White Plains.
Source: CT Chime and NY SPARCS database. .*See* Exhibit 3.

Applicants did not provide any of this data in their CON Application because they know it in no way supports their proposal. They also have not provided any credible reasons why these utilization trends will change in the future.

There also has not been any increase in Greenwich's own emergency PCI volumes that would suggest a need for an elective angioplasty program at their hospital. In the three year period before Greenwich submitted its prior application for an elective PCI program, it performed 38, 33 and 41 primary angioplasties, respectively, and in the three year period

before this Application, it performed 40, 32 and 38 primary angioplasties, respectively. Final Decision, pg. 4; Application, Docket No. 12-31748-CON ("Application"), p. 30. As you can see, Greenwich's own primary angioplasty volume has not grown at a level that suggests the need for an additional elective PCI program in the service area.

Residents of the Proposed Service Area Already Have Ample Access to PCI Services

The map titled "Cardiac Services in Connecticut – January 2011" from the State of Connecticut, Certificate of Need Database, (attached to my testimony as Exhibit 4) shows all four Fairfield County hospitals – St. Vincent's, Bridgeport Hospital, Danbury Hospital and Stamford – that operate within or adjacent to the Applicants' proposed Connecticut service area. Each of these hospitals offers primary and elective angioplasty services with cardiac surgery back-up. In addition, both Greenwich and Norwalk Hospitals offer primary PCI programs. Furthermore, Greenwich Hospital's Connecticut service area, as identified in the Application, is identical to Stamford's primary and secondary service area, and the two hospitals are located a mere six (6) miles apart. *See* Application, p. 24. For Applicants not to mention the existence of Stamford Hospital's cardiac program until page 28 of their Application and for them to state on page 29 that their proposal will not result in unnecessary duplication of existing or approved health care services is quite remarkable given these overlapping service areas and the close proximity of our hospitals. Even if you disregard the fact that Stamford Hospital and Greenwich Hospital operate right next to each other, one glance at the map we have provided is enough to tell you that if there is a need for a groundbreaking elective PCI program without on-site surgery in this state, it does not exist in Fairfield County.

In considering the lack of volume growth cited above, it is also important to note that the White Plains Hospital elective angioplasty program began operating in 2010, making the field of elective PCI providers in the Applicants' proposed service area even more crowded than it was in 2009 when Applicants' previous application was denied. White Plains Hospital is located approximately ten miles to Greenwich Hospital's west. This means that if this Application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other. How can that possibly make sense or be an appropriate balance of health care services? The answers are that it doesn't and it can't, especially in a time of zero volume growth.

That the Greenwich Hospital and White Plains programs will severely overlap in the proposed New York service area is borne out by the data. In FY 2011, WPH performed 165 total PCIs, with 110 of these procedures performed on residents of Greenwich Hospital's New York service area. *See* Exhibit 5. Attached to my testimony as Exhibit 6 is a letter from Susan Fox, Executive Vice President of White Plains Hospital which describes that Hospital's elective angioplasty program in more detail and sets forth its position on the pending Application. This letter verifies that the Westchester County market targeted by Applicants is well served not only by WPH but by a host of other providers including the Westchester County Medical Center, Montefiore Medical Center, New York Presbyterian-Weill Cornell Medical Center, New York Presbyterian-Columbia University Medical Center, Lenox Hill Hospital and Mount Sinai Medical Center. This being the case, Applicants' certainly cannot rely on a lack of capacity in New York to establish clear public need for their proposal.

The situation in Fairfield and Westchester Counties is clearly different from the eastern part of Connecticut as presented by Lawrence & Memorial Hospital ("L&M") in its

recent application for an elective angioplasty program without on-site cardiac surgery in New London, a copy of which is attached hereto as Exhibit 7 ("L&M Application"). While Greenwich Hospital is located a mere 6 and 10 miles from Stamford Hospital and WPH, respectively, L&M is located 48, 49 and 61 miles from its nearest elective PCI providers.[3] L&M Application, p. 20. I would also note that L&M's annual primary angioplasty volume is approximately two times higher than Greenwich's. L&M Application, p. 40; Application, p. 31. At least with respect to these factors, L&M's application demonstrates that if OHCA were to approve an elective PCI program without surgical backup, such a program is far better suited for the eastern part of Connecticut where local access to elective PCI programs is much more limited.

This is in contrast to the towns and cities in the service area that Greenwich and Yale propose to serve in their Application, where there is a plethora of existing providers that can easily accommodate the number of cardiac patients that need elective angioplasty procedures. In sum, Applicants have not presented any data or other evidence of backlogs or scheduling problems at any of these hospitals, nor have they provided any evidence of existing facilities failing to provide high quality services to patients. Given the absence of any evidence of need and the absence of any evidence of a lack of access to elective PCI in the service area, Applicants' proposal should be denied.

[3] L&M is located 48 miles from St. Francis Hospital, 49 miles from Yale, 49 miles from Hartford Hospital and 61 miles from Miriam Hospital in Providence.

GH's Volume Projections are Suspect and Do Not Support Approval of the Proposal

With PCI and cardiac catheterization volumes remaining stagnant and more providers than ever vying to treat the same pool of patients, it also does not make sense that Applicants can now project even higher volumes in the first three years of operation for their current proposal (196, 217 and 242 cases, respectively) than they could three years ago in their prior application when they projected 120, 150 and 200 cases, respectively. Application, p. 31; Final Decision, p. 9. Furthermore, Applicants project a greater number of PCIs in the first three (3) years of their proposed program than L&M projects in the first three (3) years of its proposed program, despite the fact that L&M currently performs far more primary PCIs than does Greenwich Hospital, as discussed above. Application, p. 31; L&M Application, p. 41. This also seems illogical.

The present Application goes to great lengths to state that Greenwich Hospital's cardiac catheterization volumes are down because physicians prefer to refer patients to facilities that also perform elective PCI, and the Applicants predict this volume will rebound if the proposed elective angioplasty program is approved. Application, pgs. 23, 32-33. However, this argument is belied by the steady downward trend in inpatient cardiac catheterization at hospitals that already provide elective PCI. On this point, I refer you to the data for Stamford, Danbury, Bridgeport and St. Vincent's contained in the chart on page 6 of my testimony.

A flaw also exists in Applicants' methodology for estimating cardiac catheterization volume (which plays a role in their PCI volume projections). Greenwich's projected cardiac catheterization volume is based on the results of a telephone survey of cardiologists and large internal medicine practices on its medical staff who were asked to "estimate" the number of

cases that they would refer for cardiac catheterizations if Greenwich Hospital obtained approval for its elective PCI program. Application, p. 33. This is no way equates to utilization studies and other more traditional methods of estimating volume. Also, the Applicants state that the increase in "volume" will result from "the addition of New York interventional cardiologists who currently do not practice at Greenwich Hospital but have referral relationships with the cardiologists on the Hospital medical staff." Application, p. 34. This is simply a shift of existing volume, and Applicants fail to address the impact of this shift on existing providers.

Strip away the projected volume that comes from the speculative methodology that I have just described, and the average of 38 primary angioplasty cases per year that Greenwich and Yale also built into the volume estimates contained at page 31 of the Application, and what you are left with is an elective PCI program designed to serve an exceedingly small number of elective patients. This population is described by the Applicants as "approximately 50 patients each year who would not have to be transferred to another hospital if Greenwich Hospital could perform elective angioplasty." Applicants' Responses to Completeness Questions, Docket No. 12-31748-CON ("Responses"), p. 589; Application p. 31. These 50 cases are the only tangible volume on which Applicants can rely. Stamford Hospital respectfully suggests that approving an elective PCI program without surgical back-up to treat 50 patients per year in a market that is already well served is not a wise allocation of resources, especially when Stamford and White Plains Hospital are located just six and ten miles away from Greenwich Hospital, respectively.

Collaboration Not Self-Interest Should Take Precedence In Improving Care for Patients

In opposing this Application, Stamford Hospital also wishes to note that heart disease

is a public health issue that can be addressed in many ways besides creating an unnecessary proliferation of elective PCI programs. A report issued by the state Department of Public Health last November, that is attached to my testimony at Exhibit 8, states that heart disease death rates in Connecticut declined by 28.7% between 1999 and 2008 as a result of improved control of high blood pressure and high cholesterol, a decline in the prevalence of smoking and improvements in treatments, medications and quality of care.

All health care providers, Stamford, Greenwich and Yale-New Haven Hospital included, have a responsibility to see that these positive trends continue. In this case, there is more than adequate access to top quality elective PCI treatment in the proposed service area, but this does not foreclose other ways for hospitals and other healthcare providers to join together to combat heart disease.

The CON Application that is presently before OCHA clearly demonstrates that there is room for more collaboration between Stamford and Greenwich Hospitals as only 2 out of 246 patients requiring transfer from Greenwich to another facility for elective PCI since 2008 were transferred to our facility. This is despite the close proximity of the two institutions and despite Applicants' basing their Application on the need for local access to elective PCI. Application, p. 23 ("Patients prefer to be treated locally, close to their residence and family members.")

As my predecessor as Chief Medical Officer for Stamford Hospital, Dr. John Rodis, indicated during the public hearing on the Applicants' prior application three years ago, Stamford Hospital has an open medical staff and is more than willing to extend privileges to qualified physicians from the Yale School of Medicine and Greenwich's medical staff so that their patients can receive elective PCI at our facility and be followed during their course of

treatment. OHCA appropriately raised the question of why Stamford Hospital – which except for certain areas of Greenwich is closer in proximity than Greenwich Hospital to every Connecticut town that Applicants hope to serve through this proposal -- was being bypassed as a treatment site for its elective PCI patients. Responses, p. 587. The answers that OHCA received to this question, including the statement that "the medical staffs at the two hospitals are quite distinct and there are only a handful of physicians who treat at both locations," do not present any obstacles that cannot be overcome if our two hospitals are committed to working together for the good of the community. Responses, p. 588. This will avoid the unnecessary duplication of elective PCI services caused by this proposal, will foster collaboration and will improve the overall efficiency of the healthcare delivery system.

In addition, while I know Dr. Gray will speak about the clinical literature in more detail, I do want to point out that the *2011 ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention* clearly states that "desires for personal or institutional financial gain, prestige, market share or other similar motives are not appropriate considerations for initiation of PCI programs without on-site cardiac surgery." *2011 ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention: a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiogrpahy and Interventions,* Attachment VI to the Application, p. 164.[4] Again, OHCA appropriately inquired in its completeness questions as to how Applicants were acting consistently with this guidance if they were basing a good part of their need argument on the costs Greenwich presently incurs to support its primary angioplasty program and how an elective PCI program "would reduce the costs per case of the present

[4] Page reference is to Attachment VI.

arrangement." Application, pp. 15, 20; Responses, p. 598.

In their responses, Applicants stress that Greenwich Hospital's considerations for the proposed program "address cost-effectiveness and not institutional financial gain", but they then go on to say the following:

> The current primary angioplasty program is extremely costly to operate. ... By offering an elective angioplasty program along with the primary program, the additional case volume and associated revenues will help to offset the significant fixed costs which exist for the primary program alone and would help fortify the primary PCI program and ensure its continued survival for this necessary service needed by the community served by Greenwich Hospital.

Responses, p. 598 (emphasis added).

Applicants can engage in semantics if they want, but clearly the above language describes the financial gains that Greenwich Hospital hopes to realize if this proposal for an elective PCI program is approved. While Stamford Hospital is not unsympathetic to Greenwich's financial concerns, the fact is that all hospitals face enormous financial challenges in the current health care environment and most provide services to the public that lose money. Nevertheless, the 2011 ACCF/AHA/SCAI Guideline flatly states that financial considerations are inappropriate in this context, and we would urge OHCA to follow this important guidance by denying this unnecessary proposal.

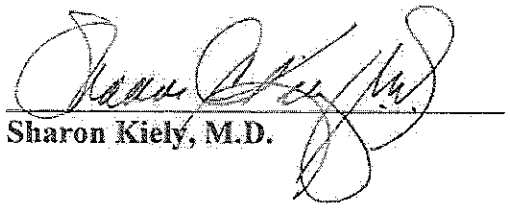
My final remark on this point is that it was less than a decade ago that Yale repeatedly went on record before OHCA stating that there was no need for additional interventional cardiac programs in Connecticut.[5] In the intervening years, three full service programs (two of which are in Fairfield County -- Stamford and Danbury Hospital) have been added, the use of non-interventional methods of treating heart disease have flourished and PCI volumes have not grown. It cannot be that an Applicant that did not see a need for expansion of PCI services then sees one now.

Conclusion

In summary, Stamford Hospital very much appreciates the importance of OHCA's mission to promote effective health planning in the state and its statutory duties to ensure access to high quality health care for Connecticut residents while avoiding unnecessary duplication. Effective health planning in this case would be to deny Applicants' proposal. To do otherwise would result in the establishment of what almost certainly will be a low volume program that will need to drive down volumes at neighboring intuitions, including Stamford Hospital, to survive. None of those outcomes would contribute to the provision of high quality health care or the financial stability of the delivery system.

[5] *See, e.g.,* YNHH Petition for Party Status in Danbury Hospital CON for Open Heart and Elective Angioplasty Services, Docket # 03-30143, p.5 ("There is clearly no need for additional cardiac surgery of elective angioplasty services in Connecticut."); YNHH Petition for Party Status in Waterbury/St. Mary's Hospital CON for Open Heart and Elective Angioplasty Services, Docket # 03-30176, p.5 ("There is clearly no need for additional cardiac surgery or elective angioplasty services in Connecticut."); YNHHHI Petition for Intervenor Status in Norwalk Hospital CON for Open Heart and Primary and Elective Angioplasty Services, Docket # 04-30286, p.10 ("The Applicant has not demonstrated any clear public need for such additional services, and granting the Applicant's proposal would be detrimental to quality and cost-effectiveness of cardiac care in Connecticut and thus inconsistent with the interest of patients and payors."); and YNHHHI Petition for Intervenor Status in Stamford Hospital CON for Open Heart and Primary and Elective Angioplasty Services, Docket # 04-30374, p. 6 ("Residents of the greater Stamford area have full and appropriate access to all levels of cardiac care.")

Thank you for the opportunity to speak with you today, and I am happy to answer any questions.



Sharon Kiely, M.D.

THIS PAGE LEFT INTENTIONALLY BLANK.

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 12, 2012

Pre-File Testimony of William A. Gray, M.D.

Good morning Deputy Commissioner Davis and Office of Health Care Access ("OHCA") staff. My name is William Gray, and I am an Associate Professor of Clinical Medicine at Columbia University and Director of Endovascular Services for the New York Presbyterian Hospital/Columbia University Medical Center ("NYP/C"). I am here today to speak in opposition to the Yale-New Haven Hospital and Greenwich Hospital (the "Applicants") Certificate of Need ("CON") Application to provide elective angioplasty ("PCI") without cardiac surgery on site ("SOS") at Greenwich Hospital.

NYP/C has worked closely with Stamford Hospital in the operation of its elective angioplasty and open heart surgery program. Accordingly, my remarks today will be focused in three areas. First, I will discuss the recent *2011 ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention: a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiography and Interventions* (the "2011 ACCF/AHA/SCAI Guideline"), and the *2012 American College of Cardiology Foundation/Society for Cardiovascular Angiography and Interventions Expert Consensus Document on Cardiac Catheterization Laboratory Standards Update* (the "2012 ACCF/SCAI Update"), including what both documents state regarding PCI

without SOS and how these statements are relevant to the CON Application currently before OHCA.

Secondly, I will discuss the application of the 2011 ACCF/AHA/SCAI Guideline and 2012 ACCF/SCAI Update to the proposed service area. Finally, I will share my view of where the field of interventional cardiology is headed and why approval of this CON Application would appear inconsistent with creating the resources necessary to provide state-of-the-art care.

Professional Background

My professional background is described in the Curriculum Vitae attached as Exhibit 1 to my testimony. Briefly, I am a graduate of Temple University School of Medicine and did my postgraduate and fellowship training in cardiology as well as interventional cardiology at Brown University/Rhode Island Hospital. I am board certified in Internal Medicine, Cardiology and Interventional Cardiology as well as in Vascular and Endovascular Medicine and have focused my entire career on interventional cardiology. The interventional cardiology team with whom I presently practice performs more than 3,500 interventional procedures a year, and our cath lab has consistently achieved low morbidity and mortality rates to help NYP/C achieve ranking as one of the top heart hospitals in the U.S. During my career, I have performed approximately 4,000 coronary interventions.

The ACCF/AHA/SCAI Guideline Does Not Endorse Applicants' Program

If there is one concept that is important for OHCA to take away from my presentation today it is that the science is still evolving regarding the safety and efficiency of providing elective angioplasty without SOS. As I will explain in a moment, the 2011 ACCF/AHA/SCAI Guideline has only moved incrementally in this area. To my mind, that is a good thing because, despite reference in Yale and Greenwich's Application to "the routine nature" of elective PCI

procedures (Application, p. 19), we are still talking about a coronary intervention where any risk of complication can have dire consequences for the patient.

At the time of Greenwich Hospital's 2009 CON Application to establish an elective angioplasty without SOS demonstration project (the "Prior Application"), the then current PCI Guideline classified elective PCI performed in facilities without SOS as a Class III recommendation, stating that "elective PCI should not be performed at institutions that do not provide onsite cardiac surgery." *See 2005 ACCF/AHA/SCAI Guideline Update for PCI a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines* ("2005 ACCF/AHA/SCAI Update"), p. 39, attached as Exhibit 2 to my testimony. The Class III recommendation meant that a "procedure/treatment should NOT be performed/administered SINCE IT IS NOT HELPFUL AND MAY BE HARMFUL." 2005 ACCF/AHA/SCAI Update, p. 5 (emphasis in original).

The current 2011 ACCF/AHA/SCAI Guideline, which is contained in Greenwich and Yale's current CON Application at Attachment VI, now assigns a Class IIb indication to elective PCI without SOS and states that it "might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical angiographic criteria are used for patient selection … (Level of Evidence: B)." 2011 ACCF/AHA/SCAI Guideline, p. 164 (page references are to Attachment VI). A Class IIb indication still bespeaks caution, however, since it means (i) that the benefit may equal or exceed the risk, (ii) that additional studies with broad objectives are needed and additional registry data would be helpful and (iii) that the procedure MAY BE CONSIDERED. 2011 ACCF/AHA/SCAI Guideline, p. 144 (emphasis in original). A Class IIb recommendation should give all of us in the health care community pause since it falls far short of both a Class I recommendation, which

means that the benefit of the procedure far outweighs the risk and should be performed and a Class IIa recommendation where the benefit is much greater than the risk and it has been determined that it is reasonable to perform the procedure. *Id.* (emphasis added).

In their CON Application, Yale and Greenwich Hospital also rely heavily on the results of the Cardiovascular Patient Outcomes Research Team Non-Primary PCI ("CPORT-E") trial to argue that elective PCI without SOS is both safe and efficacious. Application, p. 15. While I concur that the results of the CPORT-E trial were promising, I believe that this is too rash of a statement to make.

Attached to my testimony at Exhibit 3 is a recent New England Journal of Medicine article that summarizes the results of CPORT-E. The overall conclusion of the trial was that, with respect to all-cause mortality at 6 weeks and major adverse cardiac events at 9 months, outcomes at hospitals without SOS were "noninferior" to those at hospitals with SOS. Noninferior is a scientific term used in the context of clinical trials which means that a new treatment (here, elective PCI without SOS) was found to be equivalent to the standard treatment (elective PCI with SOS) in the study, but the term does not mean that the treatment is preferred over performing PCI with cardiac backup on site. Complications in elective angioplasty cases performed on low-risk patients are not common, but they happen. And when they do, it is far better to have cardiac surgical back-up on site than to have to transfer the patient to a full service hospital.

Even in the CPORT-E trial there were differences in outcomes that are worthy of further investigation. For example, the trial participants in CPORT-E that were treated at hospitals without SOS more frequently required target-vessel revascularization (6.5% among participants

at hospitals without SOS and 5.4% among participants at hospitals with SOS). Only further research will determine whether this finding is significant or not.

CPORT-E was a large, randomized clinical trial, but it is still only one study. While there have been other demonstration projects and non-SOS PCI programs established around the country, the 2011 ACCF/AHA/SCAI Guideline still states in pertinent part as follows:

> It is only appropriate to consider initiation of a PCI program without on-site surgical back-up if those programs will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical back-up, may not be in the best interests of the community.

2011 ACCF/AHA/SCAI Guideline, p. 164.

My understanding is that Yale and Greenwich have taken the peculiar position that the language quoted above pertains only to Class III indications because it follows the "Class III: Harm" heading in the 2011 ACCF/AHA/SCAI Guideline document (Responses to Completeness Questions, Docket No. 12-31748-CON ("Responses"), pgs. 592, 597-98). I do not agree and believe the more accurate interpretation is that this cautionary language pertains to all PCI programs at hospitals without SOS, as is suggested by the quoted text. My reasons for this view follow.

First, as discussed earlier, the "Class III: Harm" indication means that a procedure should not be performed since it may be harmful to patients. 2011 ACCF/AHA/SCAI Guideline, p. 144. Secondly, the Guideline definitively states that primary or elective PCI should not be performed at all in hospitals without SOS unless a proven plan for rapid transport to a nearby hospital with the appropriate facilities or appropriate hemodynamic support capability for transfer exists. 2011 ACCF/AHA/SCAI Guideline, p. 164. Accordingly, if a PCI program would lack the appropriate transfer methods such that it would be given a "Class III: Harm"

indication, there would be no need to consider initiation of the non-SOS PCI program in the first place. Additionally, it makes no sense to think that the 2011 ACCF/AHA/SCAI Guideline would not consider the relevant marketplace and availability of treatment from other providers when establishing this type of interventional cardiac service since the clinical literature on PCI has shown that there is a relationship between quality and the volume of cases performed by individual operators and hospitals. Therefore, the language about it being "only appropriate to consider initiation of a PCI program without on-site surgical back-up if these programs will clearly fill a void in the healthcare needs of the community" is relevant to all PCI programs at hospitals without SOS.

As further evidence of my position, the quoted language in the 2011 ACCF/AHA/SCAI Guideline appears immediately above Tables 5 and 6, which list the expert consensus document personnel and facility requirements for PCI programs without SOS. Applicants admit that these requirements are relevant to their proposal and, in fact, went to great lengths to provide OHCA with evidence of their compliance with the standards. Responses, pp. 592-97. Thus, despite these tables being listed after the "Class III: Harm" heading, and after the language which Yale and Greenwich contend does not apply to them, both hospitals acknowledge that the information in Tables 5 and 6 applies to their program. In short, the Applicants cannot have it both ways so that some of the information under the Class IIII Harm heading applies to them and some does not. The better interpretation is that this very common-sense and cautionary language from the ACCF/AHA/SCAI consensus document applies to any proposed program for elective PCI without SOS.

In addition, the 2012 ACCF/SCAI Update, attached as Exhibit 4 to my testimony, clearly states that the issue of performing PCI without SOS "remains controversial" especially when

other active PCI programs are located within the same geographic area. 2012 ACCF/SCAI Update, p. 19. Accordingly, the 2012 ACCF/SCAI Update states as follows: "It behooves the cardiology community to foster [elective PCI programs without SOS] only when such programs improve access to a higher level of cardiovascular care than would otherwise be available." 2012 ACCF/SCAI Update, p. 19. This statement, which echoes the language quoted above from the 2011 ACCF/AHA/SCAI Guideline, is not qualified as pertaining only to Class III recommendations since, as previously discussed, such a qualification would not make sense. What the language in the 2012 ACCF/SCAI Update does is reiterate the concept that such a program should be established in areas where access to programs with surgical back-up is lacking.

Lastly, I have been shown a copy of the Lawrence & Memorial Hospital ("L&M") CON Application that Dr. Kiely referenced in her testimony. Clearly, it is the aim of that hospital to partner with the Yale system to provide an elective angioplasty without SOS in the eastern part of Connecticut. And I note that, just as clearly, L&M readily accepts that part of its burden under the 2011 ACCF/AHA/SCAI Guideline and 2012 ACCF/SCAI Update is to show that the program it is proposing "clearly fills a void in the healthcare needs of the community." *See* L&M CON Application, pp. 13, 17, 21 and 34.

Application of the Guidelines to the Proposed Service Area

As has already been discussed by Dr. Kiely, there is no debating that lower Fairfield County and Westchester County residents already have ample access to elective angioplasty services. Two hospitals located within the proposed service area (Stamford Hospital and White Plains Hospital) already provide elective PCI while a number of others, including the New York Presbyterian-Columbia University Medical Center, also serve the residents of these communities.

This being the case, there is no void in the healthcare system that needs to be filled by yet another provider.

In addition, the 2011 ACCF/AHA/SCAI Guideline also states that competition with another PCI program in the same geographic area, particularly an established program with surgical back-up like Stamford Hospital's, may not be in the best interests of the community. 2011 ACCF/AHA/SCAI Guideline, p. 164. Here these are several reasons why approving the Greenwich-Yale proposal might be a disservice to the residents of Fairfield and Westchester counties.

First, given the lack of volume growth and the number of established programs in (and around) the service area, there is a real risk that the Greenwich Hospital program will not exceed 200 cases per year if approved. There is also a real risk, if this proposal is approved, that the region will then have three PCI programs – Greenwich Hospital, White Plains Hospital, which performed 290 PCI procedures in fiscal year ("FY") 2011 (250 elective and 40 emergency cases), and Stamford Hospital, which performed 250 PCIs in FY 2011 (191 elective and 59 emergency) – each performing fewer than 200 PCIs per year. The recommendations contained in the 2011 ACCF/AHA/SCAI Guideline at page 164 make clear that the goal of the White Plains and Stamford programs from a quality perspective should be to become high volume centers performing more than 400 procedures per year.

This is because, as I previously noted, there continues to be a correlation between quality and hospital volumes associated with PCI programs and falling below the 200-case volume threshold is not recommended. On this point, the 2011 ACCF/AHA/SCAI Guideline states that "[a]n institution with a volume of fewer than 200 procedures per year, unless in a region that is

underserved because of geography, should carefully consider whether it should continue to offer this service." 2011 ACCF/AHA/SCAI Guideline, p. 193.

Creating a scenario where three underperforming programs are in close proximity to one another could undermine quality of care at each hospital and, although I do not want to believe such a thing could happen, this could also result in doctors feeling pressure to refer patients for procedures to keep institutional volumes up. Occurrences like these will only drive up healthcare costs for payers and patients. These costs to the healthcare delivery system – not to mention the costs associated with poor patient outcomes due to any diminution in quality – are also likely to dwarf the savings on ambulance rides and other expenses that Applicants claim will be realized by no longer having to transfer approximately 50 patients per year from Greenwich to Yale for an elective PCI procedure. Application p. 20; Responses pp. 599-60.

It is my understanding that OHCA often looks to the laws and regulations of other states to help develop regulations and other CON guidance in Connecticut. In this spirit, it is worth noting that the State of New York has adopted special regulations for the determination of public need for PCI programs without SOS. These regulations are attached to my testimony at Exhibit 5. Notably, one of the CON requirements that New York has adopted for approving a new PCI Capable Cardiac Catheterization Laboratory Center (which is defined as a laboratory that performs percutaneous coronary and other percutaneous procedures to diagnose and treat abnormalities of the heart or great vessels in adult patients), is that:

> existing referral patterns indicate that approval of an additional service at the applicant facility will not jeopardize the minimum volume required at other existing PCI Capable Cardiac Catheterization Laboratory Centers and one of the following conditions exists:
>
> (1) The proposed PCI Capable Cardiac Catheterization Laboratory Center is located more than one hour average surface travel time ... from the nearest existing PCI Capable Cardiac Catheterization Laboratory Center; or

> (2) All existing PCI Capable Cardiac Catheterization Laboratory Centers within one hour average surface travel time of the applicant facility ... perform and are expected to continue to perform at a level of at least 300 PCI procedures per year after the addition of the proposed new program...

N.Y. Comp. Codes R. & Regs. tit. 10, § 709.14(d)(1)(ii)(d).

Accordingly, if Greenwich Hospital were subject to CON jurisdiction in New York, it is difficult to envision its current proposal gaining approval given the close proximity of both Stamford Hospital and White Plains Hospital and the respective PCI volumes of each institution.

In summary, there is no way to read the 2011 ACCF/AHA/SCAI Guideline without coming to the logical conclusion that PCI-only cardiac programs are best situated in geographic regions where access to PCI services is limited. This is not the case in either Southwestern Connecticut or Westchester County where access to many high quality programs abounds.

PCI-Only Programs Do Not Represent Interventional Cardiology's Future

In preparing for my testimony today, I also learned that, in addition to Greenwich Hospital, there are currently three other hospitals in this state operating standalone primary angioplasty programs and that at least two of those – Hospital of Central Connecticut and Lawrence & Memorial Hospital – have also applied to OHCA recently to be able to provide elective angioplasty without SOS. I realize that the potential of having every standalone primary PCI program in this state converted to an elective PCI program without SOS and perhaps every community hospital providing this same service creates some real policy and health planning challenges for OHCA. While I am not an expert in health policy or planning, I would like to close my remarks today by commenting briefly on why I do not see effective interventional cardiology programs at hospitals being built around the limited scope of services that PCI-only programs provide.

To the contrary, it is my view and the view of many of my colleagues that the future of cardiac care is moving toward the development of comprehensive centers of excellence, where, for example, the same facility can offer PCI as well as a variety of other interventional services. Rather than only focusing on angioplasty procedures, these state-of-the-art facilities will allow interventional cardiologists and surgeons to immediately follow a diagnostic procedure with a therapeutic one regardless of whether that entails a valve replacement, performing cardiac ablation, revascularizing a patient with a stent or performing another type of interventional procedure. For example, at NYP/C, we have several operating rooms that used to be dedicated exclusively to CABG and other types of cardiac surgery which have been converted to "hybrid" operating suites that are outfitted with the latest diagnostic imaging technology so physicians have the flexibility to perform many of these procedures. The treatment the patient receives combines some of the technological and clinical components of both PCI and cardiac surgery in many cases.

It is in these types of therapies, like transcatheter aortic valve implantation (TAVI) procedures that my colleagues at NYP/C have pioneered for patients with severe aortic stenosis, where the real breakthroughs in cardiac care are being made. Only full-service cardiac programs can support this work. To my mind, it is services like these – not the proliferation of low volume PCI programs without SOS – that will provide much more value to patients and the overall health care delivery system over the next 5 to 10 years.

Thank you for providing me with the opportunity to speak before you today, and I am happy to answer any questions.

William A. Gray, M.D.

Hi Steve and Jack-
Please find attached our rebuttal testimony and procedural motions for the above referenced Docket. Please email back that you received? We will be faxing a copy to Attorney Cowherd.

Hard copies will be delivered by noon to OHCA.

Thanks, Karen

Re: Certificate of Need Application (CON); Docket Number 12-31748
Proposal to Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital

Dear Hearing Officer Yandow:

Please find enclosed an original and six (6) copies of our rebuttal testimony and procedural motions for tomorrow's public hearing on July 17, 2012.

We will bring signed copies of the rebuttal testimony to the hearing.

Thank you in advance for your time and effort on this critically important CON application.

Sincerely,

Gayle L. Capozzalo
Executive Vice President, Strategy and System Development

Proposal to Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital

Docket Number: 12-31748-CON

Rebuttal Testimony

July 16, 2012

Certificate of Need Application Docket Number: 12-31748
Greenwich Hospital and Yale New Haven Hospital Elective Angioplasty Program
Rebuttal Testimony

Marna Borgstrom

I would like to begin by addressing some of the statements made by Dr. Sharon Kiely which are either incorrect or misleading.

- It is ironic that Dr. Kiely would raise the need for collaboration among Stamford, Greenwich and Yale-New Haven Hospitals in her testimony given Stamford Hospital's refusal to pursue such collaboration. Yale-New Haven Heart and Vascular Center (YNHHVC) began to discuss collaboration opportunities with Stamford Hospital in March 2012. There were a total of six telephone calls (3/9/12, 4/25/12, 5/4/12, 5/25/12, 6/21/12, and 7/3/12) and multiple email exchanges between Ms. Gayle Capozzalo, our Executive Vice President for Strategy and System Development, and Mr. David Smith, Stamford Hospital's Senior Vice President of Strategy and Chief Strategy and Network Development Officer. In addition, there was a face-to-face meeting held on May 22, 2012 with several representatives including cardiac surgeons and cardiologists from all three hospitals. Stamford Hospital representatives clearly communicated that they were unhappy with the level of support from New York Presbyterian (NYP) and were very interested in developing a relationship with YNHHVC. It was agreed by all three hospitals that there were many opportunities for collaboration, and in fact, an outline of principles was developed as well as a draft letter of intent (LOI) for the arrangement (See Attachment I). We were told by Mr. Smith, that the terms as outlined in the LOI were acceptable to Stamford Hospital. These terms included as an initial focus initiating an elective PCI program at Greenwich Hospital (Attachment I, Principles, Section 3). Our follow-up calls to Mr. Smith regarding the arrangement and the elective angioplasty program at Greenwich Hospital were abruptly discontinued on July 3, 2012, when Mr. Smith informed us that they will be opposing our CON application because he said there was not time to meet with NYP to discuss the concept of transferring an affiliation to

YNHHVC. Ms. Capozzalo will be in attendance at the hearing and can address her discussions with Stamford Hospital under oath.

YNHHVC and Greenwich Hospital fully intended to collaborate with Stamford Hospital in the area of cardiac care and had sought to help strengthen Stamford's open heart surgery program, which is suffering from low volume. The presence of Yale faculty based in southwestern Connecticut communities along with the YNHHVC's clinical program support and quality improvement systems would have significantly improved Stamford Hospital's cardiac surgery program's credibility, which is at significant risk, evidenced by the fact that they performed only 80 open heart cases last year and are on track to perform approximately 50 this fiscal year based on 6 months volumes from CHIME (see Table below).

Connecticut Inpatient Volume for Open Heart Surgery by Hospital for FY 2010 - FY 2012 (6 Months)				
Hospital	FY 2010	FY 2011	FY 2012*	
Bridgeport	152	127	140	
Danbury	181	182	150	
Dempsey	67	71	72	
Hartford	793	801	702	
HSR	343	313	300	
St. Francis	867	781	734	
St. Mary's	118	100	114	
St. Vincent's	239	223	200	
Stamford	54	80	54	
Waterbury	109	102	104	
YNHH	869	800	820	
TOTAL	**3,792**	**3,580**	**3,390**	
Source: CHIME				
*FY 2012 annualized based on 6 months actual				

It is clear that YNHHVC acted in good faith to create a cost effective care model for cardiology services in the Stamford and Greenwich area, but it is Stamford Hospital that does not want to collaborate.

- I would also like to point out that Stamford Hospital's extremely low cardiac surgery volume does not come close to meeting professional society recommendations or OHCA's own standards as outlined in the Agreed Settlement for Stamford Hospital (DN: 04-30374-CON) (see Attachment II). Condition #8 states:

  > "If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. **If these volumes are not met for a period of <u>two consecutive 12-month periods</u>, TSH's OHS program <u>shall be terminated</u>..."**

  We are not aware that this condition has been modified by OHCA based on a review of OHCA's website and modifications pursued by Stamford Hospital.

  According to OHCA's own data (see Attachment III) through 2010, Stamford Hospital has never come close to reaching 125 open heart surgeries in a year. In fact, it appears that its highest volume was 80 in FY 2011. As previously shown above, based on 6 months of CHIME data for 2012, they are on track to perform about 54 surgeries this year, less than half of the guidelines requirement. These low volumes have been of concern to YNHHVC physicians and we suspect have contributed to fewer referrals to their surgery program. Low surgical volume can also affect the physicians' decisions to transfer patients to Stamford for elective angioplasty, given the uncertain quality of the surgical backup available at that site. Such low surgical volumes present a significant quality concern as identified by the American College of Surgeons which published that an annual volume of 100-125 is **<u>necessary</u>** from a quality standpoint and this requirement has also been noted by OHCA in its draft Cardiac Services section of the new State Health Plan (see Attachment IV).

- Dr. Kiely states that OHCA should not approve Greenwich Hospital's proposed elective angioplasty program because elective angioplasty volumes are flat in Connecticut and the proposed service area. Stamford Hospital did not previously view flat or declining volumes as problematic when it pursued its full service cardiac program CON. At that time, their own cardiac catheterization volumes had been in decline as noted in OHCA's

Agreed Settlement's Findings of Fact #11 (previously referenced as Attachment II); statewide inpatient cardiac catheterization and angioplasty volumes had declined steadily between 2003 and 2005, as shown in Dr. Kiely's own testimony and open heart surgery volumes had also been declining between 2002 and 2005 as shown in the OHCA table and graph below.

Table 3A: Open heart surgery discharges by provider, FFYs 2002-2010

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	FFY 05-10 (5-yr)% Change	FFY 08-10 (3-yr)% Change	FFY 09-10 (1-yr) % Change
Bridgeport	345	313	268	263	175	194	106	96	136	-22%	28%	42%

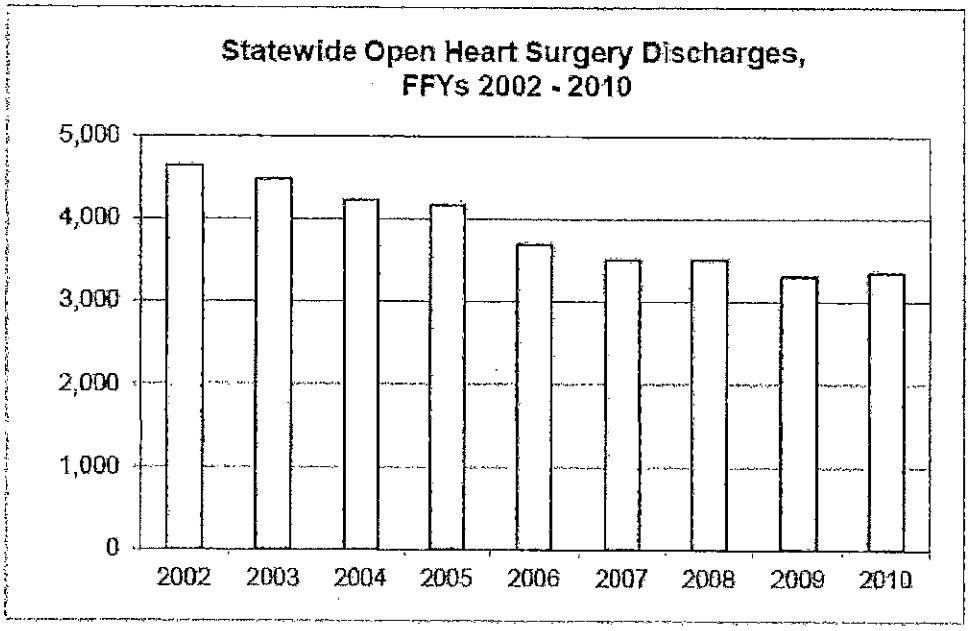
ICD-9-CM Procedure Codes: 35.10-35.28 and 36.10-36.19

Please note: unduplicated counts utilizing all procedure codes



All of these related and declining volumes did not seem relevant to Stamford Hospital or OHCA as a full service cardiac program was proposed and approved. Stamford Hospital expended more than $8 million dollars in capital expenses to develop their angioplasty and surgery program in a declining volume market (modified from the $5.4 million they estimated at the time of their original CON filing). They based their need on such factors as improved accessibility, continuity of care and improved quality. These are the same reasons why Greenwich Hospital seeks to offer elective angioplasty and can do so without any capital expense.

- Dr. Kiely's testimony includes conflicting statistics and information about New York programs. First, I would like to highlight the following statement from OHCA's 2010 Declaratory Ruling, Docket Number: 09-31433-DCR, which specifically states that:

  "...OHCA only has the authority to act on behalf of the state within the parameters of its enabling statutes and its jurisdiction is limited to health care facilities located within the state. Thus, OHCA has no jurisdiction over health care facilities located in other states just as those states have no authority to regulate facilities located within Connecticut."

Given the language from the above mentioned Declaratory Ruling, as well as the OHCA enabling statutes, it is clear that the agency has no jurisdiction over New York hospitals and their positions regarding this CON application are not relevant. This is likely why White Plains Hospital has submitted its arguments through Stamford Hospital rather than petitioning for status itself.

Even if one considers the information presented about and from White Plains Hospital, there are inconsistent and incorrect statements provided that call into question its credibility. Dr. Kiely states that White Plains Hospital performed 165 total PCIs in FY 2011 in her written testimony and attached a patient origin volume report with the same statistic. Ms. Fox states in her letter that in FY 2011, 290 PCIs were performed at White Plains Hospital. Additionally, Ms. Fox states in her letter that "two hospitals that serve Westchester County residents – Sound Shore Medical Center in New Rochelle and St. John's Riverside in Yonkers -...have been unsuccessful in attempts to gain regulatory approval from the New York Department of Health to provide elective angioplasty services." This statement is inaccurate and misleading. As shown in Attachment V, the email correspondences between Ms. Nancy Rosenthal, Senior Vice President – Health Systems Development at Greenwich Hospital and Anna Colello, Esq., Director of Regulatory Compliance and Cardiac Services Program at the New York State Department of Health, St. John's Riverside withdrew its application in April of this year and the Sound Shore application remains open.

It is also worth noting that within the email correspondences just referenced, New York State currently has 14 hospitals operating elective angioplasty programs without onsite cardiac surgery and one additional program was recently approved but has not yet opened.

- Dr. Kiely claims that flaws exist in our methodology for estimating cardiac catheterization and angioplasty volume. As OHCA is aware, developing projected volume for any proposed service involves multiple considerations and OHCA does not prescribe to a specific methodology for projecting need. Our projections include the

historical volume of emergency angioplasty, transferred (from Greenwich Hospital) elective angioplasty cases, cases referred to YNHH initially, as well as a conservative estimates provided by Greenwich Hospital cardiologists during a telephone survey conducted by Greenwich Hospital's Director of Planning, Ms. Nancy Hamson. Ms. Hamson personally spoke with the medical cardiologists on the staff of Greenwich Hospital, who are not active at Stamford Hospital and obtained their volume estimates. Ms. Hamson will be in attendance at the hearing and can address her methodology under oath. These physicians currently bypass Greenwich Hospital for cardiac catheterization referrals when they suspect an angioplasty procedure may be required, to save their patients from having to undergo two invasive procedures. They do not refer cases to Stamford Hospital. In addition, we have two interventional cardiologists who subsequent to the submission of the CON application have come forward and put in writing their intention to bring 80 – 105 angioplasty cases per year to Greenwich Hospital. These two physicians do not perform invasive cardiac procedures at Stamford Hospital. Their volumes were not even considered when the projections were developed and therefore demonstrate the conservative nature of our projections.

- Dr. Kiely states that since Greenwich Hospital's emergency angioplasty volume has not increased, there is no need for an elective angioplasty program. As I am sure Dr. Kiely is aware, the criteria for emergency angioplasty are very narrow and apply to only a small percentage of patients. The emergency angioplasty patient population is separate and distinct from the elective angioplasty patient population. Dr. Kiely's own testimony including data from White Plains Hospital shows that in FY 2011, the hospital performed 40 emergency angioplasty cases but 250 elective cases. Their emergency volume is quite similar to Greenwich Hospital's.

- I would also like to comment on Dr. Kiely's reference to previous testimony given by YNHH representatives at CON hearings for Danbury Hospital, Waterbury/St. Mary's Hospitals, Norwalk Hospital and Stamford Hospital. At the time of those hearings, which date back almost 10 years, it was clear to us that cardiac surgery volumes had been and were going to continue to decline. That certainly has proven to be true and

we continue to believe as we did then, that there was no need for additional open heart surgery programs. In the case of angioplasty, OHCA approved several emergency angioplasty programs without onsite cardiac surgery and these programs along with many others in the United States, as evidenced by the research we included in our application, have been shown to be safe for patients. In fact, our view regarding angioplasty has evolved as discussed in previously submitted testimony based on evidence described in medical literature, changes to clinical practice guidelines, and the opinions of our excellent cardiovascular physicians.

- Finally, Dr. Kiely's testimony references and attaches Lawrence & Memorial Hospital's recently submitted CON for elective angioplasty. This CON application is completely irrelevant to our application for the following reasons:
    - The CON is incomplete and should not be recognized by OHCA in this proceeding; and
    - The CON is for a program located approximately 90 miles away and serves a completely different service area.

We have separately moved to strike all references of this submission from Stamford's testimony.

DRAFT –June 19, 2012
Confidential: Attorney Client Privilege

Principles
for
Yale-New Haven Heart and Vascular Services at Stamford Hospital and Greenwich Hospital

I. **Mission**

- Create a cost effective care model utilizing the most appropriate location to provide convenient patient access to safe, high quality care
- Develop a sustainable clinical business model with appropriate professional and technical resources allocated to each program or modality
- Maintain the highest standard of care and superior outcomes through comprehensive staff training and QA/PI programs
- Offer technological advances as these become economically and programmatically feasible to the greater Stamford and Greenwich communities through qualified physicians.
- Monitor operational performance to maintain regulatory compliance (CMS/DPH/TJC) and improve patient satisfaction
- Support other elements of the non-profit missions of Stamford Hospital, Greenwich Hospital, Yale School of Medicine and Yale-New Haven Hospital, respectively

II. **Participants**

- Stamford Hospital, as the principal provider and Connecticut Department of Health license holder for technical services rendered in Stamford, Connecticut, will also be responsible for the Conditions of Participation for CMS certification, where applicable.
- The Stamford Hospital Medical Staff, in particular, the employed CT surgeons, Cardiac Interventionalists and primary care cardiologists will participate in various cardiovascular service offerings.
- Greenwich Hospital, which may share coverage of the PAMI/PCI programs with Stamford Hospital and whose cardiologists may refer appropriate CT surgery cases to Stamford Hospital
- The Greenwich Medical Staff, in particular, the employed and independent Cardiac Interventionalists and the primary care cardiologists will participate in various cardiovascular services offerings
- The Yale-New Haven Heart and Vascular Center (YNHHVC), a virtual organization of Yale-New Haven Hospital (YNHH) and Yale University, that integrates the professional and technical service of select Yale University School of Medicine

(YSM) and YNHH Departments to provide care and clinical management services for the proposed programs.

III. **Scope of Strategic Partnership**

The following array of cardiovascular services may be offered to the greater Stamford and Greenwich communities. The initial focus will be on initiating an elective PCI program at Greenwich and strengthening Stamford CT Surgery building on the existing team and program, followed by the development of a heart failure program at Stamford and Greenwich. Clinical protocols and consultation systems will be developed for each service or program to address basic or tertiary services and low or high risk patients for each procedure.

PAMI at Stamford	PAMI at Greenwich	Elective PCI at Stamford	Elective PCI at Greenwich	Elective PCI at YNHH
Yale coverage potential	Yale Coverage	Yale coverage potential	Low risk	High risk and valves

Heart Failure/Cardiology at Stamford and Greenwich	Heart Failure/Cardiology at YNHH	CT Surgical Procedures at Stamford	CT Surgical Procedures at YNHH	Peripheral Vascular Procedures at Stamford	Peripheral Vascular Procedures at YNHH
Class A+B+C	Class C evaluations +D Transplant and VAD evaluations	CABG and valves	Minimally invasive, Transplant and, VAD	Basic	Advanced

- As a general principle, low and moderate risk interventional procedures will be performed at Greenwich under generally recognized criteria, unless patient insurance or personal preference directs another site of care.
- The presence of Yale faculty, based in the Southwestern CT communities coupled with Yale-New Haven Heart and Vascular clinical program support and PI/QA systems should enhance the program's credibility in the community of referring physicians and discerning patients.
- The CT Surgical Director at Stamford Hospital will discuss high risk cases with the YNHHVC CT Surgical Director and determine whether or not patients requiring cardiac surgery should be transferred to Yale-New Haven Hospital. The Y-Access transfer line may be employed for this purpose. Other coverage arrangements may be pursued in the future.

IV. **Physician Credentialing and Privileges**

All participating physicians performing these procedures must be members of the Stamford or Greenwich medical staff in good standing with delineated privileges for the proposed procedures. Minimum procedural volume requirements will be met by including procedures performed at all hospitals.

The hospitals will not limit participating physician eligibility for medical staff privileges based upon geographic considerations as long as comprehensive coverage is incorporated in the proposed service model.

V. **CON and Regulatory Approvals**

To the extent necessary, the Stamford Hospital CON will be amended to reflect this CT Surgery support.

VI. **Physician Employment, Revenue and Expense Allocations**

The entity that funds the cost of physician services will also provide a provider number for professional billing and receive the revenue credit. Physicians will assign their billing right to this entity. Each participating physician should have one employer to reduce tax liabilities and optimize personal benefit contributions. Participating physicians must abide by all principles and policies incorporated into this arrangement.

In certain subspecialties the most attractive candidates may prefer to be part of an academic medical center with access to new clinical trials, fellows and multidisciplinary specialists. The YNHHVC would recruit, if mutually agreeable, those physicians and deploy them at Stamford and Greenwich. YSM has created a clinician track without academic faculty ladder research expectations, which is appropriate for geographic full time physicians and for split and covering physicians.

Stamford and Greenwich would agree to exclusively obtain covering interventional and supporting surgical services from YNHHVC provided that CT Surgery and interventional coverage is maintained by YNHHVC. However, Stamford Hospital has sufficient coverage with two CT surgeons at this time.

Physician compensation should be at fair market value based on work RVUs, including stipends for night and weekend coverage, patient satisfaction and quality measures. Physicians should not have a financial incentive to perform a procedure at Greenwich, Stamford or YNHH so that care decisions may be made solely in the best interest of the patient.

VII. **Medical Directors**

Greenwich Hospital or Stamford Hospital and the YNH Heart and Vascular Center will jointly approve Surgical and Medical Directors. The Directors will have clinical management responsibilities for the program and a jointly approved position descriptions.

The Surgical and Medical Directors will have dual reporting relationships to the Chief of Surgery or Medicine/Chief of Staff at each hospital and to the Medical Director of the YNHHVC, Henry Cabin, M.D., and Surgical Director of the YNHVC, David Yuh, M.D.

VIII. **Branding/Marketing/Communications**

Stamford and Greenwich physicians who maintain voluntary or full-time faculty Yale appointment may reflect such in their practice profiles and on the Stamford and Greenwich website for physician search.

Recognizing that there will not be a discrete practice site of the Yale-New Haven Heart and Vascular Center with respect to the inpatient programs, Greenwich Hospital will represent

these services as the Yale-New Haven Heart and Vascular Center within the Hospital on its website, service line stationary and in community publications. Media advertising will require YNHH approval. Given the more limited direct clinical service provided by YNHHVC at Stamford Hospital this relationship will be initially described as a Stamford program affiliated with Yale-New Haven Heart and Vascular Center Any use of the brand will require YNHH approval. The parties will mutually decide if the branding relationship should be changed in the future.

A joint press release will be issued after formal agreement and any physician appointments. CME events will be organized for primary care physicians and other members of the Stamford and Greenwich medical staff. Participating physicians will support other Stamford and Greenwich community educational activities.

IX. Hospital and Program Staff Relationships

YNHHVC will assign an administrative officer to Stamford Hospital and Greenwich Hospital with matrix management responsibility for general management staff training, QA/PI programs and other YNHHVC duties under this agreement. Stamford and Greenwich will also designate an administrator responsible for local program development and operations. However, all on-site hospital staff responsible for the proposed services will be Stamford or Greenwich employees.

New clinical hospital staff will receive in-service training in the OR or Cath Lab YNHH. All employees will participate in periodic conference conducted by the Medical Directors and other YNHHVC specialists.

- All technical and nursing staff from the Stamford and Greenwich Hospital's OR and cardiac catheterization laboratories will participate in a mandatory education program consisting of didactic, one on one observational and hands on training. Training will include:
  - CT operating room equipment and procedures
  - Pump team training
  - Angioplasty equipment (guide catheters, guide wires and angioplasty catheters including balloons and stents)
  - Commonly used drugs
  - Assessment and monitoring of anticoagulation
  - Use of intra-aortic balloon pump equipment
  - Patient transfer
  - Items related to patient care before, during and after the procedure
- Hospital staff will also rotate through the YNHH OR and cardiac catheterization laboratory and shadow experiences in the CTICU, CCU and general floor units
- YNHHVC policies, protocols and procedures will be adopted by Stamford and Greenwich for program development, care management and staff training.

X. QA/PI Programs and Decision Support Tools

- The local cath lab conference will provide the foundation for full integration into the YNHHVC quality and safety improvement activities including monthly morbidity and mortality (M&M) conferences and quality indicator monitoring.

- Participation in YNHVC Surgical M&M and Heart Failure video conference will also be facilitated.

- Stamford and Greenwich will participate in the ACC benchmarking registry and Door to Balloon (D2B) benchmarking.

- Utilization and outcomes will be tracked by YNH Heart and Vascular Center and the Yale-New Haven Hospital Center for Outcomes Research and Evaluation (CORE) and provided to Stamford and Greenwich on a quarterly basis for ongoing quality improvement.

- Stamford and Greenwich may also participate in jointly approved state and national benchmarking projects.

- YNHH has piloted a patient consent tool that specifies risks of bleeding and other complications for use by Stamford and Greenwich nurses and the interventional attendings.

- IT interfaces will be enhanced, where feasible at Stamford. Greenwich Hospital will experience complete IT integration through Epic.

XI. **Fees**

An annual management fee of $250,000 will be paid by Stamford to YNHH for professional, management, training and QA/PI services described herein for which can be amended as additional programs are introduced. The management fee will include the achievement of quality indicators..

A more efficient coverage system may enhance the financial benefits of the programs. A review of service schedules and volume projections will be required to further this analysis.

XII. **Term and Amendments**

Stamford Hospital and Greenwich Hospital will agree to an exclusive arrangement with YNHH during the term of the agreement. A legally appropriate agreement will be developed with an initial five year term, with five year renewals. .

If this relationship becomes financially or clinically unstable or is in conflict with new regulations, the Participants agree to modify the agreement. Any unwind must minimize impact on care in the greater Stamford and Greenwich communities.

Additional services will be added after joint review of programmatic and financial feasibility. Most of the proposed services offering elements should not require a CON.

Draft June 19, 2012

YALE NEW HAVEN HEALTH

Stamford Hospital
30 Shelburne Road
Stamford, CT 06904
Attention: [_____]

Re: ***Letter of Intent Regarding Proposed Affiliation with Greenwich Hospital, Yale-New Haven Hospital and Yale University relating to Interventional Cardiology Services***

Dear [_____]:

Yale-New Haven Hospital ("***YNHH***") and Yale University, acting through its School of Medicine ("***Yale***") have long collaborated on various patient-care services, including cardiology services. Together, YNHH and Yale have established and supported the Yale-New Haven Heart and Vascular Center ("***YNHHVC***"), renowned for providing comprehensive cardiac and vascular care, including cardiac catheterization, emergency and elective angioplasty and open-heart surgery.

Greenwich Hospital has been affiliated with Yale-New Haven Hospital and the Yale New Haven Health System since 1996. Through this affiliation, Greenwich Hospital, YNHH and Yale collaborated to obtain regulatory approvals for Greenwich Hospital to provide, in addition to diagnostic cardiac catheterization services, primary angioplasty services for acute myocardial infarction ("***PAMI***") patients presenting with ST-segment elevation and left bundle branch blockage, with professional interventional cardiology services provided by Yale physicians (the "***Greenwich PAMI Program***"). Regulatory approval is currently being sought to expand this program to include elective angioplasty ("***Elective PCI***") services without open-heart surgery back-up.

Stamford Hospital currently provides a range of cardiovascular services, including PAMI, Elective PCI and open-heart surgery. A relationship with a quaternary center such as YNHH for surgical program support and consultation may strengthen Stamford Hospital's position and relationships with Greenwich Hospital cardiologists.

Each of YNHH, Yale, Greenwich Hospital and Stamford Hospital (each, a "***Party***" and, collectively, the "***Parties***") desire to enter into this letter of intent (this "***Letter of Intent***") to confirm their intent to collaborate to establish a cost-effective care model for heart and vascular patients that utilizes the most appropriate location to provide convenient patient access to safe, high quality care (the "***Collaboration***"). The Parties agree that the goal of the Collaboration is to ensure that patients can be cared for in the community when appropriate, but also have access to tertiary and quaternary care when medically required.

It is expressly understood and agreed that this Letter of Intent is only binding with respect to Section 2, Section 3 and Section 4. Any Party may, for whatever reason, terminate this Letter of Intent and further negotiations by written notice to the other Parties. In such event, there shall be no liability among the Parties hereto as a result of the execution of this Letter of Intent, any action taken in reliance on this Letter of Intent, or such termination, except as set forth in Section 2, Section 3 or Section 4.

1. Terms of Collaboration. Based upon the dialogue to date, attached as Exhibit A sets out the proposed principal terms of the Collaboration. During the Exclusivity Period (as defined below), the Parties will exercise good faith and use their reasonable efforts to negotiate and agree upon the terms and usual and customary covenants, conditions, indemnities, representations and warranties of the definitive agreements related to the Collaboration, all of which are to be generally consistent with the provisions of the Term Sheet. The parties acknowledge and agree that execution of any definitive agreements and consummation of the Collaboration may be subject to the approval of relevant government authorities, including the Office of Health Care Access, and agree to support each other's efforts in obtaining any such approvals.

2. Exclusivity. Each Party understands and agrees that it is a significant premise of its participation hereunder and agreement hereto that this Letter of Intent be exclusive as to the subject matter set forth above. Therefore, each Party agrees that for a period of **[six (6) months]** following the date hereof it will not (a) enter into any agreement (b) carry on or continue any discussions of any kind with a third party or (c) enter into negotiations concerning the subject matter of this Letter of Intent, and specifically, any affiliation relating to interventional cardiology or CT Surgery services in Fairfield County. Notwithstanding anything herein to the contrary, nothing in this Letter of Intent shall limit or restrict YNHH and Greenwich Hospital from collaborating to provide any services, including interventional cardiology services at facilities affiliated with the Yale New Haven Health System.

3. Confidentiality. In furtherance of the negotiations contemplated by this Letter of Intent, the Parties may request of each other certain information, some of which may be confidential. As a condition to, and in consideration for, each Party furnishing such information to the other Parties, each Party hereby agrees to treat the information furnished by the other Parties in accordance with the provisions of this Letter of Intent and to take or refrain from taking certain other actions as set forth herein.

For purposes of this Letter of Intent, the term "***Confidential Information***" means all information in whatever form furnished to any Party by or on behalf of any other Party, together with any other information concerning such other Party which has already been furnished to the Party receiving such information; provided that it does not include information which the Party receiving such information can demonstrate (a) is generally available to or known by the public other than as a result of disclosure by such Party or (b) was obtained by the Party receiving such information from a source other than the Party furnishing such information, provided that such source is not bound by a duty of confidentiality to the Party furnishing such information or another person or entity with respect to such information.

Each Party shall use Confidential Information solely to evaluate and consider a possible transaction among the Parties. No Party shall use any such Confidential Information to compete with or adversely affect the business or operations of the Party furnishing such information or its affiliates or those doing business with them, including the other Parties. Each Party shall keep the Confidential Information of each other Party strictly confidential and, except as authorized in this Letter of Intent, will not disclose or distribute the Confidential Information of the any other Party to any person or entity without the prior written consent of the Party furnishing such information. Each Party may disclose Confidential Information of the other Parties to such of its directors, officers, employees and agents (the "***Representatives***") who need to have the Confidential Information to participate in or contribute to the proposed transaction, so long as those Representatives agree to be bound by this Letter of Intent, and then only to the extent necessary to their participation or contribution. Each Party shall be responsible for any breach of this Letter of Intent by its Representatives.

Except as and to the extent mutually agreed in accordance with Section 4 hereof, or as required by law, no Party shall, and each Party shall direct its Representatives not to, directly or indirectly, make any public comment, statement or communication with respect to, or otherwise disclose or permit the disclosure of the existence of, this Letter of Intent or any discussions regarding a possible transaction between the Parties or any of the terms, conditions or other aspects of such transactions.

Upon request by any Party at any time, the other Parties shall promptly return to the Party furnishing such information the original and all copies of all non-oral Confidential Information furnished by such Party. Each Party shall, upon request of any other Party, certify as to its compliance with the preceding sentence.

4. Publicity. As the Parties evaluate the Collaboration, they shall also consult as to the propriety and need, timing, form and substance of any press release or other public disclosure (including without limitation disclosure to government regulatory agencies, government officials and community groups) related to the Collaboration. No such disclosure shall be made without the mutual consent of the Parties.

This Letter of Intent may be executed in counterparts, each of which shall be deemed an original, but all of which taken together shall constitute one and the same instrument. Each Party acknowledges that in the event of the breach of this Letter of Intent by any Party, the non-breaching Parties shall be entitled to all remedies available at law or in equity for such breach.

* * *

If you are in agreement with the foregoing, please execute and return one copy of this Letter of Intent, whereupon each of the Parties shall be legally bound to the extent described herein under Connecticut law.

Sincerely,

YALE-NEW HAVEN HOSPITAL

ATTACHMENT II

Office of Health Care Access
Certificate of Need Application

Agreed Settlement

Hospital:	The Stamford Hospital and New York Presbyterian Healthcare System, Inc.
Docket Number:	04-30374-CON
Project Title:	Establish Elective Angioplasty and Open Heart Surgery Program at The Stamford Hospital
Statutory Reference:	Sections 19a-638 & 639, Connecticut General Statutes
Filing Date:	August 15, 2005
Hearing Dates:	Public Portion: September 22, 2005 Technical Portion: October 6, 2005 and October 27, 2005
Commissioner & Presiding Officer:	Cristine A. Vogel
Agreed Settlement Date:	January 4, 2006
Default Date:	Not Applicable
OHCA Staff	Steven W. Lazarus Michael Sabados

Project Description: The Stamford Hospital ("TSH" and "Hospital") and New York Presbyterian Healthcare System, Inc. ("Applicants") propose the establishment of an elective angioplasty ("PCI") and open-heart surgery ("OHS") program, to be located at the Hospital, at a capital expenditure of $5,404,425.

Nature of Proceedings: On August 15, 2005, the Office of Health Care Access ("OHCA") received the Applicants' Certificate of Need ("CON") application seeking authorization to establish an elective angioplasty and open-heart surgery program, to be located at the Hospital, at a capital expenditure of $5,404,425. The Stamford Hospital is organized under the laws of Connecticut, and New York Presbyterian Healthcare System, Inc. is a corporation organized under the laws of the State of New York. The Hospital is a health care facility or institution as defined by Section 19a-630 of the Connecticut General Statutes ("C.G.S.").

Public hearings regarding the CON Application were held on September 22, 2005, October 6, 2005 and October 27, 2005. The Hospital was notified of the date, time, and place of the hearings and notices to the public were published prior to the hearings in *The Advocate* (Stamford) by OHCA. The hearings were conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the Connecticut General Statutes) and Sections 19a-638 and 19a-639, C.G.S.

Yale-New Haven Hospital, Bridgeport Hospital, and Greenwich Hospital collectively known as Yale-New Haven Heart Health Institute were granted Intervenor status with rights to cross-examine. St. Vincent's Medical Center was granted Intervenor status with the rights to cross-examine.

The Presiding Officer heard testimony from the general public, legislators, local officials and witnesses for the Hospital and Intervenors. In rendering this decision, the presiding officer has considered the entire record of the proceeding. OHCA's authority to review, approve, modify or deny this proposal is established by Sections 19a-638 and 19a-639, C.G.S. The provisions of these sections, as well as the principles and guidelines set forth in Section 19a-637, C.G.S., were considered by OHCA in its review.

Findings of Fact

Clear Public Need
Impact on The Hospital's Current Utilization Statistics
Proposal's Contribution to Accessibility and Quality of Health Care Delivery in the Region

1. The Stamford Hospital ("TSH" and "Hospital") is a not-for-profit, 305-bed acute care hospital located in Stamford, Connecticut. TSH, as an affiliate member of the New York Presbyterian Healthcare System ("System"). TSH provides a comprehensive array of services including: Medicine, Surgery, Obstetrics/Gynecology, Psychiatry as well as Medical and Surgical critical care units. *(Completeness Responses, Proposed Resolution, August 15, 2005, Exhibit 3 and Certificate of Need Application, August 15, 2005, page 1-3)*

2. The New York Presbyterian Healthcare System, Inc ("NYPHS") coordinates a system of hospitals and other healthcare institutions throughout the tri-state area, including The Stamford Hospital ("TSH") and New-York Presbyterian Hospital ("NYPH"). NYPH operates New York-Presbyterian Hospital/Columbia University Medical Center ("NYP/C") in affiliation with Columbia University College of Physicians and Surgeons ("CU"). *(Certificate of Need Application, August 15, 2005, pages 2-3)*

3. TSH and NYPHS ("Applicants") propose the establishment of an elective percutaneous coronary angioplasty[a] ("PCI") and open-heart surgery[b] ("OHS") program, to be located at the Hospital. *(Certificate of Need Application, August 15, 2005, page 2)*

4. TSH's proposal is for a full-service cardiovascular services program in the lower Fairfield County. TSH is located in the region's largest population center. *(Prefiled Testimony of Brian Grissler, September 19, 2005,)*

---

[a] Elective (Scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

[b] Open-heart surgery is a surgical intervention performed on the opened heart while the bloodstream is diverted through a heart-lung machine. Cardiac Surgery includes Coronary Artery Bypass Graft (CABG), Valvuloplasty, and Valve Replacement. CABG is where a vein from the chest or leg, or a prosthesis, is grafted onto either side of a blockage in the coronary artery. This reroutes blood flow around the blockage to the heart muscle. Valvuloplasty is where a balloon tipped catheter is inserted into plaque-blocked heart valves to widen and separate them through repeated balloon inflation. A Valve Replacement is a replacement of plaque-blocked heart valves with prosthetic or tissue graft.

5. On August 25, 2004, TSH received CON authorization from OHCA to perform primary[c] PCI services. *(Certificate of Need Application, August 15, 2005, page 2)*

6. The proposed program will augment existing cardiovascular services at the Hospital. The Hospital currently offers:

Primary Angioplasty	Electrocardiogram
Interventional electrophysiology (ablations)	Electrophysiology
Diagnostic cardiac catheterization	Holter monitoring
Coronary care unit	Intra-aortic balloon pump
Telemetry inpatient care	Nuclear stress testing
Cardiac imaging	Pulmonary function testing
Cardiac rehabilitation	Stress testing
Cardiac ultrasound	Tilt table testing
Cardiopulmonary testing	Vascular and thoracic surgical services

(Certificate of Need Application, August 15, 2005, pages 8-9)

7. TSH's cardiology primary and secondary service areas consist of the following Connecticut towns:

Table 1: Stamford Hospital's Proposed Service Area for this Proposal for FYs 2002 – 2005 (1st Two Quarters)

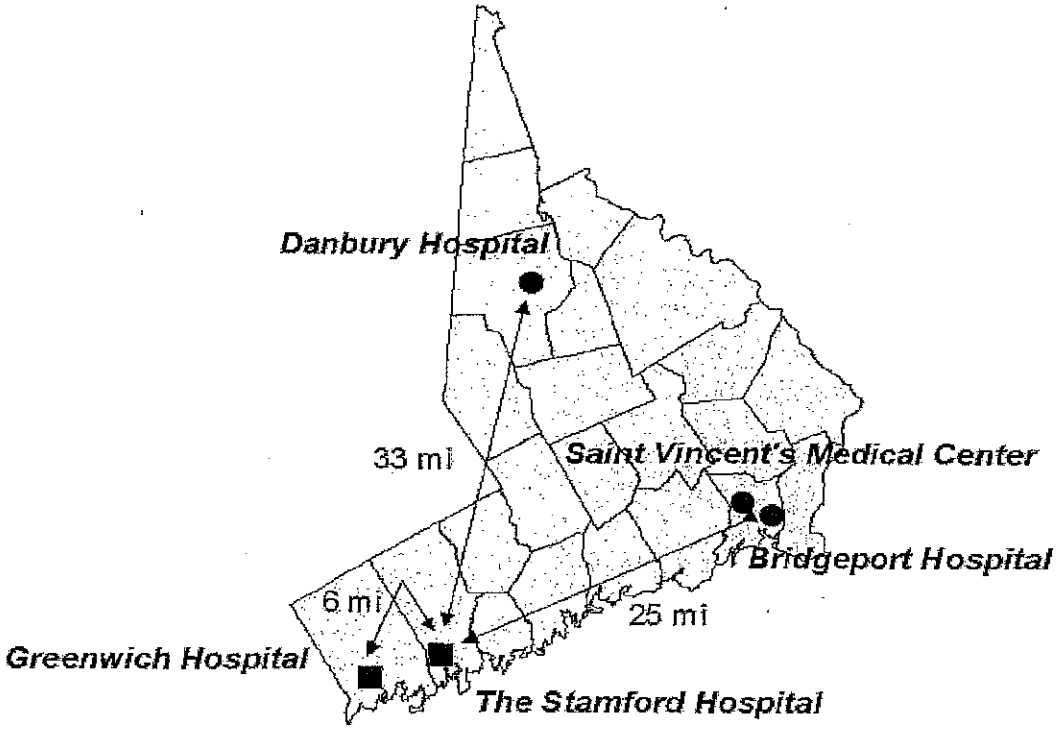
Towns	Primary	Secondary	Total Service Area
	Darien Stamford	Greenwich New Canaan Norwalk Weston Westport Wilton	Darien Greenwich New Canaan Norwalk Stamford Weston Westport Wilton
TSH's Share of Service Area's Inpatient Cardiac Catheterizations	57.4%	4.2%	26.1%
Service Area's share of TSH's Inpatient Cardiac Catheterizations	84.6%	8.7%	93.3%

(Source: Cardiac catheterization volume from *OHCA's Acute Care Hospital Inpatient Discharge Database. Service Area from Certificate of Need Application August 15, 2005, page 22)*

[c] Primary (Emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow. Non-ST Segment elevation MI (NSTEMI or high-risk) patients consist of 80% of all MIs and are considered for angioplasty on an elective basis within 72 hours. Performance of elective angioplasty without cardiac surgery back up is not recommended by the American College of Cardiology or the American Heart Association.

8. Providers of interventional cardiac services in the Hospital's total service area ("TSA") are as follows

Map 1: Area Providers of Interventional Cardiac Services



Danbury Hospital began performing open heart surgery in January 2005.
Greenwich Hospital began performing Primary PCI in February 2005.
Stamford Hospital began performing Primary PCI in August 2005.

(Connecticut Acute Care Hospital Inpatient Discharge Database and Travel Distances from Yahoo Maps)

9. The Applicants based the need for the proposed Elective PCI and OHS program on the following:
   - Improved accessibility for patients;
   - Improved continuity of care;
   - Historical/Existing cardiac volume;
   - Adopting a standard of care that exists in the other large urban area; and
   - Improved quality of cardiac services.

   (Certificate of Need Application, August 15, 2005, pages 2-55)

10. TSH stated that the establishment of a full-service cardiac program in Stamford will provide timely access and local availability of these services in keeping with trends that have been already established nationally.
    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

11. TSH's cardiac catheterization volume for FYs 2000 through 2005 are as follows:

Table 2: TSH's Historical Cardiac Catheterization Volume, FYs 2002 – 2005 1st Two Quarters

CT Service Area	2002	2003	2004	2005
Inpatient	354	352	296	147
Outpatient	321	283	332	-
Total	**675**	**635**	**628**	**147**

(Inpatient catheterization figures from OHCA's Acute Care Hospital Inpatient Discharge Database and outpatient volume from August 15, 2005, Responses to OHCA Completeness Letter, pages 1-2)

12. The following is a table of the average annual historical and projected Total PCI volumes (Primary & Elective) in TSH's service area:

Table 3: Average Annual Historical and Projected Total PCI Volumes in TSH's Service Area, FYs 2002 – 2005

	FYs 2002–2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average PCIs**	**Adult Use Rate**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**
Primary	277	2.55	78%	216	83.5%	231	83.4%	231
Secondary	418	2.48	6.8%	28	11.0%	46	20.3%	85
Total Service Area	695	2.51	36.3%	244	40.6%	276	45.7%	316
Connecticut	**8,024**	**2.98**	-	-	-	-	-	-

Note: "Adult" refers to those 15 years and older. Adult use rate per 1,000 population.
Projected PCI volumes were calculated by applying the applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 277 (average volume) * .78 (market share) = 216 PCIs.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures, and August 15, 2005 CON Application, *pages 45& 23)*

13. The following table is the annual average historical and projected OHS for TSH in the proposed service area for FYs 2002-2005:

Table 4: Historical and Projected, Average Annual OHS Volumes in TSH's Service Area, FYs 2002–2005

	FYs 2000 – 2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average OHS**	**Adult Use Rate**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**
Primary	112	1.03	78.1%	88	83.5%	94	83.5%	94
Secondary	213	1.27	6.7%	14	10.9%	23	20.3%	43
Total Service Area	325	1.17	32.9%	102	38.8%	117	45.7%	137
Connecticut	**4,640**	**1.72**	-	-	-	-	-	-

Note: FY 2005 is First two quarters only.
"Adult" refers to those 15 years and older. Adult use rate per 1,000 population
Projected OHS volumes were calculated by applying the Applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 112 (average volume) * .781 (market share) = 88 open-heart surgeries.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures; and August 15, 2005, CON Application, pages 46&23).

14. TSH projects the following number of elective PCIs procedures and OHS for its service area.

Table 5: Projected Cardiac Volume for TSH's Service Area

Service	FY 2007	FY 2008	FY 2009
Angioplasties (Elective only)	193	324	417
Open-heart surgeries	86	150	197

Note: TSH based the projected volumes on historical utilization and population data. The use-rates utilized are based on Claritas data. OHCA can not verify any of the above claimed data. *(Responses to the Interrogatories, September 28, 2005, Updated Financial Attachment and CON Application)*

15. The 2001 American College of Cardiology ("ACC") and the American Heart Association ("AHA") Guidelines for Percutaneous Coronary Intervention ("PCI") recommend that PCI be performed by higher volume operators (>75 cases/year) with advanced technical skills (e.g. subspecialty certification) at institutions with fully equipped interventional laboratories and experienced support staff. This setting will most often be in a high-volume center (>400 cases/year) associated with an on-site cardiovascular surgical program. Therefore, PCI is best done by high-volume operators in high-volume institutions. *(JACC, 2001, Vol. 37, No.8, page 2239)*

16. The ACC/AHA Guidelines for CABG Surgery (1999) state the following:
    - Studies suggest that survival after CABG is negatively affected when carried out in institutions that perform fewer than a threshold number of cases annually. Similar conclusions have been drawn regarding individual surgeon volumes.
    - The ACC/AHA are supportive of a posture of close monitoring of institutions or individuals that perform <100 cases annually.

17. TSH states that it will utilize the existing guidelines published by the ACC and AHA as a basis for the development of standards for the proposed services, as specified in **Attachment I.** *(Certificate of Need Application, August 15, 2005, page 11)*

18. The Guidelines for Standards in Cardiac Surgery by the Advisory Council for Cardiothoracic Surgery ("ACCS") and the American College of Surgeons ("ACS") (1996) state the following:
    - An annual volume of at least 100 to 125 open-heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume.
    - At least 200 procedures per year as previously recommended in the 1975 report of the Inter-Society Commission on Heart Disease Resources are necessary in order for a program to function efficiently.
    - A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the operating room.

19. Dr. Steven F. Horowitz testified to the following at the public hearing:
    - TSH can sustain a full-service cardiac program due to the increase in the size of the minority population.
    - Numerous studies have confirmed that the cardiovascular risk profile for both Hispanics and African Americans has been worsening in recent years as obesity and diabetes continue to rise exponentially within these populations.
      (Prefiled Testimony of Steven F. Horowitz, M.D. Chief of Cardiology at TSH, September 19, 2005)

20. Kathleen Silard testified to the following at the public hearing:
    - TSH has examined the significant disparity in utilization rates for PCI and OHS that exists for African Americans in TSH service area as well as other regions of the state when compared to the Caucasian population. TSH has seen how some of the major precursors of heart disease, such as diabetes and obesity, can disproportionately effect minority populations as well as the economically disadvantaged.
    - One of the primary goals of TSH's proposed program will be to address and hopefully eradicate some of those disparities by improving access to PCI and OHS to these high-risk groups.
      (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

21. The demographic characteristics by Race for TSH's TSA are as follows:

Table 6: TSH Demographics by Race

Service Area	Caucasian	African American	Native American	Asian	Other	Total
Primary	73.6%	13.2%	0.2%	4.6%	8.4%	100%
Secondary	85.7%	6.6%	0.1%	3.5%	4.1%	100%
Total Service Area	81.0%	9.2%	0.2%	3.9%	5.7	100%
Connecticut	81.6%	9.1%	0.3%	2.4%	6.6%	100%

Source: Census 2000.

22. The demographic characteristics by Hispanic ethnicity for the proposed TSA:

Table 7: Hispanic Ethnicity of TSH Service Areas

Service Area	Hispanic or Latino	Non-Hispanic	Total
Primary	14.7%	85.3%	**100%**
Secondary	8.4%	91.6%	**100%**
Total Service Area	10.8%	89.2%	**100%**
Connecticut	**9.4%**	**90.6%**	**100%**

Source: Census 2000.

23. The AMI discharges for the TSH TSA are as follows:

Table 8: Share of AMI by Race and Hispanic Ethnicity, FYs 2002 – 2005 (First 2 Quarters)

Service Area	Caucasian	African American	Hispanic	Asian	Native American	Other	Total
Primary	84.7%	7.0%	4.2%	0.1%	0.0%	4.0%	**100%**
Secondary	85.1%	7.1%	3.4%	1.0%	0.1%	3.3%	**100%**
Total Service Area	84.9%	7.0%	3.7%	0.6%	0.1%	3.6%	**100%**
Connecticut	**87.1%**	**4.7%**	**4.0%**	**0.3%**	**0.1%**	**3.8%**	**100%**

(Discharges from OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases. "White," "Black," "Asian," "Native American," and "Other" are non-Hispanic categories.)

24. NYPH has one of the largest cardiac surgery and cardiac catheterization[d] programs in New York State with its physicians performing over 3,000 PCIs and close to 2,000 OHS in calendar year 2004. *(Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)*

[d] Diagnostic Cardiac Catheterization is a diagnostic procedure in which a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to the heart to measure electrical activity, blood pressure, and locate blockages.

25. Dr. Steven Horowitz, testified on behalf of TSH to the following:
    - Diabetes is a leading cause of hospitalization among Connecticut's African American and Hispanic populations which are 3.8 and 2.2 times more likely to be hospitalized directly due to the disease as compared to the Caucasian Connecticut residents.
    - The percent difference for the African American utilization rates in the TSH's TSA versus those statewide is nearly 26% and 62% for PCI and cardiac surgery respectively. The same numbers skyrocket to 41% and 95% when the focus is placed solely on the City of Stamford.
    - TSH can target the African American and Hispanic population and relieve some of these barriers to access through the comprehensive preventive and medical outreach program.

    (Prefiled Testimony of Steven F. Horowitz, M.D., Chief of Cardiology Department at TSH, September 19, 2005)

26. Dr. Arthur Klein testified to the following at the public hearing:
    - NYPH and NYPHS have developed a number of strong and effective partnerships with affiliated hospitals to elevate the scope of and quality of cardiac care in the tri-state region.
    - NYPHS assists in the operation of nine (9) diagnostic cardiac catheterization programs through out the tri-state area, four elective angioplasty programs and one primary angioplasty program.
    - In this proposal, the cardiac surgery professional services will be provided exclusively by full-time faculty of the Division of Cardiothoracic Surgery, Department of Surgery of Columbia College of Physicians and Surgeons.
    - Oversight of elective angioplasty shall be through a joint committee co-chaired by Drs. Moses and Stone, senior faculty from Columbia University's Division of Cardiology and Stamford Hospital's cardiology leadership.

    (Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)

27. Dr. Eric A. Rose testified at the public hearing that Columbia University Department of Surgery's professional expertise in cardiothoracic research, its strategic network of partnerships and its vast clinical experience will help support TSH in their cardiac health services. *(Prefiled Testimony of Eric A. Rose, M.D., Chairman for the Dept. of Surgery at NYP/C, September 19, 2005)*

28. TSH submitted a signed Draft Agreement with NYPHS. NYPHS' role is defined as follows:
    - Arrange consultative assistance to the Hospital in the following areas:
        - Preparation of the CON Application;
        - Clinical training of nursing and technical staff;
        - Development of the Hospital's standards of care, risk stratification criteria and operational policies;
        - Development of clinical guidelines and protocols;
        - Collection and analysis of quality data for clinical outcomes and performance monitoring;
        - Recruiting procedures; and

- Adoption by the Hospital of policies, procedures and protocols, including developing practice guidelines and requirements related to the proposed program.

- Recommend CPC standards and/or the standards of NYPHS-affiliated Connecticut institutions for physician, nursing and technical staff protocols to foster a high-quality credentialing program; and
- Advise the Hospital with respect to quality assurance and utilization management functions related to the proposed program.

(Completeness Responses, August 15, 2005, Draft Agreement between the Applicants, Exhibit 4, page 4)

29. TSH proposes to provide elective PCI utilizing five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. *(Certificate of Need Application, August 15, 2005, page 11)*

30. The PCI volumes for the proposed interventionalists for FYs 2002-2005 1st two quarters are as follows:

Table 9: Volume of Proposed Program Interventionalists (FYs 2002 – FY 2005 1st Two Quarters)

Physician	Hospital Affiliation	Office/Home	Average Annual PTCA Volume
Alcan[1]	St. Vincent's & TSH	Norwalk	347
Jumper[2]	St. Vincent's & TSH	Valhalla, NY	119[3]
Charney	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Messinger	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Stone	NY Presbyterian, TSH (pending)	Greenwich	-

[1]Member of Cardiology Associates of Fairfield County
[2]In training
[3]Dr. Jumper performed 57 in FY 2004 and 122 in the first two quarters of FY 2005.
[4] TSH reported volume (FYs 2003 & 2004 – NYP physicians not specifically identified)
Physician C: 156 & 145 and Physician D: 108 & 126
(OHCA Acute Care Hospital Inpatient Discharge Database and CON Application, August 15, 2005, page 11&58 and Completeness Responses, August 15, 2005, page 8)

31. TSH stated that three additional cardiac interventionalists, Drs. Portnay, Lorenz and Corvaja will be added to the proposed program to perform PCIs at TSH. *(CON Application, August 15, 2005, pages 11&58 and Completeness Responses, August 15, 2005, page 8)*

32. TSH proposes to staff the proposed OHS program with two (2) board-certified cardiac surgeons, who will practice full-time at TSH and be credentialed at both TSH and at NYP/C. These two surgeons will be recruited through the formation of a three (3) person committee which will include as its members, Dr. Craig Smith, Dr. Mehmet Oz and Dr. Eric Rose, Chair of the Surgery Department at NYP/C. *(Certificate of Need Application, August 15, 2005, page 11)*

33. The average annual PCI and OHS volumes in TSH's TSA by hospital provider for FYs 2000-2005 (1st two quarters) are as follows:

Table 10: Average Annual PCI and Open-Heart Surgery Volumes by Provider in TSH's TSA by Provider, (FYs 2002 – 2005 1st Two Quarters)

	PCIs			Open-Heart Surgeries		
Hospital	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)

Totals	**695**	**100%**	-	**325**	**100%**	-

*Greenwich Hospital began providing primary PCI in February 2005.
(OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases)

34. Danbury Hospital, along with Waterbury Hospital and St. Mary's Hospital (one program, two sites in Waterbury) were authorized by OHCA to offer full-service cardiac programs in 2003. *(Certificate of Need Applications, Final Decision Docket Numbers 03-30167 & 03-30143, both dated July 23, 2005)*

35. St. Vincent's Medical Center ("SVMC") testified to the following:
    a. Angioplasty volume is flat nationally and has begun to decline in Connecticut.
    b. If TSH proposal is approved, St. Vincent's Medical Center would not be able to achieve both institutional and surgeon specific minimum volumes for OHS and would put the quality of St. Vincent's Medical Center at significant risk.
    c. SVMC performed 1,097 PCIs and 283 OHS in FY 2005.
    d. The overall risk adjusted mortality rate at SVMC is 1.3%.
    e. Other than volume, SVMC measures quality through independent third party companies (to whom they report data to).
    (Prefiled Testimony of Jose Missri, M.D. St. Vincent's Medical Center, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

36. Bridgeport Hospital ("BH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. BH performed under 1,200 PCIs and under 250 OHS in FY 2005.
    b. BH could not specify their overall risk adjusted mortality rate, BH simply stated that it was under 2.0%.
    c. Other than volume, BH measures quality through independent third party companies (to whom they report data to).

d. If the proposed CON was to be approved, this would not impact the physician coverage at BH.
(Prefiled Testimony of Stuart .Zarich, M.D., Bridgeport Hospital, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

37. Yale-New Haven Hospital ("YNHH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. There is a statewide decline in the number of OHS cases,
    b. There is a flattening of PCI volumes,
    c. Proliferation of full-service cardiac program will place additional stress on the state's staffing infrastructure,
    d. Additional cardiac programs will not improve mortality rates,
    e. The residents of Fairfield County have a wide range of options for their full-service cardiac care needs,
    f. There is a direct correlation between physician and institutional case volumes and quality outcomes, and
    g. In FY 2004, YNHH had 64 PCI discharges (4.3% of YNHH's total PCI) and 52 OHS discharges (6.2% of YNHH's total OHS) from the Stamford service area.
    (Prefiled Testimony of Kyle Kramer, Executive Director of the Yale-New Haven Health Heart Institute, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

38. In order to implement the proposed project, TSH will require a series of facility renovations. The renovations will include an expansion of surgical facilities on Level 2 of TSH's North building to allow for the creation of two new, state-of–the-art operating rooms that will be the primary operating suites for the proposed program as well as enlarged perioperative and other surgical support areas.
(Certificate of Need Application, August 15, 2005, page 13)

Financial Feasibility of the Proposal and its Impact on the Hospital's Rates and Financial Condition

Impact of the Proposal on the Interests of Consumers and Payers of Health Care Services

Consideration of Other Section 19a-637, C.G.S. Principles and Guidelines

39. The proposal has a total expenditure cost of $5,404,425 which consists of the following:

Table 11: Total Capital Expenditure

Description	Cost
Medical Equipment	3,109,345
Construction/Renovation	1,590,065
Project Contingency	704,925
Total Capital Expenditure	**$5,404,425**

(Certificate of Need, August 15, 2005, page 63)

40. The proposal will be financed from the TSH's equity through operations. *(Certificate of Need, August 15, 2005, page 64)*

41. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program. This arrangement will be finalized if the proposal is approved by OHCA. *(Arthur S. Klein, Chief Operating Officer of NYPHS, Public Hearing Testimony, October 6&27, 2005)*

42. TSH projects incremental to the project losses from operations for the first two years of operation for FYs 2007 and 2008 of ($1,940,000) and ($294,000), respectively. This is due to program start up. However, TSH is projecting incremental gains from operation of $1,082,000 for the third year of operation, FY 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

43. TSH is projecting a gain from operations with the CON project of $10,137,000, $12,327,000 and $14,365,000, for FYs 2007, 2008 and 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

44. TSH proposes to hire 26, 34 and 38 Full Time Equivalent employees for FYs 2007, 2008 and 2009, respectively. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

45. There is no State Health Plan in existence at this time. *(Certificate of Need Application, August 15, 2005, page 14)*

46. TSH has adduced evidence that this proposal is consistent with TSH's long-range plan. *(Certificate of Need Application, August 15, 2005, page 14)*

47. TSH has improved productivity and contained costs by participating in group purchasing, energy conservation, reengineering and through application of technology. *(Certificate of Need Application, August 15, 2005, page 59)*

48. TSH stated that this proposal will help enhance the existing academic affiliation with Columbia University College of Physicians and Surgeons. *(Certificate of Need Application, August 15, 2005, pages 59&60)*

49. TSH stated that the patient physician mix of TSH is unique as the cardiac patient care is fully integrated across all medical disciplines and is managed through a state-of-the-art multi-modality data management system. *(Certificate of Need Application, August 15, 2005, page 60)*

50. TSH's rates are sufficient to cover the proposed capital expenditure and operating costs associated with this proposal. *(Responses to Interrogatories, September 28, 2005, Updated Financial Attachment)*

Rationale

The Office of Health Care Access ("OHCA") approaches community and regional need for proposed services on a case-by-case basis. Certificate of Need ("CON") applications for cardiac services do not lend themselves to general applicability due to the variety and complexity of factors, which may affect any given proposal; e.g., the characteristics of the population to be served, the nature of the existing services, the specific services proposed to be offered, the current utilization of services, and the financial feasibility of the proposed service. In considering this application, OHCA determined that TSH's current cardiac utilization, population served, quality of providers and physicians and geographic accessibility were significant factors in determining need.

The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (collectively known as "Applicants"), propose to expand the cardiac services delivered at TSH to include elective angioplasty services and open heart surgery. The Applicants based the need for the elective PCI and open heart surgery programs on improved accessibility for patients, improved continuity of care, historical and existing cardiac volume, adopting a standard of care that exists in the other large urban areas and improved quality of care.

TSH's primary and secondary service area ("TSA") consists of eight (8) towns. There are no providers of elective PCI or OHS in TSH's TSA. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population when compared to the rest of the state overall. The primary service area has experienced higher adult per capita rates of AMI discharges for African American and Hispanic as compared to the state as a whole. In addition, there appears to be a disparity in the utilization rates for PCI and OHS for Hispanics and African Americans in the service area when compared to the Caucasian population. This proposed cardiac program will enhance the access for the African American and Hispanic population in TSH's TSA. OHCA concludes that the Applicants proposal will provide the residents of lower Fairfield County with improved access to the full continuum of cardiac care.

TSH's historical cardiac catheterizations volumes for FYs 2002, 2003, 2004, and 2005 (1st 2 quarters) were 675, 635, 628 and 147, respectively. OHCA determined that TSH could potentially perform a minimum of 244 annual total PCIs (primary & elective) and 102 OHS cases on residents of TSH's TSA in the first full year of operation of the proposal based upon historical catheterization volume and its market share. This volume increases to 276 total PCI procedures and 117 OHS cases for the second year of operation, and 316 total PCI procedures and 137 OHS cases for the third of operation. Based on historical inpatient diagnostic cardiac catheterization volume and market share, the proposed full-service cardiac program at TSH would exceed institutional minimum volumes recommended by the ACC/AHA for PCI (200) and the American College of Surgeons–Advisory Council for Cardiothoracic Surgery for open-heart surgery (100–125 surgeries per year).

The proposal involves offering of elective Percutaneous Coronary Intervention ("PCI") through the use of five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. TSH also proposes to provide OHS utilizing two (2) surgeons will be recruited from outside of Connecticut, through the formation of a three (3) person committee comprised of TSH and Columbia physicians. Therefore this program will not impact coverage at any of the existing cardiac programs in Connecticut. In addition, OHCA concludes that even though the PCI and OHS volumes may decline at the existing providers, the PCI and OHS volumes will not fall below the institutional minimum volumes recommended by ACC/AHA for PCI and American College of Surgeons-Advisory Council for Cardiothoracic Surgery for OHS.

TSH's proposal will increase the availability of quality PCI and OHS services for residents of TSH's TSA. The proposed elective PCI and OHS program will be developed in collaboration with NYPHS. NYPHS will provide or arrange for TSH consulting in the areas of clinical training for staff, development of TSH's standards of care, development of clinical guidelines, collection and analysis of data and recruiting procedures. NYPHS expects the initial training to continue over an eighteen month period. NYPHS will also advise TSH with respect to quality assurances and utilization management and provide assistance to TSH concerning the adoption of policies, procedures and protocols, including developing practice guidelines and program requirements. This proposal will improve the quality of care and continuity of TSH's cardiac services.

Finally, the CON proposal is financially feasible. The proposal has a total capital expenditure of $5,404,425, which consists $3,109,345 for medical equipment, $1,590,065 for construction/renovations and $704,925 for contingency costs. TSH proposes to fund the proposed total capital expenditure through TSH's equity, specifically through operations. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program; however, the details have not yet been finalized. TSH projects incremental losses from project operations for the first two years of operation of ($1,940,000), and ($294,000), respectively. However, TSH is projecting an incremental gain from operation of $1,082,000 by the third year of operation. Further, TSH is projecting gains from total Hospital operations with the CON project of $10,137,000, $12,327,000 and $14,365,000 for the first three years of operations. The projected utilization and financials of this proposal appear to be reasonable, financially feasible and cost-effective and will not adversely impact the interests of consumers and payers of such services.

TSH's proposed elective angioplasty and open heart surgery program is differentiated from other cardiac-related proposals in the following ways. TSH currently operates a high volume diagnostic cardiac catheterization program and recently initiated a primary angioplasty program. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population than the rest of the state. The implementation of the proposed program should address some of the disparities in utilization of cardiac services by this population. Additionally, the proposed program is not expected to impact the physician coverage at any of the existing cardiac programs in Connecticut because the interventionalists are already on staff at TSH and the cardiac surgeons will be

recruited from out of state. TSH's strong collaborative relationship with the NYPHS will enhance the accessibility of high quality, community-based medical services offered by TSH. TSH will utilize the resources of NYPHS to further enhance provision of quality care including access to the expertise, information, and consultative support of a nationally recognized academic healthcare center renowned for the diagnosis and treatment of cardiac disease. Finally, implementation of TSH's proposal will bring appropriate access to high quality cardiac services to the residents of the proposal's TSA. In summary, the proposal will result in enhanced cardiac services in the Stamford region.

Order

NOW, THEREFORE, the Office of Health Care Access ("OHCA") and The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (together referred to as "Applicants") hereby stipulate and agree to the terms of settlement with respect to the Applicants' request to establish elective angioplasty and open heart surgery program to be located at Stamford Hospital at a total capital expenditure of $5,404,425, as follows:

1. The Applicants' request for a CON to establish an elective angioplasty and open-heart surgery program to be located at TSH, a total capital expenditure of $5,404,425, is hereby approved.

2. TSH shall only commence operation of the OHS program at The Stamford Hospital initially. Once the number of OHS procedures exceeds 125, the Hospital may commence operation of the elective angioplasty program. Prior to commencement of the angioplasty services, TSH is required to provide OHCA evidence that it has performed the required 125 OHS.

3. TSH will have at least two cardiac surgeons as part of this proposal, who are in the process of being recruited and shall be identified prior to the beginning of the OHS program. The surgeons must be fully credentialed and have the following qualifications:
   - Board-Certified in cardiac surgery
   - Maintains a Connecticut license and admitting privileges at the Hospital
   - Has performed OHS procedures at a cardiac surgical center that meets or exceeds the annual ACCS/ACS minimum institutional volume standard for cardiac surgery for the past 2 years
   - TSH shall provide the Curriculum Vitae ("CV") of the cardiac surgeons prior to commencement of the OHS program. TSH shall demonstrate that the cardiac surgeons satisfy all requirements specified above. The OHS program shall not commence operation until OHCA acknowledges receipt of the CV and that it complies with this Order.

4. TSH shall provide the CVs of each of the cardiac operating room nurses, Board-certified cardiac anesthesiologists, intensivists and perfusionists for the authorized OHS program prior to commencement of the OHS program. Fifty percent (50%) of each of the core OR staff mentioned above must be trained in OHS prior to commencement of the OHS program. The OHS program shall not commence operation until OHCA acknowledges receipt of the CVs and that they comply with this Order.

5. TSH shall not exceed the approved total capital expenditure of $5,404,425. In the event TSH learns of potential cost increases or expects final project costs will exceed those approved, the Hospital shall file with OHCA a request for approval of

the revised CON project budget. The source of funding for the project will be The Stamford Hospital's operations and owner equity.

6. TSH shall complete and submit to OHCA on a quarterly basis the data elements in the Connecticut Cardiac Data Registry (**Attachment II**). Data should be submitted to OHCA on a computer disk in either an excel workbook or comma-delimited text file in a format specified by OHCA. The most current version of the Connecticut Cardiac Data Registry includes, but may not be limited to, the elements listed in **Attachment II**. Data must be reported to OHCA thirty (30) calendar days following the end of the quarter. Fiscal Year quarters end December 31st, March 31st, June 30th, and September 30th. Upon receipt, OHCA will check the data's conformance to the required specifications and within ten (10) business days notify TSH in writing of its evaluation. If OHCA finds questionable material, TSH will have fifteen (15) business days from notification by OHCA to submit a revised dataset for evaluation. All patient-level data submitted to OHCA to satisfy this requirement will be subject to the laws and regulations of the state of Connecticut and the Office of Health Care Access regarding its collection, use and confidentiality. If TSH does not submit the data elements in the Connecticut Cardiac Data Registry on a quarterly basis, the programs may be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the programs.

7. TSH shall submit on an annual basis to OHCA the following reports which must be reported to OHCA thirty (30) calendar days following the end the year, for the first three (3) years of operation:
   a. A report of all elective PCIs and OHS performed each year by ethnicity and race, in a format to be specified.
   b. A report which illustrates that this CON proposal helped relieve the barriers to access through comprehensive preventive and medical out-reach programs for the African American and Hispanic population within TSH's TSA.

8. If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. If these volumes are not met for a period of two consecutive 12-month periods, TSH's OHS program shall be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the OHS program.

9. If TSH does not perform 200 elective PCIs within twelve months of the initiation of the PCI program, TSH shall submit monthly reports of elective PCIs arrayed by physician to OHCA until such time as these volumes are met by TSH.

10. TSH shall participate in the Society of Thoracic Surgeons Database (STS-DB) database and the ACC National Cardiovascular Database Registry (ACC-NCDR) and report all data including the optional follow-up section. TSH shall provide OHCA quarterly data reports from STS-DB and ACC-NCDR. Data must be

reported to OHCA thirty (30) calendar days subsequent to TSH receiving the reports from the STS and ACC. TSH is required to comply with the STS and ACC/AHA criteria and standards. If TSH determines not to participate in the STS-DB or ACC-NCDR, TSH shall notify OHCA immediately, and continue to comply with the STS and ACC/AHA criteria and standards set forth in Attachment III.

11. TSH shall provide OHCA with a copy of a dated and signed Consulting Services Agreement with NYPHS or its Affiliates prior to commencement of operation of the OHS program. This contract shall be renewed annually for a period of three years.

12. OHCA and TSH agree that this Agreed Settlement represents a final agreement between OHCA and TSH with respect to this request. The signing of this Agreed Settlement resolves all objections, claims and disputes, which may have been raised by the Hospital with regard to Docket Number 04-30374.

13. This authorization for the OHS program shall expire on December 31, 2008. Should the TSH's open-heart surgery program not commence operation by that date, TSH must seek further approval from OHCA to complete the project beyond that date.

14. This Agreed Settlement is an order of the Office of Health Care Access with all the rights and obligations attendant thereto, and the Office of Health Care Access may enforce this Agreed Settlement pursuant to the provisions of Sections 19a-642 and 19a-653 of the Connecticut General Statutes at TSH's expense, if TSH fails to comply with its terms.

GUIDELINES FOR STANDARDS IN CARDIAC SURGERY

The following statement is an updated version of guidelines that were first published by the American College of Surgeons in 1991. The revised statement was developed by the Advisory Council for Cardiothoracic Surgery and approved by the College's Board of Regents in October 1996.

Preamble

This report provides guidelines to be used by hospital executives and appropriate medical staff only. It places no value judgment on existing successful programs or on the treatment of individual patients.

While current standards of practice form the basis of this report, it is recognized that large programs in cardiac surgery grow from smaller ones. Hospitals and their staffs should exercise their own discretion in approving programs based on local need and the responsibility for achieving a good standard of practice.

While attention is directed primarily to open-heart surgery, the proposed standards should apply to closed-heart operations as well as to operations on the great vessels within the chest.

In borderline situations, in which the number of open-heart operations does not meet the established guidelines, the American College of Surgeons recommends the use of peer review.

Professional team

Specification of the qualifications for cardiac surgeons in an established practice is beyond the scope of these guidelines. Surgeons practicing cardiac surgery should be certified or awaiting certification by the American Board of Thoracic Surgery or its Canadian equivalent within five years after completion of an approved residency program in cardiac surgery. It is recommended that hospital committees for staff accreditation exercise their judgments for privileges based on the nature of the cardiothoracic residency or postresidency experiences of the applicant.

A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR. It is recognized that, depending on the particular setting and situation, the assistant on a particular case may vary in experience and qualification.

Hospital operative volume–Adult cardiac surgery

The 1975 report of the Inter-Society Commission on Heart Disease Resources recommended that cardiac surgical programs in a *hospital* should perform at least 200 procedures annually. This recommendation was based on the premise of a hospital dedicating 1 operating room to cardiac surgery and functioning at 80 percent capacity (4 cases per week x 52 weeks = 200 per year). While there are no presently available data linking an *individual surgeon's* patient volume and hospital mortality rate, there are data to suggest that an annual volume of at least 100 to 125 open heart procedures (including coronary artery bypass procedures, valve replacements, and other operations requiring the use of cardiopulmonary bypass) per *hospital* is necessary from a quality standpoint and that there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume. While 100 to 125 cases per year per *hospital* appears sufficient from a quality standpoint, it is likely that considerably more, and at least 200 procedures per year as previously recommended, are necessary in order for a program to function efficiently.

Congenital heart surgery

Surgery for congenital heart disease, especially in infants, requires a setting that readily meets the complex and special needs

of this group of patients. These requirements include a cardiac surgeon experienced in the operative and perioperative management of such patients. There should be a pediatric cardiologist, an anesthesia team, perfusionists, intensive care nurses, and appropriate intensive care facilities for the treatment of infants and children. At a hospital where congenital heart operations are performed, a total of 100 congenital heart operations (both open and closed, not including neonatal ductus ligations) should be done. The occasional management of an infant or child with congenital heart disease by an otherwise busy and well-functioning adult cardiac surgical team is strongly discouraged.

Hospital facilities and personnel

It is urged that hospital committees for staff accreditation use peer review to determine that adequate standards of practice are maintained in terms of case frequency and results. A registry for the recording of cardiac surgical results is mandatory.

The complex operating room environment required by cardiac surgery in terms of equipment and instruments requires constant improvement in technique and proper indoctrination of personnel. Such educational programs should be under the direction of a clearly designated individual with particular interest and skill in cardiac surgery. Operating room nurses and technicians specializing in cardiac surgery are important. It should be mandatory that operating room nurses and technicians be assigned to cardiac surgery sufficiently often to develop and maintain the skills required for proficient performance in this area.

Anesthesia for cardiac surgical patients encompasses a variety of special problems. To ensure technical competence, frequent changing of the anesthesiologists assigned to cardiac surgery should be avoided.

The operation of a heart-lung machine should be performed by a specially trained nurse or technician under the supervision of the operating surgeon. A perfusionist certified by the American Board of Cardiovascular Perfusion is recommended. Perfusionists who are not certified should have at least two years of experience under supervision in an active clinical program in open-heart surgery and have a thorough background in operating room sterile techniques, perfusion physiology, the use of monitoring equipment, and a general understanding of commonly performed cardiac surgical procedures. The primary responsibility for determining the capability of the perfusionist remains with the cardiac surgeon.

Cardiac surgeons must be primarily responsible for the postoperative care of their patients, including that provided in the intensive care unit. Portions of that care may be shared with others, such as nurses and other physicians. However, only the cardiac surgeon is fully cognizant of all aspects of a given patient's condition and retains the responsibility for the continuity of care, which includes the preoperative status, the operative management, and the postoperative care.

Intensive care nursing of cardiac surgical patients is recognized as a true specialty involving skills in dealing with cardiac and respiratory emergencies. Assignment to cardiac surgical patients should be sufficiently often to maintain competence in this area of nursing. The surgeon should participate in the supervision of cardiac intensive care unit nurses.

The operating room, intensive care unit, and other facilities must conform to standards mandated by the Joint Commission on Accreditation of Health Care Organizations.

The nature of cardiac surgery makes it mandatory that diagnostic facilities be available to the surgical team. A proper cardiac catheterization laboratory must be available for hemodynamic and cine' angiographic studies. This laboratory should be under the direction of a qualified specialist and be accessible for preoperative elective studies, postoperative elective studies, and emergency procedures on a 24-hour basis.

Standard laboratory studies should be available on a 24-hour basis, including blood-gas analysis.

A blood bank facility with full resources under the direction of qualified specialists in this field is mandatory.

An intensive care facility must be available for all patients following cardiac surgery, and in some instances, for patients who are severely ill, preoperatively. This should be a limited-access area that is off limits to nonparticipating personnel and should have facilities for the adequate isolation of septic patients.

Patient follow-up

Proper patient follow-up is an integral part of surgical treatment. An effective follow-up system for patients having open-heart surgery is the responsibility of the surgical team. The team should be able to demonstrate that it has an adequate follow-up system and that patients are seen as often as necessary during the immediate postdischarge period and, subsequently, are followed up at appropriate intervals.

sponsor hospitals and OEMS the ability to begin to collect EMS data, creating the potential in the near future to begin to analyze the data and create best practices to elevate the quality of care and delivery of Emergency Medical Services to the residents and visitors of Connecticut.

In late 2008/early 2009 the AHA formed a "STEMI stakeholders group" comprised of three sub-committees (pre-hospital, timely transfers and education) intended to develop and promulgate best practice related to ST segment myocardial infarction (STEMI). The group had a varied composition including physicians (EMS/ED, cardiology, and interventional cardiology), nurses, pre-hospital providers and health care administrators/regulators. This group drafted a document outlining recommendations to improve care in relation to pre-hospital triage of STEMI patients, timely transfers of patients between facilities and issues of education for pre-hospital providers. A "STEMI Protocol" was also drafted that was intended to offer state-wide guidance for best practice regarding patients experiencing chest pain and subsequently diagnosed with a STEMI by pre-hospital EKG (including bypass for more timely cardiac catheterization).

The "STEMI Protocol" was reviewed by the CT EMS Medical Advisory Committee (CEMSMAC) beginning in 2010. In 2011, after a significant amount of thoughtful work by the CEMSMAC, a revised version of the document entitled "CT EMS STEMI Guideline" was completed and submitted to the Commissioner of Public Health for review; it was approved in January 2012.

OHCA would encourage the adherence of the "CT EMS STEMI Guideline." The foremost goal is for authorized EMS personnel to obtain a 12-lead electrocardiogram in the field for all patients suspected of myocardial infarction, thereby increasing the likelihood for percutaneous coronary intervention (PCI) within 90 minutes of first medical contact. Please see link below for the complete "CT EMS STEMI Guideline" document:

http://www.ct.gov/dph/lib/dph/ems/pdf/stemi_patients.pdf

CARDIAC SERVICES

Heart disease is the leading cause of death for both men and women in the United States.[53] In 2010, coronary heart disease alone was projected to cost the United States approximately $108.9 billion in health care services, medications, and lost productivity.[54] In Connecticut, cardiovascular disease (CVD) is also a significant public health concern and contributor of resident deaths. In fact, about one third of Connecticut resident deaths are due to CVD; coronary heart disease (48%), cerebrovascular disease (15%) also known as stroke and heart failure (8%) account form the majority of CVD deaths.[55]

Existing Connecticut statute requires CON authorization for the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery. According to OHCA's Policies and Procedures, "interventional cardiology" is defined as non-

surgical procedures performed in the cardiac catheterization laboratory for the treatment of coronary artery and peripheral vascular disease. Procedures include, but are not limited to, angioplasty, valvuloplasty, cardiac ablation, coronary thrombectomy, and congenital heart defect correction. Only those procedures authorized pursuant to CON may be performed by a health care facility or provider. Multiple cardiac services may be authorized under one CON decision. A facility that is authorized to provide open heart surgery is also authorized to provide the full range of cardiac procedures mentioned above.

CARDIAC CATHETERIZATION

Cardiac catheterization is defined as a medical procedure requiring the passage of a catheter into one or more cardiac chambers of the left and right heart, with or without coronary arteriograms, for the purpose of diagnosing congenital or acquired cardiovascular disease, or for determining measurement of blood pressure flow.

ANGIOPLASTY/PERCUTANEOUS CORONARY INTERVENTION

Primary (emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow

Elective (scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization lab whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

PCI and Elective PCI are often combined with the permanent placement of a small wire mesh tube called a stent to help prop the artery open and decrease the chance of it narrowing again. Some stents are coated with medication to help keep the artery open (drug-eluting stents), while others are not (bare-metal stents).

OPEN HEART SURGERY

Open heart surgery refers to a therapeutic operative procedure performed on the heart and/or its coronary arteries in order to correct anomalous conditions (for example, coronary artery bypass surgery, heart valve replacement), often using a heart-lung by-pass machine to perform the functions of circulation during surgery.

Authorization for Connecticut hospitals to perform elective catheter-based interventions for coronary artery disease has been limited in the past to hospitals with the ability to perform cardiac surgery onsite. However, increasing operator experience, improvements in surgical technique and major advances in technology and pharmacology have contributed to a progressive trend to allow PCI without on-site surgical backup. New evidence gives support to the positive effects that these medical advances have contributed to the significant reduction in emergency surgery following PCI[56]. Elective PCI without on-site surgical backup was, until recently, recommended as class III (not recommended, potentially harmful). However, an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation. CPORT-E trial findings conclude that patients have no greater risk of death or complications when they have Elective PCI at a hospital without cardiac surgery backup. However, similar to the 2007 SCAI Expert Consensus document, the revised guidelines also recommend stringent criteria for such programs. Connecticut hospitals seeking authorization to initiate an Elective PCI program without on-site cardiac surgery capabilities will be required to meet the SCAI conditions required in guidelines as well as demonstrate clear public need for the program.

DESCRIPTION OF DATA SOURCES

The primary source to be used for Acute Care utilization will be the CT Office of Health Care Access Acute Care Hospital Inpatient Discharge Database.

STANDARDS/GUIDELINES

Connecticut General Statutes Section 19a-638 specifies that at CON is required for: the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery.

The Office of Health Care Access has historically utilized Professional Societies and Organizations held to be the experts for establishing standards and guidelines for cardiac care and will continue to make appropriate use of their recommendations in the future review and determination of CON applications. Examples of expert sources to be used in determining standards and guidelines include: the American College of Cardiology, the American Heart Association and the Advisory Council for Cardiothoracic Surgery.

PERCUTANEOUS CORONARY INTERVENTION (PCI)

Primary PCI

1. Based on ACC and AHA, Primary PCI for STEMI should be performed by experienced operators who perform more than 75 elective PCIs per year and, ideally, at least 11 PCI procedures for STEMI per year. Ideally, these procedures should be performed in institutions that perform more than 400 elective PCIs per year and more than 36 primary PCI procedures for STEMI per year.
2. A report by the American College of Cardiology/American Heart Association Task Force on practice guidelines, referring to Class II b, suggests that Primary PCI for patients with STEMI might be considered in hospitals without on-site cardiac surgery provided that appropriate planning for program development has been accomplished and includes: appropriately experienced physician operators (more than 75 total PCIs and, ideally, at least 11 primary PCIs per year for STEMI); an experienced catheterization team on a 24 hours per day; a 7 day per week call schedule; a well-equipped catheterization lab with digital imaging equipment; a full array of interventional equipment; intra-aortic balloon pump capability; and a proven plan for rapid transport to a cardiac surgery operating room in a nearby hospital with appropriate hemodynamic support capability for transfer. Primary PCI should be limited to patients with STEMI or MI with new or presumably new LBBB on ECG and should be performed in a timely fashion (goal of balloon inflation within 90 minutes of presentation) by persons skilled in the procedure (at least 75 PCIs per year) and at hospitals that perform a minimum of 36 Primary PCI procedures per year. (Level of Evidence: B - Limited populations evaluated. Data derived from a single randomized trial or nonrandomized studies).

Elective PCI

1. Elective/urgent PCI should be performed by operators with an acceptable annual volume (>75 procedures) at high volume centers (> 400 procedures) with on-site cardiac surgery (Level of Evidence: C)
2. Elective/urgent PCI should be performed by operators and institutions whose current risk-adjusted outcome statistics are comparable to those reported in contemporary national data registries, (Level of Evidence: C)
3. It is reasonable that low volume operators (< 75 PCI procedures per year) perform elective/urgent PCI at high volume centers (> 400 PCI procedures per year) with on-site cardiac surgery. Ideally, operators with an annual procedure volume of fewer than 75 procedures per year should only work at institutions with an activity level of more than 600 procedures per year. Operators who perform fewer than 75 procedures per year should develop a defined mentoring relationship with a highly experienced operator who has an annual procedural volume of at least 150 procedures per year. (Level of Evidence C)
4. It is not recommended that elective/urgent PCI be performed by low volume operators (< 75 PCI procedures per year) at low volume centers (200 to 400 procedures per year) with or without on-site cardiac surgery. An institution with a volume of fewer than 200 procedures per year, unless in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service. (Level of Evidence: C)
5. The 2005 PCI Guideline does not establish an explicit minimum hospital volume threshold for elective PCI; there are multiple references in the context of operator and institutional competency to "centers" performing 200 – 400 elective PCI procedures per year.
6. The 2011 PCI Guideline states that operator and hospital volume recommendations have been carried over from the ACC/AHA/SCAI 2005 Guideline Update for Percutaneous Coronary Intervention.

   a. PCI in Hospitals without On-Site Surgical Back-up is in the Class IIb category.

      Class II b: Elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection (Level of Evidence: B)

      Any hospital considering elective PCI without on-site-cardiac surgery must meet the criteria set forth in the 2011 ACCF/ANA/SCAI PCI Guideline, Section 4.8., PCI in Hospitals Without On-Site Surgical Backup: Recommendations (see link below):

      http://content.onlinejacc.org/cgi/reprint/58/24/e44.pdf

      Any hospital not meeting the 2011 ACCF/ANA/SCAI PCI Guideline criteria will be considered to be in Class III.

Class III–Harm: Primary and elective PCI should not be performed in hospitals without on-site cardiac surgery capabilities without a proven plan for rapid transport to a surgery operating room in a nearby hospital or without appropriate hemodynamic support capability for transfer. (Level of Evidence: C)

Quality and Performance Considerations for PCI Programs

Based on the 2011 American College of Cardiology Foundation/American Heart Association/Society for Cardiovascular Angiography and Interventions Guidelines for Percutaneous Coronary Intervention:

1. Every PCI program should operate a quality improvement program that routinely:
   a) reviews quality and outcomes of the entire program;
   b) reviews results of individual operators;
   c) includes risk adjustment;
   d) provides peer review of difficult or complicated cases; and
   e) performs random case reviews (Level of Evidence: C)
2. Every PCI program should participate in a regional or national PCI registry for the purpose of benchmarking its outcomes against national norms. (Level of Evidence: C)

PCI quality and performance considerations are defined by attributes related to structure, processes, and risk adjusted outcomes. Structural elements include, for example, staffing, equipment, supplies, operator and institutional volumes, and the availability of electronic medical records. Processes include strategies for the appropriate patient, protocols for pre- and post-procedural care, appropriate procedural execution and management of complications, and participation in databases and registries for benchmarking program and individual operator performance. The end result of these structures and processes of care are risk-adjusted outcomes, and when available, are more reliable measures of quality than the institutional and individual operator volumes.[58]

CARDIAC SURGERY/OPEN HEART SURGERY[59]

1. Guidelines for Standards in Cardiac Surgery developed by the Advisory Council for Cardiothoracic Surgery and approved by the American College of Surgeons' Board of Regents in October 1996 – Bulletin of the American College of Surgeons, Vol. 82, No. 2, February 1997
   a. An annual volume of at least 100 to 125 open heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes as compared with those doing a high volume.
   b. At least 200 procedures per year are necessary in order for a program to function efficiently
   c. A team approach with a minimum of 2 qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR.
2. The following conditions must be met to initiate a new OHS program:

a. The annual caseload of other programs w/in the proposed PSA shall not drop below 350 procedures.
b. Epidemiological evidence of conditions for which OHS is appropriate w/in the PSA or demonstrates a significant unmet need in the PSA for these procedures.
c. Existing program(s) in the service area are performing at least 350 open heart surgeries annually.
d. Evidence demonstrating the performance of a minimum of 200 open heart surgeries annually within the first three years of the start of the new Open Heart Surgery program.

CARDIAC UTILIZATION

Based on hospital discharge data, inpatient cardiac care is declining both in patient volume and overall patient days (see Table 4.7 and Chart 4.3). From FY 2008 to FY 2011, Cardiac Care-Medical discharges dropped 6%, while the corresponding patient days declined by 3%. During the same time period, Cardiac Care-Surgical care declined even more significantly, with both discharges (11%) and patient days (8%) falling.

Table 3.11: Statewide Cardiac Inpatient Data

Discharges	FY 2008	FY 2009	FY 2010	FY 2011	chg 08-11	chg 10-11

DISCUSSION OF UNMET NEED AND GAPS IN SERVICES, CAPACITY ISSUES, ETC.

The tables below provide an initial step toward the identification of potential areas of unmet need for cardiac care in the state. The tables below provide information that compares the number of residents from a given region that received treatment for cardiac medical services or surgery in a given year (patient demand). This patient demand is compared to the overall volume of cardiac patients served by hospitals in the same region. If hospital volumes are lower than patient demand in the region, it may indicate the need for additional capacity and warrants additional study to examine patient migration patterns to confirm or refute this assertion.

Table 3.12: Bed Need for Inpatient Cardiac Services

RECOMMENDATIONS

1. Examine volume as indicator of quality, as well as other indicators, by examining institutional and operator performance.
2. Continue to review and update Connecticut's cardiac guidelines to reflect updated information and recommendations provided by Professional Societies and Organizations with expert knowledge of cardiac care.

CANCER TREATMENT

Oncology is the branch of medicine concerned with the study and treatment of cancer, including screening, diagnosis, therapy, follow-up and palliative care. It includes various sub specialties such as radiation oncology (medical use of high-energy radiation to kill malignant cells), surgical oncology, and pediatric oncology. Chemotherapy, most generally the treatment of disease by chemicals, can be used for a range of diseases but most frequently refers to antineoplastic drugs to treat cancer.

In Connecticut, there is no unique licensure category for cancer treatment. The Commission on Cancer (CoC), a consortium of professional organizations dedicated to improving cancer patients' lives, administers an accreditation program that encourages hospitals, treatment centers, and other facilities to improve the quality of patient care by focusing on prevention, early diagnosis, pretreatment evaluation, staging, optimal treatment, rehabilitation, surveillance for recurrent disease, support services, and end-of-life care. A broad range of available medical services combined with a multidisciplinary team approach has resulted in 80 percent of all newly diagnosed cancer patients in the US being treated in CoC-accredited cancer programs.[60] According to the CT Cancer Partnership, 67% of acute care hospitals in Connecticut are ACoS accredited.[61].

They have not been denied privileges. Why did you think so?

St John's Riverside withdrew its application in April 2012.
Sound Shore requested more time and their application remains open.

RE: PCI without surgery on site

Anna,

Could you tell me when and why St. Johns Riverside and Sound Shore Hospitals were denied angioplasty privileges?

Nancy

On Fri, Jul 13, 2012 at 11:37 AM, Anna D. Colello wrote:

This is in response to your query regarding the number of hospitals which perform elective angioplasty (PCI - percutaneous coronary intervention) without surgery on site. Section 405.29 of the Department of Health regulations specify that hospitals wishing to perform PCI must perform both primary (emergency) and elective. These regulations were promulgated in November 2009. Prior to that time there was a waiver process which

allowed first primary and later elective procedures to be approved for centers without surgery on site. One center (Bronx Lebanon Hospital) was approved for primary under the waiver system which has not yet requested approval for elective. No new center would be permitted to do just primary because of the regulations.

The centers which perform PCI without surgery on site are:
Unity Health System (Wilson Hospital)
South Nassau Communities Hospital
Faxton-St Luke's Healthcare (St Luke's Division)
Orange Regional Medical Center
St Luke's Cornwall Hospital
St Catherine of Siena Medical Center
Glens Falls Hospital
White Plains Hospital
Brookdale Hospital Medical Center
Long Island College Hospital
Lutheran Medical Center
City Hospital at Elmhurst
Jamaica Hospital Medical Center
St Barnabas
Good Samaritan Hospital on Long Island received approval as a surgery center but has not opened its surgery center so remains PCi w/o surgery at this time
Brookhaven Hospital was very recently approved to do PCI (but do not believe it has opened for PCI) It previously was diagnostic only.

Southside Hospital was approved as a surgery center in 2011

Dr. Christopher Howes

I would like to make some comments regarding certain aspects of Dr. William Gray's testimony including some content from the 2011 ACCF/AHA/SCAI Guidelines for Angioplasty and the 2012 ACCF/SCAI Expert Consensus Document Update.

- Dr. Gray highlighted certain content from the above referenced documents, but neglected to mention other content which clearly is consistent with the proposed program at Greenwich Hospital.

  The 2012 ACCF/SCAI Expert Consensus Document Update states on page 5 of the publication that:

  > "It is generally believed that elective and primary PCI are permissible in sites without cardiovascular surgery, if there is strict adherence to national guidelines. In particular, there must be a documented working relationship with a larger facility with cardiovascular surgical services and an emergency transportation system operative."

  As our CON application clearly says, the proposed elective angioplasty program would be a satellite of the YNHHVC, which is a full service cardiac facility. There is already an emergency transportation system in operation that includes both land and air. Consistent with the 2011 ACCF/AHA/SCAI Guidelines for Angioplasty, our ambulance provider has committed to respond to requests within 20 minutes (see Attachment I). The 2012 ACCF/SCAI Expert Consensus Document Update also stresses (page 5) that a QA/QI system be operative and active, operate 24/7 if emergency angioplasty is provided and participate in a national registry such as the ACC's National Cardiovascular Data Registry. The current emergency angioplasty program at Greenwich Hospital meets all of these recommendations and the proposed elective angioplasty program will as well.

The change in the 2011 ACCF/AHA/SCAI guidelines for elective angioplasty without onsite cardiac surgery from a Class III to a Class IIb is significant. Dr. Gray states this change is only "incremental", but my opinion is to move from a Class III which indicates harm to a Class IIb which states such a program might be considered as long as there is appropriate program development and rigorous criteria for proper patient selection is beyond "incremental". OHCA has recognized this significant change and incorporated in their Cardiac Services section of the new State Health Plan (draft form) the following statement:

> "...an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation".

- Dr. Gray discusses the results of the CPORT-E study recently published in the New England Journal of Medicine and suggests that our CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with onsite surgery. Our application never included any such suggestion. But the CPORT-E study, along with others noted in Dr. Cabin's prefiled testimony, and the shift from a Class III to a Class IIb assignment by the ACCF/AHA/SCAI Angioplasty Guidelines all support the reasonableness of offering elective angioplasty without onsite cardiac surgery as long as number of criteria are met which we have already addressed in our CON application. Dr. Gray's skepticism and criticism of angioplasty without onsite cardiac surgery is puzzling given his institution's (NYP) support of White Plains Hospital's program as well as support of a similar program by another NYP affiliate, Holy Name Hospital in Teaneck, New Jersey.

- Dr. Gray also highlights the statement in the 2011 ACCF/AHA/SCAI Guidelines which discusses competition with another angioplasty program in the same geographic area, particularly an established program with surgical back-up and that such competition MAY not be in the best interests of the community. The data we included in our prefiled testimony clearly shows that Greenwich and Stamford Hospitals are overwhelmingly serving residents of different communities. I would go so far as to say that we do not compete in the area of cardiology, despite our close geography. Our medical staff in

cardiovascular services does not overlap to any measurable degree and referral patterns to the interventional cardiologists are different. We have offered emergency angioplasty for approximately 8 years and despite the entrance of Stamford Hospital's program, we have maintained our emergency and elective transfer volume because patients want their care from Greenwich Hospital and the YNHHVC. In this case, a program at Greenwich Hospital IS in the best interest of the community because the Greenwich Hospital community has demonstrated that is where they want their care.

- Dr. Gray states that if the program at Greenwich Hospital is approved there is a risk that Stamford and Greenwich Hospital's angioplasty programs may perform less than 200 PCIs per year. For the reasons I have outlined above, we do not believe our program will impact Stamford's program due to the lack of patient and physician crossover. It is worthy to note that since the opening of White Plains Hospital's program, Stamford Hospital has not seen any decline in their angioplasty volume. According to Stamford Hospital's Petition, Stamford Hospital "...is on track to perform 277 PCIs in FY 2012" which represents a 25% increase from its 2011 volume as noted on Dr. Kiely's testimony page 32 (PCR data). Clearly, the presence of the White Plains Hospital program, which is located only 15 miles from Stamford Hospital and performed as many as 290 PCIs last year, has not had any impact on Stamford Hospital's angioplasty volumes.

- I must comment on Dr. Gray's suggestion that approval of the proposed program at Greenwich Hospital would in some way encourage physicians to feel "...pressure to refer patients for procedures to keep institutional volumes up. Occurrences like these will only drive up healthcare costs for payers and patients." Dr. Gray is suggesting that physicians may send a patient for an unnecessary procedure just to increase institutional volumes. This may be the practice at New York Presbyterian, but I can assure you that this is NOT the practice of YNHHVC physicians nor would it ever be condoned or permitted.

- Finally, I would like to put on the record that the State of New York regulations cited in Dr. Gray's testimony have no relevance in this CON application. Those regulations apply only to New York hospitals. Although they are irrelevant to this proceeding, it is interesting to note in New York State, hospitals seeking to perform angioplasty without onsite cardiac surgery must perform BOTH primary and elective (refer to Attachment V of Marna Borgstrom's rebuttal testimony). I suspect New York State incorporated this requirement because they recognize the benefits to patients by ensuring access to both types of angioplasty and the positive impact on institutional volumes.

Nelson Pride in Service AMBULANCE ACCESS Ambulance Service CONNECTICUT HANDIVAN

208 Quinnipiac Ave North Haven, CT 06473

July12,2012

To whom it may concern,

Nelson /Access Ambulance and Connecticut Handivan has the privilege of serving Greenwich hospital for patient transportation at ALS and BLS level care as well as wheelchair transportation.

We also staff a critical care Ambulance at Greenwich hospital to facilitate transport for any Advanced Life Support patients. The Paramedic units are equipped with ventilators and Greenwich hospital compatible IV pumps.

It will be our commitment to have an ALS ambulance on scene for pick up within the twenty (20) minute time frame of the call for all Catheterization Lab patient needed transfers to other hospitals.

We appreciate the opportunity to service Greenwich Hospital for all patient transportation, we look forward to servicing the patient's needs as a new innovative procedural department opens.

PROCEDURAL MOTIONS

STATE OF CONNECTICUT
DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS DIVISION

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S OBJECTION TO THE STAMFORD HOSPITAL'S PETITION FOR INTERVENOR STATUS & MOTION TO STRIKE TESTIMONY

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby object to the Petition for Intervenor Status With Full Procedural Rights filed by The Stamford Hospital ("TSH"), on July 12, 2012 ("Petition"). Specifically, Applicants object to TSH's request that it be allowed to submit "rebuttal testimony" in connection with the public hearing scheduled for July 17, 2012. "Rebuttal testimony" is a privilege that OHCA typically reserves for applicants, who are customarily given the last word on the record in their own applications. In addition, Applicants move to strike all references in the testimony and exhibits to the elective angioplasty CON application filed by Lawrence & Memorial Hospital ("L&M Application"). The L&M Application has not yet been deemed complete by OHCA and, as such, it is not considered an official CON request. Moreover, because OHCA evaluates and

decides each CON application on its own merits, the arguments advanced by L&M in an unrelated CON request are irrelevant to this proceeding.

TSH Is Not Entitled To Submit Rebuttal Testimony

In its Petition, TSH "seeks permission to offer rebuttal testimony" and claims that it will demonstrate the deficiencies in Applicants' proposal through "evidence … presented in rebuttal." Petition, pp. 8 & 9. As TSH and its counsel are aware, intervenors in a contested case are not usually given the right to submit written rebuttal evidence prior to the public hearing. As an intervenor (should OHCA grant TSH this status), TSH was required to pre-file any and all testimony that it intends to present at the hearing by June 12, 2012 at noon. TSH has had access to a copy of Applicants' initial CON submission since it was filed on February 14, 2012, and has had ample time to consider and prepare its opposition. Applicants, on the other hand, will have had access to TSH's 388-page opposition document for a mere 5 days before the hearing and did not have benefit of reviewing this document prior to submitting their own testimony (which was also due at noon on June 12th). It is for this reason that Applicants are allowed an opportunity to submit a written rebuttal. Also, it is Applicants' burden of proving their case in chief for this CON request, and it is fair that they be given the last word in written submissions.

Moreover, if OHCA grants TSH full procedural rights, TSH will have an opportunity to rebut any information contained in Applicants' pre-hearing submissions through cross-examination of Applicants' witnesses. In addition, as TSH and its counsel surely know, "rebuttal" points are often raised without objection during oral hearing presentations and in response to questions posed by OHCA and the parties. For these reasons, Applicants request that TSH be denied the right to submit

or introduce, at or before the hearing, any additional written testimony or evidence beyond what was included in their June 12th filing.

All References to the L&M Elective Angioplasty CON Application Should be Stricken from the Record

TSH has included in its Petition, as well as in the testimonies of Drs. Sharon Kiely and William Gray, numerous references to the CON application submitted by L&M to establish an elective angioplasty program in New London. Reference is made in the text of the Petition at pages 6-7. Dr. Kiely mentions the L&M project in her testimony (pp. 10-11, 12) and, incredibly, attaches the 56-page CON application in that matter as an exhibit (pp. 53-109). Dr. Gray also mentions the L&M proposal in his testimony at pages 7 and 10 (page 10 makes reference to the CON application for elective angioplasty being filed by The Hospital of Central Connecticut as well).

As a threshold matter, OHCA should not consider the L&M Application because it has not yet been deemed complete. OHCA is still in the process of its completeness review and until L&M responds to any questions from the agency, the CON application remains incomplete and does not constitute an official CON request.

TSH's argument for including the L&M Application is simple – that L&M presents a better case for the addition of elective angioplasty without onsite surgery than Greenwich. However, none of what TSH proposes to say about the L&M Application is relevant to the matter before OHCA. Other than the relationships that both programs have with the Yale New Haven Heart and Vascular Center ("YNHHVC"), the proposals are entirely different. As TSH aptly points out, the programs operate at opposite ends of the state serving distinct patient populations. Allowing this type of

testimony into the record opens the door for future applicants to claim relevance of similar proposals at hospitals and facilities that are nowhere near their own.

OHCA has been clear in its policy that each CON request is evaluated on its own merits and that applications do not lend themselves to general applicability. The fact that TSH has included the L&M Application in its opposition submission is inappropriate. It is a not-so-veiled attempt by TSH to convince OHCA that it should approve only one YNHHVC satellite elective angioplasty program without onsite surgery – the one that is 90 miles away from Stamford. TSH has an obvious self-interest in defeating Applicants' proposal, which is clearly needed and which will undoubtedly improve the quality and accessibility of angioplasty services for area residents. TSH should not be allowed to distract from the real issues before this agency by testifying and cross-examining Applicants' witnesses on a CON that has no relevance to the pending application. For these reasons, Applicants request that all references to the L&M Application be stricken from the record.

WHEREFORE, for the foregoing reasons Applicants request that their Objection to TSH's Petition for Intervenor Status be sustained and their Motion to Strike be granted.

Respectfully Submitted,

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S OBJECTION TO THE ADMINISTRATIVE NOTICE OF DOCKET NO. 08-31210-CON

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby object to OHCA's decision (see Exhibit A attached) to take administrative notice of the entire record of Applicants' previous CON request for permission to establish an elective angioplasty program in Greenwich (Docket No. 08-31210-CON) (the "2008 Docket"). Applicants object to the inclusions of the 2008 Docket in the record of this matter on the grounds that (i) it is the written policy of OHCA to evaluate every CON proposal on a case-by-case basis and decide each application on its own merits; and (ii) the current application is fundamentally different than the 2008 Docket and the inclusion of outdated and irrelevant information from that docket will only serve to confuse the issues before OHCA in this proceeding.

While OHCA has the authority to take administrative notice of judicially cognizable facts, including prior orders and decisions, it has long been the policy of the agency not to take notice of prior dockets in their entirety for purposes of a hearing on a CON request. Participants in a hearing will often ask the agency to take notice of prior dockets involving their opponents so that they can cross-examine for inconsistencies. Applicants sometimes also ask OHCA to take

administrative notice of the dockets of similar proposals for purposes of comparison. OHCA's response has typically been to deny the requests for administrative notice on the grounds that each CON is unique (while giving latitude to cross-examine witnesses on select parts of relevant dockets that are included in pre-hearing submissions) – meaning prior dockets, whether they involve the same parties or the same or similar services, are irrelevant to the analysis of a CON proposal. The preamble to virtually every CON decision since 2005 includes a caveat stating that CONs do not lend themselves to general applicability and that every case is reviewed and judged on its merits.

Applicants are concerned that by taking administrative notice of the 2008 Docket, and by possibly allowing The Stamford Hospital to cross-examine Applicants' witnesses on prior submissions, the issues before OHCA will become confused and the current application will not be decided on its own merits. Much of the information contained within the 2008 Docket has changed and is no longer relevant to Applicants' elective angioplasty proposal. This includes, but is not limited to, changes in the structure of the proposed affiliation arrangement; changes to the ACCF/AHA/SCAI Guidelines recommendations for elective angioplasty without onsite surgical backup; revised need methodology; and changes in the treatment of border hospitals by OHCA for state health planning purposes. In addition, the CON laws themselves have changed since the 2008 Docket was decided and the statutory decision criteria that governed that application are not applicable to this CON request.

For these reasons, Applicants respectfully request that OHCA reconsider its decision to take administrative notice of the 2008 Docket. In the alternative, if the 2008 Docket remains a part of the record in this matter, Applicants request that any cross-examination be limited to information relevant to the 2012 elective angioplasty proposal. Applicants further request that

any information from that docket be given appropriately limited weight and consideration. This will afford Applicants' the fairest possible resolution of the current CON request.

WHEREFORE, Applicants respectfully request that their Objection to the Administrative Notice of Docket No. 08-31210-CON be granted.

Respectfully Submitted,

RE: Certificate of Need Application; Docket Number: 12-31748-CON
Yale-New Haven Hospital and Greenwich Hospital
Proposal to Establish and Operate an Elective Angioplasty
Program without Onsite Surgical Backup at Greenwich Hospital

Dear Ms. Ahn:

On February 14, 2012, the Office of Health Care Access ("OHCA") received your initial Certificate of Need ("CON") application filing on behalf of Yale-New Haven Hospital ("YNHH") and Greenwich Hospital ("Hospital") (collectively the "Applicants") for the establishment and operation of an elective angioplasty program without onsite surgical backup at the Hospital.

Note: Please be advised, administrative notice is being taken of the entire record of the prior CON application in this matter, as identified under Docket Number: 08-31210-CON. A copy of the Final Table of the Record from the aforementioned record has been attached as Exhibit I, identifying all the individual exhibits included in the record.

OHCA has reviewed the CON application and requests the following additional information pursuant to General Statutes §19a-639a(c):

Clear Public Need - pages 15 through 29

1. With respect to the state map presented on page 18 of the CON application, please provide a map legend and notes of a legible size as the application's presentation is difficult to discern.

2. With respect to the table entitled "Number of Patients Discharged Directly from GH to Another Institution for Elective Angioplasty" on page 19 of the CON application, please address the following:

   a. Identify the distance in miles and travel time between Greenwich Hospital and each of the other six hospitals to which Greenwich Hospital transfered patients requiring elective angioplasty over the last four and a quarter fiscal year period.

   b. Describe the existing physician referral patterns that have resulted in 232 patients needing elective angioplasty, not being able to access this service and being transferred to other Connecticut hospitals; 235 to Yale-New Haven Hospital and 2 to Stamford Hospital over four and a quarter fiscal year period.

3. The Applicants point out that: "... transferring patients to another facility creates an unnecessary stressful and uncomfortable situation for patients and family." Further "transferring to another facility is an increased stress for the patients and their families with regard to transportation. For some, in Greenwich Hospital's greater service area, transportation outside the service area is problematic." This being the case, why is Yale-New Haven Hospital the institution of choice when transferring a patient requiring elective angioplasty, as Stamford Hospital presents a much closer Connecticut alternative hospital site?

4. With respect to the table entitled Population Projections- Greenwich Hospital Service Area on page 27 of the CON application, please provide two tables in the same format, the first depicting the population projections for the state of Connecticut and the second depicting the population projections for the state of New York.

5. Please address the following questions regarding existing providers of elective angioplasty closest to the Hospital and its service area:

   a. Please identify all providers that currently offer Elective Angioplasty.
   b. Identify the existing providers that currently offer elective angioplasty with on-site surgical backup.
   c. What impact will this proposal have on these exiting providers financially and on their elective PCI utilization?

6. Provide a copy of the Hospital's protocols related to the proposed elective angioplasty without cardiac surgery backup. Additionally, explain any protocols that will be specific to this program.

2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention-pages 140-230

7. In regard to the Attachment VI: 2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention, please address the following questions:

a. How does the Hospital meet each of the criteria listed in Class IIa, IIb, III and tables 5 & 6?

b. How does the Hospital plan to meet the guidelines regarding the rapid transport to a cardiac surgery operating room in a nearby hospital and without hemodynamic support to transfer?

c. How do ACCF/AHA/SCAI guidelines define "nearby" hospital/operating room?

d. How does the Hospital's transport agreement with YNHH (where majority of the patients have been transferred in the past) relate to or meet the guidelines?

e. The Hospital's median time to immediate PCI for STEMI patients is 67.0 minutes. As reported in the ACC-NCDR report (Attachment XI of the CON application) all hospitals in the 90th percentile have a median time to immediate PCI for STEMI patients of 50.4 minutes. How does Hospital's median time relate to the ACCF/AHA/SCAI guidelines published in November 2011?

8. The Applicants state on page 15, that the Hospital "must address the cost-effectiveness of angioplasty services." Please address how this goal of the Applicants is consistent with the statement in Class III, which states that desires for personal or institutional financial gain…are not appropriate consideration(s) for initiation of a PCI program without on-site cardiac surgery.

9. The guidelines state that "[c]ompetition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community." Please address your proposal in relation to this statement while taking into consideration the existing providers of elective angioplasty in the Hospital's service area (and geographic) (in CT and NY).

10. Considering that the Hospital does not have access to a helicopter, explain how it expects to meet the protocols related to emergency transportation to a cardiac facility with a cardiac surgery program. In particular, discuss the Hospital's transfer agreement with its affiliate YNHH in this matter.

In responding to the questions contained in this letter, please repeat each question before providing your response. **Paginate and date** your response (i.e., each page in its entirety). Information filed after the initial CON application submission (i.e. completeness response letter, prefile testimony, late file submissions and the like) must be numbered sequentially from the Applicant's document preceding it. Please reference "Docket Number: 12-31748-CON." Submit one (1) original and five (5) hard copies of your response. In addition, please submit a scanned copy of your response including all attachments on CD in an Adobe format (.pdf) and in an MS Word format.

If you have any questions concerning this letter, please feel free to contact me or Steven W. Lazarus at (860) 418-7001.

Sincerely,

Jack A. Huber

TABLE OF THE RECORD

APPLICANTS: **Greenwich Hospital and Yale-New Haven Hospital**

DOCKET NUMBER: **08-31210-CON**

PUBLIC HEARING: **February 24, 2009 at 9:00 a.m.**

PLACE: **410 Capitol Avenue, Third Floor Hearing Room**
Hartford, Connecticut

EXHIBIT	DESCRIPTION
A	Letter from Greenwich Hospital and Yale-New Haven Hospital ("Applicants") dated July 25, 2008, enclosing Letter of Intent forms to establish and operate an elective angioplasty program at Greenwich Hospital, received by the Office of Health Care Access ("OHCA") on July 25, 2008.
B	OHCA's request for legal notification in the *Greenwich Times* and the *New Haven Register* and notification to Applicants of receipt of the Letter of Intent in the matter of the CON application under Docket Number 08-31210, dated July 30, 2008.
C	OHCA's letter to the Applicants dated S4eptember 12, 2008, enclosing the Certificate of Need ("CON") application forms under Docket Number 08-31210.
D	Various emails between the Applicants and OHCA beginning September 12, 2008 through November 5, 2008 in the matter of the CON application under Docket Number 08-31210.
E	Email between the Applicants and OHCA dated November 6, 2008 in the matter of the CON application under Docket Number 08-31210.
F	Letter from the Applicants dated November 21, 2008, enclosing the CON application under Docket Number 08-31210, received by OHCA on November 21, 2008.
G	OHCA's letter to the Applicants dated December 8, 2008, requesting additional information and/or clarification in the matter of the CON application under Docket Number 08-31210.

H	Applicants' responses to OHCA's letter of December 8, 2008 dated January 23, 2009, in the matter of the CON application under Docket Number 08-31210, received by OHCA on January 23, 2009.
I	OHCA's request for legal notification in the *Greenwich Times* and the *New Haven Register* and OHCA's Notice to the Applicants of the public hearing scheduled for February 24, 2009, in the matter of the CON application under Docket Number 08-31210, dated February 6, 2009.
J	OHCA's letter to the Applicants dated February 11, 2009, requesting prefile testimony and interrogatories in the matter of the CON application under Docket Number 08-31210.
K	OHCA's email to the Applicants dated February 18, 2009 confirming the hearing scheduled for February 24, 2009 in the matter of the CON application under DN 08-31210.
L	Letter from the Applicants enclosing Prefile Testimony and responses to interrogatories dated February 19, 2009 in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 19, 2009.
M	Petition of The Stamford Hospital dated February 19, 2009, requesting party status or intervenor status with full procedural rights as well as prefile testimonies and a notice of appearance of Jeffers and Ireland in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 19, 2009.
N	Email from The Stamford Hospital to OHCA dated February 20, 2009 attaching their request for status, prefile testimony and exhibits in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 20, 2009.
O	Email from OHCA to the Applicants dated February 20, 2009 forwarding the email OHCA received from The Stamford Hospital in the matter of the CON application under Docket Number 08-31210.
P	Facsimile letter from Wiggin and Dana LLP to OHCA dated February 20, 2009 noticing their appearance on behalf of the Applicants in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 20, 2009.
Q	Facsimile letter from the Applicants to OHCA dated February 23, 2009 requesting a continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210, receive by OHCA on February 23, 2009.
R	Facsimile letter from Jeffers & Ireland to OHCA dated February 22, 2009 opposing the request by the Applicants to continue or reschedule the hearing in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.

S	Facsimile letter from the Applicants to OHCA dated February 23, 2009 objecting to the request by The Stamford Hospital for party status in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
T	Facsimile letter from the Applicants to OHCA dated February 23, 2009 responding to The Stamford Hospital's objection to the Applicants request for continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
U	Letter from OHCA to the Applicants dated February 23, 2009 denying their request for continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210.
V	Email from Jeffers & Ireland to OHCA dated February 23, 2009 responding to Applicants letter for request of continuance in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
W	OHCA's Ruling on the Petition of The Stamford Hospital to be granted intervenor status in the matter of the CON application under Docket Number 08-31210, dated February 23, 2009.

Where Applicable faxes will be used as originals.

Administrative Notice is taken of the following items:

1. Greenwich Hospital, Docket Number 07-027AR, FY 2007 Annual Reporting.
2. Yale-New Haven Hospital Docket Number 07-016AR, FY 2007 Annual Reporting
3. OHCA's Administrative Folder containing Agenda, Table of the Record etc. in the matter of the CON application under Docket Number:08-31210

Late Files requested by OHCA at the Hearing on February 24, 2009:

1. Information regarding New York's elective angioplasty.

Late File from the Applicant dated March 9, 2009, received by OHCA on March 10, 2009 in the matter of the CON application under Docket Number: 08-31210.

E-mail from OHCA to the Intervenor dated March 13, 2009 confirming due date Of March 17, 2009 for responses to the Applicants late file.

Intervenors responses dated March16, 2009 received by OHCA on March 17, 2009 in the matter of the CON application under Docket Number: 08-31210.

Email from the Applicant to OHCA confirming their response date to the Intervenors response of March 20, 2009 in the matter of the CON application under Docket Number: 08-31210.

Applicants response to the intervenors responses dated March 20, 2009 in the matter of the CON application under Docket Number 08-31210, received by OHCA on March 20, 2009 (email, faxed and hardcopy received on the same day).

Letter from the Intervenor dated March 23, 2009 responding to Applicants letter dated march 20, 2009 in the matter of the CON application under Docket Number: 08-31210, received by OHCA (fax on March 23, 2009 and hardcopy on March 24, 2009)

Letter from White Plains Hospital dated March 16, 2009 in the matter of the CON application under Docket Number: 08-31210, received by OHCA on March 23, 2009

OHCA's letter dated March 26, 2009 to all parties closing the public hearing in the matter of the CON application under Docket Number: 08-31210.

OFFICE OF HEALTH CARE ACCESS DIVISION

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S MOTION TO DISQUALIFY COUNSEL FOR THE STAMFORD HOSPITAL

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby move to disqualify Stephen M. Cowherd and the law firm of Jeffers Cowherd (collectively "Cowherd") from representing The Stamford Hospital ("TSH") at the public hearing on this matter scheduled for July 17, 2012[1], should the Department of Public Health Office of Health Care Access Division ("OHCA") grant TSH status in this proceeding.[2] This Motion to Disqualify is based upon the potential ethical conflict of interest that arises from Cowherd having served as a paid consultant for OHCA in connection with YNHH's CON application for the acquisition of the Hospital of St. Raphael (Docket No. 12-31747-CON) (the "YNHH/HSR Proceeding").

[1] Applicants understand that if OHCA grants this Motion to Disqualify Cowherd, a continuance of the hearing may be required so that TSH can secure alternate counsel.

[2] TSH filed a Petition For Intervenor Status With Full Procedural Rights and prefiled the testimony of several witnesses on July 12, 2012.

Factual Background

This docket concerns a request by Applicants for permission to add elective angioplasty to the suite of cardiac services available at Greenwich Hospital ("Greenwich Elective Angioplasty Program"). Greenwich and YNHH are both members of the Yale New Haven Health System ("YNHHS") and Greenwich serves as a satellite of the Yale New Haven Heart and Vascular Center ("YNHHVC"). Notice of this CON was published in the Greenwich Time on December 1, 2 and 3, 2011, and the CON Application was filed with OHCA on February 14, 2012.

On February 9, 2012, Applicant YNHH and the Hospital of St. Raphael ("HSR") filed their CON Application for the change of ownership of HSR. Soon thereafter, OHCA retained Cowherd to serve as a paid consultant with respect to the YNHH/HSR CON. According to the Jeffers Cowherd website, Attorney Cowherd's practice focuses on healthcare and administrative law, including but not limited to, work before OHCA in connection with CON matters. He represents a variety of providers, including acute care hospitals. Notably, Cowherd has represented TSH for many years. He represented TSH in 2009, when the hospital opposed Applicants' last request for permission to establish an elective angioplasty program at Greenwich (Docket No. 08-31210-CON). This representation occurred prior to Cowherd's retention by OHCA as a consultant in connection with the YNHH/HSR Proceeding.

Cowherd was one of several attorneys that OHCA considered for the YNHH/HSR engagement and he was hired over the objection of YNHH. YNHH objected to Cowherd's involvement based on the fact that he represents TSH, which competes with and has been aggressive in opposing projects proposed by Greenwich and YNHH. At the time Cowherd agreed to consult with OHCA on the YNHH/HSR Proceeding, he was aware of the Greenwich

Elective Angioplasty Program filing (which had been noticed in December of 2011) and he knew or should have known, based on past experience, that his client TSH would oppose the CON request.

Cowherd's involvement in the YNHH/HSR Proceeding afforded him unique and unprecedented access to OHCA staff in connection with their evaluation of a CON and formulation of an Agreed Settlement. He reviewed documents and provided advice to staff, the specifics of which cannot be known by Applicants given that they were not involved in the discussions. Moreover, Cowherd was privy to confidential information, not otherwise available to the public, in the discharge of his duties as advisor to OHCA. It is our understanding that Cowherd reviewed "draft" documents from the agency, which are not discoverable under the Connecticut Freedom of Information Act ("CT FOIA"), and had conversations with senior OHCA staff regarding the substance of the agency's completeness review. Cowherd also reviewed information regarding OHCA's statewide facilities planning process, which has yet to be finalized and which presumably had some relevance to OHCA's review of the YNHH/HSR CON.

Argument

Cowherd should be disqualified as counsel in this matter based on the prohibitions set forth in Rule 1.11(c) of the Connecticut Rules of Professional Conduct (see Exhibit A attached). Rule 1.11(c) provides, in pertinent part, as follows:

> [A] lawyer having information that the lawyer knows is confidential government information about a person acquired when the lawyer was a public officer or employee, may not represent a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person. As used in this Rule, "confidential government information" means information that has been obtained under governmental authority and which ... the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public.

According to its commentary, Rule 1.11 is intended to prevent attorneys who have worked with the government from obtaining an unfair advantage over their clients' adversaries as a result of information learned during the attorneys' service.

Here, Cowherd's relationship with OHCA in connection with the YNHH/HSR CON, while characterized as that of consultant, was akin to that of a staff attorney employed by the agency. In fact, Applicants' understanding is that he was hired because the agency was short-staffed, due in part to the recent departure of its in-house counsel. To the best of Applicants' knowledge, Cowherd was asked to review the CON submissions, assist in formulating completeness questions and advise OHCA regarding the application's conformance with the agency's statutes and statewide facilities planning objectives, much like the former OHCA staff attorney would have done. Cowherd's position with OHCA, however titled, gives his client an unfair advantage over Applicants in this matter.

In addition, it is clear that Cowherd was privy to "confidential government information" during his service, which OHCA has the right to withhold from the public. As previously noted, confidential government information is information that has been obtained under governmental authority and which the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public (see Rule 1.11). Cowherd had access to, and reviewed and provided comment on, initial drafts of the completeness questions issued to YNHH and HSR, which in final form had a far more "legal" tone than questions typically issued by OHCA staff (see Exhibit B attached). It is unclear whether Cowherd had access to initial drafts of the Agreed Settlement as well. These preliminary agency documents are not available to the public, including YNHH and HSR, but rather are protected from disclosure by the CT FOIA exemption found in Section 1-210(b)(1) of

the Connecticut General Statutes. Section 1-210(b)(1) provides that an agency need not disclose to the public any "[p]reliminary drafts or notes provided the public agency has determined that the public interest in withholding such documents clearly outweighs the public interest in disclosure." It has been the policy of OHCA not to disclose to the public drafts of documents, including completeness letters and decisions, which ultimately make their way into the administrative record in final form.

Moreover, Cowherd may have had access to certain documents associated with the YNHH/HSR Proceeding that were not made available to the public by agreement between the agency and the parties. These documents included several independent consulting reports obtained by the hospitals and an un-redacted version of the Asset Purchase Agreement for the transaction. OHCA staff may also have shared with Cowherd their thought processes regarding CON decision-making in general, resolution of the YNHH/HSR application specifically, and YNHHS system and service-line development. None of this information is available to the general public or to applicants and counsel who practice before the agency. This information may also be considered "confidential government information" under Rule 1.11.

Now, less than three weeks after the YNHH/HSR transaction was approved by OHCA via Agreed Settlement, Cowherd seeks to represent TSH, a competitor of Greenwich and YNHH, in opposing their CON request for an elective angioplasty satellite. However, Rule 1.11 expressly prohibits a lawyer in Cowherd's position from "represent[ing] a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person." Here, the "private client" is TSH and "that person" is YNHH, an Applicant in this matter along with its sister hospital Greenwich. The "information" at issue could include specific facts regarding YNHH and YNHHS services (including cardiac

services), as well as general OHCA priorities for system development and CONs, any of which could conceivably be used to oppose the current application. Cowherd has filed a lengthy and detailed opposition to the Greenwich Elective Angioplasty Program on behalf of TSH. Applicants have no assurance that Cowherd has not used and will not use, either intentionally or unintentionally, confidential information that he obtained by virtue of his consulting arrangement with OHCA to the material disadvantage of YNHH and Greenwich in this proceeding. As previously noted, Rule 1.11 seeks to avoid just this type of "unfair advantage" resulting from the use of inside information obtained during an attorney's government service.

Furthermore, Canon 9 of the ABA Model Code of Professional Responsibility states that an attorney shall strive to avoid "not only professional impropriety but also the appearance of impropriety" (see Exhibit C attached). The fact that Cowherd agreed to serve as a consultant to OHCA in the YNHH/HSR Proceeding, knowing full well that his client, TSH, would soon be opposing a YNHH CON request for an elective angioplasty satellite in Greenwich, gives at the very least the appearance of impropriety. Applicants and the public are left wondering whether and to what extent Cowherd has gained inside knowledge about OHCA and YNHHS that he will use for the benefit of TSH and to the material disadvantage of Applicants.

Conclusion

The Hearing Officer has the authority to make such orders as will aid in the just resolution of a contested case. Reg., Conn State Agencies, Section 19a-9-29(g). Cowherd cannot separate the information he learned serving as a consultant to OHCA in a YNHH matter from his representation of TSH in opposition to this Greenwich/YNHH CON request.

Accordingly, the interests of justice require that Stephen M. Cowherd and the law firm of Jeffers Cowherd be disqualified from representing TSH in this proceeding.[3]

WHEREFORE, Applicants respectfully request that their Motion to Disqualify Stephen M. Cowherd and the law firm of Jeffers Cowherd be granted.

Respectfully Submitted,

GREENWICH HOSPITAL
YALE-NEW HAVEN HOSPITAL

EXHIBIT A

Principles of Imputed Disqualification. The rule of imputed disqualification stated in subsection (a) gives effect to the principle of loyalty to the client as it applies to lawyers who practice in a law firm. Such situations can be considered from the premise that a firm of lawyers is essentially one lawyer for purposes of the rules governing loyalty to the client, or from the premise that each lawyer is vicariously bound by the obligation of loyalty owed by each lawyer with whom the lawyer is associated. Subsection (a) operates only among the lawyers currently associated in a firm. When a lawyer moves from one firm to another, the situation is governed by Rules 1.9 (b) and 1.10 (b).

The Rule in subsection (a) does not prohibit representation where neither questions of client loyalty nor protection of confidential information are presented. Where one lawyer in a firm could not effectively represent a given client because of strong political beliefs, for example, but that lawyer will do no work on the case and the personal beliefs of the lawyer will not materially limit the representation by others in the firm, the firm should not be disqualified. On the other hand, if an opposing party in a case were owned by a lawyer in the law firm, and others in the firm would be materially limited in pursuing the matter because of loyalty to that lawyer, the personal disqualification of the lawyer would be imputed to all others in the firm.

The Rule in subsection (a) also does not prohibit representation by others in the law firm where the person prohibited from involvement in a matter is a nonlawyer, such as a paralegal or legal secretary. Nor does subsection (a) prohibit representation if the lawyer is prohibited from acting because of events before the person became a lawyer, for example, work that the person did while a law student. Such persons, however, must be screened from any personal participation in the matter to avoid communication to others in the firm of confidential information that both the nonlawyers and the firm have a legal duty to protect. See Rules 1.0 (k) and 5.3.

Rule 1.10 (b) operates to permit a law firm, under certain circumstances, to represent a person with interests directly adverse to those of a client represented by a lawyer who formerly was associated with the firm. The Rule applies regardless of when the formerly associated lawyer represented the client. However, the law firm may not represent a person with interests adverse to those of a present client of the firm, which would violate Rule 1.7. Moreover, the firm may not represent the person where the matter is the same or substantially related to that in which the formerly associated lawyer represented the client and any other lawyer currently in the firm has material information protected by Rules 1.6 and 1.9 (c).

Rule 1.10 (c) removes imputation with the informed consent of the affected client or former client under the conditions stated in Rule 1.7. The conditions stated in Rule 1.7 require the lawyer to determine that the representation is not prohibited by Rule 1.7 (b) and that each affected client or former client has given informed consent to the representation, confirmed in writing. In some cases, the risk may be so severe that the conflict may not be cured by client consent. For a discussion of the effectiveness of client waivers of conflicts that might arise in the future, see Rule 1.7 and its Commentary. For a definition of informed consent, see Rule 1.0 (f).

Where a lawyer has joined a private firm after having represented the government, imputation is governed by Rule 1.11 (b) and (c), not this Rule. Under Rule 1.11 (d), where a lawyer represents the government after having served clients in private practice, nongovernmental employment or in another government agency, former-client conflicts are not imputed to government lawyers associated with the individually disqualified lawyer.

Where a lawyer is prohibited from engaging in certain transactions under Rule 1.8, subsection (k) of that Rule, and not this Rule, determines whether that prohibition also applies to other lawyers associated in a firm with the personally prohibited lawyer.

Rule 1.11. Special Conflicts of Interest for Former and Current Government Officers and Employees

(Amended June 26, 2006, to take effect Jan. 1, 2007.)

(a) Except as law may otherwise expressly permit, a lawyer who has formerly served as a public officer or employee of the government:

(1) is subject to Rule 1.9 (c); and

(2) shall not otherwise represent a client in connection with a matter in which the lawyer participated personally and substantially as a public officer or employee, unless the appropriate government agency gives its informed consent, confirmed in writing, to the representation.

(b) When a lawyer is disqualified from representation under subsection (a), no lawyer in a firm with which that lawyer is associated may knowingly undertake or continue representation in such a matter unless:

(1) The disqualified lawyer is timely screened from any participation in the matter and is apportioned no part of the fee therefrom; and

(2) Written notice is promptly given to the appropriate government agency to enable it to ascertain compliance with the provisions of this Rule.

(c) Except as law may otherwise expressly permit, a lawyer having information that the lawyer knows is confidential government information about a person acquired when the lawyer was a public officer or employee, may not represent a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person. As used in this Rule, the term "confidential government information" means information that has been obtained under governmental authority and which, at the time this Rule is applied, the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public. A firm with which that lawyer is associated may undertake or continue representation in the matter only if the disqualified lawyer is timely screened from any participation in the matter and is apportioned no part of the fee therefrom.

(d) Except as law may otherwise expressly permit, a lawyer currently serving as a public officer or employee:

(1) Is subject to Rules 1.7 and 1.9; and

(2) Shall not:

(i) Participate in a matter in which the lawyer participated personally and substantially while in

© Copyrighted by the Secretary of the State of the State of Connecticut

private practice or nongovernmental employment, unless the appropriate government agency gives its informed consent, confirmed in writing; or

(ii) Negotiate for private employment with any person who is involved as a party or as lawyer for a party in a matter in which the lawyer is participating personally and substantially; except that a lawyer serving as a law clerk to a judge, other adjudicative officer or arbitrator may negotiate for private employment as permitted by Rule 1.12 (b) and subject to the conditions stated in Rule 1.12 (b).

(e) As used in this Rule, the term "matter" includes:

(1) Any judicial or other proceeding, application, request for a ruling or other determination, contract, claim, controversy, investigation, charge, accusation, arrest or other particular matter involving a specific party or parties, and

(2) Any other matter covered by the conflict of interest rules of the appropriate government agency.

(P.B. 1978-1997; Rule 1.11.) (Amended June 26, 2006, to take effect Jan. 1, 2007.)

COMMENTARY: A lawyer who has served or is currently serving as a public officer or employee is personally subject to the Rules of Professional Conduct, including the prohibition against concurrent conflicts of interest stated in Rule 1.7. In addition, such a lawyer may be subject to statutes and government regulations regarding conflict of interest. Such statutes and regulations may circumscribe the extent to which the government agency may give consent under this Rule. See Rule 1.0 (f) for the definition of informed consent.

Subsections (a) (1), (a) (2) and (d) (1) restate the obligations of an individual lawyer who has served or is currently serving as an officer or employee of the government toward a former government or private client. Rule 1.10 is not applicable to the conflicts of interest addressed by this Rule. Rather, subsection (b) sets forth a special imputation rule for former government lawyers that provides for screening and notice. Because of the special problems raised by imputation within a government agency, subsection (d) does not impute the conflicts of a lawyer currently serving as an officer or employee of the government to other associated government officers or employees, although ordinarily it will be prudent to screen such lawyers.

Subsections (a) (2) and (d) (2) apply regardless of whether a lawyer is adverse to a former client and are thus designed not only to protect the former client, but also to prevent a lawyer from exploiting public office for the advantage of another client. For example, a lawyer who has pursued a claim on behalf of the government may not pursue the same claim on behalf of a later private client after the lawyer has left government service, except when authorized to do so by the government agency under subsection (a). Similarly, a lawyer who has pursued a claim on behalf of a private client may not pursue the claim on behalf of the government, except when authorized to do so by subsection (d). As with subsections (a) (1) and (d) (1), Rule 1.10 is not applicable to the conflicts of interest addressed by these subsections.

This Rule represents a balancing of interests. On the one hand, where the successive clients are a government agency and another client, public or private, the risk exists that power or discretion vested in that agency might be used for the special benefit of the other client. A lawyer should not be in a position where benefit to the other client might affect performance of the lawyer's professional functions on behalf of the government. Also, unfair advantage could accrue to the other client by reason of access to confidential government information about the client's adversary, obtainable only through the lawyer's government service. On the other hand, the rules governing lawyers presently or formerly employed by a government agency should not be so restrictive as to inhibit transfer of employment to and from the government. The government has a legitimate need to attract qualified lawyers as well as to maintain high ethical standards. Thus, a former government lawyer is disqualified only from particular matters in which the lawyer participated personally and substantially. The provisions for screening and waiver in subsection (b) are necessary to prevent the disqualification rule from imposing too severe a deterrent against entering public service. The limitation of disqualification in subsections (a) (2) and (d) (2) to matters involving a specific party or parties, rather than extending disqualification to all substantive issues on which the lawyer worked, serves a similar function.

When a lawyer has been employed by one government agency and then moves to a second government agency, it may be appropriate to treat that second agency as another client for purposes of this Rule, as when a lawyer is employed by a city and subsequently is employed by a federal agency. However, because the conflict of interest is governed by subsection (d), the latter agency is not required to screen the lawyer as subsection (b) requires a law firm to do. The question of whether two government agencies should be regarded as the same or different clients for conflict of interest purposes is beyond the scope of these Rules. See Commentary to Rule 1.13.

Subsections (b) and (c) contemplate a screening arrangement. See Rule 1.0 (l) (requirements for screening procedures). These subsections do not prohibit a lawyer from receiving a salary or partnership share established by prior independent agreement, but that lawyer may not receive compensation directly relating the lawyer's compensation to the fee in the matter in which the lawyer is disqualified.

Notice, including a description of the screened lawyer's prior representation and of the screening procedures employed, generally should be given as soon as practicable after the need for screening becomes apparent.

Subsection (c) operates only when the lawyer in question has knowledge of the information, which means actual knowledge; it does not operate with respect to information that merely could be imputed to the lawyer.

Subsections (a) and (d) do not prohibit a lawyer from jointly representing a private party and a government agency when doing so is permitted by Rule 1.7 and is not otherwise prohibited by law.

For purposes of subsection (e) of this Rule, a "matter" may continue in another form. In determining whether two particular matters are the same, the lawyer should consider the extent to which the matters involve the same basic facts, the same or related parties, and the time elapsed.

Rule 1.12. Former Judge, Arbitrator, Mediator or Other Third-Party Neutral

(Amended June 26, 2006, to take effect Jan. 1, 2007.)

(a) Except as stated in subsection (d), a lawyer shall not represent anyone in connection with a matter in which the lawyer participated personally as a judge or other adjudicative officer or law clerk

RE: Certificate of Need Application; Docket Number: 12-31747-CON
Proposal for Yale-New Haven Hospital's Acquisition of the Saint Raphael Healthcare System Inc. and Hospital of Saint Raphael

Dear Ms. Ahn and Ms. Estes,

On February 9, 2012, the Office of Health Care Access ("OHCA") received your initial Certificate of Need ("CON") application for Yale-New Haven Hospital's ("YNHH") acquisition of the Saint Raphael Healthcare System Inc. ("SRHS"), including the Hospital of Saint Raphael ("HSR").

OHCA has reviewed the CON application and requests additional information pursuant to General Statutes § 19a-639a(c):

Project Description and Need: Change of Ownership or Control – pages 20 through 25

1. Please describe the following:

   a. SHRHS' ownership and control of Saint Regis Health Center, Inc. d/b/a Sister Virginie Grimes Center;
   b. HSR's ownership and control of Connecticut CK Leasing, LLC;
   c. DePaul Health Services Corporation, Inc.'s ownership and control of Saint Raphael Dialysis Center Partnership; and
   d. The businesses engaged in by Connecticut CK Leasing, LLC and Saint Raphael Dialysis Center Partnership and any services they provide to inpatients or outpatients of HSR.

2. On page 21, applicants state that HSR provides "a number of community based programs" and outlines some of these programs in a list.

   Please indicate whether each of these programs is expected to continue following the acquisition. In addition, please provide information regarding all other HSR community based programs and indicate whether each of these additional programs will continue following the acquisition. If any program will be terminated as a result of or directly following the acquisition, describe the reason for such termination, how the decision was made and how the need will be met.

3. On page 22, applicants state that "[d]espite many efforts to mitigate financial losses, HSR recognized that without outside assistance and investment, it could not survive long term as a standalone entity."

   Please describe in detail the efforts HSR has taken to mitigate financial losses and provide detailed evidence supporting the conclusion that HSR could not survive as a standalone entity.

4. Applicants indicate, on page 24, that, "absent the proposed acquisition of HSR, YNHH will have to construct a 5th bed tower..." and further indicate that such tower is estimated to cost approximately $400 million and take nearly five years to complete.

   Please describe:

   a. The number and types of beds (by service category) that were estimated to be contained in the tower.
   b. How the cost and timeline estimates for the tower were determined.

5. Also on page 24, applicants state that "YNHH will make significant investments in the HSR campus to improve its facilities and technological capabilities."

   Please address the following:

   a. Describe, in detail, the nature of the facility improvements that will be made.
   b. Describe, in detail, the nature of the technological improvements that will be made.
   c. Describe how decisions will be made regarding these facility and technological improvements.
   d. Provide an estimated completion date for the improvements described in subsections (a) and (b), respectively.

6. Also on page 24, applicants state that "HSR's long term debt will be extinguished and resources will be provided to address the current Church plan pension shortfall."

   Please provide the following:

   a. The amount of long term debt that HSR currently carries and the amount that will be extinguished;
   b. The amount of the current Church plan pension shortfall and the amount that the shortfall will be reduced; and
   c. The source of the funds that will be used to make the payments described in subsections (a) and (b).

7. Please address the following:

   a. How are the current 421 operational beds at HSR allocated between medical/surgical, pediatric, obstetric, rehabilitation and psychiatric services.
   b. Would YNHH's acquisition of HSR result in any change to the current allocation of beds on the HSR campus.
   c. What would be necessary to make all of HSR's 511 licensed beds operational (up from the current 421 operational beds).
   d. Beyond the current 421 operational beds at HSR, how many additional beds could be phased into operation before the end of FY 2015, what would the likely phasing schedule be and what would be necessary to achieve this.
   e. From 10/08 to the month of applicants' completeness response, what has been the average monthly census for HSR based on both total beds and medical/surgical beds (please provide this data in chart and table form similar to that found on pps. 15-17 of YNHH's CON Application to Increase the Hospital's Licensed Bed Count by 70 under Docket No. 12-31745-CON).
   f. Assuming YNHH is licensed at 1,407 general hospital beds post-acquisition of HSR, and based on the projected inpatient utilization of both campuses, when would YNHH expect to exceed an 80% occupancy level based on average monthly census projections (please provide evidence of all assumptions and calculations on which such projection is based, and a chart of YNHH's bed need for each year until the 80% threshold is reached).
   g. Provide the same information as requested in subsection (f) above, but restrict the projection to when 80% occupancy of the combined medical/surgical beds on both campuses would be exceeded.
   h. Assuming YNHH is licensed at 1,477 general hospital beds post-acquisition of HSR, and based on the projected inpatient utilization of both campuses, when would YNHH expect to exceed an 80% occupancy level based on average monthly census projections (please provide evidence of all assumptions and calculations on which such projection is based).
   i. Provide the same information as requested in subsection (h) above, but restrict the projection to when 80% occupancy of the combined medical/surgical beds on both campuses would be exceeded.

8. On pages 24 and 25, applicants indicate that they engaged Deloitte "to identify cost savings which could be achieved through the acquisition" and that these cost savings are expected to exceed a half of a billion dollars over the next five years.

   Please provide:

   a. A copy of the Deloitte report;
   b. The applicants' cost savings plan; and
   c. An explanation of how applicants foresee that the savings will reduce costs of health care services for patients served by YNHH if the CON application is granted.

9. On page 25, applicants state that "[b]oth HSR and YNHH have focused on maintaining access and improving the quality of care despite the ever-present financial challenges of the industry."

   Please explain, in detail, HSR's efforts to maintain access and improve quality of care since 10/08.

10. Please describe, in detail, how the acquisition of HSR by YNHH will affect the following:

    a. Teaching and residency programs currently located at HSR and YNHH;
    b. Research and clinical trials conducted at HSR and YNHH;
    c. Emergency department services currently located at HSR and YNHH;
    d. Charity care and financial assistance programs currently operating at HSR and YNHH; and
    e. The rates currently charged for hospital services at HSR and YNNH.

Determination of Need by HSR – pages 26 through 27

11. Please describe, in detail, the steps that HSR took to address its financial situation. In addition, provide detailed evidence for the conclusion that HSR will be unable to achieve financial stability in the future. Please include information regarding the following cost saving efforts in the discussion:

    a. Aggressive negotiations with managed care organizations;
    b. Productivity enhancements;
    c. Supply chain cost reductions;
    d. Adjustments to fringe benefits; and
    e. Postponement of essential renovations and equipment purchases.

12. On page 26, applicants indicate that in early 2010, the SRHS Board's Ad Hoc Strategy Committee "began to explore and evaluate options to ensure continuation of the mission of Saint Raphael's and the Sisters into the future."

    Please provide evidence of the Committee's exploration and evaluation of options. Include information regarding the other options besides integration with YNHH that were explored.

13. Provide any reports prepared by Navigant Consulting relating to the analysis of health systems that it performed for HSR.

14. Provide a copy of the letter of intent signed by YNHH and HSR in March 2011.

Benefits to HSR – pages 27 through 29

15. On page 27, applicants state that HSR identified YNHH as its optimal partner for a number of reasons outlined in the application. Please address the following:

    a. Describe any clinical staff/clinical positions at HSR that would not be retained after the acquisition.
    b. Explain what Centers of Excellence would be created and located at the HSR campus.
    c. How will the HSR campus be held out/identified to the public post-acquisition by YNHH?

16. On pages 28 and 29, applicants state that "[i]n the first five years, YNHH plans to invest $129.5 million" in the HSR campus for a variety of purposes. Please address the following:

    a. Is the $129.5 million investment separate and distinct from the $160 million being paid by Buyer pursuant to Section 2.3 of the Asset Purchase Agreement set forth at Attachment III to the CON application?
    b. List the deferred capital purchases and projects on the HSR campus the investment will address.
    c. List the investments in clinical service infrastructure that will be made on the HSR campus.
    d. Explain when YNHH would expect the existing information technology systems on the HSR campus to be integrated with YNHH's and when the implementation of the Epic electronic medical record system would be completed on the HSR campus.

17. Describe, in detail, the "new, integrated organization [that] will preserve clinical services and ensure HSR's charitable assets for future generations" referenced on page 29. Please also provide the following information regarding the Charitable Funds defined at Section 5.5 of the Asset Purchase Agreement:

    a. What amount of Charitable Funds, if any, will be transferred to Buyer or Buyer's Affiliate as part of the Purchased Assets and how will they be used for the benefit of the Facilities?
    b. What amount of Charitable Funds that cannot be transferred to Buyer or Buyer's Affiliate as part of the Purchased Assets will be used by Sellers at or for the benefit of the Facilities and how will they be used?
    c. What amount of Charitable Funds shall be used by Sellers to fund activities mutually agreed upon by the parties that benefit the delivery of health care services consistent with the Directives in the greater New Haven area and how will they be used?

Determination of Need by YNHH – pages 29 through 35

18. On page 32 in Graphs I and II, respectively, applicants provided information on YNHH's occupancy based on the midnight census and the contact census for all services and for medical/surgical beds as compared to total beds and 80% occupancy levels. Please provide HSR's occupancy based on its census data from FY 2011 to FY 2012 (year to date) in the same format.

19. YNHH recently submitted a CON application to add 70 beds which will be temporarily located in its East Pavilion. Assuming that CON is granted, please explain what will happen to these 70 beds if the CON application for the acquisition of HSR is not approved and, alternatively, if the CON application for the acquisition of HSR is approved.

20. Please provide a copy of YNHH's long range financial plan showing the need for an additional 74 beds by 2016 even if 70 additional beds are added pursuant to Docket No. 12-31745-CON.

21. Please provide copies of the inpatient volume projections submitted to the Connecticut Attorney General and the Federal Trade Commission.

22. Please provide evidence of YNHH's decision-making process regarding the location of the new bed tower that has been contemplated as part of its long range financial planning efforts.

Benefits to YNHH – pages 35 through 40

23. On page 35, applicants state that "[t]he opportunity to avoid duplicative investments and focus on key strategies, such as primary care development, will enhance access to services for patients in the region."

    Please describe the discussions HSR and YNHH have had surrounding the development of primary care and the avoidance of duplication of services.

24. On page 36, applicants state that "discussions have been held with the State of Connecticut Attorney General and the Federal Trade Commission to initiate governmental approval of the transaction."

    Please describe the status of those discussions and provide a timeline for when decisions from the Attorney General's Office and the Federal Trade Commission might be expected if they have not already been rendered.

25. On page 37, applicants state that they "have worked to identify a number of options to achieve cost savings and work flow efficiencies."

    Please describe these cost savings and work flow efficiencies.

    a. Please provide additional detail regarding which subspecialties will be, or are likely to be consolidated, on one campus (indicating which campus) and include the reasoning behind each decision.
    b. What subspecialties will be, or are likely to be, offered on both campuses? Explain how these service lines were selected.

26. On page 37, applicants state that "Deloitte has estimated cost savings from clinical and business operational integrations of at least $300 million over five years."

    Please provide information that describes these cost savings in detail, including a breakdown of the approximate amount of money saved by each measure.

27. Please describe how the acquisition will improve efficiency, access to health care and quality for the area's growing elderly population.

28. Please provide an unredacted copy of the Asset Purchase Agreement and all exhibits thereto.

Quality Measures – pages 40 through 43

29. To the extent not already provided, please describe the $85 million in facility upgrades that YNHH plans to undertake on the HSR campus and the estimated amounts that will be spent in each year.

30. To the extent not already provided, please describe the type of routine capital expenditures that will amount to $25 million in expenditures over the next five years and the estimated amounts that will be spent in each year.

31. When will the EPIC installation at YNHH be complete? If the acquisition is approved, how long after Closing is it estimated that EPIC installation at HSR would begin?

Proposed Capital Expenditures/Costs and Patient Population Mix – pages 45 through 52

32. Please describe what makes up the $60,248,000 in the "Other Non-Construction (Other Asset Purchases)" line of the proposed capital expenditure chart on page 45.

33. On page 45, applicants state that specific capital costs for HSR's assets equal $147,879,000. Please provide information on how much of the remaining $12,021,000 in capital expense is being allocated to the purchase of DePaul Health Services Corporation, Inc.'s ownership interest in the Saint Raphael Magnetic Resonance Center (SRMRC).

34. Please summarize any analyses or reports from Barclays Capital, other underwriters or YNHH's financial advisors regarding YNHH's credit rating and ability to obtain the $160 million in bond financing necessary to complete the proposed acquisition.

35. On page 49, with respect to the assumptions for patient population mix, please explain why volumes for HSR are assumed to be flat through the projection period.

Financial Attachments I & II – pages 50-52 and Attachments VII and VIII

36. On page 231 (Attachment I for YNHH), please explain, in detail, the underlying assumptions for the increases in bad debt and interest expense connected with the HSR acquisition?

37. On page 234 (Attachment I for HSR), please explain, in detail, the underlying assumptions for inpatient discharges dropping in FY 2012 and remaining flat throughout the projection period without the YNHH affiliation taking place.

38. On page 234 (Attachment I for HSR), please explain, in detail, the underlying assumptions for outpatient visits increasing in FY 2012 and remaining flat throughout the projection period without the YNHH affiliation taking place.

39. On page 238, please explain the basis for the net negative adjustment to hospital inpatient and outpatient revenue due to health care reform.

40. On pages 50-51, please explain in more detail how YNHH intends to establish budget neutral agreements "with new payment terms that will not result in an adverse financial impact to the managed care payers or the self-funded employers they represent" if the affiliation occurs. Please also explain whether YNHH would be able to negotiate similar budget neutral agreements if the affiliation with HSR did not occur and how the affiliation impacts YNHH's ability to negotiate with managed care plans as well as other private health insurers.

MRI CON Questions and Responses – Appendix I

41. On page 246, applicants state that inpatient "scan volume is projected to increase in proportion to an expected increase in the average daily census (ADC) at the Saint Raphael campus following the acquisition by YNHH ... ADC is projected to increase by 40 in FY 2012, 60 in FY 2014 and 85 in FY 2015." Yet, at page 236 of the CON Application, no increase in HSR utilization is assumed. Please explain this apparent discrepancy.

42. Will there be any change in the radiologists who provide professional services interpreting the SRMRC MRI scans as a result of YNNH's acquisition of HSR?

In responding to the questions contained in this letter, please repeat each question before providing your response. Paginate and date your response. Information filed must be numbered sequentially from the applicants' document preceding it. For example, if the application concludes with page 100, your completeness response letter would begin with page 101. Please reference "Docket Number: 12-31747-CON" and submit one (1) original and five (5) hard copies of your response. In addition, please submit a scanned copy of your response, including all attachments, on CD using MS Word format or Adobe Acrobat.

Upon receipt of the responses to this letter and after incorporating the provided information into the initial submission, OHCA staff will perform a detailed review of the entire CON application. If you have any questions concerning this letter, please feel free to contact Steven W. Lazarus at OHCA at (860) 418-7012.

Sincerely,

Steven W. Lazarus
Associate Health Care Analyst

EXHIBIT C

CANON 9
A Lawyer Should Avoid Even the Appearance of Professional Impropriety

ETHICAL CONSIDERATIONS

EC 9-1 Continuation of the American concept that we are to be governed by rules of law requires that the people have faith that justice can be obtained through our legal system.[1] A lawyer should promote public confidence in our system and in the legal profession.[2]

EC 9-2 Public confidence in law and lawyers may be eroded by irresponsible or improper conduct of a lawyer. On occasion, ethical conduct of a lawyer may appear to laymen to be unethical. In order to avoid misunderstandings and hence to maintain confidence, a lawyer should fully and promptly inform his client of material developments in the matters being handled for the client. While a lawyer should guard against otherwise proper conduct that has a tendency to diminish public confidence in the legal system or in the legal profession, his duty to clients or to the public should never be subordinate merely because the full discharge of his obligation may be misunderstood or may tend to subject him or the legal profession to criticism. When explicit ethical guidance does not exist, a lawyer should determine his conduct by acting in a manner that promotes public confidence in the integrity and efficiency of the legal system and the legal profession.[3]

EC 9-3 After a lawyer leaves judicial office or other public employment, he should not accept employment in connection with any matter in which he had substantial responsibility prior to his leaving, since to accept employment would give the appearance of impropriety even if none exists.[4]

EC 9-4 Because the very essence of the legal system is to provide procedures by which matters can be presented in an impartial manner so that they may be decided solely upon the merits, any statement or suggestion by a lawyer that he can or would attempt to circumvent those procedures is detrimental to the legal system and tends to undermine public confidence in it.

EC 9-5 Separation of the funds of a client from those of his lawyer not only serves to protect the client but also avoids even the appearance of impropriety, and therefore commingling of such funds should be avoided.

EC 9-6 Every lawyer owes a solemn duty to uphold the integrity and honor of his profession; to encourage respect for the law and for the courts and the judges thereof; to observe the Code of Professional Responsibility; to act as a member of a learned profession, one dedicated to public service; to cooperate with his brother lawyers in supporting the organized bar through the devoting of his time, efforts, and financial support as his professional standing and ability reasonably permit; to conduct himself so as to reflect credit on the legal profession and to inspire the confidence, respect, and trust of his clients and of the public; and to strive to avoid not only professional impropriety but also the appearance of impropriety.[5]

EC 9-7 A lawyer has an obligation to the public to participate in collective efforts of the bar to reimburse persons who have lost money or property as a result of the misappropriation or defalcation of another lawyer, and contribution to a client's security fund is an acceptable method of meeting this obligation.[6]

DISCIPLINARY RULES

DR 9-101 Avoiding Even the Appearance of Impropriety.[1]

(A) -A lawyer shall not accept private employment in a matter upon the merits of which he has acted in a judicial capacity.[4]

(B) -A lawyer shall not accept private employment in a matter in which he had substantial responsibility while he was a public employee.[5]

(C) -A lawyer shall not state or imply that he is able to influence improperly or upon irrelevant grounds any tribunal, legislative body,[6] or public official.

DR 9-102 Preserving Identity of Funds and Property of a Client.[7]

(A) -All funds of clients paid to a lawyer or law firm, other than advances for costs and expenses, shall be deposited in one or more identifiable bank accounts maintained in the state in which the law office is situated and no funds belonging to the lawyer or law firm shall be deposited therein except as follows:

(1) -Funds reasonably sufficient to pay bank charges may be deposited therein.

(2) -Funds belonging in part to a client and in part presently or potentially to the lawyer or law firm must be deposited therein, but the portion belonging to the lawyer or law firm may be withdrawn when due unless the right of the lawyer or law firm to receive it is disputed by the client, in which event the disputed portion shall not be withdrawn until the dispute is finally resolved.

(B) -A lawyer shall:

(1 -)Promptly notify a client of the receipt of his funds, securities, or other properties.

(2) -Identify and label securities and properties of a client promptly upon receipt and place them in a safe deposit box or other place of safekeeping as soon as practicable.

(3) -Maintain complete records of all funds, securities, and other properties of a client coming into the possession of the lawyer and render appropriate accounts to his client regarding them.

(4) -Promptly pay or deliver to the client as requested by a client the funds, securities, or other properties in the possession of the lawyer which the client is entitled to receive.

NOTES

1. "Integrity is the very breath of justice. Confidence in our law, our courts, and in the administration of justice is our supreme interest. No practice must be permitted to prevail which invites towards the administration of justice a doubt or distrust of its integrity." Erwin M. Jennings Co. v. DiGenova, 107 Conn. 491, 499, 141 A. 866, 868 (1928).

2. "A lawyer should never be reluctant or too proud to answer unjustified criticism of his profession, of himself, or of his brother lawyer. He should guard the reputation of his profession and of his brother as zealously as he guards his own." Rochelle & Payne, *The Struggle for Public Understanding*, 25 Texas B.J. 109, 162 (1962).

3. *See* ABA Canons of Professional Ethics, Canon 29 (1908).

4. *See* ABA Canons of Professional Ethics, Canon 36 (1908).

5. "As said in Opinion 49, of the Committee on Professional Ethics and Grievances of the American Bar Association, page 134: 'An attorney should not only avoid impropriety but should avoid the appearance of impropriety.' " State ex rel. Nebraska State Bar Ass'n v. Richards, 165 Neb. 80, 93, 84 N.W.2d 136, 145 (1957).

"It would also be preferable that such contribution [to the campaign of a candidate for judicial office] be made to a campaign committee rather than to the candidate personally. In so doing, possible appearances of impropriety would be reduced to a minimum" *ABA Opinion* 226 (1941).

"The lawyer assumes high duties, and has imposed upon him grave responsibilities. He may be the means of much good or much mischief. Interests of vast magnitude are entrusted to him; confidence is reposed in him; life, liberty, character and property should be protected by him. He should guard, with zealous watchfulness, his own reputation, as well as that of his profession." People ex rel. Culler v. Ford, 54 Ill. 520, 522 (1870), and also quoted in State Board of Law Examiners v. Sheldon, 43 Wyo. 522, 526, 7 P.2d 226, 227 (1932).

See ABA Opinion 150 (1936).

6. Amended, February 1980; House Informational Report No. 105.

7. *Cf.* Model Code of Professional Responsibility, EC 5-6.

8. *See* ABA Canons of Professional Ethics, Canon 36 (1908).

"It is the duty of the judge to rule on questions of law and evidence in misdemeanor cases and examinations in felony cases. That duty calls for impartial and uninfluenced judgment, regardless of the effect on those immediately involved or others who may, directly or indirectly, be affected. Discharge of that duty might be greatly interfered with if the judge, in another capacity, were permitted to hold himself out to employment by those who are to be, or who may be, brought to trial in felony cases, even though he did not conduct the examination. His private interests as a lawyer in building up his clientele, his duty as such zealously to espouse the cause of his private clients and to defend against charges of crime brought by law enforcement agencies of which he is a part, might prevent, or even destroy, that unbiased judicial judgment which is so essential in the administration of justice.

"In our opinion, acceptance of a judgeship with the duties of conducting misdemeanor trials, and examinations in felony

cases to determine whether those accused should be bound over for trial in a higher court, ethically bars the judge from acting as attorney for the defendants upon such trial, whether they were examined by him or by some other judge. Such a practice would not only diminish public confidence in the administration of justice in both courts, but would produce serious conflict between the private interests of the judge as a lawyer, and of his clients, and his duties as a judge in adjudicating important phases of criminal processes in other cases. The public and private duties would be incompatible. The prestige of judicial office would be diverted to private benefit, and the judicial office would be demeaned thereby." *ABA Opinion* 242 (1942).

"A lawyer, who has previously occupied a judicial position or acted in a judicial capacity, should refrain from accepting employment in any matter involving the same facts as were involved in any specific question which he acted upon in a judicial capacity and, for the same reasons, should also refrain from accepting any employment which might reasonably appear to involve the same facts." *ABA Opinion* 49 (1931).

See ABA Opinion 110 (1934).

9. *See ABA Opinions* 125 (1935) and 134 (1935); *cf.* ABA CANONS OF PROFESSIONAL ETHICS, CANON 36 (1980) and *ABA Opinions* 59 (1931) and 26 (1930). *But see ABA Opinion* 37 (1931).

10. "[A statement by a governmental department or agency with regard to a lawyer resigning from its staff that includes a laudation of his legal ability] carries implications, probably not founded in fact, that the lawyer's acquaintance and previous relations with the personnel of the administrative agencies of the government place him in an advantageous position in practicing before such agencies. So to imply would not only represent what probably is untrue, but would be highly reprehensible." *ABA Opinion* 184 (1938).

11. *See* ABA CANONS OF PROFESSIONAL ETHICS, CANON 11 (1908).

"*Rule 9* . . . . A member of the State Bar shall not commingle the money or other property of a client with his own; and he shall promptly report to the client the receipt by him of all money and other property belonging to such client. Unless the client otherwise directs in writing, he shall promptly deposit his client's funds in a bank or trust company . . . in a bank account separate from his own account and clearly designated as 'Clients' Funds Account' or 'Trust Funds Account' or words of similar import. Unless the client otherwise directs in writing, securities of a client in bearer form shall be kept by the attorney in a safe deposit box at a bank or trust company . . . which safe deposit box shall be clearly designated as 'Clients' Account' or 'Trust Account' or words of similar import, and be separate from the attorney's own safe deposit box." CAL. BUSINESS AND PROFESSIONS CODE §6076 (West 1962).

"[C]ommingling is committed when a client's money is intermingled with that of his attorney and its separate identity lost so that it may be used for the attorney's personal expenses or subjected to claims of his creditors . . . . The rule against commingling was adopted to provide against the probability in some cases, the possibility in many cases, and the danger in all cases that such commingling will result in the loss of clients' money." Black v State Bar, 57 Cal. 2d 219, 225-26, 368 P.2d 118, 122, 18 Cal. Rptr. 518, 522 (1962).

Re: Certificate of Need Application; Docket Number: 12-31748-CON
Yale-New Haven Hospital and Greenwich Hospital to
Establish and Operate an Elective Angioplasty Program at Greenwich Hospital

Dear Kim:

Enclosed please find two corrected pages of Dr. Kiely's pre-file testimony – pages 8 and 10. Also enclosed are blacklined copies of the same showing the corrections.

Please contact the undersigned should you have any questions.

Respectfully submitted,

Stephen M. Cowherd /am

FY 2009-2011 Inpatient Cardiac Catheterization Volume in Proposed Service Area

State	FY 09	FY 10	FY 11
CT Service Area*	1,000	948	808
NY Service Area**	1,443	1,355	1,353
Total	2,443	2,303	2,161

*The CT Service Area is made up of Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston and Westport. (*See* Application at p. 24)
** The NY Service Area is made up of Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneck, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Round Ridge, Purchase, Scarsdale, South Salem, West Harrison, and White Plains. (*See* Application at p. 24)
Source: CT Chime and NY SPARCS database. *See* Exhibit 3.

FY 2009-2011 Inpatient Coronary Angioplasty (PCI) Volume in Proposed Services Area

State	FY 09	FY 10	FY 11
CT Service Area*	598	610	429
NY Service Area**	844	775	772
Total	1,442	1,385	1,201

*The CT Service Area is made up of Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston and Westport.
** The NY Service Area is made up of Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneck, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Round Ridge, Purchase, Scarsdale, South Salem, West Harrison, and White Plains.
Source: CT Chime and NY SPARCS database. *See* Exhibit 3.

Applicants did not provide any of this data in their CON Application because they know it in no way supports their proposal. They also have not provided any credible reasons why these utilization trends will change in the future.

There also has not been any increase in Greenwich's own emergency PCI volumes that would suggest a need for an elective angioplasty program at their hospital. In the three year period before Greenwich submitted its prior application for an elective PCI program, it performed 38, 33 and 41 primary angioplasties, respectively, and in the three year period

In considering the lack of volume growth cited above, it is also important to note that the White Plains Hospital elective angioplasty program began operating in 2010, making the field of elective PCI providers in the Applicants' proposed service area even more crowded than it was in 2009 when Applicants' previous application was denied. White Plains Hospital is located approximately ten miles to Greenwich Hospital's west. This means that if this Application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other. How can that possibly make sense or be an appropriate balance of health care services? The answers are that it doesn't and it can't, especially in a time of zero volume growth.

That the Greenwich Hospital and White Plains programs will severely overlap in the proposed New York service area is borne out by the data. In FY 2011, WPH performed 165 inpatient PCIs, with 110 of these procedures performed on residents of Greenwich Hospital's New York service area. *See* Exhibit 5. Attached to my testimony as Exhibit 6 is a letter from Susan Fox, Executive Vice President of White Plains Hospital which describes that Hospital's elective angioplasty program in more detail and sets forth its position on the pending Application. This letter verifies that the Westchester County market targeted by Applicants is well served not only by WPH but by a host of other providers including the Westchester County Medical Center, Montefiore Medical Center, New York Presbyterian-Weill Cornell Medical Center, New York Presbyterian-Columbia University Medical Center, Lenox Hill Hospital and Mount Sinai Medical Center. This being the case, Applicants' certainly cannot rely on a lack of capacity in New York to establish clear public need for their proposal.

The situation in Fairfield and Westchester Counties is clearly different from the eastern part of Connecticut as presented by Lawrence & Memorial Hospital ("L&M") in its

IN THE MATTER OF:

A Certificate of Need Application by
Greenwich Hospital and Yale-New Haven Hospital
To Establish and Operate an Elective Angioplasty Program

Docket Number: 12-31748-CON
July 16, 2012

ORDERS

1. RULING ON A PETITION FILED BY THE STAMFORD HOSPITAL TO BE DESIGNATED AS AN INTERVENOR WITH FULL RIGHTS OF CROSS-EXAMINATION

On July 12, 2012, The Stamford Hospital ("Petitioner") filed *Petition of the Stamford Hospital for Intervenor Status with Full Procedural Rights*. On July 16, 2012, Greenwich Hospital and Yale-New Haven Hospital (collectively "Applicant") filed an objection to the Petitioner's petition for intervenor status and moved to strike certain testimony.

Petitioner's petition is granted, in part, and denied, in part. Pursuant to Connecticut General Statutes § 4-177a, Petitioner is granted limited intervenor status; Petitioner's motion for status with full procedural rights is denied. Petitioner shall have the rights to inspect and copy records, physical evidence, papers and documents, to introduce evidence, and to make a brief closing argument. Petitioner shall not have the right to cross-examine Applicant's witnesses. Petitioner's witnesses are subject to cross-examination by the Applicant.

Applicant's motion to strike certain testimony will be addressed at hearing.

2. RULING ON APPLICANT'S OBJECTION TO THE ADMINISTRATIVE NOTICE OF DOCKET NO. 08-31210-CON.

On July 16, 2012, Applicant filed an objection to the administrative notice of docket no. 08-31210-CON. Applicant's objection is overruled.

3. RULING ON APPLICANT'S MOTION TO DISQUALIFY COUNSEL FOR PETITIONER

On July 16, 2012, Applicant filed a motion to disqualify Attorney Stephen M. Cowherd and the law firm of Jeffers Cowherd from representing Petitioner. Applicant has failed to demonstrate the basis for disqualification. Applicant's motion is denied.

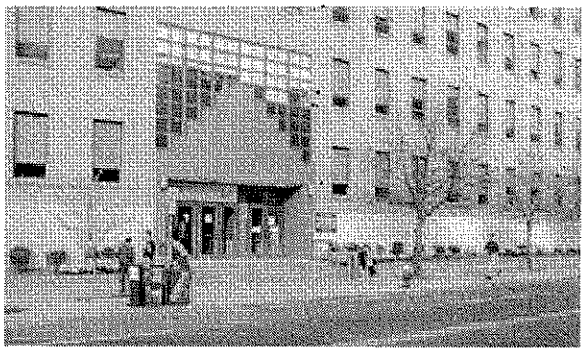
Department of Public Health

From I-91 North or South and from East of the River:
In Hartford take I-84 westbound. Exit at Asylum Street, exit 48.
At the signal at the bottom of the ramp, make a gradual right, staying to the left of the fork in the road.
At the first light, take an immediate left onto Broad Street.
Travel on Broad Street to the light at the first four-way intersection; take a right onto Capitol Avenue. OHCA (tan brick building at 410 Capitol Avenue) is two blocks down on the right.
* Pass 410 and enter in the driveway between 410 and 450 Capitol Avenue. Turn right into the parking lot behind the building and proceed to the Security building in the lot. You will be directed to available parking.



From the West:
Take I-84 East to Capitol Avenue, Exit 48B. Bear right on the exit ramp. At the end of the ramp, turn right onto Capitol Avenue. OHCA is 3 blocks down on the right (tan brick building at 410 Capitol Avenue).

Proceed from * above.

Dear Ms. Martone:

We have attached TSH's Response to Applicants' Objection to TSH's Submission of Rebuttal Testimony and Motion to Strike, TSH's Objection and Motion to Strike a Portion of Applicants' Rebuttal Testimony and TSH's rebuttal testimony for the above-referenced docket. Kindly confirm receipt by reply email. Copies of these documents are being provided simultaneously to Applicants via this email. Hard copies will be delivered to OHCA by approximately 8:30 this morning.

Best regards,

Stephen Cowherd

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

INTERVENOR THE STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE A PORTION OF REBUTTAL TESTIMONY OF MARNA BORGSTROM AND CHRISTOPHER HOWES, M.D.

Intervenor The Stamford Hospital ("TSH") hereby objects to and moves to strike portions of the pre-filed rebuttal testimony of Marna Borgstrom and Christopher Howes, M.D. submitted by Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants") for the public hearing. The portions of the testimony sought to be stricken are identified on the pages of testimony attached as Exhibit A hereto. As set forth more fully below, Ms. Borgstrom's pre-filed rebuttal testimony (pages 698-701) includes extensive commentary regarding open heart surgery, which is totally irrelevant and immaterial to the pending Application. Additionally, Dr. Howes' pre-filed rebuttal testimony (pages 762-763) inappropriately quotes the State Health Plan, which at the present time is a draft not yet finalized or adopted, and includes an unwarranted caustic and insulting comment directed at New York Presbyterian Hospital. TSH, therefore, respectfully requests that OHCA strike the foregoing impermissible testimony.

Ms. Borgstrom's pre-filed rebuttal testimony (pages 698-701 and Attachments II, III and IV (pages 716-756)) includes extensive commentary and statistical data regarding inpatient open heart surgery volume, both state-wide and at TSH, which is irrelevant and immaterial to the pending application for approval to perform elective angioplasty without open heart surgery. Ms. Borgstrom's testimony about TSH's open heart surgery program is especially prejudicial because TSH will not have the opportunity to cross-examine this witness. This rebuttal testimony has no arguable relevance to the issues pending before OHCA and should be stricken in its entirety.

Dr. Howes' pre-filed rebuttal testimony (pages 762-63) is likewise objectionable for two reasons. First, Dr. Howes quotes a single sentence from the Draft State Health Plan referencing a change in the ACCF-AHA-SCAIPCI guidelines. The best evidence in this regard is the ACCF-AHA-SCAIPCI guidelines, and it is not appropriate for the Applicant's witness to refer to a plan which exists only in draft form which has not been finalized or adopted. Moreover, if OHCA determines that it is appropriate to consider the draft State Health Plan, then the draft Plan should be considered in its entirety, rather than one sentence taken out of context, as reflected in Dr. Howes' rebuttal testimony. In addition, Dr. Howes' rebuttal testimony includes a spurious remark directed at New York Presbyterian Hospital, which bears no relevance to the issues in this proceeding and is inconsistent with the professionalism and civility customarily demonstrated by witnesses who testify before OHCA.

Wherefore, for the foregoing reasons, Intervenor's objection to the rebuttal testimony should be sustained and the testimony stricken as set forth in Exhibit A hereto.

Respectfully submitted,

THE STAMFORD HOSPITAL

EXHIBIT A

YNHHVC. Ms. Capozzalo will be in attendance at the hearing and can address her discussions with Stamford Hospital under oath.

~~YNHHVC and Greenwich Hospital fully intended to collaborate with Stamford Hospital in~~ the area of cardiac care and had sought to help strengthen Stamford's open heart surgery program, which is suffering from low volume. The presence of Yale faculty based in southwestern Connecticut communities along with the YNHHVC's clinical program support and quality improvement systems would have significantly improved Stamford Hospital's cardiac surgery program's credibility, which is at significant risk, evidenced by the fact that they performed only 80 open heart cases last year and are on track to perform approximately 50 this fiscal year based on 6 months volumes from CHIME (see Table below).

Connecticut Inpatient Volume for Open Heart Surgery by Hospital for FY 2010 - FY 2012 (6 Months)				
Hospital	FY 2010	FY 2011	FY 2012*	
Bridgeport	152	127	140	
Danbury	181	182	150	
Dempsey	67	71	72	
Hartford	793	801	702	
HSR	343	313	300	
St. Francis	867	781	734	
St. Mary's	118	100	114	
St. Vincent's	239	223	200	
Stamford	84	80	54	
Waterbury	109	102	104	
YNHH	869	800	820	
TOTAL	3,792	3,580	3,390	
Source: CHIME				
*FY 2012 annualized based on 6 months actual				

It is clear that YNHHVC acted in good faith to create a cost effective care model for cardiology services in the Stamford and Greenwich area, but it is Stamford Hospital that does not want to collaborate.

- I would also like to point out that Stamford Hospital's extremely low cardiac surgery volume does not come close to meeting professional society recommendations or OHCA's own standards as outlined in the Agreed Settlement for Stamford Hospital (DN: 04-30374-CON) (see Attachment II). Condition #8 states:

  "If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. If **these volumes are not met for a period of <u>two consecutive 12-month periods</u>, TSH's OHS program <u>shall be terminated</u>...**"

  We are not aware that this condition has been modified by OHCA based on a review of OHCA's website and modifications pursued by Stamford Hospital.

  According to OHCA's own data (see Attachment III) through 2010, Stamford Hospital has never come close to reaching 125 open heart surgeries in a year. In fact, it appears that its highest volume was 80 in FY 2011. As previously shown above, based on 6 months of CHIME data for 2012, they are on track to perform about 54 surgeries this year, less than half of the guidelines requirement. These low volumes have been of concern to YNHHVC physicians and we suspect have contributed to fewer referrals to their surgery program. Low surgical volume can also affect the physicians' decisions to transfer patients to Stamford for elective angioplasty, given the uncertain quality of the surgical backup available at that site. Such low surgical volumes present a significant quality concern as identified by the American College of Surgeons which published that an annual volume of 100-125 is <u>necessary</u> from a quality standpoint and this requirement has also been noted by OHCA in its draft Cardiac Services section of the new State Health Plan (see Attachment IV).

- Dr. Kiely states that OHCA should not approve Greenwich Hospital's proposed elective angioplasty program because elective angioplasty volumes are flat in Connecticut and the proposed service area. Stamford Hospital did not previously view flat or declining volumes as problematic when it pursued its full service cardiac program CON. At that time, their own cardiac catheterization volumes had been in decline as noted in OHCA's

Agreed Settlement's Findings of Fact #11 (previously referenced as Attachment II); statewide inpatient cardiac catheterization and angioplasty volumes had declined steadily between 2003 and 2005, as shown in Dr. Kiely's own testimony and open heart surgery volumes had also been declining between 2002 and 2005 as shown in the OHCA table and graph below.

Table 3A: Open heart surgery discharges by provider, FFYs 2002-2010

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	FFY 06-10 (5-yr)% Change	FFY 08-10 (3-yr)% Change	FFY 09-10 (1-yr) % Change

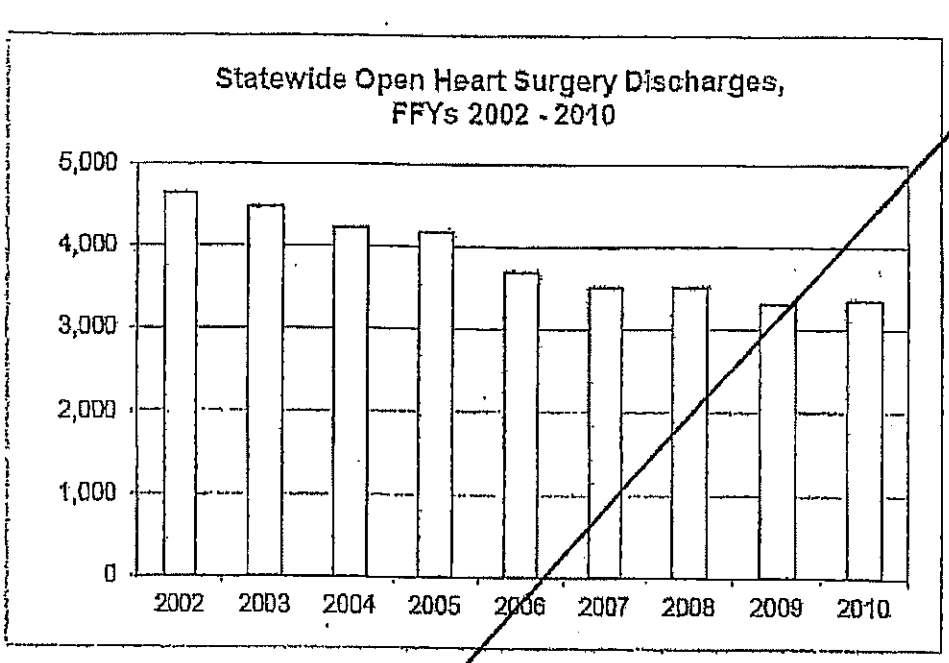
Source: CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.

ICD-9-CM Procedure Codes: 35.10-35.28 and 35.10-36.19

Please note: unduplicated counts utilizing all procedure codes



All of these related and declining volumes did not seem relevant to Stamford Hospital or OHCA as a full service cardiac program was proposed and approved. Stamford Hospital expended more than $8 million dollars in capital expenses to develop their angioplasty and surgery program in a declining volume market (modified from the $5.4 million they estimated at the time of their original CON filing). They based their need on such factors as improved accessibility, continuity of care and improved quality. These are the same reasons why Greenwich Hospital seeks to offer elective angioplasty and ~~can do so without any capital expense.~~

- Dr. Kiely's testimony includes conflicting statistics and information about New York programs. First, I would like to highlight the following statement from OHCA's 2010 Declaratory Ruling, Docket Number: 09-31433-DCR, which specifically states that:

  "...OHCA only has the authority to act on behalf of the state within the parameters of its enabling statutes and its jurisdiction is limited to health care facilities located within the state. Thus, OHCA has no jurisdiction over health care facilities located in other states just as those states have no authority to regulate facilities located within Connecticut."

ATTACHMENT II

Office of Health Care Access
Certificate of Need Application

Agreed Settlement

Hospital:	The Stamford Hospital and New York Presbyterian Healthcare System, Inc.
Docket Number:	04-30374-CON
Project Title:	Establish Elective Angioplasty and Open Heart Surgery Program at The Stamford Hospital
Statutory Reference:	Sections 19a-638 & 639, Connecticut General Statutes
Filing Date:	August 15, 2005
Hearing Dates:	Public Portion: September 22, 2005 Technical Portion: October 6, 2005 and October 27, 2005
Commissioner & Presiding Officer:	Cristine A. Vogel
Agreed Settlement Date:	January 4, 2006
Default Date:	Not Applicable
OHCA Staff	Steven W. Lazarus Michael Sabados

Project Description: The Stamford Hospital ("TSH" and "Hospital") and New York Presbyterian Healthcare System, Inc. ("Applicants") propose the establishment of an elective angioplasty ("PCI") and open-heart surgery ("OHS") program, to be located at the Hospital, at a capital expenditure of $5,404,425.

Nature of Proceedings: On August 15, 2005, the Office of Health Care Access ("OHCA") received the Applicants' Certificate of Need ("CON") application seeking authorization to establish an elective angioplasty and open-heart surgery program, to be located at the Hospital, at a capital expenditure of $5,404,425. The Stamford Hospital is organized under the laws of Connecticut, and New York Presbyterian Healthcare System, Inc. is a corporation organized under the laws of the State of New York. The Hospital is a health care facility or institution as defined by Section 19a-630 of the Connecticut General Statutes ("C.G.S.").

Public hearings regarding the CON Application were held on September 22, 2005, October 6, 2005 and October 27, 2005. The Hospital was notified of the date, time, and place of the hearings and notices to the public were published prior to the hearings in *The Advocate* (Stamford) by OHCA. The hearings were conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the Connecticut General Statutes) and Sections 19a-638 and 19a-639, C.G.S.

Yale-New Haven Hospital, Bridgeport Hospital, and Greenwich Hospital collectively known as Yale-New Haven Heart Health Institute were granted Intervenor status with rights to cross-examine. St. Vincent's Medical Center was granted Intervenor status with the rights to cross-examine.

The Presiding Officer heard testimony from the general public, legislators, local officials and witnesses for the Hospital and Intervenors. In rendering this decision, the presiding officer has considered the entire record of the proceeding. OHCA's authority to review, approve, modify or deny this proposal is established by Sections 19a-638 and 19a-639, C.G.S. The provisions of these sections, as well as the principles and guidelines set forth in Section 19a-637, C.G.S., were considered by OHCA in its review.

Findings of Fact

Clear Public Need
Impact on The Hospital's Current Utilization Statistics
Proposal's Contribution to Accessibility and Quality of Health Care Delivery in the Region

1. The Stamford Hospital ("TSH" and "Hospital") is a not-for-profit, 305-bed acute care hospital located in Stamford, Connecticut. TSH, as an affiliate member of the New York Presbyterian Healthcare System ("System"). TSH provides a comprehensive array of services including: Medicine, Surgery, Obstetrics/Gynecology, Psychiatry as well as Medical and Surgical critical care units. *(Completeness Responses, Proposed Resolution, August 15, 2005, Exhibit 3 and Certificate of Need Application, August 15, 2005, page 1-3)*

2. The New York Presbyterian Healthcare System, Inc ("NYPHS") coordinates a system of hospitals and other healthcare institutions throughout the tri-state area, including The Stamford Hospital ("TSH") and New-York Presbyterian Hospital ("NYPH"). NYPH operates New York-Presbyterian Hospital/Columbia University Medical Center ("NYP/C") in affiliation with Columbia University College of Physicians and Surgeons ("CU"). *(Certificate of Need Application, August 15, 2005, pages 2-3)*

3. TSH and NYPHS ("Applicants") propose the establishment of an elective percutaneous coronary angioplasty[a] ("PCI") and open-heart surgery[b] ("OHS") program, to be located at the Hospital. *(Certificate of Need Application, August 15, 2005, page 2)*

4. TSH's proposal is for a full-service cardiovascular services program in the lower Fairfield County. TSH is located in the region's largest population center. *(Prefiled Testimony of Brian Grissler, September 19, 2005,)*

---

[a] Elective (Scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

[b] Open-heart surgery is a surgical intervention performed on the opened heart while the bloodstream is diverted through a heart-lung machine. Cardiac Surgery includes Coronary Artery Bypass Graft (CABG), Valvuloplasty, and Valve Replacement. CABG is where a vein from the chest or leg, or a prosthesis, is grafted onto either side of a blockage in the coronary artery. This reroutes blood flow around the blockage to the heart muscle. Valvuloplasty is where a balloon tipped catheter is inserted into plaque-blocked heart valves to widen and separate them through repeated balloon inflation. A Valve Replacement is a replacement of plaque-blocked heart valves with prosthetic or tissue graft.

5. On August 25, 2004, TSH received CON authorization from OHCA to perform primary[c] PCI services. *(Certificate of Need Application, August 15, 2005, page 2)*

6. The proposed program will augment existing cardiovascular services at the Hospital. The Hospital currently offers:

Primary Angioplasty	Electrocardiogram
Interventional electrophysiology (ablations)	Electrophysiology
Diagnostic cardiac catheterization	Holter monitoring
Coronary care unit	Intra-aortic balloon pump
Telemetry inpatient care	Nuclear stress testing
Cardiac imaging	Pulmonary function testing
Cardiac rehabilitation	Stress testing
Cardiac ultrasound	Tilt table testing
Cardiopulmonary testing	Vascular and thoracic surgical services

(Certificate of Need Application, August 15, 2005, pages 8-9)

7. TSH's cardiology primary and secondary service areas consist of the following Connecticut towns:

Table 1: Stamford Hospital's Proposed Service Area for this Proposal for FYs 2002 – 2005 (1st Two Quarters)

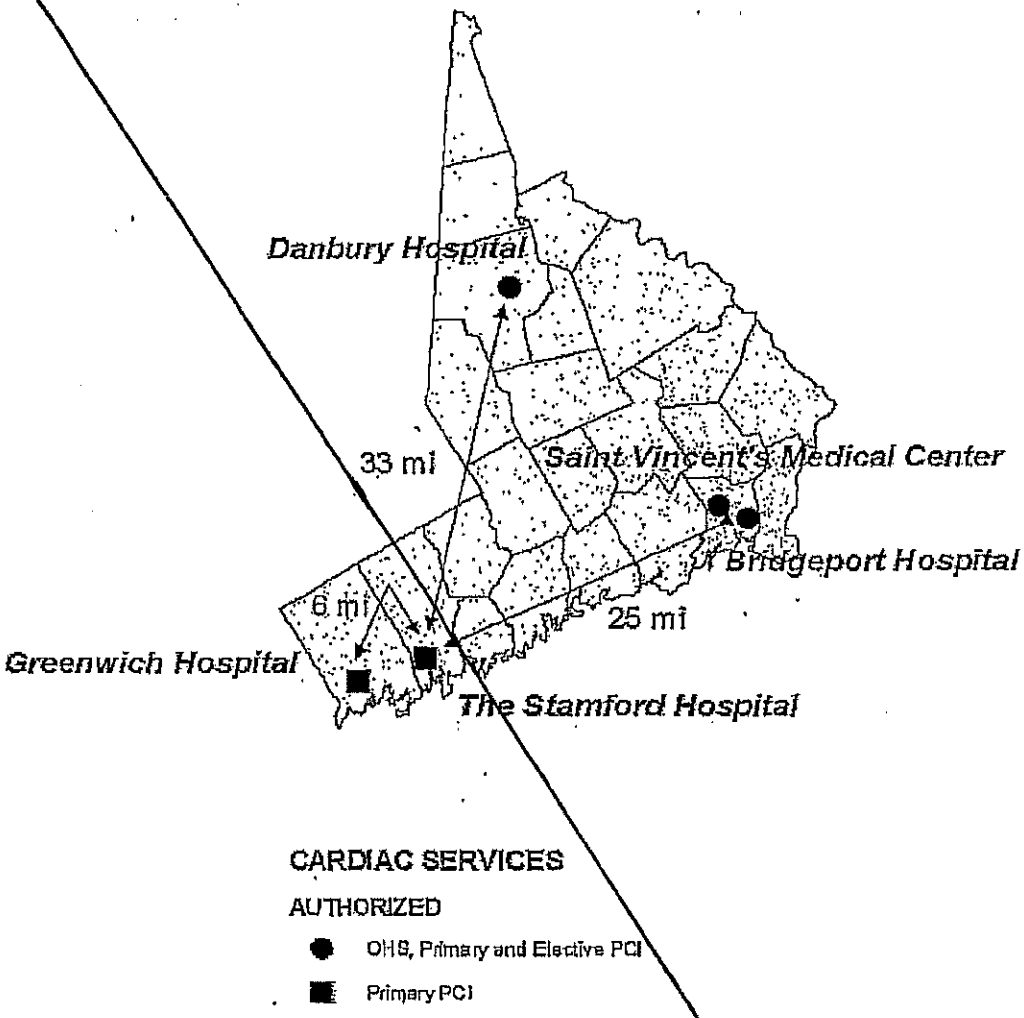
Towns	Primary	Secondary	Total Service Area
	Darien Stamford	Greenwich New Canaan Norwalk Weston Westport Wilton	Darien Greenwich New Canaan Norwalk Stamford Weston Westport Wilton
TSH's Share of Service Area's Inpatient Cardiac Catheterizations	57.4%	4.2%	26.1%
Service Area's share of TSH's Inpatient Cardiac Catheterizations	84.6%	8.7%	93.3%

(Source: Cardiac catheterization volume from *OHCA's Acute Care Hospital Inpatient Discharge Database. Service Area from Certificate of Need Application August 15, 2005, page 22)*

[c] Primary (Emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow. Non-ST Segment elevation MI (NSTEMI or high-risk) patients consist of 80% of all MIs and are considered for angioplasty on an elective basis within 72 hours. Performance of elective angioplasty without cardiac surgery back up is not recommended by the American College of Cardiology or the American Heart Association.

8. Providers of interventional cardiac services in the Hospital's total service area ("TSA") are as follows

Map 1: Area Providers of Interventional Cardiac Services



Danbury Hospital began performing open heart surgery in January 2005.
Greenwich Hospital began performing Primary PCI in February 2005.
Stamford Hospital began performing Primary PCI in August 2005.

(Connecticut Acute Care Hospital Inpatient Discharge Database and Travel Distances from Yahoo Maps)

9. The Applicants based the need for the proposed Elective PCI and OHS program on the following:
   - Improved accessibility for patients;
   - Improved continuity of care;
   - Historical/Existing cardiac volume;
   - Adopting a standard of care that exists in the other large urban area; and
   - Improved quality of cardiac services.

   (Certificate of Need Application, August 15, 2005, pages 2-55)

10. TSH stated that the establishment of a full-service cardiac program in Stamford will provide timely access and local availability of these services in keeping with trends that have been already established nationally.
    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

11. TSH's cardiac catheterization volume for FYs 2000 through 2005 are as follows:

Table 2: TSH's Historical Cardiac Catheterization Volume, FYs 2002 – 2005 1st Two Quarters

CT Service Area	2002	2003	2004	2005
Inpatient	354	352	296	147
Outpatient	321	283	332	-
Total	**675**	**635**	**628**	**147**

(Inpatient catheterization figures from OHCA's Acute Care Hospital Inpatient Discharge Database and outpatient volume from August 15, 2005, Responses to OHCA Completeness Letter, pages 1-2)

12. The following is a table of the average annual historical and projected Total PCI volumes (Primary & Elective) in TSH's service area:

Table 3: Average Annual Historical and Projected Total PCI Volumes in TSH's Service Area, FYs 2002 – 2005

	FYs 2002–2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average PCIs**	**Adult Use Rate**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**
Primary	277	2.55	78%	216	83.5%	231	83.4%	231
Secondary	418	2.48	6.8%	28	11.0%	46	20.3%	85
Total Service Area	695	2.51	36.3%	244	40.6%	276	45.7%	316
Connecticut	8,024	2.98	-	-	-	-	-	-

Note: "Adult" refers to those 15 years and older. Adult use rate per 1,000 population.
Projected PCI volumes were calculated by applying the applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 277 (average volume) * .78 (market share) = 216 PCIs.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures, and August 15, 2005 CON Application, *pages 45 & 23)*

13. The following table is the annual average historical and projected OHS for TSH in the proposed service area for FYs 2002-2005:

Table 4: Historical and Projected, Average Annual OHS Volumes in TSH's Service Area, FYs 2002–2005

	FYs 2000 – 2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	Average OHS	Adult Use Rate	Market Share (%)	Projected OHS	Market Share (%)	Projected OHS	Market Share (%)	Projected OHS
Primary	112	1.03	78.1%	88	83.5%	94	83.5%	94
Secondary	213	1.27	6.7%	14	10.9%	23	20.3%	43
Total Service Area	325	1.17	32.9%	102	38.8%	117	45.7%	137
Connecticut	4,640	1.72	-	-	-	-	-	-

Note: FY 2005 is First two quarters only.
"Adult" refers to those 15 years and older. Adult use rate per 1,000 population
Projected OHS volumes were calculated by applying the Applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 112 (average volume) * .781 (market share) = 88 open-heart surgeries.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures; and August 15, 2005, CON Application, pages 46&23).

14. TSH projects the following number of elective PCIs procedures and OHS for its service area.

Table 5: Projected Cardiac Volume for TSH's Service Area

Service	FY 2007	FY 2008	FY 2009
Angioplasties (Elective only)	193	324	417
Open-heart surgeries	86	150	197

Note: TSH based the projected volumes on historical utilization and population data. The use-rates utilized are based on Claritas data. OHCA can not verify any of the above claimed data. *(Responses to the Interrogatories, September 28, 2005, Updated Financial Attachment and CON Application)*

15. The 2001 American College of Cardiology ("ACC") and the American Heart Association ("AHA") Guidelines for Percutaneous Coronary Intervention ("PCI") recommend that PCI be performed by higher volume operators (>75 cases/year) with advanced technical skills (e.g. subspecialty certification) at institutions with fully equipped interventional laboratories and experienced support staff. This setting will most often be in a high-volume center (>400 cases/year) associated with an on-site cardiovascular surgical program. Therefore, PCI is best done by high-volume operators in high-volume institutions. *(JACC, 2001, Vol. 37, No.8, page 2239)*

16. The ACC/AHA Guidelines for CABG Surgery (1999) state the following:
    - Studies suggest that survival after CABG is negatively affected when carried out in institutions that perform fewer than a threshold number of cases annually. Similar conclusions have been drawn regarding individual surgeon volumes.
    - The ACC/AHA are supportive of a posture of close monitoring of institutions or individuals that perform <100 cases annually.

17. TSH states that it will utilize the existing guidelines published by the ACC and AHA as a basis for the development of standards for the proposed services, as specified in **Attachment I.** *(Certificate of Need Application, August 15, 2005, page 11)*

18. The Guidelines for Standards in Cardiac Surgery by the Advisory Council for Cardiothoracic Surgery ("ACCS") and the American College of Surgeons ("ACS") (1996) state the following:
    - An annual volume of at least 100 to 125 open-heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume.
    - At least 200 procedures per year as previously recommended in the 1975 report of the Inter-Society Commission on Heart Disease Resources are necessary in order for a program to function efficiently.
    - A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the operating room.

19. Dr. Steven F. Horowitz testified to the following at the public hearing:
    - TSH can sustain a full-service cardiac program due to the increase in the size of the minority population.
    - Numerous studies have confirmed that the cardiovascular risk profile for both Hispanics and African Americans has been worsening in recent years as obesity and diabetes continue to rise exponentially within these populations.

    (Prefiled Testimony of Steven F. Horowitz, M.D. Chief of Cardiology at TSH, September 19, 2005)

20. Kathleen Silard testified to the following at the public hearing:
    - TSH has examined the significant disparity in utilization rates for PCI and OHS that exists for African Americans in TSH service area as well as other regions of the state when compared to the Caucasian population. TSH has seen how some of the major precursors of heart disease, such as diabetes and obesity, can disproportionately effect minority populations as well as the economically disadvantaged.
    - One of the primary goals of TSH's proposed program will be to address and hopefully eradicate some of those disparities by improving access to PCI and OHS to these high-risk groups.

    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

21. The demographic characteristics by Race for TSH's TSA are as follows:

Table 6: TSH Demographics by Race

Service Area	Caucasian	African American	Native American	Asian	Other	Total
Primary	73.6%	13.2%	0.2%	4.6%	8.4%	100%
Secondary	85.7%	6.6%	0.1%	3.5%	4.1%	100%
Total Service Area	81.0%	9.2%	0.2%	3.9%	5.7	100%
Connecticut	81.6%	9.1%	0.3%	2.4%	6.6%	100%

Source: Census 2000.

22. The demographic characteristics by Hispanic ethnicity for the proposed TSA:

Table 7: Hispanic Ethnicity of TSH Service Areas

Service Area	Hispanic or Latino	Non-Hispanic	Total
Primary	14.7%	85.3%	100%
Secondary	8.4%	91.6%	100%
Total Service Area	10.8%	89.2%	100%
Connecticut	9.4%	90.6%	100%

Source: Census 2000.

23. The AMI discharges for the TSH TSA are as follows:

Table 8: Share of AMI by Race and Hispanic Ethnicity, FYs 2002 – 2005 (First 2 Quarters)

Service Area	Caucasian	African American	Hispanic	Asian	Native American	Other	Total
Primary	84.7%	7.0%	4.2%	0.1%	0.0%	4.0%	100%
Secondary	85.1%	7.1%	3.4%	1.0%	0.1%	3.3%	100%
Total Service Area	84.9%	7.0%	3.7%	0.6%	0.1%	3.6%	100%
Connecticut	87.1%	4.7%	4.0%	0.3%	0.1%	3.8%	100%

(Discharges from OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases. "White," "Black," "Asian," "Native American," and "Other" are non-Hispanic categories.)

24. NYPH has one of the largest cardiac surgery and cardiac catheterization[d] programs in New York State with its physicians performing over 3,000 PCIs and close to 2,000 OHS in calendar year 2004. *(Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)*

[d] Diagnostic Cardiac Catheterization is a diagnostic procedure in which a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to the heart to measure electrical activity, blood pressure, and locate blockages.

25. Dr. Steven Horowitz, testified on behalf of TSH to the following:
    - Diabetes is a leading cause of hospitalization among Connecticut's African American and Hispanic populations which are 3.8 and 2.2 times more likely to be hospitalized directly due to the disease as compared to the Caucasian Connecticut residents.
    - The percent difference for the African American utilization rates in the TSH's TSA versus those statewide is nearly 26% and 62% for PCI and cardiac surgery respectively. The same numbers skyrocket to 41% and 95% when the focus is placed solely on the City of Stamford.
    - TSH can target the African American and Hispanic population and relieve some of these barriers to access through the comprehensive preventive and medical outreach program.

    (Prefiled Testimony of Steven F. Horowitz, M.D., Chief of Cardiology Department at TSH, September 19, 2005)

26. Dr. Arthur Klein testified to the following at the public hearing:
    - NYPH and NYPHS have developed a number of strong and effective partnerships with affiliated hospitals to elevate the scope of and quality of cardiac care in the tri-state region.
    - NYPHS assists in the operation of nine (9) diagnostic cardiac catheterization programs through out the tri-state area, four elective angioplasty programs and one primary angioplasty program.
    - In this proposal, the cardiac surgery professional services will be provided exclusively by full-time faculty of the Division of Cardiothoracic Surgery, Department of Surgery of Columbia College of Physicians and Surgeons.
    - Oversight of elective angioplasty shall be through a joint committee co-chaired by Drs. Moses and Stone, senior faculty from Columbia University's Division of Cardiology and Stamford Hospital's cardiology leadership.

    (Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)

27. Dr. Eric A. Rose testified at the public hearing that Columbia University Department of Surgery's professional expertise in cardiothoracic research, its strategic network of partnerships and its vast clinical experience will help support TSH in their cardiac health services. *(Prefiled Testimony of Eric A. Rose, M.D., Chairman for the Dept. of Surgery at NYP/C, September 19, 2005)*

28. TSH submitted a signed Draft Agreement with NYPHS. NYPHS' role is defined as follows:
    - Arrange consultative assistance to the Hospital in the following areas:
        - Preparation of the CON Application;
        - Clinical training of nursing and technical staff;
        - Development of the Hospital's standards of care, risk stratification criteria and operational policies;
        - Development of clinical guidelines and protocols;
        - Collection and analysis of quality data for clinical outcomes and performance monitoring;
        - Recruiting procedures; and

- Adoption by the Hospital of policies, procedures and protocols, including developing practice guidelines and requirements related to the proposed program.

- Recommend CPC standards and/or the standards of NYPHS-affiliated Connecticut institutions for physician, nursing and technical staff protocols to foster a high-quality credentialing program; and
- Advise the Hospital with respect to quality assurance and utilization management functions related to the proposed program.

(Completeness Responses, August 15, 2005, Draft Agreement between the Applicants, Exhibit 4, page 4)

29. TSH proposes to provide elective PCI utilizing five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. *(Certificate of Need Application, August 15, 2005, page 11)*.

30. The PCI volumes for the proposed interventionalists for FYs 2002-2005 1st two quarters are as follows:

Table 9: Volume of Proposed Program Interventionalists (FYs 2002 – FY 2005 1st Two Quarters)

Physician	Hospital Affiliation	Office/Home	Average Annual PTCA Volume
Alcan[1]	St. Vincent's & TSH	Norwalk	347
Jumper[2]	St. Vincent's & TSH	Valhalla, NY	119[3]
Charney	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Messinger	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Stone	NY Presbyterian, TSH (pending)	Greenwich	-

[1]Member of Cardiology Associates of Fairfield County
[2]In training
[3]Dr. Jumper performed 57 in FY 2004 and 122 in the first two quarters of FY 2005.
[4] TSH reported volume (FYs 2003 & 2004 – NYP physicians not specifically identified)
Physician C: 156 & 145 and Physician D: 108 & 126
(OHCA Acute Care Hospital Inpatient Discharge Database and CON Application, August 15, 2005, page 11&58 and Completeness Responses, August 15, 2005, page 8)

31. TSH stated that three additional cardiac interventionalists, Drs. Portnay, Lorenz and Corvaja will be added to the proposed program to perform PCIs at TSH. *(CON Application, August 15, 2005, pages 11&58 and Completeness Responses, August 15, 2005, page 8)*

32. TSH proposes to staff the proposed OHS program with two (2) board-certified cardiac surgeons, who will practice full-time at TSH and be credentialed at both TSH and at NYP/C. These two surgeons will be recruited through the formation of a three (3) person committee which will include as its members, Dr. Craig Smith, Dr. Mehmet Oz and Dr. Eric Rose, Chair of the Surgery Department at NYP/C. *(Certificate of Need Application, August 15, 2005, page 11)*

33. The average annual PCI and OHS volumes in TSH's TSA by hospital provider for FYs 2000-2005 (1st two quarters) are as follows:

Table 10: Average Annual PCI and Open-Heart Surgery Volumes by Provider in TSH's TSA by Provider, (FYs 2002 – 2005 1st Two Quarters)

	PCIs			Open-Heart Surgeries		
Hospital	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)
Bridgeport	154	22.2%	12.3%	75	23.1%	24.3%
Danbury	0	0.0%	-	0	0.0%	-
Greenwich	1*	0.1%	100%	-	0.0%	-
Hartford	0	0.0%	-	0	0.0%	-

Saint Francis	0	0.0%	-	1	.3%	.1%
Saint Raphael's	4	0.5%	0.4%	3	.9%	.4%
Saint Vincent's	392	56.4%	34.9%	119	36.6%	39.7%
Yale	78	11.2%	4.8%	57	17.5%	6.4%
Out of State	65	9.3%	-	70	21.6%	-
Totals	**695**	**100%**	-	**325**	**100%**	-

*Greenwich Hospital began providing primary PCI in February 2005.
(OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases)

34. Danbury Hospital, along with Waterbury Hospital and St. Mary's Hospital (one program, two sites in Waterbury) were authorized by OHCA to offer full-service cardiac programs in 2003. *(Certificate of Need Applications, Final Decision Docket Numbers 03-30167 & 03-30143, both dated July 23, 2005)*

35. St. Vincent's Medical Center ("SVMC") testified to the following:
    a. Angioplasty volume is flat nationally and has begun to decline in Connecticut.
    b. If TSH proposal is approved, St. Vincent's Medical Center would not be able to achieve both institutional and surgeon specific minimum volumes for OHS and would put the quality of St. Vincent's Medical Center at significant risk.
    c. SVMC performed 1,097 PCIs and 283 OHS in FY 2005.
    d. The overall risk adjusted mortality rate at SVMC is 1.3%.
    e. Other than volume, SVMC measures quality through independent third party companies (to whom they report data to).
    (Prefiled Testimony of Jose Missri, M.D. St. Vincent's Medical Center, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

36. Bridgeport Hospital ("BH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. BH performed under 1,200 PCIs and under 250 OHS in FY 2005.
    b. BH could not specify their overall risk adjusted mortality rate, BH simply stated that it was under 2.0%.
    c. Other than volume, BH measures quality through independent third party companies (to whom they report data to).

d. If the proposed CON was to be approved, this would not impact the physician coverage at BH.
(Prefiled Testimony of Stuart Zarich, M.D., Bridgeport Hospital, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

37. Yale-New Haven Hospital ("YNHH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. There is a statewide decline in the number of OHS cases,
    b. There is a flattening of PCI volumes,
    c. Proliferation of full-service cardiac program will place additional stress on the state's staffing infrastructure,
    d. Additional cardiac programs will not improve mortality rates,
    e. The residents of Fairfield County have a wide range of options for their full-service cardiac care needs,
    f. There is a direct correlation between physician and institutional case volumes and quality outcomes, and
    g. In FY 2004, YNHH had 64 PCI discharges (4.3% of YNHH's total PCI) and 52 OHS discharges (6.2% of YNHH's total OHS) from the Stamford service area.
    (Prefiled Testimony of Kyle Kramer, Executive Director of the Yale-New Haven Health Heart Institute, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

38. In order to implement the proposed project, TSH will require a series of facility renovations. The renovations will include an expansion of surgical facilities on Level 2 of TSH's North building to allow for the creation of two new, state-of-the-art operating rooms that will be the primary operating suites for the proposed program as well as enlarged perioperative and other surgical support areas.
(Certificate of Need Application, August 15, 2005, page 13)

Financial Feasibility of the Proposal and its Impact on the Hospital's Rates and Financial Condition

Impact of the Proposal on the Interests of Consumers and Payers of Health Care Services

Consideration of Other Section 19a-637, C.G.S. Principles and Guidelines

39. The proposal has a total expenditure cost of $5,404,425 which consists of the following:

Table 11: Total Capital Expenditure

Description	Cost
Medical Equipment	3,109,345
Construction/Renovation	1,590,065
Project Contingency	704,925
Total Capital Expenditure	**$5,404,425**

(Certificate of Need, August 15, 2005, page 63)

40. The proposal will be financed from the TSH's equity through operations. *(Certificate of Need, August 15, 2005, page 64)*

41. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program. This arrangement will be finalized if the proposal is approved by OHCA. *(Arthur S. Klein, Chief Operating Officer of NYPHS, Public Hearing Testimony, October 6&27, 2005)*

42. TSH projects incremental to the project losses from operations for the first two years of operation for FYs 2007 and 2008 of ($1,940,000) and ($294,000), respectively. This is due to program start up. However, TSH is projecting incremental gains from operation of $1,082,000 for the third year of operation, FY 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

43. TSH is projecting a gain from operations with the CON project of $10,137,000, $12,327,000 and $14,365,000, for FYs 2007, 2008 and 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

44. TSH proposes to hire 26, 34 and 38 Full Time Equivalent employees for FYs 2007, 2008 and 2009, respectively. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

45. There is no State Health Plan in existence at this time. *(Certificate of Need Application, August 15, 2005, page 14)*

46. TSH has adduced evidence that this proposal is consistent with TSH's long-range plan. *(Certificate of Need Application, August 15, 2005, page 14)*

47. TSH has improved productivity and contained costs by participating in group purchasing, energy conservation, reengineering and through application of technology. *(Certificate of Need Application, August 15, 2005, page 59)*

48. TSH stated that this proposal will help enhance the existing academic affiliation with Columbia University College of Physicians and Surgeons. *(Certificate of Need Application, August 15, 2005, pages 59&60)*

49. TSH stated that the patient physician mix of TSH is unique as the cardiac patient care is fully integrated across all medical disciplines and is managed through a state-of-the-art multi-modality data management system. *(Certificate of Need Application, August 15, 2005, page 60)*

50. TSH's rates are sufficient to cover the proposed capital expenditure and operating costs associated with this proposal. *(Responses to Interrogatories, September 28, 2005, Updated Financial Attachment)*

Rationale

The Office of Health Care Access ("OHCA") approaches community and regional need for proposed services on a case-by-case basis. Certificate of Need ("CON") applications for cardiac services do not lend themselves to general applicability due to the variety and complexity of factors, which may affect any given proposal; e.g., the characteristics of the population to be served, the nature of the existing services, the specific services proposed to be offered, the current utilization of services, and the financial feasibility of the proposed service. In considering this application, OHCA determined that TSH's current cardiac utilization, population served, quality of providers and physicians and geographic accessibility were significant factors in determining need.

The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (collectively known as "Applicants"), propose to expand the cardiac services delivered at TSH to include elective angioplasty services and open heart surgery. The Applicants based the need for the elective PCI and open heart surgery programs on improved accessibility for patients, improved continuity of care, historical and existing cardiac volume, adopting a standard of care that exists in the other large urban areas and improved quality of care.

TSH's primary and secondary service area ("TSA") consists of eight (8) towns. There are no providers of elective PCI or OHS in TSH's TSA. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population when compared to the rest of the state overall. The primary service area has experienced higher adult per capita rates of AMI discharges for African American and Hispanic as compared to the state as a whole. In addition, there appears to be a disparity in the utilization rates for PCI and OHS for Hispanics and African Americans in the service area when compared to the Caucasian population. This proposed cardiac program will enhance the access for the African American and Hispanic population in TSH's TSA. OHCA concludes that the Applicants proposal will provide the residents of lower Fairfield County with improved access to the full continuum of cardiac care.

TSH's historical cardiac catheterizations volumes for FYs 2002, 2003, 2004, and 2005 (1st 2 quarters) were 675, 635, 628 and 147, respectively. OHCA determined that TSH could potentially perform a minimum of 244 annual total PCIs (primary & elective) and 102 OHS cases on residents of TSH's TSA in the first full year of operation of the proposal based upon historical catheterization volume and its market share. This volume increases to 276 total PCI procedures and 117 OHS cases for the second year of operation, and 316 total PCI procedures and 137 OHS cases for the third of operation. Based on historical inpatient diagnostic cardiac catheterization volume and market share, the proposed full-service cardiac program at TSH would exceed institutional minimum volumes recommended by the ACC/AHA for PCI (200) and the American College of Surgeons–Advisory Council for Cardiothoracic Surgery for open-heart surgery (100–125 surgeries per year).

The proposal involves offering of elective Percutaneous Coronary Intervention ("PCI") through the use of five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. TSH also proposes to provide OHS utilizing two (2) surgeons will be recruited from outside of Connecticut, through the formation of a three (3) person committee comprised of TSH and Columbia physicians. Therefore this program will not impact coverage at any of the existing cardiac programs in Connecticut. In addition, OHCA concludes that even though the PCI and OHS volumes may decline at the existing providers, the PCI and OHS volumes will not fall below the institutional minimum volumes recommended by ACC/AHA for PCI and American College of Surgeons-Advisory Council for Cardiothoracic Surgery for OHS.

TSH's proposal will increase the availability of quality PCI and OHS services for residents of TSH's TSA. The proposed elective PCI and OHS program will be developed in collaboration with NYPHS. NYPHS will provide or arrange for TSH consulting in the areas of clinical training for staff, development of TSH's standards of care, development of clinical guidelines, collection and analysis of data and recruiting procedures. NYPHS expects the initial training to continue over an eighteen month period. NYPHS will also advise TSH with respect to quality assurances and utilization management and provide assistance to TSH concerning the adoption of policies, procedures and protocols, including developing practice guidelines and program requirements. This proposal will improve the quality of care and continuity of TSH's cardiac services.

Finally, the CON proposal is financially feasible. The proposal has a total capital expenditure of $5,404,425, which consists $3,109,345 for medical equipment, $1,590,065 for construction/renovations and $704,925 for contingency costs. TSH proposes to fund the proposed total capital expenditure through TSH's equity, specifically through operations. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program; however, the details have not yet been finalized. TSH projects incremental losses from project operations for the first two years of operation of ($1,940,000), and ($294,000), respectively. However, TSH is projecting an incremental gain from operation of $1,082,000 by the third year of operation. Further, TSH is projecting gains from total Hospital operations with the CON project of $10,137,000, $12,327,000 and $14,365,000 for the first three years of operations. The projected utilization and financials of this proposal appear to be reasonable, financially feasible and cost-effective and will not adversely impact the interests of consumers and payers of such services.

TSH's proposed elective angioplasty and open heart surgery program is differentiated from other cardiac-related proposals in the following ways. TSH currently operates a high volume diagnostic cardiac catheterization program and recently initiated a primary angioplasty program. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population than the rest of the state. The implementation of the proposed program should address some of the disparities in utilization of cardiac services by this population. Additionally, the proposed program is not expected to impact the physician coverage at any of the existing cardiac programs in Connecticut because the interventionalists are already on staff at TSH and the cardiac surgeons will be

recruited from out of state. TSH's strong collaborative relationship with the NYPHS will enhance the accessibility of high-quality, community-based medical services offered by TSH. TSH will utilize the resources of NYPHS to further enhance provision of quality care including access to the expertise, information, and consultative support of a nationally recognized academic healthcare center renowned for the diagnosis and treatment of cardiac disease. Finally, implementation of TSH's proposal will bring appropriate access to high quality cardiac services to the residents of the proposal's TSA. In summary, the proposal will result in enhanced cardiac services in the Stamford region.

Order

NOW, THEREFORE, the Office of Health Care Access ("OHCA") and The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (together referred to as "Applicants") hereby stipulate and agree to the terms of settlement with respect to the Applicants' request to establish elective angioplasty and open heart surgery program to be located at Stamford Hospital at a total capital expenditure of $5,404,425, as follows:

1. The Applicants' request for a CON to establish an elective angioplasty and open-heart surgery program to be located at TSH, a total capital expenditure of $5,404,425, is hereby approved.

2. TSH shall only commence operation of the OHS program at The Stamford Hospital initially. Once the number of OHS procedures exceeds 125, the Hospital may commence operation of the elective angioplasty program. Prior to commencement of the angioplasty services, TSH is required to provide OHCA evidence that it has performed the required 125 OHS.

3. TSH will have at least two cardiac surgeons as part of this proposal, who are in the process of being recruited and shall be identified prior to the beginning of the OHS program. The surgeons must be fully credentialed and have the following qualifications:
   - Board-Certified in cardiac surgery
   - Maintains a Connecticut license and admitting privileges at the Hospital
   - Has performed OHS procedures at a cardiac surgical center that meets or exceeds the annual ACCS/ACS minimum institutional volume standard for cardiac surgery for the past 2 years
   - TSH shall provide the Curriculum Vitae ("CV") of the cardiac surgeons prior to commencement of the OHS program. TSH shall demonstrate that the cardiac surgeons satisfy all requirements specified above. The OHS program shall not commence operation until OHCA acknowledges receipt of the CV and that it complies with this Order.

4. TSH shall provide the CVs of each of the cardiac operating room nurses, Board-certified cardiac anesthesiologists, intensivists and perfusionists for the authorized OHS program prior to commencement of the OHS program. Fifty percent (50%) of each of the core OR staff mentioned above must be trained in OHS prior to commencement of the OHS program. The OHS program shall not commence operation until OHCA acknowledges receipt of the CVs and that they comply with this Order.

5. TSH shall not exceed the approved total capital expenditure of $5,404,425. In the event TSH learns of potential cost increases or expects final project costs will exceed those approved, the Hospital shall file with OHCA a request for approval of

the revised CON project budget. The source of funding for the project will be The Stamford Hospital's operations and owner equity.

6. TSH shall complete and submit to OHCA on a quarterly basis the data elements in the Connecticut Cardiac Data Registry (**Attachment II**). Data should be submitted to OHCA on a computer disk in either an excel workbook or comma-delimited text file in a format specified by OHCA. The most current version of the Connecticut Cardiac Data Registry includes, but may not be limited to, the elements listed in **Attachment II**. Data must be reported to OHCA thirty (30) calendar days following the end of the quarter. Fiscal Year quarters end December 31st, March 31st, June 30th, and September 30th. Upon receipt, OHCA will check the data's conformance to the required specifications and within ten (10) business days notify TSH in writing of its evaluation. If OHCA finds questionable material, TSH will have fifteen (15) business days from notification by OHCA to submit a revised dataset for evaluation. All patient-level data submitted to OHCA to satisfy this requirement will be subject to the laws and regulations of the state of Connecticut and the Office of Health Care Access regarding its collection, use and confidentiality. If TSH does not submit the data elements in the Connecticut Cardiac Data Registry on a quarterly basis, the programs may be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the programs.

7. TSH shall submit on an annual basis to OHCA the following reports which must be reported to OHCA thirty (30) calendar days following the end the year, for the first three (3) years of operation:
   a. A report of all elective PCIs and OHS performed each year by ethnicity and race, in a format to be specified.
   b. A report which illustrates that this CON proposal helped relieve the barriers to access through comprehensive preventive and medical out-reach programs for the African American and Hispanic population within TSH's TSA.

8. If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. If these volumes are not met for a period of two consecutive 12-month periods, TSH's OHS program shall be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the OHS program.

9. If TSH does not perform 200 elective PCIs within twelve months of the initiation of the PCI program, TSH shall submit monthly reports of elective PCIs arrayed by physician to OHCA until such time as these volumes are met by TSH.

10. TSH shall participate in the Society of Thoracic Surgeons Database (STS-DB) database and the ACC National Cardiovascular Database Registry (ACC-NCDR) and report all data including the optional follow-up section. TSH shall provide OHCA quarterly data reports from STS-DB and ACC-NCDR. Data must be

reported to OHCA thirty (30) calendar days subsequent to TSH receiving the reports from the STS and ACC. TSH is required to comply with the STS and ACC/AHA criteria and standards. If TSH determines not to participate in the STS-DB or ACC-NCDR, TSH shall notify OHCA immediately, and continue to comply with the STS and ACC/AHA criteria and standards set forth in Attachment III.

11. TSH shall provide OHCA with a copy of a dated and signed Consulting Services Agreement with NYPHS or its Affiliates prior to commencement of operation of the OHS program. This contract shall be renewed annually for a period of three years.

12. OHCA and TSH agree that this Agreed Settlement represents a final agreement between OHCA and TSH with respect to this request. The signing of this Agreed Settlement resolves all objections, claims and disputes, which may have been raised by the Hospital with regard to Docket Number 04-30374.

13. This authorization for the OHS program shall expire on December 31, 2008. Should the TSH's open-heart surgery program not commence operation by that date, TSH must seek further approval from OHCA to complete the project beyond that date.

14. This Agreed Settlement is an order of the Office of Health Care Access with all the rights and obligations attendant thereto, and the Office of Health Care Access may enforce this Agreed Settlement pursuant to the provisions of Sections 19a-642 and 19a-653 of the Connecticut General Statutes at TSH's expense, if TSH fails to comply with its terms.

ATTACHMENT IV

GUIDELINES FOR STANDARDS IN CARDIAC SURGERY

The following statement is an updated version of guidelines that were first published by the American College of Surgeons in 1991. The revised statement was developed by the Advisory Council for Cardiothoracic Surgery and approved by the College's Board of Regents in October 1996.

Preamble

This report provides guidelines to be used by hospital executives and appropriate medical staff only. It places no value judgment on existing successful programs or on the treatment of individual patients.

While current standards of practice form the basis of this report, it is recognized that large programs in cardiac surgery grow from smaller ones. Hospitals and their staffs should exercise their own discretion in approving programs based on local need and the responsibility for achieving a good standard of practice.

While attention is directed primarily to open-heart surgery, the proposed standards should apply to closed-heart operations as well as to operations on the great vessels within the chest.

In borderline situations, in which the number of open-heart operations does not meet the established guidelines, the American College of Surgeons recommends the use of peer review.

Professional team

Specification of the qualifications for cardiac surgeons in an established practice is beyond the scope of these guidelines. Surgeons practicing cardiac surgery should be certified or awaiting certification by the American Board of Thoracic Surgery or its Canadian equivalent within five years after completion of an approved residency program in cardiac surgery. It is recommended that hospital committees for staff accreditation exercise their judgments for privileges based on the nature of the cardiothoracic residency or postresidency experiences of the applicant.

A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR. It is recognized that, depending on the particular setting and situation, the assistant on a particular case may vary in experience and qualification.

Hospital operative volume–Adult cardiac surgery

The 1975 report of the Inter-Society Commission on Heart Disease Resources recommended that cardiac surgical programs in a *hospital* should perform at least 200 procedures annually. This recommendation was based on the premise of a hospital dedicating 1 operating room to cardiac surgery and functioning at 80 percent capacity (4 cases per week x 52 weeks = 200 per year). While there are no presently available data linking an *individual surgeon's* patient volume and hospital mortality rate, there are data to suggest that an annual volume of at least 100 to 125 open heart procedures (including coronary artery bypass procedures, valve replacements, and other operations requiring the use of cardiopulmonary bypass) per *hospital* is necessary from a quality standpoint and that there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume. While 100 to 125 cases per year per *hospital* appears sufficient from a quality standpoint, it is likely that considerably more, and at least 200 procedures per year as previously recommended, are necessary in order for a program to function efficiently.

Congenital heart surgery

Surgery for congenital heart disease, especially in infants, requires a setting that readily meets the complex and special needs

of this group of patients. These requirements include a cardiac surgeon experienced in the operative and perioperative management of such patients. There should be a pediatric cardiologist, an anesthesia team, perfusionists, intensive care nurses, and appropriate intensive care facilities for the treatment of infants and children. At a hospital where congenital heart operations are performed, a total of 100 congenital heart operations (both open and closed, not including neonatal ductus ligations) should be done. The occasional management of an infant or child with congenital heart disease by an otherwise busy and well-functioning adult cardiac surgical team is strongly discouraged.

Hospital facilities and personnel

It is urged that hospital committees for staff accreditation use peer review to determine that adequate standards of practice are maintained in terms of case frequency and results. A registry for the recording of cardiac surgical results is mandatory.

The complex operating room environment required by cardiac surgery in terms of equipment and instruments requires constant improvement in technique and proper indoctrination of personnel. Such educational programs should be under the direction of a clearly designated individual with particular interest and skill in cardiac surgery. Operating room nurses and technicians specializing in cardiac surgery are important. It should be mandatory that operating room nurses and technicians be assigned to cardiac surgery sufficiently often to develop and maintain the skills required for proficient performance in this area.

Anesthesia for cardiac surgical patients encompasses a variety of special problems. To ensure technical competence, frequent changing of the anesthesiologists assigned to cardiac surgery should be avoided.

The operation of a heart-lung machine should be performed by a specially trained nurse or technician under the supervision of the operating surgeon. A perfusionist certified by the American Board of Cardiovascular Perfusion is recommended. Perfusionists who are not certified should have at least two years of experience under supervision in an active clinical program in open-heart surgery and have a thorough background in operating room sterile techniques, perfusion physiology, the use of monitoring equipment, and a general understanding of commonly performed cardiac surgical procedures. The primary responsibility for determining the capability of the perfusionist remains with the cardiac surgeon.

Cardiac surgeons must be primarily responsible for the postoperative care of their patients, including that provided in the intensive care unit. Portions of that care may be shared with others, such as nurses and other physicians. However, only the cardiac surgeon is fully cognizant of all aspects of a given patient's condition and retains the responsibility for the continuity of care, which includes the preoperative status, the operative management, and the postoperative care.

Intensive care nursing of cardiac surgical patients is recognized as a true specialty involving skills in dealing with cardiac and respiratory emergencies. Assignment to cardiac surgical patients should be sufficiently often to maintain competence in this area of nursing. The surgeon should participate in the supervision of cardiac intensive care unit nurses.

The operating room, intensive care unit, and other facilities must conform to standards mandated by the Joint Commission on Accreditation of Health Care Organizations.

The nature of cardiac surgery makes it mandatory that diagnostic facilities be available to the surgical team. A proper cardiac catheterization laboratory must be available for hemodynamic and cine' angiographic studies. This laboratory should be under the direction of a qualified specialist and be accessible for preoperative elective studies, postoperative elective studies, and emergency procedures on a 24-hour basis.

Standard laboratory studies should be available on a 24-hour basis, including blood-gas analysis.

A blood bank facility with full resources under the direction of qualified specialists in this field is mandatory.

An intensive care facility must be available for all patients following cardiac surgery, and in some instances, for patients who are severely ill, preoperatively. This should be a limited-access area that is off limits to nonparticipating personnel and should have facilities for the adequate isolation of septic patients.

Patient follow-up

Proper patient follow-up is an integral part of surgical treatment. An effective follow-up system for patients having open-heart surgery is the responsibility of the surgical team. The team should be able to demonstrate that it has an adequate follow-up system and that patients are seen as often as necessary during the immediate postdischarge period and, subsequently, are followed up at appropriate intervals.

sponsor hospitals and OEMS the ability to begin to collect EMS data, creating the potential in the near future to begin to analyze the data and create best practices to elevate the quality of care and delivery of Emergency Medical Services to the residents and visitors of Connecticut.

In late 2008/early 2009 the AHA formed a "STEMI stakeholders group" comprised of three sub-committees (pre-hospital, timely transfers and education) intended to develop and promulgate best practice related to ST segment myocardial infarction (STEMI). The group had a varied composition including physicians (EMS/ED, cardiology, and interventional cardiology), nurses, pre-hospital providers and health care administrators/regulators. This group drafted a document outlining recommendations to improve care in relation to pre-hospital triage of STEMI patients, timely transfers of patients between facilities and issues of education for pre-hospital providers. A "STEMI Protocol" was also drafted that was intended to offer state-wide guidance for best practice regarding patients experiencing chest pain and subsequently diagnosed with a STEMI by pre-hospital EKG (including bypass for more timely cardiac catheterization).

The "STEMI Protocol" was reviewed by the CT EMS Medical Advisory Committee (CEMSMAC) beginning in 2010. In 2011, after a significant amount of thoughtful work by the CEMSMAC, a revised version of the document entitled "CT EMS STEMI Guideline" was completed and submitted to the Commissioner of Public Health for review; it was approved in January 2012.

OHCA would encourage the adherence of the "CT EMS STEMI Guideline." The foremost goal is for authorized EMS personnel to obtain a 12-lead electrocardiogram in the field for all patients suspected of myocardial infarction, thereby increasing the likelihood for percutaneous coronary intervention (PCI) within 90 minutes of first medical contact. Please see link below for the complete "CT EMS STEMI Guideline" document:

http://www.ct.gov/dph/lib/dph/ems/pdf/stemi_patients.pdf

CARDIAC SERVICES

Heart disease is the leading cause of death for both men and women in the United States.[53] In 2010, coronary heart disease alone was projected to cost the United States approximately $108.9 billion in health care services, medications, and lost productivity.[54] In Connecticut, cardiovascular disease (CVD) is also a significant public health concern and contributor of resident deaths. In fact, about one third of Connecticut resident deaths are due to CVD; coronary heart disease (48%), cerebrovascular disease (15%) also known as stroke and heart failure (8%) account form the majority of CVD deaths.[55]

Existing Connecticut statute requires CON authorization for the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery. According to OHCA's Policies and Procedures, "interventional cardiology" is defined as non-

surgical procedures performed in the cardiac catheterization laboratory for the treatment of coronary artery and peripheral vascular disease. Procedures include, but are not limited to, angioplasty, valvuloplasty, cardiac ablation, coronary thrombectomy, and congenital heart defect correction. Only those procedures authorized pursuant to CON may be performed by a health care facility or provider. Multiple cardiac services may be authorized under one CON decision. A facility that is authorized to provide open heart surgery is also authorized to provide the full range of cardiac procedures mentioned above.

CARDIAC CATHETERIZATION

Cardiac catheterization is defined as a medical procedure requiring the passage of a catheter into one or more cardiac chambers of the left and right heart, with or without coronary arteriograms, for the purpose of diagnosing congenital or acquired cardiovascular disease, or for determining measurement of blood pressure flow.

ANGIOPLASTY/PERCUTANEOUS CORONARY INTERVENTION

Primary (emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow

Elective (scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization lab whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

PCI and Elective PCI are often combined with the permanent placement of a small wire mesh tube called a stent to help prop the artery open and decrease the chance of it narrowing again. Some stents are coated with medication to help keep the artery open (drug-eluting stents), while others are not (bare-metal stents).

OPEN HEART SURGERY

Open heart surgery refers to a therapeutic operative procedure performed on the heart and/or its coronary arteries in order to correct anomalous conditions (for example, coronary artery bypass surgery, heart valve replacement), often using a heart-lung by-pass machine to perform the functions of circulation during surgery.

Authorization for Connecticut hospitals to perform elective catheter-based interventions for coronary artery disease has been limited in the past to hospitals with the ability to perform cardiac surgery onsite. However, increasing operator experience, improvements in surgical technique and major advances in technology and pharmacology have contributed to a progressive trend to allow PCI without on-site surgical backup. New evidence gives support to the positive effects that these medical advances have contributed to the significant reduction in emergency surgery following PCI[56]. Elective PCI without on-site surgical backup was, until recently, recommended as class III (not recommended, potentially harmful). However, an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation. CPORT-E trial findings conclude that patients have no greater risk of death or complications when they have Elective PCI at a hospital without cardiac surgery backup. However, similar to the 2007 SCAI Expert Consensus document, the revised guidelines also recommend stringent criteria for such programs. Connecticut hospitals seeking authorization to initiate an Elective PCI program without on-site cardiac surgery capabilities will be required to meet the SCAI conditions required in guidelines as well as demonstrate clear public need for the program.

DESCRIPTION OF DATA SOURCES

The primary source to be used for Acute Care utilization will be the CT Office of Health Care Access Acute Care Hospital Inpatient Discharge Database.

STANDARDS/GUIDELINES

Connecticut General Statutes Section 19a-638 specifies that at CON is required for: the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery.

The Office of Health Care Access has historically utilized Professional Societies and Organizations held to be the experts for establishing standards and guidelines for cardiac care and will continue to make appropriate use of their recommendations in the future review and determination of CON applications. Examples of expert sources to be used in determining standards and guidelines include: the American College of Cardiology, the American Heart Association and the Advisory Council for Cardiothoracic Surgery.

PERCUTANEOUS CORONARY INTERVENTION (PCI)

Primary PCI

1. Based on ACC and AHA, Primary PCI for STEMI should be performed by experienced operators who perform more than 75 elective PCIs per year and, ideally, at least 11 PCI procedures for STEMI per year. Ideally, these procedures should be performed in institutions that perform more than 400 elective PCIs per year and more than 36 primary PCI procedures for STEMI per year.
2. A report by the American College of Cardiology/American Heart Association Task Force on practice guidelines, referring to Class II b, suggests that Primary PCI for patients with STEMI might be considered in hospitals without on-site cardiac surgery provided that appropriate planning for program development has been accomplished and includes: appropriately experienced physician operators (more than 75 total PCIs and, ideally, at least 11 primary PCIs per year for STEMI); an experienced catheterization team on a 24 hours per day; a 7 day per week call schedule; a well-equipped catheterization lab with digital imaging equipment; a full array of interventional equipment; intra-aortic balloon pump capability; and a proven plan for rapid transport to a cardiac surgery operating room in a nearby hospital with appropriate hemodynamic support capability for transfer. Primary PCI should be limited to patients with STEMI or MI with new or presumably new LBBB on ECG and should be performed in a timely fashion (goal of balloon inflation within 90 minutes of presentation) by persons skilled in the procedure (at least 75 PCIs per year) and at hospitals that perform a minimum of 36 Primary PCI procedures per year. (Level of Evidence: B - Limited populations evaluated. Data derived from a single randomized trial or nonrandomized studies).

Elective PCI

1. Elective/urgent PCI should be performed by operators with an acceptable annual volume (>75 procedures) at high volume centers (> 400 procedures) with on-site cardiac surgery (Level of Evidence: C)
2. Elective/urgent PCI should be performed by operators and institutions whose current risk-adjusted outcome statistics are comparable to those reported in contemporary national data registries, (Level of Evidence: C)
3. It is reasonable that low volume operators (< 75 PCI procedures per year) perform elective/urgent PCI at high volume centers (> 400 PCI procedures per year) with on-site cardiac surgery. Ideally, operators with an annual procedure volume of fewer than 75 procedures per year should only work at institutions with an activity level of more than 600 procedures per year. Operators who perform fewer than 75 procedures per year should develop a defined mentoring relationship with a highly experienced operator who has an annual procedural volume of at least 150 procedures per year. (Level of Evidence C)
4. It is not recommended that elective/urgent PCI be performed by low volume operators (< 75 PCI procedures per year) at low volume centers (200 to 400 procedures per year) with or without on-site cardiac surgery. An institution with a volume of fewer than 200 procedures per year, unless in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service. (Level of Evidence: C)
5. The 2005 PCI Guideline does not establish an explicit minimum hospital volume threshold for elective PCI; there are multiple references in the context of operator and institutional competency to "centers" performing 200 – 400 elective PCI procedures per year.
6. The 2011 PCI Guideline states that operator and hospital volume recommendations have been carried over from the ACC/AHA/SCAI 2005 Guideline Update for Percutaneous Coronary Intervention.

a. PCI in Hospitals without On-Site Surgical Back-up is in the Class IIb category.

Class IIb: Elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection (Level of Evidence: B)

Any hospital considering elective PCI without on-site-cardiac surgery must meet the criteria set forth in the 2011 ACCF/ANA/SCAI PCI Guideline, Section 4.8., PCI in Hospitals Without On-Site Surgical Backup: Recommendations (see link below):

http://content.onlinejacc.org/cgi/reprint/58/24/e44.pdf

Any hospital not meeting the 2011 ACCF/ANA/SCAI PCI Guideline criteria will be considered to be in Class III.

Class III–Harm: Primary and elective PCI should not be performed in hospitals without on-site cardiac surgery capabilities without a proven plan for rapid transport to a surgery operating room in a nearby hospital or without appropriate hemodynamic support capability for transfer. (Level of Evidence: C)

Quality and Performance Considerations for PCI Programs

Based on the 2011 American College of Cardiology Foundation/American Heart Association/Society for Cardiovascular Angiography and Interventions Guidelines for Percutaneous Coronary Intervention:

1. Every PCI program should operate a quality improvement program that routinely:
   a) reviews quality and outcomes of the entire program;
   b) reviews results of individual operators;
   c) includes risk adjustment;
   d) provides peer review of difficult or complicated cases; and
   e) performs random case reviews (Level of Evidence: C)
2. Every PCI program should participate in a regional or national PCI registry for the purpose of benchmarking its outcomes against national norms. (Level of Evidence: C)

PCI quality and performance considerations are defined by attributes related to structure, processes, and risk adjusted outcomes. Structural elements include, for example, staffing, equipment, supplies, operator and institutional volumes, and the availability of electronic medical records. Processes include strategies for the appropriate patient, protocols for pre- and post-procedural care, appropriate procedural execution and management of complications; and participation in databases and registries for benchmarking program and individual operator performance. The end result of these structures and processes of care are risk-adjusted outcomes, and when available, are more reliable measures of quality than the institutional and individual operator volumes.[58]

CARDIAC SURGERY/OPEN HEART SURGERY[59]

1. Guidelines for Standards in Cardiac Surgery developed by the Advisory Council for Cardiothoracic Surgery and approved by the American College of Surgeons' Board of Regents in October 1996 – Bulletin of the American College of Surgeons, Vol. 82, No. 2, February 1997
   a. An annual volume of at least 100 to 125 open heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes as compared with those doing a high volume.
   b. At least 200 procedures per year are necessary in order for a program to function efficiently
   c. A team approach with a minimum of 2 qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR.
2. The following conditions must be met to initiate a new OHS program:

a. The annual caseload of other programs w/in the proposed PSA shall not drop below 350 procedures.
b. Epidemiological evidence of conditions for which OHS is appropriate w/in the PSA or demonstrates a significant unmet need in the PSA for these procedures.
c. Existing program(s) in the service area are performing at least 350 open heart surgeries annually.
d. Evidence demonstrating the performance of a minimum of 200 open heart surgeries annually within the first three years of the start of the new Open Heart Surgery program.

CARDIAC UTILIZATION

Based on hospital discharge data, inpatient cardiac care is declining both in patient volume and overall patient days (see Table 4.7 and Chart 4.3). From FY 2008 to FY 2011, Cardiac Care-Medical discharges dropped 6%, while the corresponding patient days declined by 3%. During the same time period, Cardiac Care-Surgical care declined even more significantly, with both discharges (11%) and patient days (8%) falling.

Table 3.11: Statewide Cardiac Inpatient Data

Discharges	FY2008	FY2009	FY2010	FY 2011	chg 08-11	chg 10-11
Cardiac Care -Medical	43,072	41,747	41,795	40,542	-6%	-3%
Cardiac Care -Surgical	18,681	18,299	18,104	16,710	-11%	-8%
Total Cardiac	61,753	60,046	59,899	57,252	-7%	-4%

Patient Days	FY2008	FY2009	FY2010	FY 2011	chg 08-11	chg 10-11

DISCUSSION OF UNMET NEED AND GAPS IN SERVICES, CAPACITY ISSUES, ETC.

The tables below provide an initial step toward the identification of potential areas of unmet need for cardiac care in the state. The tables below provide information that compares the number of residents from a given region that received treatment for cardiac medical services or surgery in a given year (patient demand). This patient demand is compared to the overall volume of cardiac patients served by hospitals in the same region. If hospital volumes are lower than patient demand in the region, it may indicate the need for additional capacity and warrants additional study to examine patient migration patterns to confirm or refute this assertion.

Table 3.12: Bed Need for Inpatient Cardiac Services

RECOMMENDATIONS

1. Examine volume as indicator of quality, as well as other indicators, by examining institutional and operator performance.
2. Continue to review and update Connecticut's cardiac guidelines to reflect updated information and recommendations provided by Professional Societies and Organizations with expert knowledge of cardiac care.

CANCER TREATMENT

Oncology is the branch of medicine concerned with the study and treatment of cancer, including screening, diagnosis, therapy, follow-up and palliative care. It includes various sub specialties such as radiation oncology (medical use of high-energy radiation to kill malignant cells), surgical oncology, and pediatric oncology. Chemotherapy, most generally the treatment of disease by chemicals, can be used for a range of diseases but most frequently refers to antineoplastic drugs to treat cancer.

In Connecticut, there is no unique licensure category for cancer treatment. The Commission on Cancer (CoC), a consortium of professional organizations dedicated to improving cancer patients' lives, administers an accreditation program that encourages hospitals, treatment centers, and other facilities to improve the quality of patient care by focusing on prevention, early diagnosis, pretreatment evaluation, staging, optimal treatment, rehabilitation, surveillance for recurrent disease, support services, and end-of-life care. A broad range of available medical services combined with a multidisciplinary team approach has resulted in 80 percent of all newly diagnosed cancer patients in the US being treated in CoC-accredited cancer programs.[60] According to the CT Cancer Partnership, 67% of acute care hospitals in Connecticut are ACoS accredited.[61].

The change in the 2011 ACCF/AHA/SCAI guidelines for elective angioplasty without onsite cardiac surgery from a Class III to a Class IIb is significant. Dr. Gray states this change is only "incremental", but my opinion is to move from a Class III which indicates harm to a Class IIb which states such a program might be considered as long as there is appropriate program development and rigorous criteria for proper patient selection is beyond "incremental". ~~OHCA has recognized this significant change and incorporated in their Cardiac Services section of the new State Health Plan (draft form) the following statement:~~

~~"...an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation".~~

- Dr. Gray discusses the results of the CPORT-E study recently published in the New England Journal of Medicine and suggests that our CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with onsite surgery. Our application never included any such suggestion. But the CPORT-E study, along with others noted in Dr. Cabin's prefiled testimony, and the shift from a Class III to a Class IIb assignment by the ACCF/AHA/SCAI Angioplasty Guidelines all support the reasonableness of offering elective angioplasty without onsite cardiac surgery as long as number of criteria are met which we have already addressed in our CON application. Dr. Gray's skepticism and criticism of angioplasty without onsite cardiac surgery is puzzling given his institution's (NYP) support of White Plains Hospital's program as well as support of a similar program by another NYP affiliate, Holy Name Hospital in Teaneck, New Jersey.

- Dr. Gray also highlights the statement in the 2011 ACCF/AHA/SCAI Guidelines which discusses competition with another angioplasty program in the same geographic area, particularly an established program with surgical back-up and that such competition MAY not be in the best interests of the community. The data we included in our prefiled testimony clearly shows that Greenwich and Stamford Hospitals are overwhelmingly serving residents of different communities. I would go so far as to say that we do not compete in the area of cardiology, despite our close geography. Our medical staff in

cardiovascular services does not overlap to any measurable degree and referral patterns to the interventional cardiologists are different. We have offered emergency angioplasty for approximately 8 years and despite the entrance of Stamford Hospital's program, we have maintained our emergency and elective transfer volume because patients want their care from Greenwich Hospital and the YNHHVC. In this case, a program at Greenwich Hospital IS in the best interest of the community because the Greenwich Hospital community has demonstrated that is where they want their care.

- Dr. Gray states that if the program at Greenwich Hospital is approved there is a risk that Stamford and Greenwich Hospital's angioplasty programs may perform less than 200 PCIs per year. For the reasons I have outlined above, we do not believe our program will impact Stamford's program due to the lack of patient and physician crossover. It is worthy to note that since the opening of White Plains Hospital's program, Stamford Hospital has not seen any decline in their angioplasty volume. According to Stamford Hospital's Petition, Stamford Hospital "...is on track to perform 277 PCIs in FY 2012" which represents a 25% increase from its 2011 volume as noted on Dr. Kiely's testimony page 32 (PCR data). Clearly, the presence of the White Plains Hospital program, which is located only 15 miles from Stamford Hospital and performed as many as 290 PCIs last year, has not had any impact on Stamford Hospital's angioplasty volumes.

- I must comment on Dr. Gray's suggestion that approval of the proposed program at Greenwich Hospital would in some way encourage physicians to feel "...pressure to refer patients for procedures to keep institutional volumes up. Occurrences like these will only drive up healthcare costs for payers and patients." ~~Dr. Gray is suggesting that physicians may send a patient for an unnecessary procedure just to increase institutional volumes. This may be the practice at New York Presbyterian, but I can assure you that this is NOT the practice of YNHHVC physicians nor would it ever be condoned or permitted.~~

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

Rebuttal Testimony of Dr. William A. Gray

I would like to address some of the statements made by Dr. Howes in his pre-filed and rebuttal testimonies and by Dr. Cabin in his pre-filed testimony.

First, I would like to address statements made by Dr. Howes. On page 668 of his pre-filed testimony, he states that the 2011 ACCF/AHA/SCAI Guideline along with the CPORT-E study results "essentially end the debate over the safety of elective angioplasty programs without onsite cardiac surgery as long as programs adhere to the SCAI program requirements." This statement is a clear mischaracterization of the Guideline and the study results.

In addition, Dr. Howes, on page 761 of his rebuttal testimony, goes on to cite language from page 5 of the 2012 ACCF/SCAI Expert Consensus Document Update stating that

> It is generally believed that elective and primary PCI are permissible in sites without cardiovascular surgery, if there is strict adherence to national guidelines. In particular, there must be a documented working relationship with a larger facility with cardiovascular surgical services and an emergency transportation system operative.

What Dr. Howes fails to mention in providing the above two excerpts is that the 2012 ACCF/SCAI Expert Consensus document also states that performance of elective PCIs without on-site surgical back-up "remains controversial," especially when other active PCI programs are located in the same geographic area. 2012 ACCF/SCAI Expert Consensus Document Update, p.

197 (page reference is to Exhibit 4 of my Pre-filed Testimony). He also fails to mention that the same 2012 ACCF/SCAI Expert Consensus document states that

> there is a declining volume of PCI despite the improvement in outcomes from stent technology and consistent with a better appreciation of which procedures provide optimal benefit to patients. These types of studies suggest maturation of the technology so that further expansion may be limited despite concerns regarding a need for more procedures in the aging population. To this end, some have called for a moratorium on allowing any further expansion of PCI services, especially to low-volume facilities without cardiovascular surgical backup.

2012 ACCF/SCAI Expert Consensus Document Update, p. 197. Finally, he also omits from his testimony the notion that the 2011 ACCF/AHA/SCAI Guideline states that it is only reasonable to consider elective angioplasty programs without on-site cardiac surgery if such programs will "clearly fill a void in the healthcare needs of the community." *See* ACCF/AHA/SCAI Guideline, p. 164 (page reference is to Attachment VI of Applicants' CON Application)).

Given these statements, it is misleading for Dr. Howes to state that the 2011 Guideline and CPORT-E study "essentially end the debate" on this point. The debate may be ended with regard to those programs that will fill a void in the healthcare needs of the community and will improve access to a higher level of care than would otherwise be available, but none of the 2011 Guideline, the 2012 Expert Consensus document or the CPORT-E study in any way endorses duplicative elective angioplasty programs located close to established, high-quality providers with existing capacity. As TSH has said time and again, another elective PCI program in lower Fairfield County will not improve access to cardiovascular care – it will merely shift the volume in the service area from existing programs to a new program, and, in doing so, jeopardize the quality of care rendered by each program. Furthermore, it does not matter that a proposed program intends to strictly adhere to national guidelines if there is not a need for the proposed

program in the first place (*i.e.* if the program will not fill a void in the healthcare needs of the community).

I would also like to state that I did not indicate that I believed Applicants' CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with cardiac surgery. *See* Dr. Howes Rebuttal Testimony, p. 762. I do not believe any cardiac physician would take such a position. I merely indicated that it is only reasonable to consider an elective angioplasty program without onsite cardiac surgery back-up if it will "clearly fill a void in the healthcare needs of the community" and will "improve access to a higher level of cardiovascular care than would otherwise be available." *See* 2011 ACCF/AHA/SCAI Guideline, p. 164; 2012 ACCF/SCAI Expert Consensus Document Update, p. 197; Pre-filed Testimony of Dr. William A. Gray, pp. 5, 7. Here, as we have previously established, there is no such void and, with high-quality programs in the service area already providing the service, it can hardly be stated that the proposed program will improve access to a higher level of care than is already available.

Finally, with regard to page 762 of Dr. Howes' rebuttal testimony, NYP/C's support for White Plains Hospital's program filled a void in the healthcare needs of the community by providing Westchester County with a second, local elective angioplasty program. The Teaneck, New Jersey program and service areas also involved unique factors which are not replicated here.

I would also like to briefly address statements made by Dr. Cabin in his pre-filed testimony. Like Dr. Howes, Dr. Cabin emphasizes Applicants' intent to strictly adhere to the SCAI facility and personnel requirements incorporated into the 2011 ACCF/AHA/SCAI Guideline. *See* Pre-filed Testimony of Dr. Cabin, p. 636. However, like his colleague, Dr. Cabin

also fails to address the fact that a proposed program should only be approved if it will fill a void in the healthcare needs of the community, regardless of whether it can meet the SCAI requirements or not, as I discuss above. Furthermore, Dr. Cabin neglects to mention the risks inherent in angioplasty procedures which are discussed right in the 2011 ACCF/AHA/SCAI Guideline – for example, procedural and periprocedural MI, PCI-related stroke and vascular complications such as access site hematoma and coronary perforation, as well as the need for coronary artery bypass graft (CABG) surgery in some cases. *See* 2011 ACCF/AHA/SCAI Guideline, p. 159. The previous 2005 ACC/AHA/SCAI Guideline Update stated directly that a "small but real fraction of patients undergoing elective PCI will experience a life-threatening complication that could be managed with the immediate onsite availability of cardiac surgical support but cannot be managed effectively by urgent transfer." 2005 ACC/AHA/SCAI Guideline Update, p. 78 (page reference is to Exhibit 2 of my Pre-filed Testimony). These risks have not been eliminated, and they cannot be ignored.

Rebuttal of Sharon Kiely, M.D. to Testimony of
Marna Borgstrom, Christopher Howes, M.D. and Frank Corvino

I am submitting this testimony in rebuttal to various statements made in the July 12, 2012 pre-filed testimonies of Marna Borgstrom, Frank Corvino and Dr. Christopher Howes.

Rebuttal of Ms. Borgstrom's Testimony

With regard to Ms. Borgstrom's testimony, beginning at page 629 she discusses at considerable length the credentials of the Yale New Haven Heart and Vascular Center (YNHHVC) and its personnel, and its ranking for cardiac services in U.S. News and World Report. We agree that YNHHVC, YNHH and their cardiology specialists have the requisite capabilities and experience to assist its affiliate, Greenwich Hospital, with the development of the proposed satellite elective angioplasty program.

However, just because something can be done does not mean that it should be done. YNHH and YNHHVC will not bring a superior level of expertise or experience to the service area. The region's two existing elective angioplasty providers, The Stamford Hospital (TSH) and White Plains Hospital (White Plains) are affiliated with the New York Presbyterian Hospital of Columbia and Cornell (NY Presbyterian), a world-renowned academic medical center which was ranked substantially higher than YNHH in the most recent U.S. News and World Report rankings of cardiac hospitals (NY Presbyterian was #6 and YNHH was #26).

Ms. Borgstrom's testimony also suggests that the need for another elective angioplasty program in Southwestern Connecticut is established, in large part, by the "telephone survey" conducted by Ms. Hamson. This is indeed a flawed methodology as there is a conspicuous lack of information regarding the nature of this purported survey, the underlying assumptions of respondents or statistical controls. This leaves little doubt of its self-serving nature and the level of credibility it should be accorded.

Finally, Ms. Borgstrom, through her rebuttal testimony, references the discussions between TSH and YNHHVC/Greenwich Hospital regarding a possible collaboration. It is true that there were discussions and that a collaboration ultimately did not come to fruition. However, Ms. Borgstrom misstates the series of events leading up to the termination of discussions and the reason why TSH did not continue to pursue the collaboration.

It should be noted that TSH regularly assesses opportunities to collaborate with other providers to improve the delivery and coordination of care in its service area. In fact, there is a Board-designated task force that meets regularly to assess the market and identify potential opportunities. Greenwich Hospital asked TSH to support its CON application for an elective angioplasty program. TSH responded that this could only be considered within the context of a regional collaboration.

Subsequently, TSH, Greenwich Hospital, and Yale New Haven Health began exploring potential collaboration opportunities to better coordinate heart and vascular care in the region. After a series of discussions, an outline of principles and draft letter of intent were prepared by YNNH for review by TSH in order to conceptualize what a collaboration might look like. As set forth in the letter of intent, the parties were to keep any information furnished to one another

confidential and not make any public statement or comment regarding their discussions without mutual consent.

Contrary to Ms. Borgstrom's assertion, David Smith never told the parties that the terms of the draft letter of intent were acceptable to TSH. Mr. Smith did tell the parties that the draft addressed TSH's initial concerns regarding the collaboration, but he was clear that TSH felt an obligation to continue to explore opportunities with its current partner, New York Presbyterian Health Care System, to improve delivery and coordination of care. He also informed Yale's representative that time did not permit TSH to evaluate the preliminary conceptual framework as well as hold the necessary discussions with NY Presbyterian to see if its existing partnership could be enhanced prior to Greenwich/Yale proceeding with the hearings on this CON Application. TSH asked the Applicants to withdraw this CON Application. The Applicants declined and TSH informed them that it would oppose the proposed competing program.

Rebuttal of Dr. Howes' Testimony

Dr. Howes concludes his testimony by stating that "[w]*e have reached the point in time where the proposal can and should be approved. Earlier barriers have been removed and patients and physicians seek these services at Greenwich Hospital.*" Notwithstanding this proclamation, Dr. Howes has clearly chosen to ignore the largest and most important barrier, which existed in 2009 when Greenwich Hospital was most recently denied an elective angioplasty program, and which continues today – the lack in growth in PCI volume.

YNHH and Greenwich Hospital do not refute but apparently refuse to acknowledge the widely-accepted data showing that PCI volume has been flat to declining in the service area. Rather, the Applicants have based their projected volumes on a series of tenuous assumptions

and misleading information. Some of the more puzzling aspects of Dr. Howes' testimony include:

1. Greenwich Hospital and YNHH's projecting higher volumes now than were projected in 2009 despite the fact that the White Plains angioplasty program has been added to the service area since that time.

2. Greenwich Hospital and YNHH's projecting higher volumes now than were projected in 2009 despite the fact that the number of elective angioplasty cases that Greenwich Hospital has transferred or referred to another facility has dropped each year since that time.

3. Greenwich Hospital and YNHH's claim that TSH and Greenwich Hospital serve different patient populations even though the eight Connecticut towns identified in the Greenwich Hospital Service Area are the same as those identified by Stamford Hospital in its approved 2006 CON to establish a full-service cardiac program.

4. Greenwich Hospital and YNHH are basing their volume projections, in part, on a representation from two interventional cardiologists (Dr. Monsen of NY Presbyterian and Dr. Newman of WestMed Medical Group) who have indicated that, combined, they could bring between 80-105 angioplasty cases to Greenwich Hospital each year (see letters attached to Dr. Howes' testimony).

In support of item 3 above, Dr. Howes refers to Table 2 on page 670 of his testimony as evidence that of the top 20 TSH attending physicians, only one had any admission volume at Greenwich Hospital. Of course, what Dr. Howes fails to mention is that 10 of the physicians listed on Table 2 are Hospitalists who are employed by TSH, do not have offices in the community, and whose job it is to act as attending physicians for unassigned patients whose community physicians do not want to follow the patient into the hospital or who do not have admitting privileges at TSH. Accordingly, these physicians have no opportunity to refer patients outside of TSH. In addition, another physician, Dr. Coady, is a cardiac surgeon. Since Greenwich does not have a cardiac surgery program, he would have no reason to admit patients there.

Item #4 is also emblematic of the serious flaws in the applicant's volume projection methodology. First, it is must be noted that WestMed (then known as The Westchester Medical Group) provided a similar letter in support of Greenwich Hospital's 2009 CON application (see letter attached hereto as Exhibit A). At that time, WestMed represented that it would shift approximately 100 cases to Greenwich Hospital, whereas in 2012 that number fell to 50-75 (at best, a 25% reduction). This would further support the decline in PCI volume from 2009 to present.

Including the volume promised by these physicians in the projections is also misleading, since it merely reflects shifting cases from an existing provider. It does nothing to substantiate the need for the additional PCI program. As stated by Dr. Newman in his letter in support of this application, "*I estimate that we would complete 50-75 angioplasties at Greenwich Hospital that **we currently treat at a hospital outside of Connecticut.***" (emphasis added).

Relying on such promises is tantamount to building a house of cards. These physicians are under no contractual obligation to transfer cases to Greenwich Hospital, and Greenwich Hospital would have no recourse should these physicians decide to direct their patients elsewhere or should there be a change in the structure or ownership of the physician practice. Evidence of changing allegiances of referring doctors is also evidenced by Dr. Monsen's letter of support. Three years ago, Dr. Monsen was affiliated with Westchester Medical Center; today he is a member of NY Presbyterian Hospital. Given the current economic climate and the significant increase in the merger and acquisition of physician practice groups, any promises of future referrals are illusory at best, and should not be given serious consideration when determining a Certificate of Need application.

Rebuttal of Frank Corvino's Testimony

Mr. Corvino states on page 682 of his testimony that "*I want to emphasize that this proposal is all about patient care and patient access.*" As evidenced on page 15 of the CON Application, this statement is inaccurate. In fact, Greenwich and YNHH put forth three reasons to support its contention of public need. Admittedly, two of those reasons were: (1) to improve local access to elective angioplasty care at Greenwich Hospital; and (2) to improve the quality of care of elective angioplasty services provided to Greenwich Hospital service area patients. However, it is the third reason that is the most telling of the true nature of the CON Application and why Greenwich Hospital is seeking an elective angioplasty program. Simply put, it's about money.

Therefore, I respectfully submit that, based on the 2011 ACCF/AHA/SCAI Guideline, which flatly states that financial considerations are inappropriate in determining public need in this context, OHCA deny this CON Application.

EXHIBIT A

SIMEON A. SCHWARTZ, M.D.
PRESIDENT

November 14, 2008

Commissioner Cristine Vogel
Office of Health Care Access
MS # 13 HCA
410 Capital Avenue
Hartford, CT 06134-0308

Dear Commissioner:

On behalf of the Westchester Medical Group, I am writing this letter to support the application for Elective PCI at Greenwich Hospital. Over the past several years a growing number of physicians from our practice are on staff at Greenwich Hospital and many of our patients seek their hospital based services there.

An elective PCI service at Greenwich Hospital will provide our cardiac patients with choice and local access to high quality interventional cardiology services. The ability to provide elective angioplasty will also improve continuity of care for patients at Greenwich Hospital.

The Westchester Medical Group projects that on an annual basis there would be 200 cardiac catheterization cases and 100 elective angioplasty cases performed on our patients at Greenwich Hospital.

We urge you to approve this proposal.

Thank you.

Sincerely,

MD

Simeon Schwartz, MD
President

WESTCHESTER MEDICAL CENTER NEW YORK MEDICAL COLLEGE
DEPARTMENT OF MEDICINE
DIVISION OF CARDIOLOGY

November 6, 2008

Commissioner Cristine Vogel
Office of Health Care Access
MS # 13 HCA
410 Capital Avenue
Hartford, CT 06134-0308

Dear Commissioner:

I am writing this letter to express my support for the proposed elective angioplasty program at Greenwich Hospital. An elective PCI service at Greenwich Hospital would provide patients in the region with choice and greater access to interventional cardiology services. In addition, this program will improve continuity of care to cardiac patients at Greenwich Hospital.

Our practice, which is located predominantly in the immediately adjacent geographic region of Westchester County is made up of 40 physicians in a single specialty cardiovascular practice. It is one of the largest single specialty groups in the region, if not the East Coast. We presently perform approximately 1500 coronary interventions per year. Many of our patients live very close to Greenwich Hospital. I am sure that a number of them would prefer Greenwich Hospital over the Westchester County Medical Center in Valhalla, New York for their coronary interventions if an elective program were in existence. Presently, the Westchester Medical Center is the only local facility that can perform both emergency and elective PCI. Adding an elective PCI program to Greenwich Hospital would improve access and choice for a significant group of our patients.

We urge you to approve this proposal.

Yours very truly,

Craig Hjemdahl-Monsen, M.D.
Director, Interventional Cardiology
Associate Chief, Division of Cardiology

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

RESPONSE TO GREENWICH AND YALE-NEW HAVEN HOSPITALS' OBJECTION TO INTERVENOR'S REBUTTAL TESTIMONY AND MOTION TO STRIKE TESTIMONY

Rebuttal Testimony

The Stamford Hospital ("TSH") hereby responds to Greenwich Hospital's ("GH") and Yale-New Haven Hospital's ("YNHH," and, together with GH, the "Applicants") request that the Office of Health Care Access ("OHCA") preclude TSH's submission of rebuttal testimony. Applicants cite absolutely no legal or equitable rationale for precluding such submission. OHCA's Ruling issued on July 16, 2012 regarding TSH's petition to be granted intervenor status does not expressly address Applicants' request to preclude TSH from submitting rebuttal testimony, but such ruling grants TSH intervenor status, including the right "to introduce evidence." Since there is no limitation on such right in OHCA's Ruling – and no possible reason to grant Applicants' unusual request – TSH has submitted herewith written rebuttal testimony. For the record, however, TSH wishes to make the following points.

By granting TSH intervenor status, OHCA has determined that TSH can assist OHCA in resolving the issues raised by Applicants' application. *See* Regs. Conn. State Agencies § 19a-9-27. To place unnecessary and unjustified limits on the submission of evidence by TSH would fly in the face of OHCA's determination. As stated in TSH's Petition for Intervenor Status, its position as an existing provider of elective angioplasty in the same geographic area which would

be served by Applicants' proposed program makes it uniquely qualified to offer evidence and information that would otherwise not be available to OHCA to assist in evaluating Applicants' proposal. Both parties submitted their written testimony on June 12, 2012. Applicants have filed their rebuttal to the testimony submitted by TSH, and in the interest of justice and the public good, TSH must have the same opportunity.

This opportunity, which TSH assumed it would have in addition to full intervenor status, is even more critical now that OHCA has granted TSH only limited intervenor status, precluding TSH from conducting cross-examination of Applicants' witnesses. OHCA's decision to limit TSH's rights as an intervenor is virtually unprecedented in the context of cardiac Certificate of Need applications. To TSH's knowledge, in every such application filed in recent memory, each intervenor has been permitted to cross-examine witnesses. More importantly, when Applicants filed a nearly identical application three (3) years ago seeking permission to provide elective angioplasty, TSH was granted full intervenor status, including the right to cross-examine witnesses. *See* Docket No. 08-31210-CON.

TSH believes that OHCA's decision to deny TSH the right to cross-examine witnesses is not justified by law or precedent and does not serve the interests of OHCA or the public. In addition, as a provider of cardiac services, including elective angioplasty, in the very geographic area which is the subject of Applicants' proposal, TSH's interests are profoundly implicated here – providing yet another reason to have granted TSH full procedural rights as an intervenor. Still, OHCA has denied TSH such rights.

In their motion, Applicants attempt to justify precluding TSH from submitting additional useful information to OHCA via rebuttal testimony by arguing that "*if OHCA grants TSH full procedural rights, TSH will have an opportunity to rebut any information contained in*

Applicants' pre-hearing submissions through cross-examination of Applicants' witnesses." Applicants' Objection to The Stamford Hospital's Petition for Intervenor Status and Motion to Strike Testimony at p. 768. Since OHCA has now denied TSH the right to cross-examine witnesses, without the submission of rebuttal testimony, inaccuracies or distortions in the record which only TSH may be in a position to correct would otherwise go unaddressed.

Unlike a private lawsuit between two parties where a judge's decision will affect only those parties, here, OHCA's decision will affect not only TSH and other health care providers, but the public as well. In Certificate of Need proceedings, OHCA is charged with determining the need for the proposed new service, taking into account services already available and all other information relevant to determining such need, including, without limitation, how the proposed services will impact the financial strength of the state's health care system and whether the proposed services will result in unnecessary duplication of existing health care services. Conn. Gen. Stat. § 19a-639. To fulfill this responsibility, OHCA's decision to accept evidence from TSH, including written rebuttal testimony, is clearly necessary and appropriate.

TSH's rebuttal testimony is not voluminous and will not disrupt the orderly conduct of the proceedings. *See* Conn. Gen. Stat. § 4-177a(b). Applicants have provided no rationale for precluding the acceptance of such testimony, while the benefit of receiving it is obvious – more relevant information is available to OHCA. Moreover, since Applicants' counsel has the right to cross-examine TSH's witnesses with respect to such testimony, Applicants are not at all prejudiced by its submission.

Motion to Strike

Applicants move to strike all references to Lawrence & Memorial Hospital's ("L&M") CON application. The references to that application in TSH's testimony are included simply to

contrast certain elements that are present in the L&M situation which are clearly lacking in Applicants' proposal. On this basis, TSH believes that the inclusion of such information is appropriate.

For the reasons stated above, OHCA's decision to permit the submission of evidence, including rebuttal evidence, from TSH is justified and appropriate and OHCA should deny Applicants' motion to strike testimony relating to L&M's CON application.

Respectfully submitted,

THE STAMFORD HOSPITAL

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

INTERVENOR THE STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE A PORTION OF REBUTTAL TESTIMONY OF MARNA BORGSTROM AND CHRISTOPHER HOWES, M.D.

Intervenor The Stamford Hospital ("TSH") hereby objects to and moves to strike portions of the pre-filed rebuttal testimony of Marna Borgstrom and Christopher Howes, M.D. submitted by Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants") for the public hearing. The portions of the testimony sought to be stricken are identified on the pages of testimony attached as Exhibit A hereto. As set forth more fully below, Ms. Borgstrom's pre-filed rebuttal testimony (pages 698-701) includes extensive commentary regarding open heart surgery, which is totally irrelevant and immaterial to the pending Application. Additionally, Dr. Howes' pre-filed rebuttal testimony (pages 762-763) inappropriately quotes the State Health Plan, which at the present time is a draft not yet finalized or adopted, and includes an unwarranted caustic and insulting comment directed at New York Presbyterian Hospital. TSH, therefore, respectfully requests that OHCA strike the foregoing impermissible testimony.

Ms. Borgstrom's pre-filed rebuttal testimony (pages 698-701 and Attachments II, III and IV (pages 716-756)) includes extensive commentary and statistical data regarding inpatient open heart surgery volume, both state-wide and at TSH, which is irrelevant and immaterial to the pending application for approval to perform elective angioplasty without open heart surgery. Ms. Borgstrom's testimony about TSH's open heart surgery program is especially prejudicial because TSH will not have the opportunity to cross-examine this witness. This rebuttal testimony has no arguable relevance to the issues pending before OHCA and should be stricken in its entirety.

Dr. Howes' pre-filed rebuttal testimony (pages 762-63) is likewise objectionable for two reasons. First, Dr. Howes quotes a single sentence from the Draft State Health Plan referencing a change in the ACCF-AHA-SCAIPCI guidelines. The best evidence in this regard is the ACCF-AHA-SCAIPCI guidelines, and it is not appropriate for the Applicant's witness to refer to a plan which exists only in draft form which has not been finalized or adopted. Moreover, if OHCA determines that it is appropriate to consider the draft State Health Plan, then the draft Plan should be considered in its entirety, rather than one sentence taken out of context, as reflected in Dr. Howes' rebuttal testimony. In addition, Dr. Howes' rebuttal testimony includes a spurious remark directed at New York Presbyterian Hospital, which bears no relevance to the issues in this proceeding and is inconsistent with the professionalism and civility customarily demonstrated by witnesses who testify before OHCA.

Wherefore, for the foregoing reasons, Intervenor's objection to the rebuttal testimony should be sustained and the testimony stricken as set forth in Exhibit A hereto.

Respectfully submitted,

THE STAMFORD HOSPITAL

EXHIBIT A

YNHHVC. Ms. Capozzalo will be in attendance at the hearing and can address her discussions with Stamford Hospital under oath.

~~YNHHVC and Greenwich Hospital fully intended to collaborate with Stamford Hospital in~~ the area of cardiac care and had sought to help strengthen Stamford's open heart surgery program, which is suffering from low volume. The presence of Yale faculty based in southwestern Connecticut communities along with the YNHHVC's clinical program support and quality improvement systems would have significantly improved Stamford Hospital's cardiac surgery program's credibility, which is at significant risk, evidenced by the fact that they performed only 80 open heart cases last year and are on track to perform approximately 50 this fiscal year based on 6 months volumes from CHIME (see Table below).

Connecticut Inpatient Volume for Open Heart Surgery by Hospital for FY 2010 - FY 2012 (6 Months)				
Hospital	FY 2010	FY 2011	FY 2012*	
Bridgeport	152	127	140	
Danbury	181	182	150	
Dempsey	67	71	72	
Hartford	793	801	702	
HSR	343	313	300	
St. Francis	867	781	734	
St. Mary's	118	100	114	
St. Vincent's	239	223	200	
Stamford	84	80	54	
Waterbury	109	102	104	
YNHH	869	800	820	
TOTAL	**3,792**	**3,580**	**3,390**	
Source: CHIME				
*FY 2012 annualized based on 6 months actual				

It is clear that YNHHVC acted in good faith to create a cost effective care model for cardiology services in the Stamford and Greenwich area, but it is Stamford Hospital that does not want to collaborate.

- I would also like to point out that Stamford Hospital's extremely low cardiac surgery volume does not come close to meeting professional society recommendations or OHCA's own standards as outlined in the Agreed Settlement for Stamford Hospital (DN: 04-30374-CON) (see Attachment II). Condition #8 states:

  "If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. **If these volumes are not met for a period of <u>two consecutive 12-month periods</u>, TSH's OHS program <u>shall be terminated</u>...**"

  We are not aware that this condition has been modified by OHCA based on a review of OHCA's website and modifications pursued by Stamford Hospital.

  According to OHCA's own data (see Attachment III) through 2010, Stamford Hospital has never come close to reaching 125 open heart surgeries in a year. In fact, it appears that its highest volume was 80 in FY 2011. As previously shown above, based on 6 months of CHIME data for 2012, they are on track to perform about 54 surgeries this year, less than half of the guidelines requirement. These low volumes have been of concern to YNHHVC physicians and we suspect have contributed to fewer referrals to their surgery program. Low surgical volume can also affect the physicians' decisions to transfer patients to Stamford for elective angioplasty, given the uncertain quality of the surgical backup available at that site. Such low surgical volumes present a significant quality concern as identified by the American College of Surgeons which published that an annual volume of 100-125 is **<u>necessary</u>** from a quality standpoint and this requirement has also been noted by OHCA in its draft Cardiac Services section of the new State Health Plan (see Attachment IV).

- Dr. Kiely states that OHCA should not approve Greenwich Hospital's proposed elective angioplasty program because elective angioplasty volumes are flat in Connecticut and the proposed service area. Stamford Hospital did not previously view flat or declining volumes as problematic when it pursued its full service cardiac program CON. At that time, their own cardiac catheterization volumes had been in decline as noted in OHCA's

Agreed Settlement's Findings of Fact #11 (previously referenced as Attachment II); statewide inpatient cardiac catheterization and angioplasty volumes had declined steadily between 2003 and 2005, as shown in Dr. Kiely's own testimony and open heart surgery volumes had also been declining between 2002 and 2005 as shown in the OHCA table and graph below.

Table 3A: Open heart surgery discharges by provider, FFYs 2002-2010

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	FFY 05-10 (5-yr)% Change	FFY 08-10 (3-yr)% Change	FFY 09-10 (1-yr) % Change
Bridgeport	345	313	268	263	175	194	100	96	136	-22%	28%	42%

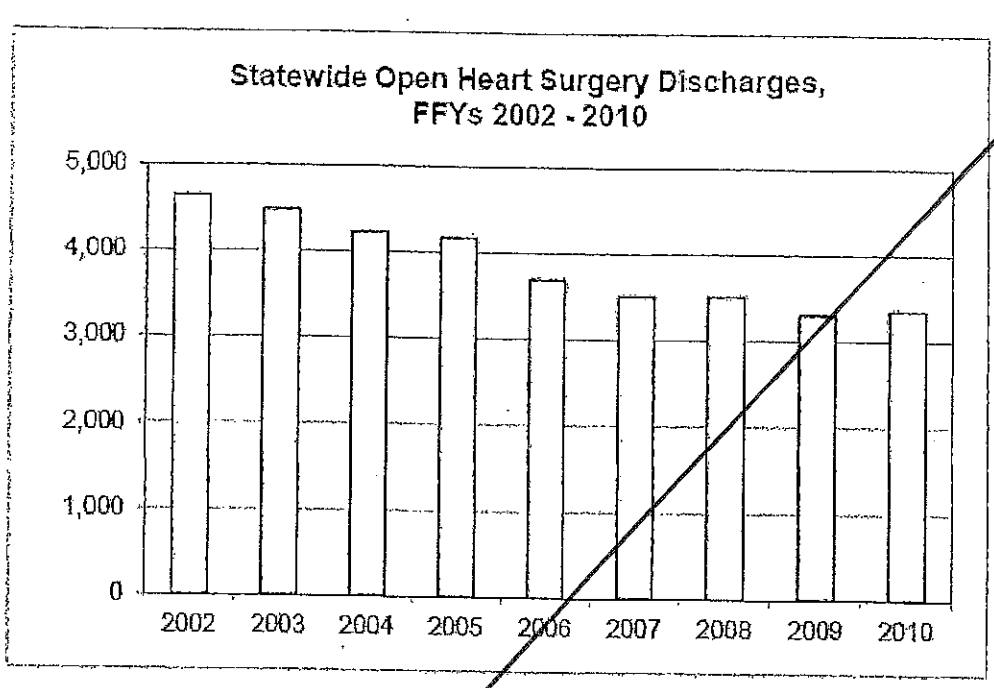
Total	4,644	4,478	4,226	4,166	3,694	3,608	3,505	3,309	3,353	-9%	-4%	-8%

Source: CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.

ICD-9-CM Procedure Codes: 35.10-35.28 and 36.10-36.19

Please note: unduplicated counts utilizing all procedure codes



All of these related and declining volumes did not seem relevant to Stamford Hospital or OHCA as a full service cardiac program was proposed and approved. Stamford Hospital expended more than $8 million dollars in capital expenses to develop their angioplasty and surgery program in a declining volume market (modified from the $5.4 million they estimated at the time of their original CON filing). They based their need on such factors as improved accessibility, continuity of care and improved quality. These are the same reasons why Greenwich Hospital seeks to offer elective angioplasty and ~~can do so without any capital expense.~~

- Dr. Kiely's testimony includes conflicting statistics and information about New York programs. First, I would like to highlight the following statement from OHCA's 2010 Declaratory Ruling, Docket Number: 09-31433-DCR, which specifically states that:

  "...OHCA only has the authority to act on behalf of the state within the parameters of its enabling statutes and its jurisdiction is limited to health care facilities located within the state. Thus, OHCA has no jurisdiction over health care facilities located in other states just as those states have no authority to regulate facilities located within Connecticut."

Project Title:	Establish Elective Angioplasty and Open Heart Surgery Program at The Stamford Hospital
Statutory Reference:	Sections 19a-638 & 639, Connecticut General Statutes
Filing Date:	August 15, 2005
Hearing Dates:	Public Portion: September 22, 2005 Technical Portion: October 6, 2005 and October 27, 2005
Commissioner & Presiding Officer:	Cristine A. Vogel
Agreed Settlement Date:	January 4, 2006
Default Date:	Not Applicable
OHCA Staff	Steven W. Lazarus Michael Sabados

Project Description: The Stamford Hospital ("TSH" and "Hospital") and New York Presbyterian Healthcare System, Inc. ("Applicants") propose the establishment of an elective angioplasty ("PCI") and open-heart surgery ("OHS") program, to be located at the Hospital, at a capital expenditure of $5,404,425.

Nature of Proceedings: On August 15, 2005, the Office of Health Care Access ("OHCA") received the Applicants' Certificate of Need ("CON") application seeking authorization to establish an elective angioplasty and open-heart surgery program, to be located at the Hospital, at a capital expenditure of $5,404,425. The Stamford Hospital is organized under the laws of Connecticut, and New York Presbyterian Healthcare System, Inc. is a corporation organized under the laws of the State of New York. The Hospital is a health care facility or institution as defined by Section 19a-630 of the Connecticut General Statutes ("C.G.S.").

Public hearings regarding the CON Application were held on September 22, 2005, October 6, 2005 and October 27, 2005. The Hospital was notified of the date, time, and place of the hearings and notices to the public were published prior to the hearings in *The Advocate* (Stamford) by OHCA. The hearings were conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the Connecticut General Statutes) and Sections 19a-638 and 19a-639, C.G.S.

Yale-New Haven Hospital, Bridgeport Hospital, and Greenwich Hospital collectively known as Yale-New Haven Heart Health Institute were granted Intervenor status with rights to cross-examine. St. Vincent's Medical Center was granted Intervenor status with the rights to cross-examine.

The Presiding Officer heard testimony from the general public, legislators, local officials and witnesses for the Hospital and Intervenors. In rendering this decision, the presiding officer has considered the entire record of the proceeding. OHCA's authority to review, approve, modify or deny this proposal is established by Sections 19a-638 and 19a-639, C.G.S. The provisions of these sections, as well as the principles and guidelines set forth in Section 19a-637, C.G.S., were considered by OHCA in its review.

Findings of Fact

Clear Public Need
Impact on The Hospital's Current Utilization Statistics
Proposal's Contribution to Accessibility and Quality of Health Care Delivery in the Region

1. The Stamford Hospital ("TSH" and "Hospital") is a not-for-profit, 305-bed acute care hospital located in Stamford, Connecticut. TSH, as an affiliate member of the New York Presbyterian Healthcare System ("System"). TSH provides a comprehensive array of services including: Medicine, Surgery, Obstetrics/Gynecology, Psychiatry as well as Medical and Surgical critical care units. *(Completeness Responses, Proposed Resolution, August 15, 2005, Exhibit 3 and Certificate of Need Application, August 15, 2005, page 1-3)*

2. The New York Presbyterian Healthcare System, Inc ("NYPHS") coordinates a system of hospitals and other healthcare institutions throughout the tri-state area, including The Stamford Hospital ("TSH") and New-York Presbyterian Hospital ("NYPH"). NYPH operates New York-Presbyterian Hospital/Columbia University Medical Center ("NYP/C") in affiliation with Columbia University College of Physicians and Surgeons ("CU"). *(Certificate of Need Application, August 15, 2005, pages 2-3)*

3. TSH and NYPHS ("Applicants") propose the establishment of an elective percutaneous coronary angioplasty[a] ("PCI") and open-heart surgery[b] ("OHS") program, to be located at the Hospital. *(Certificate of Need Application, August 15, 2005, page 2)*

4. TSH's proposal is for a full-service cardiovascular services program in the lower Fairfield County. TSH is located in the region's largest population center. *(Prefiled Testimony of Brian Grissler, September 19, 2005,)*

---

[a] Elective (Scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

[b] Open-heart surgery is a surgical intervention performed on the opened heart while the bloodstream is diverted through a heart-lung machine. Cardiac Surgery includes Coronary Artery Bypass Graft (CABG), Valvuloplasty, and Valve Replacement. CABG is where a vein from the chest or leg, or a prosthesis, is grafted onto either side of a blockage in the coronary artery. This reroutes blood flow around the blockage to the heart muscle. Valvuloplasty is where a balloon tipped catheter is inserted into plaque-blocked heart valves to widen and separate them through repeated balloon inflation. A Valve Replacement is a replacement of plaque-blocked heart valves with prosthetic or tissue graft.

5. On August 25, 2004, TSH received CON authorization from OHCA to perform primary[c] PCI services. *(Certificate of Need Application, August 15, 2005, page 2)*

6. The proposed program will augment existing cardiovascular services at the Hospital. The Hospital currently offers:

Primary Angioplasty	Electrocardiogram
Interventional electrophysiology (ablations)	Electrophysiology
Diagnostic cardiac catheterization	Holter monitoring
Coronary care unit	Intra-aortic balloon pump
Telemetry inpatient care	Nuclear stress testing
Cardiac imaging	Pulmonary function testing
Cardiac rehabilitation	Stress testing
Cardiac ultrasound	Tilt table testing
Cardiopulmonary testing	Vascular and thoracic surgical services

(Certificate of Need Application, August 15, 2005, pages 8-9)

7. TSH's cardiology primary and secondary service areas consist of the following Connecticut towns:

Table 1: Stamford Hospital's Proposed Service Area for this Proposal for FYs 2002 – 2005 (1st Two Quarters)

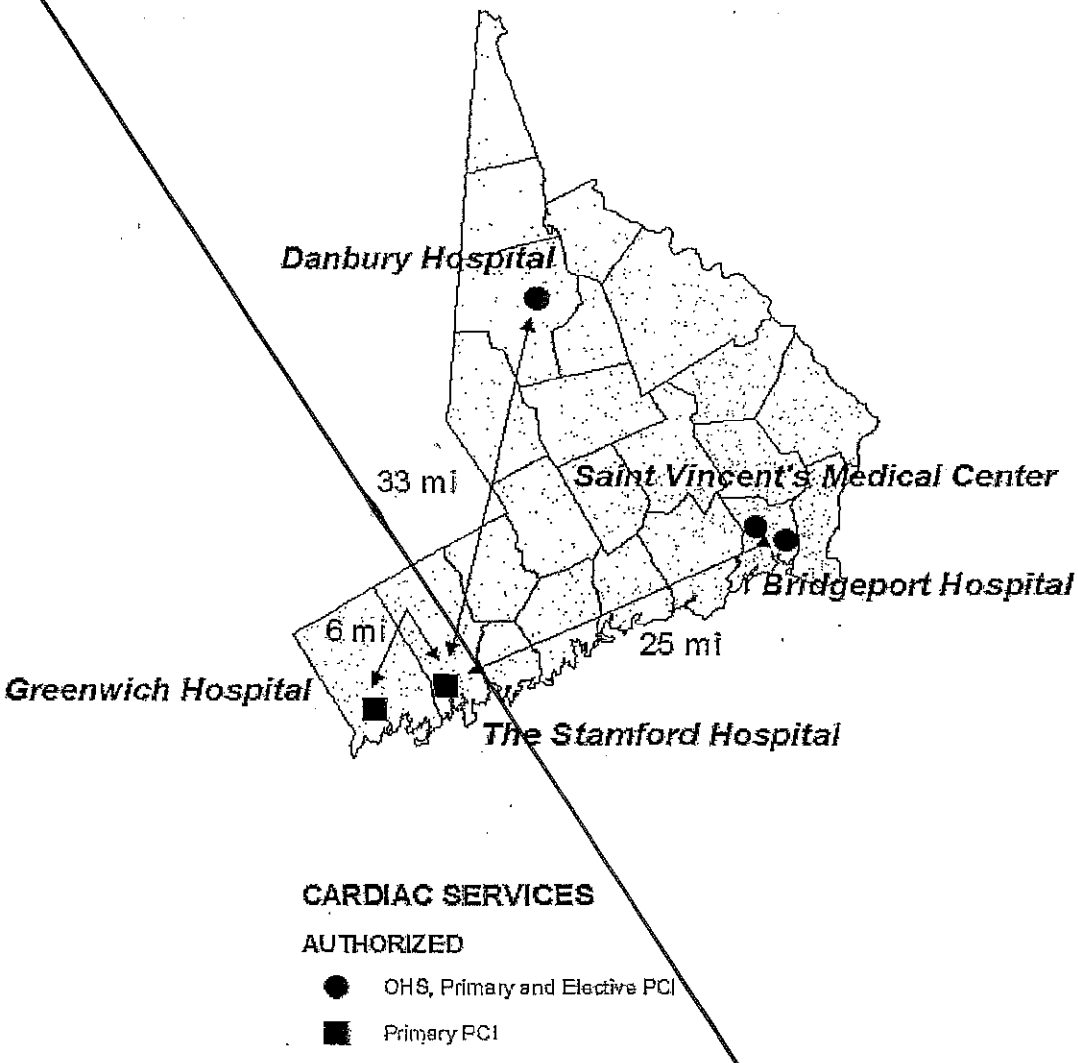
Towns	Primary	Secondary	Total Service Area
	Darien	Greenwich	Darien
	Stamford	New Canaan	Greenwich
		Norwalk	New Canaan
		Weston	Norwalk
		Westport	Stamford
		Wilton	Weston
			Westport
			Wilton
TSH's Share of Service Area's Inpatient Cardiac Catheterizations	57.4%	4.2%	26.1%
Service Area's share of TSH's Inpatient Cardiac Catheterizations	84.6%	8.7%	93.3%

(Source: Cardiac catheterization volume from *OHCA's Acute Care Hospital Inpatient Discharge Database. Service Area from Certificate of Need Application August 15, 2005, page 22)*

[c] Primary (Emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow. Non-ST Segment elevation MI (NSTEMI or high-risk) patients consist of 80% of all MIs and are considered for angioplasty on an elective basis within 72 hours. Performance of elective angioplasty without cardiac surgery back up is not recommended by the American College of Cardiology or the American Heart Association.

8. Providers of interventional cardiac services in the Hospital's total service area ("TSA") are as follows

Map 1: Area Providers of Interventional Cardiac Services



Danbury Hospital began performing open heart surgery in January 2005.
Greenwich Hospital began performing Primary PCI in February 2005.
Stamford Hospital began performing Primary PCI in August 2005.

(Connecticut Acute Care Hospital Inpatient Discharge Database and Travel Distances from Yahoo Maps)

9. The Applicants based the need for the proposed Elective PCI and OHS program on the following:
   - Improved accessibility for patients;
   - Improved continuity of care;
   - Historical/Existing cardiac volume;
   - Adopting a standard of care that exists in the other large urban area; and
   - Improved quality of cardiac services.

   (Certificate of Need Application, August 15, 2005, pages 2-55)

10. TSH stated that the establishment of a full-service cardiac program in Stamford will provide timely access and local availability of these services in keeping with trends that have been already established nationally.
    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

11. TSH's cardiac catheterization volume for FYs 2000 through 2005 are as follows:

Table 2: TSH's Historical Cardiac Catheterization Volume, FYs 2002 – 2005 1st Two Quarters

CT Service Area	2002	2003	2004	2005
Inpatient	354	352	296	147
Outpatient	321	283	332	-
Total	**675**	**635**	**628**	**147**

(Inpatient catheterization figures from OHCA's Acute Care Hospital Inpatient Discharge Database and outpatient volume from August 15, 2005, Responses to OHCA Completeness Letter, pages 1-2)

12. The following is a table of the average annual historical and projected Total PCI volumes (Primary & Elective) in TSH's service area:

Table 3: Average Annual Historical and Projected Total PCI Volumes in TSH's Service Area, FYs 2002 – 2005

	FYs 2002–2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average PCIs**	**Adult Use Rate**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**
Primary	277	2.55	78%	216	83.5%	231	83.4%	231
Secondary	418	2.48	6.8%	28	11.0%	46	20.3%	85
Total Service Area	695	2.51	36.3%	244	40.6%	276	45.7%	316
Connecticut	**8,024**	**2.98**	-	-	-	-	-	-

Note: "Adult" refers to those 15 years and older. Adult use rate per 1,000 population.
Projected PCI volumes were calculated by applying the applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 277 (average volume) * .78 (market share) = 216 PCIs.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures, and August 15, 2005 CON Application, *pages 45 & 23)*

13. The following table is the annual average historical and projected OHS for TSH in the proposed service area for FYs 2002-2005:

Table 4: Historical and Projected, Average Annual OHS Volumes in TSH's Service Area, FYs 2002–2005

	FYs 2000 – 2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average OHS**	**Adult Use Rate**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**
Primary	112	1.03	78.1%	88	83.5%	94	83.5%	94
Secondary	213	1.27	6.7%	14	10.9%	23	20.3%	43
Total Service Area	325	1.17	32.9%	102	38.8%	117	45.7%	137
Connecticut	**4,640**	**1.72**	-	-	-	-	-	-

Note: FY 2005 is First two quarters only.
"Adult" refers to those 15 years and older. Adult use rate per 1,000 population
Projected OHS volumes were calculated by applying the Applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 112 (average volume) * .781 (market share) = 88 open-heart surgeries.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures; and August 15, 2005, CON Application, pages 46&23).

14. TSH projects the following number of elective PCIs procedures and OHS for its service area.

Table 5: Projected Cardiac Volume for TSH's Service Area

Service	FY 2007	FY 2008	FY 2009
Angioplasties (Elective only)	193	324	417
Open-heart surgeries	86	150	197

Note: TSH based the projected volumes on historical utilization and population data. The use-rates utilized are based on Claritas data. OHCA can not verify any of the above claimed data. *(Responses to the Interrogatories, September 28, 2005, Updated Financial Attachment and CON Application)*

15. The 2001 American College of Cardiology ("ACC") and the American Heart Association ("AHA") Guidelines for Percutaneous Coronary Intervention ("PCI") recommend that PCI be performed by higher volume operators (>75 cases/year) with advanced technical skills (e.g. subspecialty certification) at institutions with fully equipped interventional laboratories and experienced support staff. This setting will most often be in a high-volume center (>400 cases/year) associated with an on-site cardiovascular surgical program. Therefore, PCI is best done by high-volume operators in high-volume institutions. *(JACC, 2001, Vol. 37, No.8, page 2239)*

16. The ACC/AHA Guidelines for CABG Surgery (1999) state the following:
    - Studies suggest that survival after CABG is negatively affected when carried out in institutions that perform fewer than a threshold number of cases annually. Similar conclusions have been drawn regarding individual surgeon volumes.
    - The ACC/AHA are supportive of a posture of close monitoring of institutions or individuals that perform <100 cases annually.

17. TSH states that it will utilize the existing guidelines published by the ACC and AHA as a basis for the development of standards for the proposed services, as specified in **Attachment I.** *(Certificate of Need Application, August 15, 2005, page 11)*

18. The Guidelines for Standards in Cardiac Surgery by the Advisory Council for Cardiothoracic Surgery ("ACCS") and the American College of Surgeons ("ACS") (1996) state the following:
    - An annual volume of at least 100 to 125 open-heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume.
    - At least 200 procedures per year as previously recommended in the 1975 report of the Inter-Society Commission on Heart Disease Resources are necessary in order for a program to function efficiently.
    - A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the operating room.

19. Dr. Steven F. Horowitz testified to the following at the public hearing:
    - TSH can sustain a full-service cardiac program due to the increase in the size of the minority population.
    - Numerous studies have confirmed that the cardiovascular risk profile for both Hispanics and African Americans has been worsening in recent years as obesity and diabetes continue to rise exponentially within these populations.
    (Prefiled Testimony of Steven F. Horowitz, M.D. Chief of Cardiology at TSH, September 19, 2005)

20. Kathleen Silard testified to the following at the public hearing:
    - TSH has examined the significant disparity in utilization rates for PCI and OHS that exists for African Americans in TSH service area as well as other regions of the state when compared to the Caucasian population. TSH has seen how some of the major precursors of heart disease, such as diabetes and obesity, can disproportionately effect minority populations as well as the economically disadvantaged.
    - One of the primary goals of TSH's proposed program will be to address and hopefully eradicate some of those disparities by improving access to PCI and OHS to these high-risk groups.
    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

21. The demographic characteristics by Race for TSH's TSA are as follows:

Table 6: TSH Demographics by Race

Service Area	Caucasian	African American	Native American	Asian	Other	Total
Primary	73.6%	13.2%	0.2%	4.6%	8.4%	100%
Secondary	85.7%	6.6%	0.1%	3.5%	4.1%	100%
Total Service Area	81.0%	9.2%	0.2%	3.9%	5.7	100%
Connecticut	81.6%	9.1%	0.3%	2.4%	6.6%	100%

Source: Census 2000.

22. The demographic characteristics by Hispanic ethnicity for the proposed TSA:

Table 7: Hispanic Ethnicity of TSH Service Areas

Service Area	Hispanic or Latino	Non-Hispanic	Total
Primary	14.7%	85.3%	**100%**
Secondary	8.4%	91.6%	**100%**
Total Service Area	10.8%	89.2%	**100%**
Connecticut	**9.4%**	**90.6%**	**100%**

Source: Census 2000.

23. The AMI discharges for the TSH TSA are as follows:

Table 8: Share of AMI by Race and Hispanic Ethnicity, FYs 2002 – 2005 (First 2 Quarters)

Service Area	Caucasian	African American	Hispanic	Asian	Native American	Other	Total
Primary	84.7%	7.0%	4.2%	0.1%	0.0%	4.0%	**100%**
Secondary	85.1%	7.1%	3.4%	1.0%	0.1%	3.3%	**100%**
Total Service Area	84.9%	7.0%	3.7%	0.6%	0.1%	3.6%	**100%**
Connecticut	**87.1%**	**4.7%**	**4.0%**	**0.3%**	**0.1%**	**3.8%**	**100%**

(Discharges from OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases. "White," "Black," "Asian," "Native American," and "Other" are non-Hispanic categories.)

24. NYPH has one of the largest cardiac surgery and cardiac catheterization[d] programs in New York State with its physicians performing over 3,000 PCIs and close to 2,000 OHS in calendar year 2004. *(Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)*

[d] Diagnostic Cardiac Catheterization is a diagnostic procedure in which a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to the heart to measure electrical activity, blood pressure, and locate blockages.

25. Dr. Steven Horowitz, testified on behalf of TSH to the following:
    - Diabetes is a leading cause of hospitalization among Connecticut's African American and Hispanic populations which are 3.8 and 2.2 times more likely to be hospitalized directly due to the disease as compared to the Caucasian Connecticut residents.
    - The percent difference for the African American utilization rates in the TSH's TSA versus those statewide is nearly 26% and 62% for PCI and cardiac surgery respectively. The same numbers skyrocket to 41% and 95% when the focus is placed solely on the City of Stamford.
    - TSH can target the African American and Hispanic population and relieve some of these barriers to access through the comprehensive preventive and medical outreach program.

    (Prefiled Testimony of Steven F. Horowitz, M.D., Chief of Cardiology Department at TSH, September 19, 2005)

26. Dr. Arthur Klein testified to the following at the public hearing:
    - NYPH and NYPHS have developed a number of strong and effective partnerships with affiliated hospitals to elevate the scope of and quality of cardiac care in the tri-state region.
    - NYPHS assists in the operation of nine (9) diagnostic cardiac catheterization programs through out the tri-state area, four elective angioplasty programs and one primary angioplasty program.
    - In this proposal, the cardiac surgery professional services will be provided exclusively by full-time faculty of the Division of Cardiothoracic Surgery, Department of Surgery of Columbia College of Physicians and Surgeons.
    - Oversight of elective angioplasty shall be through a joint committee co-chaired by Drs. Moses and Stone, senior faculty from Columbia University's Division of Cardiology and Stamford Hospital's cardiology leadership.

    (Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)

27. Dr. Eric A. Rose testified at the public hearing that Columbia University Department of Surgery's professional expertise in cardiothoracic research, its strategic network of partnerships and its vast clinical experience will help support TSH in their cardiac health services. *(Prefiled Testimony of Eric A. Rose, M.D., Chairman for the Dept. of Surgery at NYP/C, September 19, 2005)*

28. TSH submitted a signed Draft Agreement with NYPHS. NYPHS' role is defined as follows:
    - Arrange consultative assistance to the Hospital in the following areas:
        - Preparation of the CON Application;
        - Clinical training of nursing and technical staff;
        - Development of the Hospital's standards of care, risk stratification criteria and operational policies;
        - Development of clinical guidelines and protocols;
        - Collection and analysis of quality data for clinical outcomes and performance monitoring;
        - Recruiting procedures; and

- Adoption by the Hospital of policies, procedures and protocols, including developing practice guidelines and requirements related to the proposed program.

- Recommend CPC standards and/or the standards of NYPHS-affiliated Connecticut institutions for physician, nursing and technical staff protocols to foster a high-quality credentialing program; and
- Advise the Hospital with respect to quality assurance and utilization management functions related to the proposed program.

(Completeness Responses, August 15, 2005, Draft Agreement between the Applicants, Exhibit 4, page 4)

29. TSH proposes to provide elective PCI utilizing five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. *(Certificate of Need Application, August 15, 2005, page 11)*.

30. The PCI volumes for the proposed interventionalists for FYs 2002-2005 1st two quarters are as follows:

Table 9: Volume of Proposed Program Interventionalists (FYs 2002 – FY 2005 1st Two Quarters)

Physician	Hospital Affiliation	Office/Home	Average Annual PTCA Volume
Alcan[1]	St. Vincent's & TSH	Norwalk	347
Jumper[2]	St. Vincent's & TSH	Valhalla, NY	119[3]
Charney	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Messinger	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Stone	NY Presbyterian, TSH (pending)	Greenwich	-

[1]Member of Cardiology Associates of Fairfield County
[2]In training
[3]Dr. Jumper performed 57 in FY 2004 and 122 in the first two quarters of FY 2005.
[4] TSH reported volume (FYs 2003 & 2004 – NYP physicians not specifically identified)
Physician C: 156 & 145 and Physician D: 108 & 126
(OHCA Acute Care Hospital Inpatient Discharge Database and CON Application, August 15, 2005, page 11&58 and Completeness Responses, August 15, 2005, page 8)

31. TSH stated that three additional cardiac interventionalists, Drs. Portnay, Lorenz and Corvaja will be added to the proposed program to perform PCIs at TSH. *(CON Application, August 15, 2005, pages 11&58 and Completeness Responses, August 15, 2005, page 8)*

32. TSH proposes to staff the proposed OHS program with two (2) board-certified cardiac surgeons, who will practice full-time at TSH and be credentialed at both TSH and at NYP/C. These two surgeons will be recruited through the formation of a three (3) person committee which will include as its members, Dr. Craig Smith, Dr. Mehmet Oz and Dr. Eric Rose, Chair of the Surgery Department at NYP/C. *(Certificate of Need Application, August 15, 2005, page 11)*

38. The average annual PCI and OHS volumes in TSH's TSA by hospital provider for FYs 2000-2005 (1st two quarters) are as follows:

Table 10: Average Annual PCI and Open-Heart Surgery Volumes by Provider in TSH's TSA by Provider, (FYs 2002 – 2005 1st Two Quarters)

	PCIs			Open-Heart Surgeries		
Hospital	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)	Procedures	Market Share	Area Volume as Share of Total Provider Volume (%)
Bridgeport	154	22.2%	12.3%	75	23.1%	24.3%
Danbury	0	0.0%	-	0	0.0%	-
Greenwich	1*	0.1%	100%	-	0.0%	-
Hartford	0	0.0%	-	0	0.0%	-
John Dempsey	1	0.1%	0.2%	0	0.0%	-
Saint Francis	0	0.0%	-	1	.3%	.1%
Saint Raphael's	4	0.5%	0.4%	3	.9%	.4%
Saint Vincent's	392	56.4%	34.9%	119	36.6%	39.7%
Yale	78	11.2%	4.8%	57	17.5%	6.4%
Out of State	65	9.3%	-	70	21.6%	-
Totals	**695**	**100%**	**-**	**325**	**100%**	**-**

*Greenwich Hospital began providing primary PCI in February 2005.
(OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases)

34. Danbury Hospital, along with Waterbury Hospital and St. Mary's Hospital (one program, two sites in Waterbury) were authorized by OHCA to offer full-service cardiac programs in 2003. *(Certificate of Need Applications, Final Decision Docket Numbers 03-30167 & 03-30143, both dated July 23, 2005)*

35. St. Vincent's Medical Center ("SVMC") testified to the following:
    a. Angioplasty volume is flat nationally and has begun to decline in Connecticut.
    b. If TSH proposal is approved, St. Vincent's Medical Center would not be able to achieve both institutional and surgeon specific minimum volumes for OHS and would put the quality of St. Vincent's Medical Center at significant risk.
    c. SVMC performed 1,097 PCIs and 283 OHS in FY 2005.
    d. The overall risk adjusted mortality rate at SVMC is 1.3%.
    e. Other than volume, SVMC measures quality through independent third party companies (to whom they report data to).
    (Prefiled Testimony of Jose Missri, M.D. St. Vincent's Medical Center, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

36. Bridgeport Hospital ("BH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. BH performed under 1,200 PCIs and under 250 OHS in FY 2005.
    b. BH could not specify their overall risk adjusted mortality rate, BH simply stated that it was under 2.0%.
    c. Other than volume, BH measures quality through independent third party companies (to whom they report data to).

d. If the proposed CON was to be approved, this would not impact the physician coverage at BH.
(Prefiled Testimony of Stuart .Zarich, M.D., Bridgeport Hospital, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

37. Yale-New Haven Hospital ("YNHH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. There is a statewide decline in the number of OHS cases,
    b. There is a flattening of PCI volumes,
    c. Proliferation of full-service cardiac program will place additional stress on the state's staffing infrastructure,
    d. Additional cardiac programs will not improve mortality rates,
    e. The residents of Fairfield County have a wide range of options for their full-service cardiac care needs,
    f. There is a direct correlation between physician and institutional case volumes and quality outcomes, and
    g. In FY 2004, YNHH had 64 PCI discharges (4.3% of YNHH's total PCI) and 52 OHS discharges (6.2% of YNHH's total OHS) from the Stamford service area.
    (Prefiled Testimony of Kyle Kramer, Executive Director of the Yale-New Haven Health Heart Institute, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

38. In order to implement the proposed project, TSH will require a series of facility renovations. The renovations will include an expansion of surgical facilities on Level 2 of TSH's North building to allow for the creation of two new, state-of-the-art operating rooms that will be the primary operating suites for the proposed program as well as enlarged perioperative and other surgical support areas.
(Certificate of Need Application, August 15, 2005, page 13)

Financial Feasibility of the Proposal and its Impact on the Hospital's Rates and Financial Condition
Impact of the Proposal on the Interests of Consumers and Payers of Health Care Services
Consideration of Other Section 19a-637, C.G.S. Principles and Guidelines

39. The proposal has a total expenditure cost of $5,404,425 which consists of the following:

Table 11: Total Capital Expenditure

Description	Cost
Medical Equipment	3,109,345
Construction/Renovation	1,590,065
Project Contingency	704,925
Total Capital Expenditure	**$5,404,425**

(Certificate of Need, August 15, 2005, page 63)

40. The proposal will be financed from the TSH's equity through operations. *(Certificate of Need, August 15, 2005, page 64)*

41. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program. This arrangement will be finalized if the proposal is approved by OHCA. *(Arthur S. Klein, Chief Operating Officer of NYPHS, Public Hearing Testimony, October 6&27, 2005)*

42. TSH projects incremental to the project losses from operations for the first two years of operation for FYs 2007 and 2008 of ($1,940,000) and ($294,000), respectively. This is due to program start up. However, TSH is projecting incremental gains from operation of $1,082,000 for the third year of operation, FY 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

43. TSH is projecting a gain from operations with the CON project of $10,137,000, $12,327,000 and $14,365,000, for FYs 2007, 2008 and 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

44. TSH proposes to hire 26, 34 and 38 Full Time Equivalent employees for FYs 2007, 2008 and 2009, respectively. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

45. There is no State Health Plan in existence at this time. *(Certificate of Need Application, August 15, 2005, page 14)*

46. TSH has adduced evidence that this proposal is consistent with TSH's long-range plan. *(Certificate of Need Application, August 15, 2005, page 14)*

47. TSH has improved productivity and contained costs by participating in group purchasing, energy conservation, reengineering and through application of technology. *(Certificate of Need Application, August 15, 2005, page 59)*

48. TSH stated that this proposal will help enhance the existing academic affiliation with Columbia University College of Physicians and Surgeons. *(Certificate of Need Application, August 15, 2005, pages 59&60)*

49. TSH stated that the patient physician mix of TSH is unique as the cardiac patient care is fully integrated across all medical disciplines and is managed through a state-of-the-art multi-modality data management system. *(Certificate of Need Application, August 15, 2005, page 60)*

50. TSH's rates are sufficient to cover the proposed capital expenditure and operating costs associated with this proposal. *(Responses to Interrogatories, September 28, 2005, Updated Financial Attachment)*

Rationale

The Office of Health Care Access ("OHCA") approaches community and regional need for proposed services on a case-by-case basis. Certificate of Need ("CON") applications for cardiac services do not lend themselves to general applicability due to the variety and complexity of factors, which may affect any given proposal; e.g., the characteristics of the population to be served, the nature of the existing services, the specific services proposed to be offered, the current utilization of services, and the financial feasibility of the proposed service. In considering this application, OHCA determined that TSH's current cardiac utilization, population served, quality of providers and physicians and geographic accessibility were significant factors in determining need.

The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (collectively known as "Applicants"), propose to expand the cardiac services delivered at TSH to include elective angioplasty services and open heart surgery. The Applicants based the need for the elective PCI and open heart surgery programs on improved accessibility for patients, improved continuity of care, historical and existing cardiac volume, adopting a standard of care that exists in the other large urban areas and improved quality of care.

TSH's primary and secondary service area ("TSA") consists of eight (8) towns. There are no providers of elective PCI or OHS in TSH's TSA. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population when compared to the rest of the state overall. The primary service area has experienced higher adult per capita rates of AMI discharges for African American and Hispanic as compared to the state as a whole. In addition, there appears to be a disparity in the utilization rates for PCI and OHS for Hispanics and African Americans in the service area when compared to the Caucasian population. This proposed cardiac program will enhance the access for the African American and Hispanic population in TSH's TSA. OHCA concludes that the Applicants proposal will provide the residents of lower Fairfield County with improved access to the full continuum of cardiac care.

TSH's historical cardiac catheterizations volumes for FYs 2002, 2003, 2004, and 2005 (1st 2 quarters) were 675, 635, 628 and 147, respectively. OHCA determined that TSH could potentially perform a minimum of 244 annual total PCIs (primary & elective) and 102 OHS cases on residents of TSH's TSA in the first full year of operation of the proposal based upon historical catheterization volume and its market share. This volume increases to 276 total PCI procedures and 117 OHS cases for the second year of operation, and 316 total PCI procedures and 137 OHS cases for the third of operation. Based on historical inpatient diagnostic cardiac catheterization volume and market share, the proposed full-service cardiac program at TSH would exceed institutional minimum volumes recommended by the ACC/AHA for PCI (200) and the American College of Surgeons–Advisory Council for Cardiothoracic Surgery for open-heart surgery (100–125 surgeries per year).

The proposal involves offering of elective Percutaneous Coronary Intervention ("PCI") through the use of five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. TSH also proposes to provide OHS utilizing two (2) surgeons will be recruited from outside of Connecticut, through the formation of a three (3) person committee comprised of TSH and Columbia physicians. Therefore this program will not impact coverage at any of the existing cardiac programs in Connecticut. In addition, OHCA concludes that even though the PCI and OHS volumes may decline at the existing providers, the PCI and OHS volumes will not fall below the institutional minimum volumes recommended by ACC/AHA for PCI and American College of Surgeons-Advisory Council for Cardiothoracic Surgery for OHS.

TSH's proposal will increase the availability of quality PCI and OHS services for residents of TSH's TSA. The proposed elective PCI and OHS program will be developed in collaboration with NYPHS. NYPHS will provide or arrange for TSH consulting in the areas of clinical training for staff, development of TSH's standards of care, development of clinical guidelines, collection and analysis of data and recruiting procedures. NYPHS expects the initial training to continue over an eighteen month period. NYPHS will also advise TSH with respect to quality assurances and utilization management and provide assistance to TSH concerning the adoption of policies, procedures and protocols, including developing practice guidelines and program requirements. This proposal will improve the quality of care and continuity of TSH's cardiac services.

Finally, the CON proposal is financially feasible. The proposal has a total capital expenditure of $5,404,425, which consists $3,109,345 for medical equipment, $1,590,065 for construction/renovations and $704,925 for contingency costs. TSH proposes to fund the proposed total capital expenditure through TSH's equity, specifically through operations. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program; however, the details have not yet been finalized. TSH projects incremental losses from project operations for the first two years of operation of ($1,940,000), and ($294,000), respectively. However, TSH is projecting an incremental gain from operation of $1,082,000 by the third year of operation. Further, TSH is projecting gains from total Hospital operations with the CON project of $10,137,000, $12,327,000 and $14,365,000 for the first three years of operations. The projected utilization and financials of this proposal appear to be reasonable, financially feasible and cost-effective and will not adversely impact the interests of consumers and payers of such services.

TSH's proposed elective angioplasty and open heart surgery program is differentiated from other cardiac-related proposals in the following ways. TSH currently operates a high volume diagnostic cardiac catheterization program and recently initiated a primary angioplasty program. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population than the rest of the state. The implementation of the proposed program should address some of the disparities in utilization of cardiac services by this population. Additionally, the proposed program is not expected to impact the physician coverage at any of the existing cardiac programs in Connecticut because the interventionalists are already on staff at TSH and the cardiac surgeons will be

recruited from out of state. TSH's strong collaborative relationship with the NYPHS will enhance the accessibility of high-quality, community-based medical services offered by TSH. TSH will utilize the resources of NYPHS to further enhance provision of quality care including access to the expertise, information, and consultative support of a nationally recognized academic healthcare center renowned for the diagnosis and treatment of cardiac disease. Finally, implementation of TSH's proposal will bring appropriate access to high quality cardiac services to the residents of the proposal's TSA. In summary, the proposal will result in enhanced cardiac services in the Stamford region.

Order

NOW, THEREFORE, the Office of Health Care Access ("OHCA") and The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (together referred to as "Applicants") hereby stipulate and agree to the terms of settlement with respect to the Applicants' request to establish elective angioplasty and open heart surgery program to be located at Stamford Hospital at a total capital expenditure of $5,404,425, as follows:

1. The Applicants' request for a CON to establish an elective angioplasty and open-heart surgery program to be located at TSH, a total capital expenditure of $5,404,425, is hereby approved.

2. TSH shall only commence operation of the OHS program at The Stamford Hospital initially. Once the number of OHS procedures exceeds 125, the Hospital may commence operation of the elective angioplasty program. Prior to commencement of the angioplasty services, TSH is required to provide OHCA evidence that it has performed the required 125 OHS.

3. TSH will have at least two cardiac surgeons as part of this proposal, who are in the process of being recruited and shall be identified prior to the beginning of the OHS program. The surgeons must be fully credentialed and have the following qualifications:
   - Board-Certified in cardiac surgery
   - Maintains a Connecticut license and admitting privileges at the Hospital
   - Has performed OHS procedures at a cardiac surgical center that meets or exceeds the annual ACCS/ACS minimum institutional volume standard for cardiac surgery for the past 2 years
   - TSH shall provide the Curriculum Vitae ("CV") of the cardiac surgeons prior to commencement of the OHS program. TSH shall demonstrate that the cardiac surgeons satisfy all requirements specified above. The OHS program shall not commence operation until OHCA acknowledges receipt of the CV and that it complies with this Order.

4. TSH shall provide the CVs of each of the cardiac operating room nurses, Board-certified cardiac anesthesiologists, intensivists and perfusionists for the authorized OHS program prior to commencement of the OHS program. Fifty percent (50%) of each of the core OR staff mentioned above must be trained in OHS prior to commencement of the OHS program. The OHS program shall not commence operation until OHCA acknowledges receipt of the CVs and that they comply with this Order.

5. TSH shall not exceed the approved total capital expenditure of $5,404,425. In the event TSH learns of potential cost increases or expects final project costs will exceed those approved, the Hospital shall file with OHCA a request for approval of

the revised CON project budget. The source of funding for the project will be The Stamford Hospital's operations and owner equity.

6. TSH shall complete and submit to OHCA on a quarterly basis the data elements in the Connecticut Cardiac Data Registry (**Attachment II**). Data should be submitted to OHCA on a computer disk in either an excel workbook or comma-delimited text file in a format specified by OHCA. The most current version of the Connecticut Cardiac Data Registry includes, but may not be limited to, the elements listed in **Attachment II**. Data must be reported to OHCA thirty (30) calendar days following the end of the quarter. Fiscal Year quarters end December 31st, March 31st, June 30th, and September 30th. Upon receipt, OHCA will check the data's conformance to the required specifications and within ten (10) business days notify TSH in writing of its evaluation. If OHCA finds questionable material, TSH will have fifteen (15) business days from notification by OHCA to submit a revised dataset for evaluation. All patient-level data submitted to OHCA to satisfy this requirement will be subject to the laws and regulations of the state of Connecticut and the Office of Health Care Access regarding its collection, use and confidentiality. If TSH does not submit the data elements in the Connecticut Cardiac Data Registry on a quarterly basis, the programs may be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the programs.

7. TSH shall submit on an annual basis to OHCA the following reports which must be reported to OHCA thirty (30) calendar days following the end the year, for the first three (3) years of operation:
   a. A report of all elective PCIs and OHS performed each year by ethnicity and race, in a format to be specified.
   b. A report which illustrates that this CON proposal helped relieve the barriers to access through comprehensive preventive and medical out-reach programs for the African American and Hispanic population within TSH's TSA.

8. If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. If these volumes are not met for a period of two consecutive 12-month periods, TSH's OHS program shall be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the OHS program.

9. If TSH does not perform 200 elective PCIs within twelve months of the initiation of the PCI program, TSH shall submit monthly reports of elective PCIs arrayed by physician to OHCA until such time as these volumes are met by TSH.

10. TSH shall participate in the Society of Thoracic Surgeons Database (STS-DB) database and the ACC National Cardiovascular Database Registry (ACC-NCDR) and report all data including the optional follow-up section. TSH shall provide OHCA quarterly data reports from STS-DB and ACC-NCDR. Data must be

reported to OHCA thirty (30) calendar days subsequent to TSH receiving the reports from the STS and ACC. TSH is required to comply with the STS and ACC/AHA criteria and standards. If TSH determines not to participate in the STS-DB or ACC-NCDR, TSH shall notify OHCA immediately, and continue to comply with the STS and ACC/AHA criteria and standards set forth in Attachment III.

11. TSH shall provide OHCA with a copy of a dated and signed Consulting Services Agreement with NYPHS or its Affiliates prior to commencement of operation of the OHS program. This contract shall be renewed annually for a period of three years.

12. OHCA and TSH agree that this Agreed Settlement represents a final agreement between OHCA and TSH with respect to this request. The signing of this Agreed Settlement resolves all objections, claims and disputes, which may have been raised by the Hospital with regard to Docket Number 04-30374.

13. This authorization for the OHS program shall expire on December 31, 2008. Should the TSH's open-heart surgery program not commence operation by that date, TSH must seek further approval from OHCA to complete the project beyond that date.

14. This Agreed Settlement is an order of the Office of Health Care Access with all the rights and obligations attendant thereto, and the Office of Health Care Access may enforce this Agreed Settlement pursuant to the provisions of Sections 19a-642 and 19a-653 of the Connecticut General Statutes at TSH's expense, if TSH fails to comply with its terms.

ATTACHMENT IV

GUIDELINES FOR STANDARDS IN CARDIAC SURGERY

The following statement is an updated version of guidelines that were first published by the American College of Surgeons in 1991. The revised statement was developed by the Advisory Council for Cardiothoracic Surgery and approved by the College's Board of Regents in October 1996.

Preamble

This report provides guidelines to be used by hospital executives and appropriate medical staff only. It places no value judgment on existing successful programs or on the treatment of individual patients.

While current standards of practice form the basis of this report, it is recognized that large programs in cardiac surgery grow from smaller ones. Hospitals and their staffs should exercise their own discretion in approving programs based on local need and the responsibility for achieving a good standard of practice.

While attention is directed primarily to open-heart surgery, the proposed standards should apply to closed-heart operations as well as to operations on the great vessels within the chest.

In borderline situations, in which the number of open-heart operations does not meet the established guidelines, the American College of Surgeons recommends the use of peer review.

Professional team

Specification of the qualifications for cardiac surgeons in an established practice is beyond the scope of these guidelines. Surgeons practicing cardiac surgery should be certified or awaiting certification by the American Board of Thoracic Surgery or its Canadian equivalent within five years after completion of an approved residency program in cardiac surgery. It is recommended that hospital committees for staff accreditation exercise their judgments for privileges based on the nature of the cardiothoracic residency or postresidency experiences of the applicant.

A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR. It is recognized that, depending on the particular setting and situation, the assistant on a particular case may vary in experience and qualification.

Hospital operative volume–Adult cardiac surgery

The 1975 report of the Inter-Society Commission on Heart Disease Resources recommended that cardiac surgical programs in a *hospital* should perform at least 200 procedures annually. This recommendation was based on the premise of a hospital dedicating 1 operating room to cardiac surgery and functioning at 80 percent capacity (4 cases per week x 52 weeks = 200 per year). While there are no presently available data linking an *individual surgeon's* patient volume and hospital mortality rate, there are data to suggest that an annual volume of at least 100 to 125 open heart procedures (including coronary artery bypass procedures, valve replacements, and other operations requiring the use of cardiopulmonary bypass) per *hospital* is necessary from a quality standpoint and that there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume. While 100 to 125 cases per year per *hospital* appears sufficient from a quality standpoint, it is likely that considerably more, and at least 200 procedures per year as previously recommended, are necessary in order for a program to function efficiently.

Congenital heart surgery

Surgery for congenital heart disease, especially in infants, requires a setting that readily meets the complex and special needs

of this group of patients. These requirements include a cardiac surgeon experienced in the operative and perioperative management of such patients. There should be a pediatric cardiologist, an anesthesia team, perfusionists, intensive care nurses, and appropriate intensive care facilities for the treatment of infants and children. At a hospital where congenital heart operations are performed, a total of 100 congenital heart operations (both open and closed, not including neonatal ductus ligations) should be done. The occasional management of an infant or child with congenital heart disease by an otherwise busy and well-functioning adult cardiac surgical team is strongly discouraged.

Hospital facilities and personnel

It is urged that hospital committees for staff accreditation use peer review to determine that adequate standards of practice are maintained in terms of case frequency and results. A registry for the recording of cardiac surgical results is mandatory.

The complex operating room environment required by cardiac surgery in terms of equipment and instruments requires constant improvement in technique and proper indoctrination of personnel. Such educational programs should be under the direction of a clearly designated individual with particular interest and skill in cardiac surgery. Operating room nurses and technicians specializing in cardiac surgery are important. It should be mandatory that operating room nurses and technicians be assigned to cardiac surgery sufficiently often to develop and maintain the skills required for proficient performance in this area.

Anesthesia for cardiac surgical patients encompasses a variety of special problems. To ensure technical competence, frequent changing of the anesthesiologists assigned to cardiac surgery should be avoided.

The operation of a heart-lung machine should be performed by a specially trained nurse or technician under the supervision of the operating surgeon. A perfusionist certified by the American Board of Cardiovascular Perfusion is recommended. Perfusionists who are not certified should have at least two years of experience under supervision in an active clinical program in open-heart surgery and have a thorough background in operating room sterile techniques, perfusion physiology, the use of monitoring equipment, and a general understanding of commonly performed cardiac surgical procedures. The primary responsibility for determining the capability of the perfusionist remains with the cardiac surgeon.

Cardiac surgeons must be primarily responsible for the postoperative care of their patients, including that provided in the intensive care unit. Portions of that care may be shared with others, such as nurses and other physicians. However, only the cardiac surgeon is fully cognizant of all aspects of a given patient's condition and retains the responsibility for the continuity of care, which includes the preoperative status, the operative management, and the postoperative care.

Intensive care nursing of cardiac surgical patients is recognized as a true specialty involving skills in dealing with cardiac and respiratory emergencies. Assignment to cardiac surgical patients should be sufficiently often to maintain competence in this area of nursing. The surgeon should participate in the supervision of cardiac intensive care unit nurses.

The operating room, intensive care unit, and other facilities must conform to standards mandated by the Joint Commission on Accreditation of Health Care Organizations.

The nature of cardiac surgery makes it mandatory that diagnostic facilities be available to the surgical team. A proper cardiac catheterization laboratory must be available for hemodynamic and cine' angiographic studies. This laboratory should be under the direction of a qualified specialist and be accessible for preoperative elective studies, postoperative elective studies, and emergency procedures on a 24-hour basis.

Standard laboratory studies should be available on a 24-hour basis, including blood-gas analysis.

A blood bank facility with full resources under the direction of qualified specialists in this field is mandatory.

An intensive care facility must be available for all patients following cardiac surgery, and in some instances, for patients who are severely ill, preoperatively. This should be a limited-access area that is off limits to nonparticipating personnel and should have facilities for the adequate isolation of septic patients.

Patient follow-up

Proper patient follow-up is an integral part of surgical treatment. An effective follow-up system for patients having open-heart surgery is the responsibility of the surgical team. The team should be able to demonstrate that it has an adequate follow-up system and that patients are seen as often as necessary during the immediate postdischarge period and, subsequently, are followed up at appropriate intervals.

sponsor hospitals and OEMS the ability to begin to collect EMS data, creating the potential in the near future to begin to analyze the data and create best practices to elevate the quality of care and delivery of Emergency Medical Services to the residents and visitors of Connecticut.

In late 2008/early 2009 the AHA formed a "STEMI stakeholders group" comprised of three sub-committees (pre-hospital, timely transfers and education) intended to develop and promulgate best practice related to ST segment myocardial infarction (STEMI). The group had a varied composition including physicians (EMS/ED, cardiology, and interventional cardiology), nurses, pre-hospital providers and health care administrators/regulators. This group drafted a document outlining recommendations to improve care in relation to pre-hospital triage of STEMI patients, timely transfers of patients between facilities and issues of education for pre-hospital providers. A "STEMI Protocol" was also drafted that was intended to offer state-wide guidance for best practice regarding patients experiencing chest pain and subsequently diagnosed with a STEMI by pre-hospital EKG (including bypass for more timely cardiac catheterization).

The "STEMI Protocol" was reviewed by the CT EMS Medical Advisory Committee (CEMSMAC) beginning in 2010. In 2011, after a significant amount of thoughtful work by the CEMSMAC, a revised version of the document entitled "CT EMS STEMI Guideline" was completed and submitted to the Commissioner of Public Health for review; it was approved in January 2012.

OHCA would encourage the adherence of the "CT EMS STEMI Guideline." The foremost goal is for authorized EMS personnel to obtain a 12-lead electrocardiogram in the field for all patients suspected of myocardial infarction, thereby increasing the likelihood for percutaneous coronary intervention (PCI) within 90 minutes of first medical contact. Please see link below for the complete "CT EMS STEMI Guideline" document:

http://www.ct.gov/dph/lib/dph/ems/pdf/stemi_patients.pdf

CARDIAC SERVICES

Heart disease is the leading cause of death for both men and women in the United States.[53] In 2010, coronary heart disease alone was projected to cost the United States approximately $108.9 billion in health care services, medications, and lost productivity.[54] In Connecticut, cardiovascular disease (CVD) is also a significant public health concern and contributor of resident deaths. In fact, about one third of Connecticut resident deaths are due to CVD; coronary heart disease (48%), cerebrovascular disease (15%) also known as stroke and heart failure (8%) account form the majority of CVD deaths.[55]

Existing Connecticut statute requires CON authorization for the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery. According to OHCA's Policies and Procedures, "interventional cardiology" is defined as non-

surgical procedures performed in the cardiac catheterization laboratory for the treatment of coronary artery and peripheral vascular disease. Procedures include, but are not limited to, angioplasty, valvuloplasty, cardiac ablation, coronary thrombectomy, and congenital heart defect correction. Only those procedures authorized pursuant to CON may be performed by a health care facility or provider. Multiple cardiac services may be authorized under one CON decision. A facility that is authorized to provide open heart surgery is also authorized to provide the full range of cardiac procedures mentioned above.

CARDIAC CATHETERIZATION

Cardiac catheterization is defined as a medical procedure requiring the passage of a catheter into one or more cardiac chambers of the left and right heart, with or without coronary arteriograms, for the purpose of diagnosing congenital or acquired cardiovascular disease, or for determining measurement of blood pressure flow.

ANGIOPLASTY/PERCUTANEOUS CORONARY INTERVENTION

Primary (emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow

Elective (scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization lab whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

PCI and Elective PCI are often combined with the permanent placement of a small wire mesh tube called a stent to help prop the artery open and decrease the chance of it narrowing again. Some stents are coated with medication to help keep the artery open (drug-eluting stents), while others are not (bare-metal stents).

OPEN HEART SURGERY

Open heart surgery refers to a therapeutic operative procedure performed on the heart and/or its coronary arteries in order to correct anomalous conditions (for example, coronary artery bypass surgery, heart valve replacement), often using a heart-lung by-pass machine to perform the functions of circulation during surgery.

Authorization for Connecticut hospitals to perform elective catheter-based interventions for coronary artery disease has been limited in the past to hospitals with the ability to perform cardiac surgery onsite. However, increasing operator experience, improvements in surgical technique and major advances in technology and pharmacology have contributed to a progressive trend to allow PCI without on-site surgical backup. New evidence gives support to the positive effects that these medical advances have contributed to the significant reduction in emergency surgery following PCI[56]. Elective PCI without on-site surgical backup was, until recently, recommended as class III (not recommended, potentially harmful). However, an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation. CPORT-E trial findings conclude that patients have no greater risk of death or complications when they have Elective PCI at a hospital without cardiac surgery backup. However, similar to the 2007 SCAI Expert Consensus document, the revised guidelines also recommend stringent criteria for such programs. Connecticut hospitals seeking authorization to initiate an Elective PCI program without on-site cardiac surgery capabilities will be required to meet the SCAI conditions required in guidelines as well as demonstrate clear public need for the program.

DESCRIPTION OF DATA SOURCES

The primary source to be used for Acute Care utilization will be the CT Office of Health Care Access Acute Care Hospital Inpatient Discharge Database.

MAP OF CURRENT SERVICE LOCATIONS

Table 3.10: Adult Cardiac Services in Connecticut[57]

Hospital	Cardiac Cath	Primary PCI	Elective PCI	Open Heart

STANDARDS/GUIDELINES

Connecticut General Statutes Section 19a-638 specifies that at CON is required for: the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery.

The Office of Health Care Access has historically utilized Professional Societies and Organizations held to be the experts for establishing standards and guidelines for cardiac care and will continue to make appropriate use of their recommendations in the future review and determination of CON applications. Examples of expert sources to be used in determining standards and guidelines include: the American College of Cardiology, the American Heart Association and the Advisory Council for Cardiothoracic Surgery.

PERCUTANEOUS CORONARY INTERVENTION (PCI)

Primary PCI

1. Based on ACC and AHA, Primary PCI for STEMI should be performed by experienced operators who perform more than 75 elective PCIs per year and, ideally, at least 11 PCI procedures for STEMI per year. Ideally, these procedures should be performed in institutions that perform more than 400 elective PCIs per year and more than 36 primary PCI procedures for STEMI per year.
2. A report by the American College of Cardiology/American Heart Association Task Force on practice guidelines, referring to Class II b, suggests that Primary PCI for patients with STEMI might be considered in hospitals without on-site cardiac surgery provided that appropriate planning for program development has been accomplished and includes: appropriately experienced physician operators (more than 75 total PCIs and, ideally, at least 11 primary PCIs per year for STEMI); an experienced catheterization team on a 24 hours per day; a 7 day per week call schedule; a well-equipped catheterization lab with digital imaging equipment; a full array of interventional equipment; intra-aortic balloon pump capability; and a proven plan for rapid transport to a cardiac surgery operating room in a nearby hospital with appropriate hemodynamic support capability for transfer. Primary PCI should be limited to patients with STEMI or MI with new or presumably new LBBB on ECG and should be performed in a timely fashion (goal of balloon inflation within 90 minutes of presentation) by persons skilled in the procedure (at least 75 PCIs per year) and at hospitals that perform a minimum of 36 Primary PCI procedures per year. (Level of Evidence: B - Limited populations evaluated. Data derived from a single randomized trial or nonrandomized studies).

Elective PCI

1. Elective/urgent PCI should be performed by operators with an acceptable annual volume (>75 procedures) at high volume centers (> 400 procedures) with on-site cardiac surgery (Level of Evidence: C)
2. Elective/urgent PCI should be performed by operators and institutions whose current risk-adjusted outcome statistics are comparable to those reported in contemporary national data registries, (Level of Evidence: C)
3. It is reasonable that low volume operators (< 75 PCI procedures per year) perform elective/urgent PCI at high volume centers (> 400 PCI procedures per year) with on-site cardiac surgery. Ideally, operators with an annual procedure volume of fewer than 75 procedures per year should only work at institutions with an activity level of more than 600 procedures per year. Operators who perform fewer than 75 procedures per year should develop a defined mentoring relationship with a highly experienced operator who has an annual procedural volume of at least 150 procedures per year. (Level of Evidence C)
4. It is not recommended that elective/urgent PCI be performed by low volume operators (< 75 PCI procedures per year) at low volume centers (200 to 400 procedures per year) with or without on-site cardiac surgery. An institution with a volume of fewer than 200 procedures per year, unless in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service. (Level of Evidence: C)
5. The 2005 PCI Guideline does not establish an explicit minimum hospital volume threshold for elective PCI; there are multiple references in the context of operator and institutional competency to "centers" performing 200 – 400 elective PCI procedures per year.
6. The 2011 PCI Guideline states that operator and hospital volume recommendations have been carried over from the ACC/AHA/SCAI 2005 Guideline Update for Percutaneous Coronary Intervention.

   a. PCI in Hospitals without On-Site Surgical Back-up is in the Class IIb category.

      Class IIb: Elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection (Level of Evidence: B)

      Any hospital considering elective PCI without on-site-cardiac surgery must meet the criteria set forth in the 2011 ACCF/ANA/SCAI PCI Guideline, Section 4.8., PCI in Hospitals Without On-Site Surgical Backup: Recommendations (see link below):

      http://content.onlinejacc.org/cgi/reprint/58/24/e44.pdf

      Any hospital not meeting the 2011 ACCF/ANA/SCAI PCI Guideline criteria will be considered to be in Class III.

Class III–Harm: Primary and elective PCI should not be performed in hospitals without on-site cardiac surgery capabilities without a proven plan for rapid transport to a surgery operating room in a nearby hospital or without appropriate hemodynamic support capability for transfer. (Level of Evidence: C)

Quality and Performance Considerations for PCI Programs

Based on the 2011 American College of Cardiology Foundation/American Heart Association/Society for Cardiovascular Angiography and Interventions Guidelines for Percutaneous Coronary Intervention:

1. Every PCI program should operate a quality improvement program that routinely:
   a) reviews quality and outcomes of the entire program;
   b) reviews results of individual operators;
   c) includes risk adjustment;
   d) provides peer review of difficult or complicated cases; and
   e) performs random case reviews (Level of Evidence: C)
2. Every PCI program should participate in a regional or national PCI registry for the purpose of benchmarking its outcomes against national norms. (Level of Evidence: C)

PCI quality and performance considerations are defined by attributes related to structure, processes, and risk adjusted outcomes. Structural elements include, for example, staffing, equipment, supplies, operator and institutional volumes, and the availability of electronic medical records. Processes include strategies for the appropriate patient, protocols for pre- and post-procedural care, appropriate procedural execution and management of complications, and participation in databases and registries for benchmarking program and individual operator performance. The end result of these structures and processes of care are risk-adjusted outcomes, and when available, are more reliable measures of quality than the institutional and individual operator volumes.[58]

CARDIAC SURGERY/OPEN HEART SURGERY[59]

1. Guidelines for Standards in Cardiac Surgery developed by the Advisory Council for Cardiothoracic Surgery and approved by the American College of Surgeons' Board of Regents in October 1996 – Bulletin of the American College of Surgeons, Vol. 82, No. 2, February 1997
   a. An annual volume of at least 100 to 125 open heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes as compared with those doing a high volume.
   b. At least 200 procedures per year are necessary in order for a program to function efficiently
   c. A team approach with a minimum of 2 qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR.
2. The following conditions must be met to initiate a new OHS program:

a. The annual caseload of other programs w/in the proposed PSA shall not drop below 350 procedures.
b. Epidemiological evidence of conditions for which OHS is appropriate w/in the PSA or demonstrates a significant unmet need in the PSA for these procedures.
c. Existing program(s) in the service area are performing at least 350 open heart surgeries annually.
d. Evidence demonstrating the performance of a minimum of 200 open heart surgeries annually within the first three years of the start of the new Open Heart Surgery program.

CARDIAC UTILIZATION

Based on hospital discharge data, inpatient cardiac care is declining both in patient volume and overall patient days (see Table 4.7 and Chart 4.3). From FY 2008 to FY 2011, Cardiac Care-Medical discharges dropped 6%, while the corresponding patient days declined by 3%. During the same time period, Cardiac Care-Surgical care declined even more significantly, with both discharges (11%) and patient days (8%) falling.

Table 3.11: Statewide Cardiac Inpatient Data

Discharges	FY 2008	FY 2009	FY 2010	FY 2011	chg 08-11	chg 10-11
Cardiac Care -Medical	43,072	41,747	41,795	40,542	-6%	-3%
Cardiac Care -Surgical	18,681	18,299	18,104	16,710	-11%	-8%
Total Cardiac	**61,753**	**60,046**	**59,899**	**57,252**	**-7%**	**-4%**

Patient Days	FY 2008	FY 2009	FY 2010	FY 2011	chg 08-11	chg 10-11
Cardiac Care -Medical	159,087	156,890	155,239	153,817	-3%	-1%
Cardiac Care -Surgical	95,344	93,054	90,455	87,361	-8%	-3%

DISCUSSION OF UNMET NEED AND GAPS IN SERVICES, CAPACITY ISSUES, ETC.

The tables below provide an initial step toward the identification of potential areas of unmet need for cardiac care in the state. The tables below provide information that compares the number of residents from a given region that received treatment for cardiac medical services or surgery in a given year (patient demand). This patient demand is compared to the overall volume of cardiac patients served by hospitals in the same region. If hospital volumes are lower than patient demand in the region, it may indicate the need for additional capacity and warrants additional study to examine patient migration patterns to confirm or refute this assertion.

Table 3.12: Bed Need for Inpatient Cardiac Services

RECOMMENDATIONS

1. Examine volume as indicator of quality, as well as other indicators, by examining institutional and operator performance.
2. Continue to review and update Connecticut's cardiac guidelines to reflect updated information and recommendations provided by Professional Societies and Organizations with expert knowledge of cardiac care.

CANCER TREATMENT

Oncology is the branch of medicine concerned with the study and treatment of cancer, including screening, diagnosis, therapy, follow-up and palliative care. It includes various sub specialties such as radiation oncology (medical use of high-energy radiation to kill malignant cells), surgical oncology, and pediatric oncology. Chemotherapy, most generally the treatment of disease by chemicals, can be used for a range of diseases but most frequently refers to antineoplastic drugs to treat cancer.

In Connecticut, there is no unique licensure category for cancer treatment. The Commission on Cancer (CoC), a consortium of professional organizations dedicated to improving cancer patients' lives, administers an accreditation program that encourages hospitals, treatment centers, and other facilities to improve the quality of patient care by focusing on prevention, early diagnosis, pretreatment evaluation, staging, optimal treatment, rehabilitation, surveillance for recurrent disease, support services, and end-of-life care. A broad range of available medical services combined with a multidisciplinary team approach has resulted in 80 percent of all newly diagnosed cancer patients in the US being treated in CoC-accredited cancer programs.[60] According to the CT Cancer Partnership, 67% of acute care hospitals in Connecticut are ACoS accredited.[61].

The change in the 2011 ACCF/AHA/SCAI guidelines for elective angioplasty without onsite cardiac surgery from a Class III to a Class IIb is significant. Dr. Gray states this change is only "incremental", but my opinion is to move from a Class III which indicates harm to a Class IIb which states such a program might be considered as long as there is appropriate program development and rigorous criteria for proper patient selection is beyond "incremental". ~~OHCA has recognized this significant change and incorporated in their Cardiac Services section of the new State Health Plan (draft form) the following statement:~~

~~"...an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation".~~

- Dr. Gray discusses the results of the CPORT-E study recently published in the New England Journal of Medicine and suggests that our CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with onsite surgery. Our application never included any such suggestion. But the CPORT-E study, along with others noted in Dr. Cabin's prefiled testimony, and the shift from a Class III to a Class IIb assignment by the ACCF/AHA/SCAI Angioplasty Guidelines all support the reasonableness of offering elective angioplasty without onsite cardiac surgery as long as number of criteria are met which we have already addressed in our CON application. Dr. Gray's skepticism and criticism of angioplasty without onsite cardiac surgery is puzzling given his institution's (NYP) support of White Plains Hospital's program as well as support of a similar program by another NYP affiliate, Holy Name Hospital in Teaneck, New Jersey.

- Dr. Gray also highlights the statement in the 2011 ACCF/AHA/SCAI Guidelines which discusses competition with another angioplasty program in the same geographic area, particularly an established program with surgical back-up and that such competition MAY not be in the best interests of the community. The data we included in our prefiled testimony clearly shows that Greenwich and Stamford Hospitals are overwhelmingly serving residents of different communities. I would go so far as to say that we do not compete in the area of cardiology, despite our close geography. Our medical staff in

cardiovascular services does not overlap to any measurable degree and referral patterns to the interventional cardiologists are different. We have offered emergency angioplasty for approximately 8 years and despite the entrance of Stamford Hospital's program, we have maintained our emergency and elective transfer volume because patients want their care from Greenwich Hospital and the YNHHVC. In this case, a program at Greenwich Hospital IS in the best interest of the community because the Greenwich Hospital community has demonstrated that is where they want their care.

- Dr. Gray states that if the program at Greenwich Hospital is approved there is a risk that Stamford and Greenwich Hospital's angioplasty programs may perform less than 200 PCIs per year. For the reasons I have outlined above, we do not believe our program will impact Stamford's program due to the lack of patient and physician crossover. It is worthy to note that since the opening of White Plains Hospital's program, Stamford Hospital has not seen any decline in their angioplasty volume. According to Stamford Hospital's Petition, Stamford Hospital "...is on track to perform 277 PCIs in FY 2012" which represents a 25% increase from its 2011 volume as noted on Dr. Kiely's testimony page 32 (PCR data). Clearly, the presence of the White Plains Hospital program, which is located only 15 miles from Stamford Hospital and performed as many as 290 PCIs last year, has not had any impact on Stamford Hospital's angioplasty volumes.

- I must comment on Dr. Gray's suggestion that approval of the proposed program at Greenwich Hospital would in some way encourage physicians to feel "...pressure to refer patients for procedures to keep institutional volumes up. Occurrences like these will only drive up healthcare costs for payers and patients." ~~Dr. Gray is suggesting that physicians may send a patient for an unnecessary procedure just to increase institutional volumes. This may be the practice at New York Presbyterian, but I can assure you that this is NOT the practice of YNHHVC physicians nor would it ever be condoned or permitted~~.

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

RESPONSE TO GREENWICH AND YALE-NEW HAVEN HOSPITALS' OBJECTION TO INTERVENOR'S REBUTTAL TESTIMONY AND MOTION TO STRIKE TESTIMONY

Rebuttal Testimony

The Stamford Hospital ("TSH") hereby responds to Greenwich Hospital's ("GH") and Yale-New Haven Hospital's ("YNHH," and, together with GH, the "Applicants") request that the Office of Health Care Access ("OHCA") preclude TSH's submission of rebuttal testimony. Applicants cite absolutely no legal or equitable rationale for precluding such submission. OHCA's Ruling issued on July 16, 2012 regarding TSH's petition to be granted intervenor status does not expressly address Applicants' request to preclude TSH from submitting rebuttal testimony, but such ruling grants TSH intervenor status, including the right "to introduce evidence." Since there is no limitation on such right in OHCA's Ruling – and no possible reason to grant Applicants' unusual request – TSH has submitted herewith written rebuttal testimony. For the record, however, TSH wishes to make the following points.

By granting TSH intervenor status, OHCA has determined that TSH can assist OHCA in resolving the issues raised by Applicants' application. *See* Regs. Conn. State Agencies § 19a-9-27. To place unnecessary and unjustified limits on the submission of evidence by TSH would fly in the face of OHCA's determination. As stated in TSH's Petition for Intervenor Status, its position as an existing provider of elective angioplasty in the same geographic area which would

be served by Applicants' proposed program makes it uniquely qualified to offer evidence and information that would otherwise not be available to OHCA to assist in evaluating Applicants' proposal. Both parties submitted their written testimony on June 12, 2012. Applicants have filed their rebuttal to the testimony submitted by TSH, and in the interest of justice and the public good, TSH must have the same opportunity.

This opportunity, which TSH assumed it would have in addition to full intervenor status, is even more critical now that OHCA has granted TSH only limited intervenor status, precluding TSH from conducting cross-examination of Applicants' witnesses. OHCA's decision to limit TSH's rights as an intervenor is virtually unprecedented in the context of cardiac Certificate of Need applications. To TSH's knowledge, in every such application filed in recent memory, each intervenor has been permitted to cross-examine witnesses. More importantly, when Applicants filed a nearly identical application three (3) years ago seeking permission to provide elective angioplasty, TSH was granted full intervenor status, including the right to cross-examine witnesses. *See* Docket No. 08-31210-CON.

TSH believes that OHCA's decision to deny TSH the right to cross-examine witnesses is not justified by law or precedent and does not serve the interests of OHCA or the public. In addition, as a provider of cardiac services, including elective angioplasty, in the very geographic area which is the subject of Applicants' proposal, TSH's interests are profoundly implicated here – providing yet another reason to have granted TSH full procedural rights as an intervenor. Still, OHCA has denied TSH such rights.

In their motion, Applicants attempt to justify precluding TSH from submitting additional useful information to OHCA via rebuttal testimony by arguing that "*if OHCA grants TSH full procedural rights, TSH will have an opportunity to rebut any information contained in*

Applicants' pre-hearing submissions through cross-examination of Applicants' witnesses." Applicants' Objection to The Stamford Hospital's Petition for Intervenor Status and Motion to Strike Testimony at p. 768. Since OHCA has now denied TSH the right to cross-examine witnesses, without the submission of rebuttal testimony, inaccuracies or distortions in the record which only TSH may be in a position to correct would otherwise go unaddressed.

Unlike a private lawsuit between two parties where a judge's decision will affect only those parties, here, OHCA's decision will affect not only TSH and other health care providers, but the public as well. In Certificate of Need proceedings, OHCA is charged with determining the need for the proposed new service, taking into account services already available and all other information relevant to determining such need, including, without limitation, how the proposed services will impact the financial strength of the state's health care system and whether the proposed services will result in unnecessary duplication of existing health care services. Conn. Gen. Stat. § 19a-639. To fulfill this responsibility, OHCA's decision to accept evidence from TSH, including written rebuttal testimony, is clearly necessary and appropriate.

TSH's rebuttal testimony is not voluminous and will not disrupt the orderly conduct of the proceedings. *See* Conn. Gen. Stat. § 4-177a(b). Applicants have provided no rationale for precluding the acceptance of such testimony, while the benefit of receiving it is obvious – more relevant information is available to OHCA. Moreover, since Applicants' counsel has the right to cross-examine TSH's witnesses with respect to such testimony, Applicants are not at all prejudiced by its submission.

Motion to Strike

Applicants move to strike all references to Lawrence & Memorial Hospital's ("L&M") CON application. The references to that application in TSH's testimony are included simply to

contrast certain elements that are present in the L&M situation which are clearly lacking in Applicants' proposal. On this basis, TSH believes that the inclusion of such information is appropriate.

For the reasons stated above, OHCA's decision to permit the submission of evidence, including rebuttal evidence, from TSH is justified and appropriate and OHCA should deny Applicants' motion to strike testimony relating to L&M's CON application.

Respectfully submitted,

THE STAMFORD HOSPITAL

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748
PROPOSAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM WITHOUT ONSITE SURGICAL BACKUP AT GREENWICH HOSPITAL	:	July 17, 2012

Rebuttal of Sharon Kiely, M.D. to Testimony of
Marna Borgstrom, Christopher Howes, M.D. and Frank Corvino

I am submitting this testimony in rebuttal to various statements made in the July 12, 2012 pre-filed testimonies of Marna Borgstrom, Frank Corvino and Dr. Christopher Howes.

Rebuttal of Ms. Borgstrom's Testimony

With regard to Ms. Borgstrom's testimony, beginning at page 629 she discusses at considerable length the credentials of the Yale New Haven Heart and Vascular Center (YNHHVC) and its personnel, and its ranking for cardiac services in U.S. News and World Report. We agree that YNHHVC, YNHH and their cardiology specialists have the requisite capabilities and experience to assist its affiliate, Greenwich Hospital, with the development of the proposed satellite elective angioplasty program.

However, just because something can be done does not mean that it should be done. YNHH and YNHHVC will not bring a superior level of expertise or experience to the service area. The region's two existing elective angioplasty providers, The Stamford Hospital (TSH) and White Plains Hospital (White Plains) are affiliated with the New York Presbyterian Hospital of Columbia and Cornell (NY Presbyterian), a world-renowned academic medical center which was ranked substantially higher than YNHH in the most recent U.S. News and World Report rankings of cardiac hospitals (NY Presbyterian was #6 and YNHH was #26).

Ms. Borgstrom's testimony also suggests that the need for another elective angioplasty program in Southwestern Connecticut is established, in large part, by the "telephone survey" conducted by Ms. Hamson. This is indeed a flawed methodology as there is a conspicuous lack of information regarding the nature of this purported survey, the underlying assumptions of respondents or statistical controls. This leaves little doubt of its self-serving nature and the level of credibility it should be accorded.

Finally, Ms. Borgstrom, through her rebuttal testimony, references the discussions between TSH and YNHHVC/Greenwich Hospital regarding a possible collaboration. It is true that there were discussions and that a collaboration ultimately did not come to fruition. However, Ms. Borgstrom misstates the series of events leading up to the termination of discussions and the reason why TSH did not continue to pursue the collaboration.

It should be noted that TSH regularly assesses opportunities to collaborate with other providers to improve the delivery and coordination of care in its service area. In fact, there is a Board-designated task force that meets regularly to assess the market and identify potential opportunities. Greenwich Hospital asked TSH to support its CON application for an elective angioplasty program. TSH responded that this could only be considered within the context of a regional collaboration.

Subsequently, TSH, Greenwich Hospital, and Yale New Haven Health began exploring potential collaboration opportunities to better coordinate heart and vascular care in the region. After a series of discussions, an outline of principles and draft letter of intent were prepared by YNNH for review by TSH in order to conceptualize what a collaboration might look like. As set forth in the letter of intent, the parties were to keep any information furnished to one another

confidential and not make any public statement or comment regarding their discussions without mutual consent.

Contrary to Ms. Borgstrom's assertion, David Smith never told the parties that the terms of the draft letter of intent were acceptable to TSH. Mr. Smith did tell the parties that the draft addressed TSH's initial concerns regarding the collaboration, but he was clear that TSH felt an obligation to continue to explore opportunities with its current partner, New York Presbyterian Health Care System, to improve delivery and coordination of care. He also informed Yale's representative that time did not permit TSH to evaluate the preliminary conceptual framework as well as hold the necessary discussions with NY Presbyterian to see if its existing partnership could be enhanced prior to Greenwich/Yale proceeding with the hearings on this CON Application. TSH asked the Applicants to withdraw this CON Application. The Applicants declined and TSH informed them that it would oppose the proposed competing program.

Rebuttal of Dr. Howes' Testimony

Dr. Howes concludes his testimony by stating that "[w]*e have reached the point in time where the proposal can and should be approved. Earlier barriers have been removed and patients and physicians seek these services at Greenwich Hospital.*" Notwithstanding this proclamation, Dr. Howes has clearly chosen to ignore the largest and most important barrier, which existed in 2009 when Greenwich Hospital was most recently denied an elective angioplasty program, and which continues today – the lack in growth in PCI volume.

YNHH and Greenwich Hospital do not refute but apparently refuse to acknowledge the widely-accepted data showing that PCI volume has been flat to declining in the service area. Rather, the Applicants have based their projected volumes on a series of tenuous assumptions

and misleading information. Some of the more puzzling aspects of Dr. Howes' testimony include:

1. Greenwich Hospital and YNHH's projecting higher volumes now than were projected in 2009 despite the fact that the White Plains angioplasty program has been added to the service area since that time.

2. Greenwich Hospital and YNHH's projecting higher volumes now than were projected in 2009 despite the fact that the number of elective angioplasty cases that Greenwich Hospital has transferred or referred to another facility has dropped each year since that time.

3. Greenwich Hospital and YNHH's claim that TSH and Greenwich Hospital serve different patient populations even though the eight Connecticut towns identified in the Greenwich Hospital Service Area are the same as those identified by Stamford Hospital in its approved 2006 CON to establish a full-service cardiac program.

4. Greenwich Hospital and YNHH are basing their volume projections, in part, on a representation from two interventional cardiologists (Dr. Monsen of NY Presbyterian and Dr. Newman of WestMed Medical Group) who have indicated that, combined, they could bring between 80-105 angioplasty cases to Greenwich Hospital each year (see letters attached to Dr. Howes' testimony).

In support of item 3 above, Dr. Howes refers to Table 2 on page 670 of his testimony as evidence that of the top 20 TSH attending physicians, only one had any admission volume at Greenwich Hospital. Of course, what Dr. Howes fails to mention is that 10 of the physicians listed on Table 2 are Hospitalists who are employed by TSH, do not have offices in the community, and whose job it is to act as attending physicians for unassigned patients whose community physicians do not want to follow the patient into the hospital or who do not have admitting privileges at TSH. Accordingly, these physicians have no opportunity to refer patients outside of TSH. In addition, another physician, Dr. Coady, is a cardiac surgeon. Since Greenwich does not have a cardiac surgery program, he would have no reason to admit patients there.

Item #4 is also emblematic of the serious flaws in the applicant's volume projection methodology. First, it is must be noted that WestMed (then known as The Westchester Medical Group) provided a similar letter in support of Greenwich Hospital's 2009 CON application (see letter attached hereto as Exhibit A). At that time, WestMed represented that it would shift approximately 100 cases to Greenwich Hospital, whereas in 2012 that number fell to 50-75 (at best, a 25% reduction). This would further support the decline in PCI volume from 2009 to present.

Including the volume promised by these physicians in the projections is also misleading, since it merely reflects shifting cases from an existing provider. It does nothing to substantiate the need for the additional PCI program. As stated by Dr. Newman in his letter in support of this application, "*I estimate that we would complete 50-75 angioplasties at Greenwich Hospital that **we currently treat at a hospital outside of Connecticut.***" (emphasis added).

Relying on such promises is tantamount to building a house of cards. These physicians are under no contractual obligation to transfer cases to Greenwich Hospital, and Greenwich Hospital would have no recourse should these physicians decide to direct their patients elsewhere or should there be a change in the structure or ownership of the physician practice. Evidence of changing allegiances of referring doctors is also evidenced by Dr. Monsen's letter of support. Three years ago, Dr. Monsen was affiliated with Westchester Medical Center; today he is a member of NY Presbyterian Hospital. Given the current economic climate and the significant increase in the merger and acquisition of physician practice groups, any promises of future referrals are illusory at best, and should not be given serious consideration when determining a Certificate of Need application.

Rebuttal of Frank Corvino's Testimony

Mr. Corvino states on page 682 of his testimony that "*I want to emphasize that this proposal is all about patient care and patient access.*" As evidenced on page 15 of the CON Application, this statement is inaccurate. In fact, Greenwich and YNHH put forth three reasons to support its contention of public need. Admittedly, two of those reasons were: (1) to improve local access to elective angioplasty care at Greenwich Hospital; and (2) to improve the quality of care of elective angioplasty services provided to Greenwich Hospital service area patients. However, it is the third reason that is the most telling of the true nature of the CON Application and why Greenwich Hospital is seeking an elective angioplasty program. Simply put, it's about money.

Therefore, I respectfully submit that, based on the 2011 ACCF/AHA/SCAI Guideline, which flatly states that financial considerations are inappropriate in determining public need in this context, OHCA deny this CON Application.

EXHIBIT A

000120

The Westchester Medical Group

SIMEON A. SCHWARTZ, M.D.
PRESIDENT

November 14, 2008

Commissioner Cristine Vogel
Office of Health Care Access
MS # 13 HCA
410 Capital Avenue
Hartford, CT 06134-0308

Dear Commissioner:

On behalf of the Westchester Medical Group, I am writing this letter to support the application for Elective PCI at Greenwich Hospital. Over the past several years a growing number of physicians from our practice are on staff at Greenwich Hospital and many of our patients seek their hospital based services there.

An elective PCI service at Greenwich Hospital will provide our cardiac patients with choice and local access to high quality interventional cardiology services. The ability to provide elective angioplasty will also improve continuity of care for patients at Greenwich Hospital.

The Westchester Medical Group projects that on an annual basis there would be 200 cardiac catheterization cases and 100 elective angioplasty cases performed on our patients at Greenwich Hospital.

We urge you to approve this proposal.

Thank you.

Sincerely,

MD

Simeon Schwartz, MD

DIVISION OF CARDIOLOGY

November 6, 2008

Commissioner Cristine Vogel
Office of Health Care Access
MS # 13 HCA
410 Capital Avenue
Hartford, CT 06134-0308

Dear Commissioner:

I am writing this letter to express my support for the proposed elective angioplasty program at Greenwich Hospital. An elective PCI service at Greenwich Hospital would provide patients in the region with choice and greater access to interventional cardiology services. In addition, this program will improve continuity of care to cardiac patients at Greenwich Hospital.

Our practice, which is located predominantly in the immediately adjacent geographic region of Westchester County is made up of 40 physicians in a single specialty cardiovascular practice. It is one of the largest single specialty groups in the region, if not the East Coast. We presently perform approximately 1500 coronary interventions per year. Many of our patients live very close to Greenwich Hospital. I am sure that a number of them would prefer Greenwich Hospital over the Westchester County Medical Center in Valhalla, New York for their coronary interventions if an elective program were in existence. Presently, the Westchester Medical Center is the only local facility that can perform both emergency and elective PCI. Adding an elective PCI program to Greenwich Hospital would improve access and choice for a significant group of our patients.

We urge you to approve this proposal.

Yours very truly,

Craig Hjemdahl-Monsen, M.D.

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	July 17, 2012

Rebuttal Testimony of Dr. William A. Gray

I would like to address some of the statements made by Dr. Howes in his pre-filed and rebuttal testimonies and by Dr. Cabin in his pre-filed testimony.

First, I would like to address statements made by Dr. Howes. On page 668 of his pre-filed testimony, he states that the 2011 ACCF/AHA/SCAI Guideline along with the CPORT-E study results "essentially end the debate over the safety of elective angioplasty programs without onsite cardiac surgery as long as programs adhere to the SCAI program requirements." This statement is a clear mischaracterization of the Guideline and the study results.

In addition, Dr. Howes, on page 761 of his rebuttal testimony, goes on to cite language from page 5 of the 2012 ACCF/SCAI Expert Consensus Document Update stating that

> It is generally believed that elective and primary PCI are permissible in sites without cardiovascular surgery, if there is strict adherence to national guidelines. In particular, there must be a documented working relationship with a larger facility with cardiovascular surgical services and an emergency transportation system operative.

What Dr. Howes fails to mention in providing the above two excerpts is that the 2012 ACCF/SCAI Expert Consensus document also states that performance of elective PCIs without on-site surgical back-up "remains controversial," especially when other active PCI programs are located in the same geographic area. 2012 ACCF/SCAI Expert Consensus Document Update, p.

197 (page reference is to Exhibit 4 of my Pre-filed Testimony). He also fails to mention that the same 2012 ACCF/SCAI Expert Consensus document states that

> there is a declining volume of PCI despite the improvement in outcomes from stent technology and consistent with a better appreciation of which procedures provide optimal benefit to patients. These types of studies suggest maturation of the technology so that further expansion may be limited despite concerns regarding a need for more procedures in the aging population. To this end, some have called for a moratorium on allowing any further expansion of PCI services, especially to low-volume facilities without cardiovascular surgical backup.

2012 ACCF/SCAI Expert Consensus Document Update, p. 197. Finally, he also omits from his testimony the notion that the 2011 ACCF/AHA/SCAI Guideline states that it is only reasonable to consider elective angioplasty programs without on-site cardiac surgery if such programs will "clearly fill a void in the healthcare needs of the community." *See* ACCF/AHA/SCAI Guideline, p. 164 (page reference is to Attachment VI of Applicants' CON Application)).

Given these statements, it is misleading for Dr. Howes to state that the 2011 Guideline and CPORT-E study "essentially end the debate" on this point. The debate may be ended with regard to those programs that will fill a void in the healthcare needs of the community and will improve access to a higher level of care than would otherwise be available, but none of the 2011 Guideline, the 2012 Expert Consensus document or the CPORT-E study in any way endorses duplicative elective angioplasty programs located close to established, high-quality providers with existing capacity. As TSH has said time and again, another elective PCI program in lower Fairfield County will not improve access to cardiovascular care – it will merely shift the volume in the service area from existing programs to a new program, and, in doing so, jeopardize the quality of care rendered by each program. Furthermore, it does not matter that a proposed program intends to strictly adhere to national guidelines if there is not a need for the proposed

program in the first place (*i.e.* if the program will not fill a void in the healthcare needs of the community).

I would also like to state that I did not indicate that I believed Applicants' CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with cardiac surgery. *See* Dr. Howes Rebuttal Testimony, p. 762. I do not believe any cardiac physician would take such a position. I merely indicated that it is only reasonable to consider an elective angioplasty program without onsite cardiac surgery back-up if it will "clearly fill a void in the healthcare needs of the community" and will "improve access to a higher level of cardiovascular care than would otherwise be available." *See* 2011 ACCF/AHA/SCAI Guideline, p. 164; 2012 ACCF/SCAI Expert Consensus Document Update, p. 197; Pre-filed Testimony of Dr. William A. Gray, pp. 5, 7. Here, as we have previously established, there is no such void and, with high-quality programs in the service area already providing the service, it can hardly be stated that the proposed program will improve access to a higher level of care than is already available.

Finally, with regard to page 762 of Dr. Howes' rebuttal testimony, NYP/C's support for White Plains Hospital's program filled a void in the healthcare needs of the community by providing Westchester County with a second, local elective angioplasty program. The Teaneck, New Jersey program and service areas also involved unique factors which are not replicated here.

I would also like to briefly address statements made by Dr. Cabin in his pre-filed testimony. Like Dr. Howes, Dr. Cabin emphasizes Applicants' intent to strictly adhere to the SCAI facility and personnel requirements incorporated into the 2011 ACCF/AHA/SCAI Guideline. *See* Pre-filed Testimony of Dr. Cabin, p. 636. However, like his colleague, Dr. Cabin

also fails to address the fact that a proposed program should only be approved if it will fill a void in the healthcare needs of the community, regardless of whether it can meet the SCAI requirements or not, as I discuss above. Furthermore, Dr. Cabin neglects to mention the risks inherent in angioplasty procedures which are discussed right in the 2011 ACCF/AHA/SCAI Guideline – for example, procedural and periprocedural MI, PCI-related stroke and vascular complications such as access site hematoma and coronary perforation, as well as the need for coronary artery bypass graft (CABG) surgery in some cases. *See* 2011 ACCF/AHA/SCAI Guideline, p. 159. The previous 2005 ACC/AHA/SCAI Guideline Update stated directly that a "small but real fraction of patients undergoing elective PCI will experience a life-threatening complication that could be managed with the immediate onsite availability of cardiac surgical support but cannot be managed effectively by urgent transfer." 2005 ACC/AHA/SCAI Guideline Update, p. 78 (page reference is to Exhibit 2 of my Pre-filed Testimony). These risks have not been eliminated, and they cannot be ignored.

Proposal to Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital

Docket Number: 12-31748-CON

Rebuttal Testimony

July 16, 2012

Certificate of Need Application Docket Number: 12-31748
Greenwich Hospital and Yale New Haven Hospital Elective Angioplasty Program
Rebuttal Testimony

Marna Borgstrom

I would like to begin by addressing some of the statements made by Dr. Sharon Kiely which are either incorrect or misleading.

- It is ironic that Dr. Kiely would raise the need for collaboration among Stamford, Greenwich and Yale-New Haven Hospitals in her testimony given Stamford Hospital's refusal to pursue such collaboration. Yale-New Haven Heart and Vascular Center (YNHHVC) began to discuss collaboration opportunities with Stamford Hospital in March 2012. There were a total of six telephone calls (3/9/12, 4/25/12, 5/4/12, 5/25/12, 6/21/12, and 7/3/12) and multiple email exchanges between Ms. Gayle Capozzalo, our Executive Vice President for Strategy and System Development, and Mr. David Smith, Stamford Hospital's Senior Vice President of Strategy and Chief Strategy and Network Development Officer. In addition, there was a face-to-face meeting held on May 22, 2012 with several representatives including cardiac surgeons and cardiologists from all three hospitals. Stamford Hospital representatives clearly communicated that they were unhappy with the level of support from New York Presbyterian (NYP) and were very interested in developing a relationship with YNHHVC. It was agreed by all three hospitals that there were many opportunities for collaboration, and in fact, an outline of principles was developed as well as a draft letter of intent (LOI) for the arrangement (See Attachment I). We were told by Mr. Smith, that the terms as outlined in the LOI were acceptable to Stamford Hospital. These terms included as an initial focus initiating an elective PCI program at Greenwich Hospital (Attachment I, Principles, Section 3). Our follow-up calls to Mr. Smith regarding the arrangement and the elective angioplasty program at Greenwich Hospital were abruptly discontinued on July 3, 2012, when Mr. Smith informed us that they will be opposing our CON application because he said there was not time to meet with NYP to discuss the concept of transferring an affiliation to

YNHHVC. Ms. Capozzalo will be in attendance at the hearing and can address her discussions with Stamford Hospital under oath.

YNHHVC and Greenwich Hospital fully intended to collaborate with Stamford Hospital in the area of cardiac care and had sought to help strengthen Stamford's open heart surgery program, which is suffering from low volume. The presence of Yale faculty based in southwestern Connecticut communities along with the YNHHVC's clinical program support and quality improvement systems would have significantly improved Stamford Hospital's cardiac surgery program's credibility, which is at significant risk, evidenced by the fact that they performed only 80 open heart cases last year and are on track to perform approximately 50 this fiscal year based on 6 months volumes from CHIME (see Table below).

Connecticut Inpatient Volume for Open Heart Surgery by Hospital for FY 2010 - FY 2012 (6 Months)				
Hospital	**FY 2010**	**FY 2011**	**FY 2012***	
Bridgeport	152	127	140	
Danbury	181	182	150	
Dempsey	67	71	72	
Hartford	793	801	702	
HSR	343	313	300	
St. Francis	867	781	734	
St. Mary's	118	100	114	
St. Vincent's	239	223	200	
Stamford	54	80	54	
Waterbury	109	102	104	
YNHH	869	800	820	
TOTAL	**3,792**	**3,580**	**3,390**	
Source: CHIME				
*FY 2012 annualized based on 6 months actual				

It is clear that YNHHVC acted in good faith to create a cost effective care model for cardiology services in the Stamford and Greenwich area, but it is Stamford Hospital that does not want to collaborate.

- I would also like to point out that Stamford Hospital's extremely low cardiac surgery volume does not come close to meeting professional society recommendations or OHCA's own standards as outlined in the Agreed Settlement for Stamford Hospital (DN: 04-30374-CON) (see Attachment II). Condition #8 states:

  > "If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. **If these volumes are not met for a period of <u>two consecutive 12-month periods</u>, TSH's OHS program <u>shall be terminated</u>..."**

  We are not aware that this condition has been modified by OHCA based on a review of OHCA's website and modifications pursued by Stamford Hospital.

  According to OHCA's own data (see Attachment III) through 2010, Stamford Hospital has never come close to reaching 125 open heart surgeries in a year. In fact, it appears that its highest volume was 80 in FY 2011. As previously shown above, based on 6 months of CHIME data for 2012, they are on track to perform about 54 surgeries this year, less than half of the guidelines requirement. These low volumes have been of concern to YNHHVC physicians and we suspect have contributed to fewer referrals to their surgery program. Low surgical volume can also affect the physicians' decisions to transfer patients to Stamford for elective angioplasty, given the uncertain quality of the surgical backup available at that site. Such low surgical volumes present a significant quality concern as identified by the American College of Surgeons which published that an annual volume of 100-125 is **<u>necessary</u>** from a quality standpoint and this requirement has also been noted by OHCA in its draft Cardiac Services section of the new State Health Plan (see Attachment IV).

- Dr. Kiely states that OHCA should not approve Greenwich Hospital's proposed elective angioplasty program because elective angioplasty volumes are flat in Connecticut and the proposed service area. Stamford Hospital did not previously view flat or declining volumes as problematic when it pursued its full service cardiac program CON. At that time, their own cardiac catheterization volumes had been in decline as noted in OHCA's

Agreed Settlement's Findings of Fact #11 (previously referenced as Attachment II); statewide inpatient cardiac catheterization and angioplasty volumes had declined steadily between 2003 and 2005, as shown in Dr. Kiely's own testimony and open heart surgery volumes had also been declining between 2002 and 2005 as shown in the OHCA table and graph below.

Table 3A: Open heart surgery discharges by provider, FFYs 2002-2010

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	FFY 06-10 (5-yr)% Change	FFY 08-10 (3-yr)% Change	FFY 09-10 (1-yr) % Change
Bridgeport	345	313	268	263	175	194	106	96	136	-22%	28%	42%

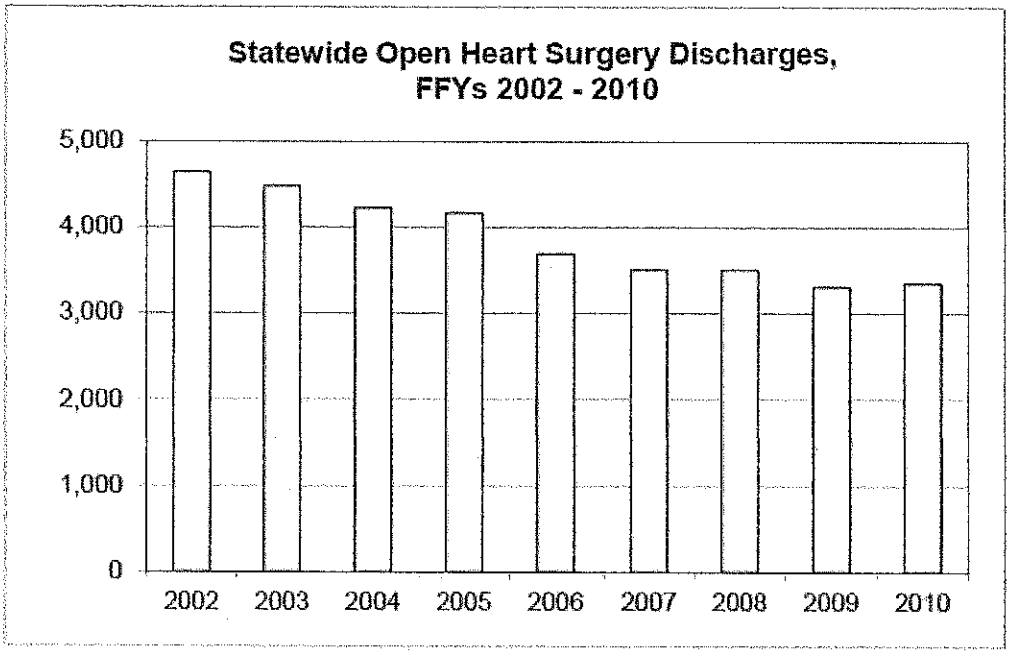
St. Vincent's	310	296	293	291	259	232	257	219	195	-25%	-24%	-15%
Stamford	0	0	0	0	0	0	75	73	46	n/a	-39%	-3%
Waterbury	0	0	0	20	117	110	134	110	98	-16%	-27%	-18%
Yale	973	905	860	861	704	664	698	691	697	-1%	0%	-1%
Total	**4,644**	**4,478**	**4,226**	**4,166**	**3,694**	**3,508**	**3,505**	**3,309**	**3,353**	**-9%**	**-4%**	**-6%**

Source: CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.

ICD-9-CM Procedure Codes: 35.10-35.28 and 36.10-36.19

Please note: unduplicated counts utilizing all procedure codes



All of these related and declining volumes did not seem relevant to Stamford Hospital or OHCA as a full service cardiac program was proposed and approved. Stamford Hospital expended more than $8 million dollars in capital expenses to develop their angioplasty and surgery program in a declining volume market (modified from the $5.4 million they estimated at the time of their original CON filing). They based their need on such factors as improved accessibility, continuity of care and improved quality. These are the same reasons why Greenwich Hospital seeks to offer elective angioplasty and can do so without any capital expense.

- Dr. Kiely's testimony includes conflicting statistics and information about New York programs. First, I would like to highlight the following statement from OHCA's 2010 Declaratory Ruling, Docket Number: 09-31433-DCR, which specifically states that:

  "...OHCA only has the authority to act on behalf of the state within the parameters of its enabling statutes and its jurisdiction is limited to health care facilities located within the state. Thus, OHCA has no jurisdiction over health care facilities located in other states just as those states have no authority to regulate facilities located within Connecticut."

Given the language from the above mentioned Declaratory Ruling, as well as the OHCA enabling statutes, it is clear that the agency has no jurisdiction over New York hospitals and their positions regarding this CON application are not relevant. This is likely why White Plains Hospital has submitted its arguments through Stamford Hospital rather than petitioning for status itself.

Even if one considers the information presented about and from White Plains Hospital, there are inconsistent and incorrect statements provided that call into question its credibility. Dr. Kiely states that White Plains Hospital performed 165 total PCIs in FY 2011 in her written testimony and attached a patient origin volume report with the same statistic. Ms. Fox states in her letter that in FY 2011, 290 PCIs were performed at White Plains Hospital. Additionally, Ms. Fox states in her letter that "two hospitals that serve Westchester County residents – Sound Shore Medical Center in New Rochelle and St. John's Riverside in Yonkers -...have been unsuccessful in attempts to gain regulatory approval from the New York Department of Health to provide elective angioplasty services." This statement is inaccurate and misleading. As shown in Attachment V, the email correspondences between Ms. Nancy Rosenthal, Senior Vice President – Health Systems Development at Greenwich Hospital and Anna Colello, Esq., Director of Regulatory Compliance and Cardiac Services Program at the New York State Department of Health, St. John's Riverside withdrew its application in April of this year and the Sound Shore application remains open.

It is also worth noting that within the email correspondences just referenced, New York State currently has 14 hospitals operating elective angioplasty programs without onsite cardiac surgery and one additional program was recently approved but has not yet opened.

- Dr. Kiely claims that flaws exist in our methodology for estimating cardiac catheterization and angioplasty volume. As OHCA is aware, developing projected volume for any proposed service involves multiple considerations and OHCA does not prescribe to a specific methodology for projecting need. Our projections include the

historical volume of emergency angioplasty, transferred (from Greenwich Hospital) elective angioplasty cases, cases referred to YNHH initially, as well as a conservative estimates provided by Greenwich Hospital cardiologists during a telephone survey conducted by Greenwich Hospital's Director of Planning, Ms. Nancy Hamson. Ms. Hamson personally spoke with the medical cardiologists on the staff of Greenwich Hospital, who are not active at Stamford Hospital and obtained their volume estimates. Ms. Hamson will be in attendance at the hearing and can address her methodology under oath. These physicians currently bypass Greenwich Hospital for cardiac catheterization referrals when they suspect an angioplasty procedure may be required, to save their patients from having to undergo two invasive procedures. They do not refer cases to Stamford Hospital. In addition, we have two interventional cardiologists who subsequent to the submission of the CON application have come forward and put in writing their intention to bring 80 – 105 angioplasty cases per year to Greenwich Hospital. These two physicians do not perform invasive cardiac procedures at Stamford Hospital. Their volumes were not even considered when the projections were developed and therefore demonstrate the conservative nature of our projections.

- Dr. Kiely states that since Greenwich Hospital's emergency angioplasty volume has not increased, there is no need for an elective angioplasty program. As I am sure Dr. Kiely is aware, the criteria for emergency angioplasty are very narrow and apply to only a small percentage of patients. The emergency angioplasty patient population is separate and distinct from the elective angioplasty patient population. Dr. Kiely's own testimony including data from White Plains Hospital shows that in FY 2011, the hospital performed 40 emergency angioplasty cases but 250 elective cases. Their emergency volume is quite similar to Greenwich Hospital's.

- I would also like to comment on Dr. Kiely's reference to previous testimony given by YNHH representatives at CON hearings for Danbury Hospital, Waterbury/St. Mary's Hospitals, Norwalk Hospital and Stamford Hospital. At the time of those hearings, which date back almost 10 years, it was clear to us that cardiac surgery volumes had been and were going to continue to decline. That certainly has proven to be true and

we continue to believe as we did then, that there was no need for additional open heart surgery programs. In the case of angioplasty, OHCA approved several emergency angioplasty programs without onsite cardiac surgery and these programs along with many others in the United States, as evidenced by the research we included in our application, have been shown to be safe for patients. In fact, our view regarding angioplasty has evolved as discussed in previously submitted testimony based on evidence described in medical literature, changes to clinical practice guidelines, and the opinions of our excellent cardiovascular physicians.

- Finally, Dr. Kiely's testimony references and attaches Lawrence & Memorial Hospital's recently submitted CON for elective angioplasty. This CON application is completely irrelevant to our application for the following reasons:
    - The CON is incomplete and should not be recognized by OHCA in this proceeding; and
    - The CON is for a program located approximately 90 miles away and serves a completely different service area.

We have separately moved to strike all references of this submission from Stamford's testimony.

The foregoing is my sworn testimony.

Marna Borgstrom

DRAFT –June 19, 2012
Confidential: Attorney Client Privilege

Principles
for
Yale-New Haven Heart and Vascular Services at Stamford Hospital and Greenwich Hospital

I. **Mission**

- Create a cost effective care model utilizing the most appropriate location to provide convenient patient access to safe, high quality care
- Develop a sustainable clinical business model with appropriate professional and technical resources allocated to each program or modality
- Maintain the highest standard of care and superior outcomes through comprehensive staff training and QA/PI programs
- Offer technological advances as these become economically and programmatically feasible to the greater Stamford and Greenwich communities through qualified physicians.
- Monitor operational performance to maintain regulatory compliance (CMS/DPH/TJC) and improve patient satisfaction
- Support other elements of the non-profit missions of Stamford Hospital, Greenwich Hospital, Yale School of Medicine and Yale-New Haven Hospital, respectively

II. **Participants**

- Stamford Hospital, as the principal provider and Connecticut Department of Health license holder for technical services rendered in Stamford, Connecticut, will also be responsible for the Conditions of Participation for CMS certification, where applicable.
- The Stamford Hospital Medical Staff, in particular, the employed CT surgeons, Cardiac Interventionalists and primary care cardiologists will participate in various cardiovascular service offerings.
- Greenwich Hospital, which may share coverage of the PAMI/PCI programs with Stamford Hospital and whose cardiologists may refer appropriate CT surgery cases to Stamford Hospital
- The Greenwich Medical Staff, in particular, the employed and independent Cardiac Interventionalists and the primary care cardiologists will participate in various cardiovascular services offerings
- The Yale-New Haven Heart and Vascular Center (YNHHVC), a virtual organization of Yale-New Haven Hospital (YNHH) and Yale University, that integrates the professional and technical service of select Yale University School of Medicine

(YSM) and YNHH Departments to provide care and clinical management services for the proposed programs.

III. **Scope of Strategic Partnership**

The following array of cardiovascular services may be offered to the greater Stamford and Greenwich communities. The initial focus will be on initiating an elective PCI program at Greenwich and strengthening Stamford CT Surgery building on the existing team and program, followed by the development of a heart failure program at Stamford and Greenwich. Clinical protocols and consultation systems will be developed for each service or program to address basic or tertiary services and low or high risk patients for each procedure.

PAMI at Stamford	PAMI at Greenwich	Elective PCI at Stamford	Elective PCI at Greenwich	Elective PCI at YNHH
Yale coverage potential	Yale Coverage	Yale coverage potential	Low risk	High risk and valves

Heart Failure/Cardiology at Stamford and Greenwich	Heart Failure/Cardiology at YNHH	CT Surgical Procedures at Stamford	CT Surgical Procedures at YNHH	Peripheral Vascular Procedures at Stamford	Peripheral Vascular Procedures at YNHH
Class A+B+C	Class C evaluations +D Transplant and VAD evaluations	CABG and valves	Minimally invasive, Transplant and, VAD	Basic	Advanced

- As a general principle, low and moderate risk interventional procedures will be performed at Greenwich under generally recognized criteria, unless patient insurance or personal preference directs another site of care.

- The presence of Yale faculty, based in the Southwestern CT communities coupled with Yale-New Haven Heart and Vascular clinical program support and PI/QA systems should enhance the program's credibility in the community of referring physicians and discerning patients.

- The CT Surgical Director at Stamford Hospital will discuss high risk cases with the YNHHVC CT Surgical Director and determine whether or not patients requiring cardiac surgery should be transferred to Yale-New Haven Hospital. The Y-Access transfer line may be employed for this purpose. Other coverage arrangements may be pursued in the future.

IV. **Physician Credentialing and Privileges**

All participating physicians performing these procedures must be members of the Stamford or Greenwich medical staff in good standing with delineated privileges for the proposed procedures. Minimum procedural volume requirements will be met by including procedures performed at all hospitals.

The hospitals will not limit participating physician eligibility for medical staff privileges based upon geographic considerations as long as comprehensive coverage is incorporated in the proposed service model.

V. **CON and Regulatory Approvals**

To the extent necessary, the Stamford Hospital CON will be amended to reflect this CT Surgery support.

VI. **Physician Employment, Revenue and Expense Allocations**

The entity that funds the cost of physician services will also provide a provider number for professional billing and receive the revenue credit. Physicians will assign their billing right to this entity. Each participating physician should have one employer to reduce tax liabilities and optimize personal benefit contributions. Participating physicians must abide by all principles and policies incorporated into this arrangement.

In certain subspecialties the most attractive candidates may prefer to be part of an academic medical center with access to new clinical trials, fellows and multidisciplinary specialists. The YNHHVC would recruit, if mutually agreeable, those physicians and deploy them at Stamford and Greenwich. YSM has created a clinician track without academic faculty ladder research expectations, which is appropriate for geographic full time physicians and for split and covering physicians.

Stamford and Greenwich would agree to exclusively obtain covering interventional and supporting surgical services from YNHHVC provided that CT Surgery and interventional coverage is maintained by YNHHVC. However, Stamford Hospital has sufficient coverage with two CT surgeons at this time.

Physician compensation should be at fair market value based on work RVUs, including stipends for night and weekend coverage, patient satisfaction and quality measures. Physicians should not have a financial incentive to perform a procedure at Greenwich, Stamford or YNHH so that care decisions may be made solely in the best interest of the patient.

VII. **Medical Directors**

Greenwich Hospital or Stamford Hospital and the YNH Heart and Vascular Center will jointly approve Surgical and Medical Directors. The Directors will have clinical management responsibilities for the program and a jointly approved position descriptions.

The Surgical and Medical Directors will have dual reporting relationships to the Chief of Surgery or Medicine/Chief of Staff at each hospital and to the Medical Director of the YNHHVC, Henry Cabin, M.D., and Surgical Director of the YNHVC, David Yuh, M.D.

VIII. **Branding/Marketing/Communications**

Stamford and Greenwich physicians who maintain voluntary or full-time faculty Yale appointment may reflect such in their practice profiles and on the Stamford and Greenwich website for physician search.

Recognizing that there will not be a discrete practice site of the Yale-New Haven Heart and Vascular Center with respect to the inpatient programs, Greenwich Hospital will represent

these services as the Yale-New Haven Heart and Vascular Center within the Hospital on its website, service line stationary and in community publications. Media advertising will require YNHH approval. Given the more limited direct clinical service provided by YNHHVC at Stamford Hospital this relationship will be initially described as a Stamford program affiliated with Yale-New Haven Heart and Vascular Center Any use of the brand will require YNHH approval. The parties will mutually decide if the branding relationship should be changed in the future.

A joint press release will be issued after formal agreement and any physician appointments. CME events will be organized for primary care physicians and other members of the Stamford and Greenwich medical staff. Participating physicians will support other Stamford and Greenwich community educational activities.

IX. Hospital and Program Staff Relationships

YNHHVC will assign an administrative officer to Stamford Hospital and Greenwich Hospital with matrix management responsibility for general management staff training, QA/PI programs and other YNHHVC duties under this agreement. Stamford and Greenwich will also designate an administrator responsible for local program development and operations. However, all on-site hospital staff responsible for the proposed services will be Stamford or Greenwich employees.

New clinical hospital staff will receive in-service training in the OR or Cath Lab YNHH. All employees will participate in periodic conference conducted by the Medical Directors and other YNHHVC specialists.

- All technical and nursing staff from the Stamford and Greenwich Hospital's OR and cardiac catheterization laboratories will participate in a mandatory education program consisting of didactic, one on one observational and hands on training. Training will include:
  - CT operating room equipment and procedures
  - Pump team training
  - Angioplasty equipment (guide catheters, guide wires and angioplasty catheters including balloons and stents)
  - Commonly used drugs
  - Assessment and monitoring of anticoagulation
  - Use of intra-aortic balloon pump equipment
  - Patient transfer
  - Items related to patient care before, during and after the procedure
- Hospital staff will also rotate through the YNHH OR and cardiac catheterization laboratory and shadow experiences in the CTICU, CCU and general floor units
- YNHHVC policies, protocols and procedures will be adopted by Stamford and Greenwich for program development, care management and staff training.

X. QA/PI Programs and Decision Support Tools

- The local cath lab conference will provide the foundation for full integration into the YNHHVC quality and safety improvement activities including monthly morbidity and mortality (M&M) conferences and quality indicator monitoring.

- Participation in YNHVC Surgical M&M and Heart Failure video conference will also be facilitated.

- Stamford and Greenwich will participate in the ACC benchmarking registry and Door to Balloon (D2B) benchmarking.

- Utilization and outcomes will be tracked by YNH Heart and Vascular Center and the Yale-New Haven Hospital Center for Outcomes Research and Evaluation (CORE) and provided to Stamford and Greenwich on a quarterly basis for ongoing quality improvement.

- Stamford and Greenwich may also participate in jointly approved state and national benchmarking projects.

- YNHH has piloted a patient consent tool that specifies risks of bleeding and other complications for use by Stamford and Greenwich nurses and the interventional attendings.

- IT interfaces will be enhanced, where feasible at Stamford. Greenwich Hospital will experience complete IT integration through Epic.

XI. **Fees**

An annual management fee of $250,000 will be paid by Stamford to YNHH for professional, management, training and QA/PI services described herein for which can be amended as additional programs are introduced. The management fee will include the achievement of quality indicators..

A more efficient coverage system may enhance the financial benefits of the programs. A review of service schedules and volume projections will be required to further this analysis.

XII. **Term and Amendments**

Stamford Hospital and Greenwich Hospital will agree to an exclusive arrangement with YNHH during the term of the agreement. A legally appropriate agreement will be developed with an initial five year term, with five year renewals. .

If this relationship becomes financially or clinically unstable or is in conflict with new regulations, the Participants agree to modify the agreement. Any unwind must minimize impact on care in the greater Stamford and Greenwich communities.

Additional services will be added after joint review of programmatic and financial feasibility. Most of the proposed services offering elements should not require a CON.

Draft June 19, 2012

YALE NEW HAVEN HEALTH

June ___, 2012

Stamford Hospital
30 Shelburne Road
Stamford, CT 06904
Attention: [_____]

Re: ***Letter of Intent Regarding Proposed Affiliation with Greenwich Hospital, Yale-New Haven Hospital and Yale University relating to Interventional Cardiology Services***

Dear [_____]:

Yale-New Haven Hospital ("***YNHH***") and Yale University, acting through its School of Medicine ("***Yale***") have long collaborated on various patient-care services, including cardiology services. Together, YNHH and Yale have established and supported the Yale-New Haven Heart and Vascular Center ("***YNHHVC***"), renowned for providing comprehensive cardiac and vascular care, including cardiac catheterization, emergency and elective angioplasty and open-heart surgery.

Greenwich Hospital has been affiliated with Yale-New Haven Hospital and the Yale New Haven Health System since 1996. Through this affiliation, Greenwich Hospital, YNHH and Yale collaborated to obtain regulatory approvals for Greenwich Hospital to provide, in addition to diagnostic cardiac catheterization services, primary angioplasty services for acute myocardial infarction ("***PAMI***") patients presenting with ST-segment elevation and left bundle branch blockage, with professional interventional cardiology services provided by Yale physicians (the "***Greenwich PAMI Program***"). Regulatory approval is currently being sought to expand this program to include elective angioplasty ("***Elective PCI***") services without open-heart surgery back-up.

Stamford Hospital currently provides a range of cardiovascular services, including PAMI, Elective PCI and open-heart surgery. A relationship with a quaternary center such as YNHH for surgical program support and consultation may strengthen Stamford Hospital's position and relationships with Greenwich Hospital cardiologists.

Each of YNHH, Yale, Greenwich Hospital and Stamford Hospital (each, a "***Party***" and, collectively, the "***Parties***") desire to enter into this letter of intent (this "***Letter of Intent***") to confirm their intent to collaborate to establish a cost-effective care model for heart and vascular patients that utilizes the most appropriate location to provide convenient patient access to safe, high quality care (the "***Collaboration***"). The Parties agree that the goal of the Collaboration is to ensure that patients can be cared for in the community when appropriate, but also have access to tertiary and quaternary care when medically required.

It is expressly understood and agreed that this Letter of Intent is only binding with respect to Section 2, Section 3 and Section 4. Any Party may, for whatever reason, terminate this Letter of Intent and further negotiations by written notice to the other Parties. In such event, there shall be no liability among the Parties hereto as a result of the execution of this Letter of Intent, any action taken in reliance on this Letter of Intent, or such termination, except as set forth in Section 2, Section 3 or Section 4.

1. Terms of Collaboration. Based upon the dialogue to date, attached as Exhibit A sets out the proposed principal terms of the Collaboration. During the Exclusivity Period (as defined below), the Parties will exercise good faith and use their reasonable efforts to negotiate and agree upon the terms and usual and customary covenants, conditions, indemnities, representations and warranties of the definitive agreements related to the Collaboration, all of which are to be generally consistent with the provisions of the Term Sheet. The parties acknowledge and agree that execution of any definitive agreements and consummation of the Collaboration may be subject to the approval of relevant government authorities, including the Office of Health Care Access, and agree to support each other's efforts in obtaining any such approvals.

2. Exclusivity. Each Party understands and agrees that it is a significant premise of its participation hereunder and agreement hereto that this Letter of Intent be exclusive as to the subject matter set forth above. Therefore, each Party agrees that for a period of **[six (6) months]** following the date hereof it will not (a) enter into any agreement (b) carry on or continue any discussions of any kind with a third party or (c) enter into negotiations concerning the subject matter of this Letter of Intent, and specifically, any affiliation relating to interventional cardiology or CT Surgery services in Fairfield County. Notwithstanding anything herein to the contrary, nothing in this Letter of Intent shall limit or restrict YNHH and Greenwich Hospital from collaborating to provide any services, including interventional cardiology services at facilities affiliated with the Yale New Haven Health System.

3. Confidentiality. In furtherance of the negotiations contemplated by this Letter of Intent, the Parties may request of each other certain information, some of which may be confidential. As a condition to, and in consideration for, each Party furnishing such information to the other Parties, each Party hereby agrees to treat the information furnished by the other Parties in accordance with the provisions of this Letter of Intent and to take or refrain from taking certain other actions as set forth herein.

For purposes of this Letter of Intent, the term "***Confidential Information***" means all information in whatever form furnished to any Party by or on behalf of any other Party, together with any other information concerning such other Party which has already been furnished to the Party receiving such information; provided that it does not include information which the Party receiving such information can demonstrate (a) is generally available to or known by the public other than as a result of disclosure by such Party or (b) was obtained by the Party receiving such information from a source other than the Party furnishing such information, provided that such source is not bound by a duty of confidentiality to the Party furnishing such information or another person or entity with respect to such information.

Each Party shall use Confidential Information solely to evaluate and consider a possible transaction among the Parties. No Party shall use any such Confidential Information to compete with or adversely affect the business or operations of the Party furnishing such information or its affiliates or those doing business with them, including the other Parties. Each Party shall keep the Confidential Information of each other Party strictly confidential and, except as authorized in this Letter of Intent, will not disclose or distribute the Confidential Information of the any other Party to any person or entity without the prior written consent of the Party furnishing such information. Each Party may disclose Confidential Information of the other Parties to such of its directors, officers, employees and agents (the "***Representatives***") who need to have the Confidential Information to participate in or contribute to the proposed transaction, so long as those Representatives agree to be bound by this Letter of Intent, and then only to the extent necessary to their participation or contribution. Each Party shall be responsible for any breach of this Letter of Intent by its Representatives.

Except as and to the extent mutually agreed in accordance with Section 4 hereof, or as required by law, no Party shall, and each Party shall direct its Representatives not to, directly or indirectly, make any public comment, statement or communication with respect to, or otherwise disclose or permit the disclosure of the existence of, this Letter of Intent or any discussions regarding a possible transaction between the Parties or any of the terms, conditions or other aspects of such transactions.

Upon request by any Party at any time, the other Parties shall promptly return to the Party furnishing such information the original and all copies of all non-oral Confidential Information furnished by such Party. Each Party shall, upon request of any other Party, certify as to its compliance with the preceding sentence.

4. Publicity. As the Parties evaluate the Collaboration, they shall also consult as to the propriety and need, timing, form and substance of any press release or other public disclosure (including without limitation disclosure to government regulatory agencies, government officials and community groups) related to the Collaboration. No such disclosure shall be made without the mutual consent of the Parties.

This Letter of Intent may be executed in counterparts, each of which shall be deemed an original, but all of which taken together shall constitute one and the same instrument. Each Party acknowledges that in the event of the breach of this Letter of Intent by any Party, the non-breaching Parties shall be entitled to all remedies available at law or in equity for such breach.

* * *

If you are in agreement with the foregoing, please execute and return one copy of this Letter of Intent, whereupon each of the Parties shall be legally bound to the extent described herein under Connecticut law.

Sincerely,

YALE-NEW HAVEN HOSPITAL

ATTACHMENT II

Office of Health Care Access
Certificate of Need Application

Agreed Settlement

Hospital:	The Stamford Hospital and New York Presbyterian Healthcare System, Inc.
Docket Number:	04-30374-CON
Project Title:	Establish Elective Angioplasty and Open Heart Surgery Program at The Stamford Hospital
Statutory Reference:	Sections 19a-638 & 639, Connecticut General Statutes
Filing Date:	August 15, 2005
Hearing Dates:	Public Portion: September 22, 2005 Technical Portion: October 6, 2005 and October 27, 2005
Commissioner & Presiding Officer:	Cristine A. Vogel
Agreed Settlement Date:	January 4, 2006
Default Date:	Not Applicable
OHCA Staff	Steven W. Lazarus Michael Sabados

Project Description: The Stamford Hospital ("TSH" and "Hospital") and New York Presbyterian Healthcare System, Inc. ("Applicants") propose the establishment of an elective angioplasty ("PCI") and open-heart surgery ("OHS") program, to be located at the Hospital, at a capital expenditure of $5,404,425.

Nature of Proceedings: On August 15, 2005, the Office of Health Care Access ("OHCA") received the Applicants' Certificate of Need ("CON") application seeking authorization to establish an elective angioplasty and open-heart surgery program, to be located at the Hospital, at a capital expenditure of $5,404,425. The Stamford Hospital is organized under the laws of Connecticut, and New York Presbyterian Healthcare System, Inc. is a corporation organized under the laws of the State of New York. The Hospital is a health care facility or institution as defined by Section 19a-630 of the Connecticut General Statutes ("C.G.S.").

Public hearings regarding the CON Application were held on September 22, 2005, October 6, 2005 and October 27, 2005. The Hospital was notified of the date, time, and place of the hearings and notices to the public were published prior to the hearings in *The Advocate* (Stamford) by OHCA. The hearings were conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the Connecticut General Statutes) and Sections 19a-638 and 19a-639, C.G.S.

Yale-New Haven Hospital, Bridgeport Hospital, and Greenwich Hospital collectively known as Yale-New Haven Heart Health Institute were granted Intervenor status with rights to cross-examine. St. Vincent's Medical Center was granted Intervenor status with the rights to cross-examine.

The Presiding Officer heard testimony from the general public, legislators, local officials and witnesses for the Hospital and Intervenors. In rendering this decision, the presiding officer has considered the entire record of the proceeding. OHCA's authority to review, approve, modify or deny this proposal is established by Sections 19a-638 and 19a-639, C.G.S. The provisions of these sections, as well as the principles and guidelines set forth in Section 19a-637, C.G.S., were considered by OHCA in its review.

Findings of Fact

Clear Public Need
Impact on The Hospital's Current Utilization Statistics
Proposal's Contribution to Accessibility and Quality of Health Care Delivery in the Region

1. The Stamford Hospital ("TSH" and "Hospital") is a not-for-profit, 305-bed acute care hospital located in Stamford, Connecticut. TSH, as an affiliate member of the New York Presbyterian Healthcare System ("System"). TSH provides a comprehensive array of services including: Medicine, Surgery, Obstetrics/Gynecology, Psychiatry as well as Medical and Surgical critical care units. *(Completeness Responses, Proposed Resolution, August 15, 2005, Exhibit 3 and Certificate of Need Application, August 15, 2005, page 1-3)*

2. The New York Presbyterian Healthcare System, Inc ("NYPHS") coordinates a system of hospitals and other healthcare institutions throughout the tri-state area, including The Stamford Hospital ("TSH") and New-York Presbyterian Hospital ("NYPH"). NYPH operates New York-Presbyterian Hospital/Columbia University Medical Center ("NYP/C") in affiliation with Columbia University College of Physicians and Surgeons ("CU"). *(Certificate of Need Application, August 15, 2005, pages 2-3)*

3. TSH and NYPHS ("Applicants") propose the establishment of an elective percutaneous coronary angioplasty[a] ("PCI") and open-heart surgery[b] ("OHS") program, to be located at the Hospital. *(Certificate of Need Application, August 15, 2005, page 2)*

4. TSH's proposal is for a full-service cardiovascular services program in the lower Fairfield County. TSH is located in the region's largest population center. *(Prefiled Testimony of Brian Grissler, September 19, 2005,)*

---

[a]Elective (Scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

[b] Open-heart surgery is a surgical intervention performed on the opened heart while the bloodstream is diverted through a heart-lung machine. Cardiac Surgery includes Coronary Artery Bypass Graft (CABG), Valvuloplasty, and Valve Replacement. CABG is where a vein from the chest or leg, or a prosthesis, is grafted onto either side of a blockage in the coronary artery. This reroutes blood flow around the blockage to the heart muscle. Valvuloplasty is where a balloon tipped catheter is inserted into plaque-blocked heart valves to widen and separate them through repeated balloon inflation. A Valve Replacement is a replacement of plaque-blocked heart valves with prosthetic or tissue graft.

5. On August 25, 2004, TSH received CON authorization from OHCA to perform primary[c] PCI services. *(Certificate of Need Application, August 15, 2005, page 2)*

6. The proposed program will augment existing cardiovascular services at the Hospital. The Hospital currently offers:

Primary Angioplasty	Electrocardiogram
Interventional electrophysiology (ablations)	Electrophysiology
Diagnostic cardiac catheterization	Holter monitoring
Coronary care unit	Intra-aortic balloon pump
Telemetry inpatient care	Nuclear stress testing
Cardiac imaging	Pulmonary function testing
Cardiac rehabilitation	Stress testing
Cardiac ultrasound	Tilt table testing
Cardiopulmonary testing	Vascular and thoracic surgical services

(Certificate of Need Application, August 15, 2005, pages 8-9)

7. TSH's cardiology primary and secondary service areas consist of the following Connecticut towns:

Table 1: Stamford Hospital's Proposed Service Area for this Proposal for FYs 2002 – 2005 (1st Two Quarters)

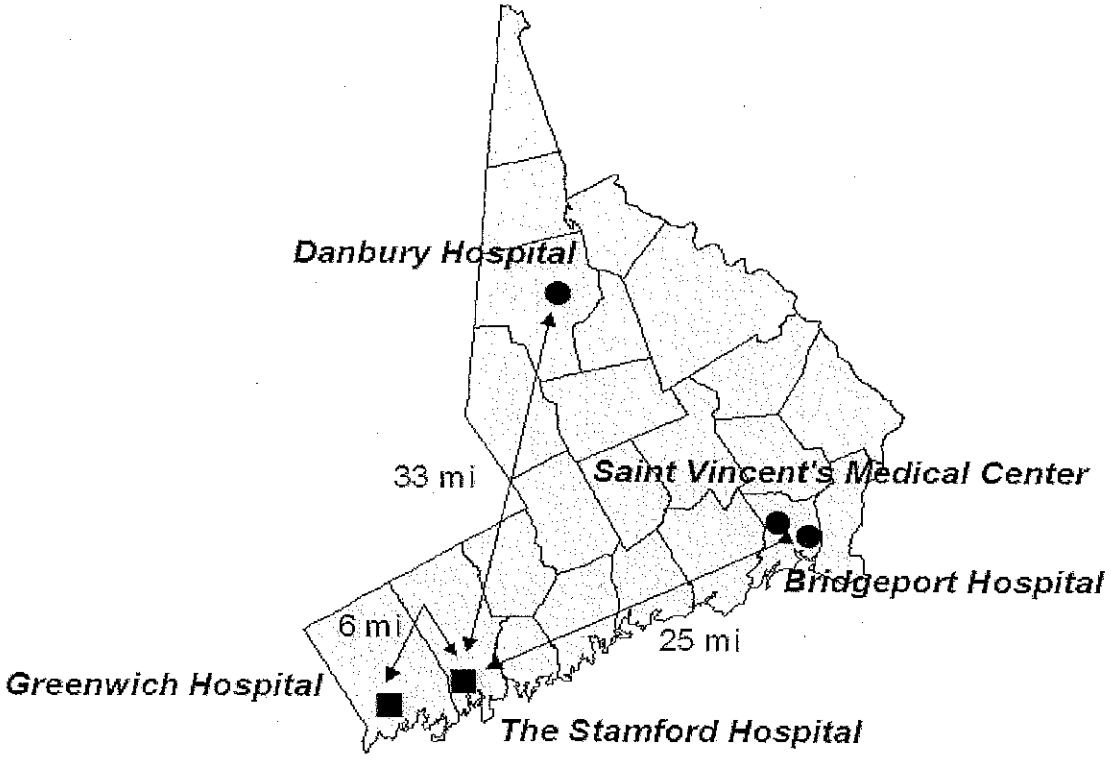
Towns	Primary	Secondary	Total Service Area
	Darien Stamford	Greenwich New Canaan Norwalk Weston Westport Wilton	Darien Greenwich New Canaan Norwalk Stamford Weston Westport Wilton
TSH's Share of Service Area's Inpatient Cardiac Catheterizations	57.4%	4.2%	26.1%
Service Area's share of TSH's Inpatient Cardiac Catheterizations	84.6%	8.7%	93.3%

(Source: Cardiac catheterization volume from *OHCA's Acute Care Hospital Inpatient Discharge Database. Service Area from Certificate of Need Application August 15, 2005, page 22)*

[c] Primary (Emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow. Non-ST Segment elevation MI (NSTEMI or high-risk) patients consist of 80% of all MIs and are considered for angioplasty on an elective basis within 72 hours. Performance of elective angioplasty without cardiac surgery back up is not recommended by the American College of Cardiology or the American Heart Association.

8. Providers of interventional cardiac services in the Hospital's total service area ("TSA") are as follows

Map 1: Area Providers of Interventional Cardiac Services



Danbury Hospital began performing open heart surgery in January 2005.
Greenwich Hospital began performing Primary PCI in February 2005.
Stamford Hospital began performing Primary PCI in August 2005.

(Connecticut Acute Care Hospital Inpatient Discharge Database and Travel Distances from Yahoo Maps)

9. The Applicants based the need for the proposed Elective PCI and OHS program on the following:
   - Improved accessibility for patients;
   - Improved continuity of care;
   - Historical/Existing cardiac volume;
   - Adopting a standard of care that exists in the other large urban area; and
   - Improved quality of cardiac services.

   (Certificate of Need Application, August 15, 2005, pages 2-55)

10. TSH stated that the establishment of a full-service cardiac program in Stamford will provide timely access and local availability of these services in keeping with trends that have been already established nationally.
    (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

11. TSH's cardiac catheterization volume for FYs 2000 through 2005 are as follows:

Table 2: TSH's Historical Cardiac Catheterization Volume, FYs 2002 – 2005 1st Two Quarters

CT Service Area	2002	2003	2004	2005
Inpatient	354	352	296	147
Outpatient	321	283	332	-
Total	**675**	**635**	**628**	**147**

(Inpatient catheterization figures from OHCA's Acute Care Hospital Inpatient Discharge Database and outpatient volume from August 15, 2005, Responses to OHCA Completeness Letter, pages 1-2)

12. The following is a table of the average annual historical and projected Total PCI volumes (Primary & Elective) in TSH's service area:

Table 3: Average Annual Historical and Projected Total PCI Volumes in TSH's Service Area, FYs 2002 – 2005

	FYs 2002–2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average PCIs**	**Adult Use Rate**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**	**Market Share (%)**	**Projected PCIs**
Primary	277	2.55	78%	216	83.5%	231	83.4%	231
Secondary	418	2.48	6.8%	28	11.0%	46	20.3%	85
Total Service Area	695	2.51	36.3%	244	40.6%	276	45.7%	316
Connecticut	**8,024**	**2.98**	-	-	-	-	-	-

Note: "Adult" refers to those 15 years and older. Adult use rate per 1,000 population.
Projected PCI volumes were calculated by applying the applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 277 (average volume) * .78 (market share) = 216 PCIs.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures, and August 15, 2005 CON Application, *pages 45& 23)*

13. The following table is the annual average historical and projected OHS for TSH in the proposed service area for FYs 2002-2005:

Table 4: Historical and Projected, Average Annual OHS Volumes in TSH's Service Area, FYs 2002–2005

	FYs 2000 – 2005 1st Two Quarters		Year One		Year Two		Year Three	
TSH Service Area	**Average OHS**	**Adult Use Rate**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**	**Market Share (%)**	**Projected OHS**
Primary	112	1.03	78.1%	88	83.5%	94	83.5%	94
Secondary	213	1.27	6.7%	14	10.9%	23	20.3%	43
Total Service Area	325	1.17	32.9%	102	38.8%	117	45.7%	137
Connecticut	**4,640**	**1.72**	-	-	-	-	-	-

Note: FY 2005 is First two quarters only.
"Adult" refers to those 15 years and older. Adult use rate per 1,000 population
Projected OHS volumes were calculated by applying the Applicant's projected capture rate to the current PCI volume in the service area. For example, in Year One in the primary service area: 112 (average volume) * .781 (market share) = 88 open-heart surgeries.
(OHCA Acute Care Hospital Inpatient Discharge Database; MA, NY, and RI Hospital Discharge Databases; Census 2000 for population figures; and August 15, 2005, CON Application, pages 46&23).

14. TSH projects the following number of elective PCIs procedures and OHS for its service area.

Table 5: Projected Cardiac Volume for TSH's Service Area

Service	FY 2007	FY 2008	FY 2009
Angioplasties (Elective only)	193	324	417
Open-heart surgeries	86	150	197

Note: TSH based the projected volumes on historical utilization and population data. The use-rates utilized are based on Claritas data. OHCA can not verify any of the above claimed data. *(Responses to the Interrogatories, September 28, 2005, Updated Financial Attachment and CON Application)*

15. The 2001 American College of Cardiology ("ACC") and the American Heart Association ("AHA") Guidelines for Percutaneous Coronary Intervention ("PCI") recommend that PCI be performed by higher volume operators (>75 cases/year) with advanced technical skills (e.g. subspecialty certification) at institutions with fully equipped interventional laboratories and experienced support staff. This setting will most often be in a high-volume center (>400 cases/year) associated with an on-site cardiovascular surgical program. Therefore, PCI is best done by high-volume operators in high-volume institutions. *(JACC, 2001, Vol. 37, No.8, page 2239)*

16. The ACC/AHA Guidelines for CABG Surgery (1999) state the following:
    - Studies suggest that survival after CABG is negatively affected when carried out in institutions that perform fewer than a threshold number of cases annually. Similar conclusions have been drawn regarding individual surgeon volumes.
    - The ACC/AHA are supportive of a posture of close monitoring of institutions or individuals that perform <100 cases annually.

17. TSH states that it will utilize the existing guidelines published by the ACC and AHA as a basis for the development of standards for the proposed services, as specified in **Attachment I.** *(Certificate of Need Application, August 15, 2005, page 11)*

18. The Guidelines for Standards in Cardiac Surgery by the Advisory Council for Cardiothoracic Surgery ("ACCS") and the American College of Surgeons ("ACS") (1996) state the following:
    - An annual volume of at least 100 to 125 open-heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume.
    - At least 200 procedures per year as previously recommended in the 1975 report of the Inter-Society Commission on Heart Disease Resources are necessary in order for a program to function efficiently.
    - A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the operating room.

19. Dr. Steven F. Horowitz testified to the following at the public hearing:
    - TSH can sustain a full-service cardiac program due to the increase in the size of the minority population.
    - Numerous studies have confirmed that the cardiovascular risk profile for both Hispanics and African Americans has been worsening in recent years as obesity and diabetes continue to rise exponentially within these populations.
      (Prefiled Testimony of Steven F. Horowitz, M.D. Chief of Cardiology at TSH, September 19, 2005)

20. Kathleen Silard testified to the following at the public hearing:
    - TSH has examined the significant disparity in utilization rates for PCI and OHS that exists for African Americans in TSH service area as well as other regions of the state when compared to the Caucasian population. TSH has seen how some of the major precursors of heart disease, such as diabetes and obesity, can disproportionately effect minority populations as well as the economically disadvantaged.
    - One of the primary goals of TSH's proposed program will be to address and hopefully eradicate some of those disparities by improving access to PCI and OHS to these high-risk groups.
      (Prefiled Testimony of Kathleen Silard, Senior Vice President for Operations at TSH, September 19, 2005)

21. The demographic characteristics by Race for TSH's TSA are as follows:

Table 6: TSH Demographics by Race

Service Area	Caucasian	African American	Native American	Asian	Other	Total
Primary	73.6%	13.2%	0.2%	4.6%	8.4%	100%
Secondary	85.7%	6.6%	0.1%	3.5%	4.1%	100%
Total Service Area	81.0%	9.2%	0.2%	3.9%	5.7	100%
Connecticut	81.6%	9.1%	0.3%	2.4%	6.6%	100%

Source: Census 2000.

22. The demographic characteristics by Hispanic ethnicity for the proposed TSA:

Table 7: Hispanic Ethnicity of TSH Service Areas

Service Area	Hispanic or Latino	Non-Hispanic	Total
Primary	14.7%	85.3%	**100%**
Secondary	8.4%	91.6%	**100%**
Total Service Area	10.8%	89.2%	**100%**
Connecticut	**9.4%**	**90.6%**	**100%**

Source: Census 2000.

23. The AMI discharges for the TSH TSA are as follows:

Table 8: Share of AMI by Race and Hispanic Ethnicity, FYs 2002 – 2005 (First 2 Quarters)

Service Area	Caucasian	African American	Hispanic	Asian	Native American	Other	Total
Primary	84.7%	7.0%	4.2%	0.1%	0.0%	4.0%	**100%**
Secondary	85.1%	7.1%	3.4%	1.0%	0.1%	3.3%	**100%**
Total Service Area	84.9%	7.0%	3.7%	0.6%	0.1%	3.6%	**100%**
Connecticut	**87.1%**	**4.7%**	**4.0%**	**0.3%**	**0.1%**	**3.8%**	**100%**

(Discharges from OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases. "White," "Black," "Asian," "Native American," and "Other" are non-Hispanic categories.)

24. NYPH has one of the largest cardiac surgery and cardiac catheterization[d] programs in New York State with its physicians performing over 3,000 PCIs and close to 2,000 OHS in calendar year 2004. *(Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)*

[d] Diagnostic Cardiac Catheterization is a diagnostic procedure in which a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to the heart to measure electrical activity, blood pressure, and locate blockages.

25. Dr. Steven Horowitz, testified on behalf of TSH to the following:
    - Diabetes is a leading cause of hospitalization among Connecticut's African American and Hispanic populations which are 3.8 and 2.2 times more likely to be hospitalized directly due to the disease as compared to the Caucasian Connecticut residents.
    - The percent difference for the African American utilization rates in the TSH's TSA versus those statewide is nearly 26% and 62% for PCI and cardiac surgery respectively. The same numbers skyrocket to 41% and 95% when the focus is placed solely on the City of Stamford.
    - TSH can target the African American and Hispanic population and relieve some of these barriers to access through the comprehensive preventive and medical outreach program.
      (Prefiled Testimony of Steven F. Horowitz, M.D., Chief of Cardiology Department at TSH, September 19, 2005)

26. Dr. Arthur Klein testified to the following at the public hearing:
    - NYPH and NYPHS have developed a number of strong and effective partnerships with affiliated hospitals to elevate the scope of and quality of cardiac care in the tri-state region.
    - NYPHS assists in the operation of nine (9) diagnostic cardiac catheterization programs through out the tri-state area, four elective angioplasty programs and one primary angioplasty program.
    - In this proposal, the cardiac surgery professional services will be provided exclusively by full-time faculty of the Division of Cardiothoracic Surgery, Department of Surgery of Columbia College of Physicians and Surgeons.
    - Oversight of elective angioplasty shall be through a joint committee co-chaired by Drs. Moses and Stone, senior faculty from Columbia University's Division of Cardiology and Stamford Hospital's cardiology leadership.
      (Prefiled Testimony of Arthur A. Klein, M.D., September 19, 2005)

27. Dr. Eric A. Rose testified at the public hearing that Columbia University Department of Surgery's professional expertise in cardiothoracic research, its strategic network of partnerships and its vast clinical experience will help support TSH in their cardiac health services. *(Prefiled Testimony of Eric A. Rose, M.D., Chairman for the Dept. of Surgery at NYP/C, September 19, 2005)*

28. TSH submitted a signed Draft Agreement with NYPHS. NYPHS' role is defined as follows:
    - Arrange consultative assistance to the Hospital in the following areas:
        - Preparation of the CON Application;
        - Clinical training of nursing and technical staff;
        - Development of the Hospital's standards of care, risk stratification criteria and operational policies;
        - Development of clinical guidelines and protocols;
        - Collection and analysis of quality data for clinical outcomes and performance monitoring;
        - Recruiting procedures; and

- Adoption by the Hospital of policies, procedures and protocols, including developing practice guidelines and requirements related to the proposed program.

- Recommend CPC standards and/or the standards of NYPHS-affiliated Connecticut institutions for physician, nursing and technical staff protocols to foster a high-quality credentialing program; and
- Advise the Hospital with respect to quality assurance and utilization management functions related to the proposed program.

(Completeness Responses, August 15, 2005, Draft Agreement between the Applicants, Exhibit 4, page 4)

29. TSH proposes to provide elective PCI utilizing five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. *(Certificate of Need Application, August 15, 2005, page 11)*

30. The PCI volumes for the proposed interventionalists for FYs 2002-2005 1st two quarters are as follows:

Table 9: Volume of Proposed Program Interventionalists (FYs 2002 – FY 2005 1st Two Quarters)

Physician	Hospital Affiliation	Office/Home	Average Annual PTCA Volume
Alcan[1]	St. Vincent's & TSH	Norwalk	347
Jumper[2]	St. Vincent's & TSH	Valhalla, NY	119[3]
Charney	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Messinger	NY Presbyterian, Greenwich, & TSH	New Rochelle	X[4]
Stone	NY Presbyterian, TSH (pending)	Greenwich	-

[1]Member of Cardiology Associates of Fairfield County
[2]In training
[3]Dr. Jumper performed 57 in FY 2004 and 122 in the first two quarters of FY 2005.
[4] TSH reported volume (FYs 2003 & 2004 – NYP physicians not specifically identified)
Physician C: 156 & 145 and Physician D: 108 & 126
(OHCA Acute Care Hospital Inpatient Discharge Database and CON Application, August 15, 2005, page 11&58 and Completeness Responses, August 15, 2005, page 8)

31. TSH stated that three additional cardiac interventionalists, Drs. Portnay, Lorenz and Corvaja will be added to the proposed program to perform PCIs at TSH. *(CON Application, August 15, 2005, pages 11&58 and Completeness Responses, August 15, 2005, page 8)*

32. TSH proposes to staff the proposed OHS program with two (2) board-certified cardiac surgeons, who will practice full-time at TSH and be credentialed at both TSH and at NYP/C. These two surgeons will be recruited through the formation of a three (3) person committee which will include as its members, Dr. Craig Smith, Dr. Mehmet Oz and Dr. Eric Rose, Chair of the Surgery Department at NYP/C. *(Certificate of Need Application, August 15, 2005, page 11)*

33. The average annual PCI and OHS volumes in TSH's TSA by hospital provider for FYs 2000-2005 (1st two quarters) are as follows:

Table 10: Average Annual PCI and Open-Heart Surgery Volumes by Provider in TSH's TSA by Provider, (FYs 2002 – 2005 1st Two Quarters)

	PCIs			Open-Heart Surgeries		
Hospital	**Procedures**	**Market Share**	**Area Volume as Share of Total Provider Volume (%)**	**Procedures**	**Market Share**	**Area Volume as Share of Total Provider Volume (%)**
Bridgeport	154	22.2%	12.3%	75	23.1%	24.3%
Danbury	0	0.0%	-	0	0.0%	-
Greenwich	1*	0.1%	100%	-	0.0%	-
Hartford	0	0.0%	-	0	0.0%	-
John Dempsey	1	0.1%	0.2%	0	0.0%	-
Saint Francis	0	0.0%	-	1	.3%	.1%
Saint Raphael's	4	0.5%	0.4%	3	.9%	.4%
Saint Vincent's	392	56.4%	34.9%	119	36.6%	39.7%
Yale	78	11.2%	4.8%	57	17.5%	6.4%
Out of State	65	9.3%	-	70	21.6%	-
Totals	**695**	**100%**	**-**	**325**	**100%**	**-**

*Greenwich Hospital began providing primary PCI in February 2005.
(OHCA Acute Care Hospital Inpatient Discharge Database and MA, NY, and RI Hospital Discharge Databases)

34. Danbury Hospital, along with Waterbury Hospital and St. Mary's Hospital (one program, two sites in Waterbury) were authorized by OHCA to offer full-service cardiac programs in 2003. *(Certificate of Need Applications, Final Decision Docket Numbers 03-30167 & 03-30143, both dated July 23, 2005)*

35. St. Vincent's Medical Center ("SVMC") testified to the following:
    a. Angioplasty volume is flat nationally and has begun to decline in Connecticut.
    b. If TSH proposal is approved, St. Vincent's Medical Center would not be able to achieve both institutional and surgeon specific minimum volumes for OHS and would put the quality of St. Vincent's Medical Center at significant risk.
    c. SVMC performed 1,097 PCIs and 283 OHS in FY 2005.
    d. The overall risk adjusted mortality rate at SVMC is 1.3%.
    e. Other than volume, SVMC measures quality through independent third party companies (to whom they report data to).
    (Prefiled Testimony of Jose Missri, M.D. St. Vincent's Medical Center, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

36. Bridgeport Hospital ("BH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. BH performed under 1,200 PCIs and under 250 OHS in FY 2005.
    b. BH could not specify their overall risk adjusted mortality rate, BH simply stated that it was under 2.0%.
    c. Other than volume, BH measures quality through independent third party companies (to whom they report data to).

d. If the proposed CON was to be approved, this would not impact the physician coverage at BH.
(Prefiled Testimony of Stuart .Zarich, M.D., Bridgeport Hospital, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

37. Yale-New Haven Hospital ("YNHH"), as part of Yale-New Haven Health Heart Institute, testified to the following:
    a. There is a statewide decline in the number of OHS cases,
    b. There is a flattening of PCI volumes,
    c. Proliferation of full-service cardiac program will place additional stress on the state's staffing infrastructure,
    d. Additional cardiac programs will not improve mortality rates,
    e. The residents of Fairfield County have a wide range of options for their full-service cardiac care needs,
    f. There is a direct correlation between physician and institutional case volumes and quality outcomes, and
    g. In FY 2004, YNHH had 64 PCI discharges (4.3% of YNHH"s total PCI) and 52 OHS discharges (6.2% of YNHH's total OHS) from the Stamford service area.
    (Prefiled Testimony of Kyle Kramer, Executive Director of the Yale-New Haven Health Heart Institute, September 28, 2005 and Public Hearing Testimony, October 6&27, 2005)

38. In order to implement the proposed project, TSH will require a series of facility renovations. The renovations will include an expansion of surgical facilities on Level 2 of TSH's North building to allow for the creation of two new, state-of–the-art operating rooms that will be the primary operating suites for the proposed program as well as enlarged perioperative and other surgical support areas.
(Certificate of Need Application, August 15, 2005, page 13)

Financial Feasibility of the Proposal and its Impact on the Hospital's Rates and Financial Condition

Impact of the Proposal on the Interests of Consumers and Payers of Health Care Services

Consideration of Other Section 19a-637, C.G.S. Principles and Guidelines

39. The proposal has a total expenditure cost of $5,404,425 which consists of the following:

Table 11: Total Capital Expenditure

Description	Cost
Medical Equipment	3,109,345
Construction/Renovation	1,590,065
Project Contingency	704,925
Total Capital Expenditure	**$5,404,425**

(Certificate of Need, August 15, 2005, page 63)

40. The proposal will be financed from the TSH's equity through operations. *(Certificate of Need, August 15, 2005, page 64)*

41. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program. This arrangement will be finalized if the proposal is approved by OHCA. *(Arthur S. Klein, Chief Operating Officer of NYPHS, Public Hearing Testimony, October 6&27, 2005)*

42. TSH projects incremental to the project losses from operations for the first two years of operation for FYs 2007 and 2008 of ($1,940,000) and ($294,000), respectively. This is due to program start up. However, TSH is projecting incremental gains from operation of $1,082,000 for the third year of operation, FY 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

43. TSH is projecting a gain from operations with the CON project of $10,137,000, $12,327,000 and $14,365,000, for FYs 2007, 2008 and 2009. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

44. TSH proposes to hire 26, 34 and 38 Full Time Equivalent employees for FYs 2007, 2008 and 2009, respectively. *(Responses to the OHCA Completeness Letter, August 15, 2005, Updated Financial Attachment)*

45. There is no State Health Plan in existence at this time. *(Certificate of Need Application, August 15, 2005, page 14)*

46. TSH has adduced evidence that this proposal is consistent with TSH's long-range plan. *(Certificate of Need Application, August 15, 2005, page 14)*

47. TSH has improved productivity and contained costs by participating in group purchasing, energy conservation, reengineering and through application of technology. *(Certificate of Need Application, August 15, 2005, page 59)*

48. TSH stated that this proposal will help enhance the existing academic affiliation with Columbia University College of Physicians and Surgeons. *(Certificate of Need Application, August 15, 2005, pages 59&60)*

49. TSH stated that the patient physician mix of TSH is unique as the cardiac patient care is fully integrated across all medical disciplines and is managed through a state-of-the-art multi-modality data management system. *(Certificate of Need Application, August 15, 2005, page 60)*

50. TSH's rates are sufficient to cover the proposed capital expenditure and operating costs associated with this proposal. *(Responses to Interrogatories, September 28, 2005, Updated Financial Attachment)*

Rationale

The Office of Health Care Access ("OHCA") approaches community and regional need for proposed services on a case-by-case basis. Certificate of Need ("CON") applications for cardiac services do not lend themselves to general applicability due to the variety and complexity of factors, which may affect any given proposal; e.g., the characteristics of the population to be served, the nature of the existing services, the specific services proposed to be offered, the current utilization of services, and the financial feasibility of the proposed service. In considering this application, OHCA determined that TSH's current cardiac utilization, population served, quality of providers and physicians and geographic accessibility were significant factors in determining need.

The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (collectively known as "Applicants"), propose to expand the cardiac services delivered at TSH to include elective angioplasty services and open heart surgery. The Applicants based the need for the elective PCI and open heart surgery programs on improved accessibility for patients, improved continuity of care, historical and existing cardiac volume, adopting a standard of care that exists in the other large urban areas and improved quality of care.

TSH's primary and secondary service area ("TSA") consists of eight (8) towns. There are no providers of elective PCI or OHS in TSH's TSA. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population when compared to the rest of the state overall. The primary service area has experienced higher adult per capita rates of AMI discharges for African American and Hispanic as compared to the state as a whole. In addition, there appears to be a disparity in the utilization rates for PCI and OHS for Hispanics and African Americans in the service area when compared to the Caucasian population. This proposed cardiac program will enhance the access for the African American and Hispanic population in TSH's TSA. OHCA concludes that the Applicants proposal will provide the residents of lower Fairfield County with improved access to the full continuum of cardiac care.

TSH's historical cardiac catheterizations volumes for FYs 2002, 2003, 2004, and 2005 (1st 2 quarters) were 675, 635, 628 and 147, respectively. OHCA determined that TSH could potentially perform a minimum of 244 annual total PCIs (primary & elective) and 102 OHS cases on residents of TSH's TSA in the first full year of operation of the proposal based upon historical catheterization volume and its market share. This volume increases to 276 total PCI procedures and 117 OHS cases for the second year of operation, and 316 total PCI procedures and 137 OHS cases for the third of operation. Based on historical inpatient diagnostic cardiac catheterization volume and market share, the proposed full-service cardiac program at TSH would exceed institutional minimum volumes recommended by the ACC/AHA for PCI (200) and the American College of Surgeons--Advisory Council for Cardiothoracic Surgery for open-heart surgery (100–125 surgeries per year).

The proposal involves offering of elective Percutaneous Coronary Intervention ("PCI") through the use of five (5) interventional cardiologists, who are currently providing primary PCI services at TSH. TSH also proposes to provide OHS utilizing two (2) surgeons will be recruited from outside of Connecticut, through the formation of a three (3) person committee comprised of TSH and Columbia physicians. Therefore this program will not impact coverage at any of the existing cardiac programs in Connecticut. In addition, OHCA concludes that even though the PCI and OHS volumes may decline at the existing providers, the PCI and OHS volumes will not fall below the institutional minimum volumes recommended by ACC/AHA for PCI and American College of Surgeons-Advisory Council for Cardiothoracic Surgery for OHS.

TSH's proposal will increase the availability of quality PCI and OHS services for residents of TSH's TSA. The proposed elective PCI and OHS program will be developed in collaboration with NYPHS. NYPHS will provide or arrange for TSH consulting in the areas of clinical training for staff, development of TSH's standards of care, development of clinical guidelines, collection and analysis of data and recruiting procedures. NYPHS expects the initial training to continue over an eighteen month period. NYPHS will also advise TSH with respect to quality assurances and utilization management and provide assistance to TSH concerning the adoption of policies, procedures and protocols, including developing practice guidelines and program requirements. This proposal will improve the quality of care and continuity of TSH's cardiac services.

Finally, the CON proposal is financially feasible. The proposal has a total capital expenditure of $5,404,425, which consists $3,109,345 for medical equipment, $1,590,065 for construction/renovations and $704,925 for contingency costs. TSH proposes to fund the proposed total capital expenditure through TSH's equity, specifically through operations. TSH will pay NYPHS a fee for expenses related to training and oversight of TSH's proposed program; however, the details have not yet been finalized. TSH projects incremental losses from project operations for the first two years of operation of ($1,940,000), and ($294,000), respectively. However, TSH is projecting an incremental gain from operation of $1,082,000 by the third year of operation. Further, TSH is projecting gains from total Hospital operations with the CON project of $10,137,000, $12,327,000 and $14,365,000 for the first three years of operations. The projected utilization and financials of this proposal appear to be reasonable, financially feasible and cost-effective and will not adversely impact the interests of consumers and payers of such services.

TSH's proposed elective angioplasty and open heart surgery program is differentiated from other cardiac-related proposals in the following ways. TSH currently operates a high volume diagnostic cardiac catheterization program and recently initiated a primary angioplasty program. The Hospital's service area is comprised of a higher proportion of African American and Hispanic population than the rest of the state. The implementation of the proposed program should address some of the disparities in utilization of cardiac services by this population. Additionally, the proposed program is not expected to impact the physician coverage at any of the existing cardiac programs in Connecticut because the interventionalists are already on staff at TSH and the cardiac surgeons will be

recruited from out of state. TSH's strong collaborative relationship with the NYPHS will enhance the accessibility of high quality, community-based medical services offered by TSH. TSH will utilize the resources of NYPHS to further enhance provision of quality care including access to the expertise, information, and consultative support of a nationally recognized academic healthcare center renowned for the diagnosis and treatment of cardiac disease. Finally, implementation of TSH's proposal will bring appropriate access to high quality cardiac services to the residents of the proposal's TSA. In summary, the proposal will result in enhanced cardiac services in the Stamford region.

Order

NOW, THEREFORE, the Office of Health Care Access ("OHCA") and The Stamford Hospital ("TSH") and New York Presbyterian Healthcare System, Inc. ("NYPHS") (together referred to as "Applicants") hereby stipulate and agree to the terms of settlement with respect to the Applicants' request to establish elective angioplasty and open heart surgery program to be located at Stamford Hospital at a total capital expenditure of $5,404,425, as follows:

1. The Applicants' request for a CON to establish an elective angioplasty and open-heart surgery program to be located at TSH, a total capital expenditure of $5,404,425, is hereby approved.

2. TSH shall only commence operation of the OHS program at The Stamford Hospital initially. Once the number of OHS procedures exceeds 125, the Hospital may commence operation of the elective angioplasty program. Prior to commencement of the angioplasty services, TSH is required to provide OHCA evidence that it has performed the required 125 OHS.

3. TSH will have at least two cardiac surgeons as part of this proposal, who are in the process of being recruited and shall be identified prior to the beginning of the OHS program. The surgeons must be fully credentialed and have the following qualifications:
   - Board-Certified in cardiac surgery
   - Maintains a Connecticut license and admitting privileges at the Hospital
   - Has performed OHS procedures at a cardiac surgical center that meets or exceeds the annual ACCS/ACS minimum institutional volume standard for cardiac surgery for the past 2 years
   - TSH shall provide the Curriculum Vitae ("CV") of the cardiac surgeons prior to commencement of the OHS program. TSH shall demonstrate that the cardiac surgeons satisfy all requirements specified above. The OHS program shall not commence operation until OHCA acknowledges receipt of the CV and that it complies with this Order.

4. TSH shall provide the CVs of each of the cardiac operating room nurses, Board-certified cardiac anesthesiologists, intensivists and perfusionists for the authorized OHS program prior to commencement of the OHS program. Fifty percent (50%) of each of the core OR staff mentioned above must be trained in OHS prior to commencement of the OHS program. The OHS program shall not commence operation until OHCA acknowledges receipt of the CVs and that they comply with this Order.

5. TSH shall not exceed the approved total capital expenditure of $5,404,425. In the event TSH learns of potential cost increases or expects final project costs will exceed those approved, the Hospital shall file with OHCA a request for approval of

the revised CON project budget. The source of funding for the project will be The Stamford Hospital's operations and owner equity.

6. TSH shall complete and submit to OHCA on a quarterly basis the data elements in the Connecticut Cardiac Data Registry (**Attachment II**). Data should be submitted to OHCA on a computer disk in either an excel workbook or comma-delimited text file in a format specified by OHCA. The most current version of the Connecticut Cardiac Data Registry includes, but may not be limited to, the elements listed in **Attachment II**. Data must be reported to OHCA thirty (30) calendar days following the end of the quarter. Fiscal Year quarters end December 31st, March 31st, June 30th, and September 30th. Upon receipt, OHCA will check the data's conformance to the required specifications and within ten (10) business days notify TSH in writing of its evaluation. If OHCA finds questionable material, TSH will have fifteen (15) business days from notification by OHCA to submit a revised dataset for evaluation. All patient-level data submitted to OHCA to satisfy this requirement will be subject to the laws and regulations of the state of Connecticut and the Office of Health Care Access regarding its collection, use and confidentiality. If TSH does not submit the data elements in the Connecticut Cardiac Data Registry on a quarterly basis, the programs may be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the programs.

7. TSH shall submit on an annual basis to OHCA the following reports which must be reported to OHCA thirty (30) calendar days following the end the year, for the first three (3) years of operation:
   a. A report of all elective PCIs and OHS performed each year by ethnicity and race, in a format to be specified.
   b. A report which illustrates that this CON proposal helped relieve the barriers to access through comprehensive preventive and medical out-reach programs for the African American and Hispanic population within TSH's TSA.

8. If TSH does not perform 125 OHS procedures within twelve months of the initiation of the OHS program, TSH shall submit monthly reports of OHS arrayed by physician to OHCA until such time as these volumes are met by TSH. If these volumes are not met for a period of two consecutive 12-month periods, TSH's OHS program shall be terminated. In the event of such a termination, TSH shall file a CON for reinstitution of the OHS program.

9. If TSH does not perform 200 elective PCIs within twelve months of the initiation of the PCI program, TSH shall submit monthly reports of elective PCIs arrayed by physician to OHCA until such time as these volumes are met by TSH.

10. TSH shall participate in the Society of Thoracic Surgeons Database (STS-DB) database and the ACC National Cardiovascular Database Registry (ACC-NCDR) and report all data including the optional follow-up section. TSH shall provide OHCA quarterly data reports from STS-DB and ACC-NCDR. Data must be

reported to OHCA thirty (30) calendar days subsequent to TSH receiving the reports from the STS and ACC. TSH is required to comply with the STS and ACC/AHA criteria and standards. If TSH determines not to participate in the STS-DB or ACC-NCDR, TSH shall notify OHCA immediately, and continue to comply with the STS and ACC/AHA criteria and standards set forth in Attachment III.

11. TSH shall provide OHCA with a copy of a dated and signed Consulting Services Agreement with NYPHS or its Affiliates prior to commencement of operation of the OHS program. This contract shall be renewed annually for a period of three years.

12. OHCA and TSH agree that this Agreed Settlement represents a final agreement between OHCA and TSH with respect to this request. The signing of this Agreed Settlement resolves all objections, claims and disputes, which may have been raised by the Hospital with regard to Docket Number 04-30374.

13. This authorization for the OHS program shall expire on December 31, 2008. Should the TSH's open-heart surgery program not commence operation by that date, TSH must seek further approval from OHCA to complete the project beyond that date.

14. This Agreed Settlement is an order of the Office of Health Care Access with all the rights and obligations attendant thereto, and the Office of Health Care Access may enforce this Agreed Settlement pursuant to the provisions of Sections 19a-642 and 19a-653 of the Connecticut General Statutes at TSH's expense, if TSH fails to comply with its terms.

ATTACHMENT IV

GUIDELINES FOR STANDARDS IN CARDIAC SURGERY

The following statement is an updated version of guidelines that were first published by the American College of Surgeons in 1991. The revised statement was developed by the Advisory Council for Cardiothoracic Surgery and approved by the College's Board of Regents in October 1996.

Preamble

This report provides guidelines to be used by hospital executives and appropriate medical staff only. It places no value judgment on existing successful programs or on the treatment of individual patients.

While current standards of practice form the basis of this report, it is recognized that large programs in cardiac surgery grow from smaller ones. Hospitals and their staffs should exercise their own discretion in approving programs based on local need and the responsibility for achieving a good standard of practice.

While attention is directed primarily to open-heart surgery, the proposed standards should apply to closed-heart operations as well as to operations on the great vessels within the chest.

In borderline situations, in which the number of open-heart operations does not meet the established guidelines, the American College of Surgeons recommends the use of peer review.

Professional team

Specification of the qualifications for cardiac surgeons in an established practice is beyond the scope of these guidelines. Surgeons practicing cardiac surgery should be certified or awaiting certification by the American Board of Thoracic Surgery or its Canadian equivalent within five years after completion of an approved residency program in cardiac surgery. It is recommended that hospital committees for staff accreditation exercise their judgments for privileges based on the nature of the cardiothoracic residency or postresidency experiences of the applicant.

A team approach with a minimum of two qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR. It is recognized that, depending on the particular setting and situation, the assistant on a particular case may vary in experience and qualification.

Hospital operative volume–Adult cardiac surgery

The 1975 report of the Inter-Society Commission on Heart Disease Resources recommended that cardiac surgical programs in a *hospital* should perform at least 200 procedures annually. This recommendation was based on the premise of a hospital dedicating 1 operating room to cardiac surgery and functioning at 80 percent capacity (4 cases per week x 52 weeks = 200 per year). While there are no presently available data linking an *individual surgeon's* patient volume and hospital mortality rate, there are data to suggest that an annual volume of at least 100 to 125 open heart procedures (including coronary artery bypass procedures, valve replacements, and other operations requiring the use of cardiopulmonary bypass) per *hospital* is necessary from a quality standpoint and that there is a greater variation in adjusted mortality rates for teams doing lower volumes of procedures as compared with those doing a high volume. While 100 to 125 cases per year per *hospital* appears sufficient from a quality standpoint, it is likely that considerably more, and at least 200 procedures per year as previously recommended, are necessary in order for a program to function efficiently.

Congenital heart surgery

Surgery for congenital heart disease, especially in infants, requires a setting that readily meets the complex and special needs

of this group of patients. These requirements include a cardiac surgeon experienced in the operative and perioperative management of such patients. There should be a pediatric cardiologist, an anesthesia team, perfusionists, intensive care nurses, and appropriate intensive care facilities for the treatment of infants and children. At a hospital where congenital heart operations are performed, a total of 100 congenital heart operations (both open and closed, not including neonatal ductus ligations) should be done. The occasional management of an infant or child with congenital heart disease by an otherwise busy and well-functioning adult cardiac surgical team is strongly discouraged.

Hospital facilities and personnel

It is urged that hospital committees for staff accreditation use peer review to determine that adequate standards of practice are maintained in terms of case frequency and results. A registry for the recording of cardiac surgical results is mandatory.

The complex operating room environment required by cardiac surgery in terms of equipment and instruments requires constant improvement in technique and proper indoctrination of personnel. Such educational programs should be under the direction of a clearly designated individual with particular interest and skill in cardiac surgery. Operating room nurses and technicians specializing in cardiac surgery are important. It should be mandatory that operating room nurses and technicians be assigned to cardiac surgery sufficiently often to develop and maintain the skills required for proficient performance in this area.

Anesthesia for cardiac surgical patients encompasses a variety of special problems. To ensure technical competence, frequent changing of the anesthesiologists assigned to cardiac surgery should be avoided.

The operation of a heart-lung machine should be performed by a specially trained nurse or technician under the supervision of the operating surgeon. A perfusionist certified by the American Board of Cardiovascular Perfusion is recommended. Perfusionists who are not certified should have at least two years of experience under supervision in an active clinical program in open-heart surgery and have a thorough background in operating room sterile techniques, perfusion physiology, the use of monitoring equipment, and a general understanding of commonly performed cardiac surgical procedures. The primary responsibility for determining the capability of the perfusionist remains with the cardiac surgeon.

Cardiac surgeons must be primarily responsible for the postoperative care of their patients, including that provided in the intensive care unit. Portions of that care may be shared with others, such as nurses and other physicians. However, only the cardiac surgeon is fully cognizant of all aspects of a given patient's condition and retains the responsibility for the continuity of care, which includes the preoperative status, the operative management, and the postoperative care.

Intensive care nursing of cardiac surgical patients is recognized as a true specialty involving skills in dealing with cardiac and respiratory emergencies. Assignment to cardiac surgical patients should be sufficiently often to maintain competence in this area of nursing. The surgeon should participate in the supervision of cardiac intensive care unit nurses.

The operating room, intensive care unit, and other facilities must conform to standards mandated by the Joint Commission on Accreditation of Health Care Organizations.

The nature of cardiac surgery makes it mandatory that diagnostic facilities be available to the surgical team. A proper cardiac catheterization laboratory must be available for hemodynamic and cine' angiographic studies. This laboratory should be under the direction of a qualified specialist and be accessible for preoperative elective studies, postoperative elective studies, and emergency procedures on a 24-hour basis.

Standard laboratory studies should be available on a 24-hour basis, including blood-gas analysis.

A blood bank facility with full resources under the direction of qualified specialists in this field is mandatory.

An intensive care facility must be available for all patients following cardiac surgery, and in some instances, for patients who are severely ill, preoperatively. This should be a limited-access area that is off limits to nonparticipating personnel and should have facilities for the adequate isolation of septic patients.

Patient follow-up

Proper patient follow-up is an integral part of surgical treatment. An effective follow-up system for patients having open-heart surgery is the responsibility of the surgical team. The team should be able to demonstrate that it has an adequate follow-up system and that patients are seen as often as necessary during the immediate postdischarge period and, subsequently, are followed up at appropriate intervals.

sponsor hospitals and OEMS the ability to begin to collect EMS data, creating the potential in the near future to begin to analyze the data and create best practices to elevate the quality of care and delivery of Emergency Medical Services to the residents and visitors of Connecticut.

In late 2008/early 2009 the AHA formed a "STEMI stakeholders group" comprised of three sub-committees (pre-hospital, timely transfers and education) intended to develop and promulgate best practice related to ST segment myocardial infarction (STEMI). The group had a varied composition including physicians (EMS/ED, cardiology, and interventional cardiology), nurses, pre-hospital providers and health care administrators/regulators. This group drafted a document outlining recommendations to improve care in relation to pre-hospital triage of STEMI patients, timely transfers of patients between facilities and issues of education for pre-hospital providers. A "STEMI Protocol" was also drafted that was intended to offer state-wide guidance for best practice regarding patients experiencing chest pain and subsequently diagnosed with a STEMI by pre-hospital EKG (including bypass for more timely cardiac catheterization).

The "STEMI Protocol" was reviewed by the CT EMS Medical Advisory Committee (CEMSMAC) beginning in 2010. In 2011, after a significant amount of thoughtful work by the CEMSMAC, a revised version of the document entitled "CT EMS STEMI Guideline" was completed and submitted to the Commissioner of Public Health for review; it was approved in January 2012.

OHCA would encourage the adherence of the "CT EMS STEMI Guideline." The foremost goal is for authorized EMS personnel to obtain a 12-lead electrocardiogram in the field for all patients suspected of myocardial infarction, thereby increasing the likelihood for percutaneous coronary intervention (PCI) within 90 minutes of first medical contact. Please see link below for the complete "CT EMS STEMI Guideline" document:

http://www.ct.gov/dph/lib/dph/ems/pdf/stemi_patients.pdf

CARDIAC SERVICES

Heart disease is the leading cause of death for both men and women in the United States.[53] In 2010, coronary heart disease alone was projected to cost the United States approximately $108.9 billion in health care services, medications, and lost productivity.[54] In Connecticut, cardiovascular disease (CVD) is also a significant public health concern and contributor of resident deaths. In fact, about one third of Connecticut resident deaths are due to CVD; coronary heart disease (48%), cerebrovascular disease (15%) also known as stroke and heart failure (8%) account form the majority of CVD deaths.[55]

Existing Connecticut statute requires CON authorization for the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery. According to OHCA's Policies and Procedures, "interventional cardiology" is defined as non-

surgical procedures performed in the cardiac catheterization laboratory for the treatment of coronary artery and peripheral vascular disease. Procedures include, but are not limited to, angioplasty, valvuloplasty, cardiac ablation, coronary thrombectomy, and congenital heart defect correction. Only those procedures authorized pursuant to CON may be performed by a health care facility or provider. Multiple cardiac services may be authorized under one CON decision. A facility that is authorized to provide open heart surgery is also authorized to provide the full range of cardiac procedures mentioned above.

CARDIAC CATHETERIZATION

Cardiac catheterization is defined as a medical procedure requiring the passage of a catheter into one or more cardiac chambers of the left and right heart, with or without coronary arteriograms, for the purpose of diagnosing congenital or acquired cardiovascular disease, or for determining measurement of blood pressure flow.

ANGIOPLASTY/PERCUTANEOUS CORONARY INTERVENTION

Primary (emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow

Elective (scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization lab whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.

PCI and Elective PCI are often combined with the permanent placement of a small wire mesh tube called a stent to help prop the artery open and decrease the chance of it narrowing again. Some stents are coated with medication to help keep the artery open (drug-eluting stents), while others are not (bare-metal stents).

OPEN HEART SURGERY

Open heart surgery refers to a therapeutic operative procedure performed on the heart and/or its coronary arteries in order to correct anomalous conditions (for example, coronary artery bypass surgery, heart valve replacement), often using a heart-lung by-pass machine to perform the functions of circulation during surgery.

Authorization for Connecticut hospitals to perform elective catheter-based interventions for coronary artery disease has been limited in the past to hospitals with the ability to perform cardiac surgery onsite. However, increasing operator experience, improvements in surgical technique and major advances in technology and pharmacology have contributed to a progressive trend to allow PCI without on-site surgical backup. New evidence gives support to the positive effects that these medical advances have contributed to the significant reduction in emergency surgery following PCI[56]. Elective PCI without on-site surgical backup was, until recently, recommended as class III (not recommended, potentially harmful). However, an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation. CPORT-E trial findings conclude that patients have no greater risk of death or complications when they have Elective PCI at a hospital without cardiac surgery backup. However, similar to the 2007 SCAI Expert Consensus document, the revised guidelines also recommend stringent criteria for such programs. Connecticut hospitals seeking authorization to initiate an Elective PCI program without on-site cardiac surgery capabilities will be required to meet the SCAI conditions required in guidelines as well as demonstrate clear public need for the program.

DESCRIPTION OF DATA SOURCES

The primary source to be used for Acute Care utilization will be the CT Office of Health Care Access Acute Care Hospital Inpatient Discharge Database.

MAP OF CURRENT SERVICE LOCATIONS

STANDARDS/GUIDELINES

Connecticut General Statutes Section 19a-638 specifies that at CON is required for: the establishment of cardiac services, including inpatient and outpatient cardiac catheterization, interventional cardiology and cardiovascular surgery.

The Office of Health Care Access has historically utilized Professional Societies and Organizations held to be the experts for establishing standards and guidelines for cardiac care and will continue to make appropriate use of their recommendations in the future review and determination of CON applications. Examples of expert sources to be used in determining standards and guidelines include: the American College of Cardiology, the American Heart Association and the Advisory Council for Cardiothoracic Surgery.

PERCUTANEOUS CORONARY INTERVENTION (PCI)

Primary PCI

1. Based on ACC and AHA, Primary PCI for STEMI should be performed by experienced operators who perform more than 75 elective PCIs per year and, ideally, at least 11 PCI procedures for STEMI per year. Ideally, these procedures should be performed in institutions that perform more than 400 elective PCIs per year and more than 36 primary PCI procedures for STEMI per year.
2. A report by the American College of Cardiology/American Heart Association Task Force on practice guidelines, referring to Class II b, suggests that Primary PCI for patients with STEMI might be considered in hospitals without on-site cardiac surgery provided that appropriate planning for program development has been accomplished and includes: appropriately experienced physician operators (more than 75 total PCIs and, ideally, at least 11 primary PCIs per year for STEMI); an experienced catheterization team on a 24 hours per day; a 7 day per week call schedule; a well-equipped catheterization lab with digital imaging equipment; a full array of interventional equipment; intra-aortic balloon pump capability; and a proven plan for rapid transport to a cardiac surgery operating room in a nearby hospital with appropriate hemodynamic support capability for transfer. Primary PCI should be limited to patients with STEMI or MI with new or presumably new LBBB on ECG and should be performed in a timely fashion (goal of balloon inflation within 90 minutes of presentation) by persons skilled in the procedure (at least 75 PCIs per year) and at hospitals that perform a minimum of 36 Primary PCI procedures per year. (Level of Evidence: B - Limited populations evaluated. Data derived from a single randomized trial or nonrandomized studies).

Elective PCI

1. Elective/urgent PCI should be performed by operators with an acceptable annual volume (>75 procedures) at high volume centers (> 400 procedures) with on-site cardiac surgery (Level of Evidence: C)
2. Elective/urgent PCI should be performed by operators and institutions whose current risk-adjusted outcome statistics are comparable to those reported in contemporary national data registries, (Level of Evidence: C)
3. It is reasonable that low volume operators (< 75 PCI procedures per year) perform elective/urgent PCI at high volume centers (> 400 PCI procedures per year) with on-site cardiac surgery. Ideally, operators with an annual procedure volume of fewer than 75 procedures per year should only work at institutions with an activity level of more than 600 procedures per year. Operators who perform fewer than 75 procedures per year should develop a defined mentoring relationship with a highly experienced operator who has an annual procedural volume of at least 150 procedures per year. (Level of Evidence C)
4. It is not recommended that elective/urgent PCI be performed by low volume operators (< 75 PCI procedures per year) at low volume centers (200 to 400 procedures per year) with or without on-site cardiac surgery. An institution with a volume of fewer than 200 procedures per year, unless in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service. (Level of Evidence: C)
5. The 2005 PCI Guideline does not establish an explicit minimum hospital volume threshold for elective PCI; there are multiple references in the context of operator and institutional competency to "centers" performing 200 – 400 elective PCI procedures per year.
6. The 2011 PCI Guideline states that operator and hospital volume recommendations have been carried over from the ACC/AHA/SCAI 2005 Guideline Update for Percutaneous Coronary Intervention.

   a. PCI in Hospitals without On-Site Surgical Back-up is in the Class IIb category.

      Class II b: Elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection (Level of Evidence: B)

      Any hospital considering elective PCI without on-site-cardiac surgery must meet the criteria set forth in the 2011 ACCF/ANA/SCAI PCI Guideline, Section 4.8., PCI in Hospitals Without On-Site Surgical Backup: Recommendations (see link below):

      http://content.onlinejacc.org/cgi/reprint/58/24/e44.pdf

      Any hospital not meeting the 2011 ACCF/ANA/SCAI PCI Guideline criteria will be considered to be in Class III.

Class III–Harm: Primary and elective PCI should not be performed in hospitals without on-site cardiac surgery capabilities without a proven plan for rapid transport to a surgery operating room in a nearby hospital or without appropriate hemodynamic support capability for transfer. (Level of Evidence: C)

Quality and Performance Considerations for PCI Programs

Based on the 2011 American College of Cardiology Foundation/American Heart Association/Society for Cardiovascular Angiography and Interventions Guidelines for Percutaneous Coronary Intervention:

1. Every PCI program should operate a quality improvement program that routinely:
   a) reviews quality and outcomes of the entire program;
   b) reviews results of individual operators;
   c) includes risk adjustment;
   d) provides peer review of difficult or complicated cases; and
   e) performs random case reviews (Level of Evidence: C)
2. Every PCI program should participate in a regional or national PCI registry for the purpose of benchmarking its outcomes against national norms. (Level of Evidence: C)

PCI quality and performance considerations are defined by attributes related to structure, processes, and risk adjusted outcomes. Structural elements include, for example, staffing, equipment, supplies, operator and institutional volumes, and the availability of electronic medical records. Processes include strategies for the appropriate patient, protocols for pre- and post-procedural care, appropriate procedural execution and management of complications, and participation in databases and registries for benchmarking program and individual operator performance. The end result of these structures and processes of care are risk-adjusted outcomes, and when available, are more reliable measures of quality than the institutional and individual operator volumes.[58]

CARDIAC SURGERY/OPEN HEART SURGERY[59]

1. Guidelines for Standards in Cardiac Surgery developed by the Advisory Council for Cardiothoracic Surgery and approved by the American College of Surgeons' Board of Regents in October 1996 – Bulletin of the American College of Surgeons, Vol. 82, No. 2, February 1997
   a. An annual volume of at least 100 to 125 open heart procedures per hospital is necessary from a quality standpoint and there is a greater variation in adjusted mortality rates for teams doing lower volumes as compared with those doing a high volume.
   b. At least 200 procedures per year are necessary in order for a program to function efficiently
   c. A team approach with a minimum of 2 qualified cardiac surgeons is recommended to provide adequate and continuous perioperative care as well as assistance in the OR.
2. The following conditions must be met to initiate a new OHS program:

a. The annual caseload of other programs w/in the proposed PSA shall not drop below 350 procedures.
b. Epidemiological evidence of conditions for which OHS is appropriate w/in the PSA or demonstrates a significant unmet need in the PSA for these procedures.
c. Existing program(s) in the service area are performing at least 350 open heart surgeries annually.
d. Evidence demonstrating the performance of a minimum of 200 open heart surgeries annually within the first three years of the start of the new Open Heart Surgery program.

CARDIAC UTILIZATION

Based on hospital discharge data, inpatient cardiac care is declining both in patient volume and overall patient days (see Table 4.7 and Chart 4.3). From FY 2008 to FY 2011, Cardiac Care-Medical discharges dropped 6%, while the corresponding patient days declined by 3%. During the same time period, Cardiac Care-Surgical care declined even more significantly, with both discharges (11%) and patient days (8%) falling.

Table 3.11: Statewide Cardiac Inpatient Data

Discharges	FY 2008	FY 2009	FY 2010	FY 2011	chg 08-11	chg 10-11
Cardiac Care -Medical	43,072	41,747	41,795	40,542	-6%	-3%

DISCUSSION OF UNMET NEED AND GAPS IN SERVICES, CAPACITY ISSUES, ETC.

The tables below provide an initial step toward the identification of potential areas of unmet need for cardiac care in the state. The tables below provide information that compares the number of residents from a given region that received treatment for cardiac medical services or surgery in a given year (patient demand). This patient demand is compared to the overall volume of cardiac patients served by hospitals in the same region. If hospital volumes are lower than patient demand in the region, it may indicate the need for additional capacity and warrants additional study to examine patient migration patterns to confirm or refute this assertion.

Table 3.12: Bed Need for Inpatient Cardiac Services

RECOMMENDATIONS

1. Examine volume as indicator of quality, as well as other indicators, by examining institutional and operator performance.
2. Continue to review and update Connecticut's cardiac guidelines to reflect updated information and recommendations provided by Professional Societies and Organizations with expert knowledge of cardiac care.

CANCER TREATMENT

Oncology is the branch of medicine concerned with the study and treatment of cancer, including screening, diagnosis, therapy, follow-up and palliative care. It includes various sub specialties such as radiation oncology (medical use of high-energy radiation to kill malignant cells), surgical oncology, and pediatric oncology. Chemotherapy, most generally the treatment of disease by chemicals, can be used for a range of diseases but most frequently refers to antineoplastic drugs to treat cancer.

In Connecticut, there is no unique licensure category for cancer treatment. The Commission on Cancer (CoC), a consortium of professional organizations dedicated to improving cancer patients' lives, administers an accreditation program that encourages hospitals, treatment centers, and other facilities to improve the quality of patient care by focusing on prevention, early diagnosis, pretreatment evaluation, staging, optimal treatment, rehabilitation, surveillance for recurrent disease, support services, and end-of-life care. A broad range of available medical services combined with a multidisciplinary team approach has resulted in 80 percent of all newly diagnosed cancer patients in the US being treated in CoC-accredited cancer programs.[60] According to the CT Cancer Partnership, 67% of acute care hospitals in Connecticut are ACoS accredited.[61].

RE: PCI without surgery on site

Anna,

Could you tell me when and why St. Johns Riverside and Sound Shore Hospitals were denied angioplasty privileges?

Nancy

On Fri, Jul 13, 2012 at 11:37 AM, Anna D. Colello wrote:

This is in response to your query regarding the number of hospitals which perform elective angioplasty (PCI - percutaneous coronary intervention) without surgery on site. Section 405.29 of the Department of Health regulations specify that hospitals wishing to perform PCI must perform both primary (emergency) and elective. These regulations were promulgated in November 2009. Prior to that time there was a waiver process which

allowed first primary and later elective procedures to be approved for centers without surgery on site. One center (Bronx Lebanon Hospital) was approved for primary under the waiver system which has not yet requested approval for elective. No new center would be permitted to do just primary because of the regulations.

The centers which perform PCI without surgery on site are:
Unity Health System (Wilson Hospital)
South Nassau Communities Hospital
Faxton-St Luke's Healthcare (St Luke's Division)
Orange Regional Medical Center
St Luke's Cornwall Hospital
St Catherine of Siena Medical Center
Glens Falls Hospital
White Plains Hospital
Brookdale Hospital Medical Center
Long Island College Hospital
Lutheran Medical Center
City Hospital at Elmhurst
Jamaica Hospital Medical Center
St Barnabas
Good Samaritan Hospital on Long Island received approval as a surgery center but has not opened its surgery center so remains PCi w/o surgery at this time
Brookhaven Hospital was very recently approved to do PCI (but do not believe it has opened for PCI) It previously was diagnostic only.

Southside Hospital was approved as a surgery center in 2011

Dr. Christopher Howes

I would like to make some comments regarding certain aspects of Dr. William Gray's testimony including some content from the 2011 ACCF/AHA/SCAI Guidelines for Angioplasty and the 2012 ACCF/SCAI Expert Consensus Document Update.

- Dr. Gray highlighted certain content from the above referenced documents, but neglected to mention other content which clearly is consistent with the proposed program at Greenwich Hospital.

  The 2012 ACCF/SCAI Expert Consensus Document Update states on page 5 of the publication that:

  > "It is generally believed that elective and primary PCI are permissible in sites without cardiovascular surgery, if there is strict adherence to national guidelines. In particular, there must be a documented working relationship with a larger facility with cardiovascular surgical services and an emergency transportation system operative."

  As our CON application clearly says, the proposed elective angioplasty program would be a satellite of the YNHHVC, which is a full service cardiac facility. There is already an emergency transportation system in operation that includes both land and air. Consistent with the 2011 ACCF/AHA/SCAI Guidelines for Angioplasty, our ambulance provider has committed to respond to requests within 20 minutes (see Attachment I). The 2012 ACCF/SCAI Expert Consensus Document Update also stresses (page 5) that a QA/QI system be operative and active, operate 24/7 if emergency angioplasty is provided and participate in a national registry such as the ACC's National Cardiovascular Data Registry. The current emergency angioplasty program at Greenwich Hospital meets all of these recommendations and the proposed elective angioplasty program will as well.

The change in the 2011 ACCF/AHA/SCAI guidelines for elective angioplasty without onsite cardiac surgery from a Class III to a Class IIb is significant. Dr. Gray states this change is only "incremental", but my opinion is to move from a Class III which indicates harm to a Class IIb which states such a program might be considered as long as there is appropriate program development and rigorous criteria for proper patient selection is beyond "incremental". OHCA has recognized this significant change and incorporated in their Cardiac Services section of the new State Health Plan (draft form) the following statement:

> "...an important change occurred in 2011, when the ACCF-AHA-SCAI PCI guidelines were modified to a class IIb (Level of evidence B) recommendation".

- Dr. Gray discusses the results of the CPORT-E study recently published in the New England Journal of Medicine and suggests that our CON application included the position that elective angioplasty without onsite cardiac surgery is preferred over sites with onsite surgery. Our application never included any such suggestion. But the CPORT-E study, along with others noted in Dr. Cabin's prefiled testimony, and the shift from a Class III to a Class IIb assignment by the ACCF/AHA/SCAI Angioplasty Guidelines all support the reasonableness of offering elective angioplasty without onsite cardiac surgery as long as number of criteria are met which we have already addressed in our CON application. Dr. Gray's skepticism and criticism of angioplasty without onsite cardiac surgery is puzzling given his institution's (NYP) support of White Plains Hospital's program as well as support of a similar program by another NYP affiliate, Holy Name Hospital in Teaneck, New Jersey.

- Dr. Gray also highlights the statement in the 2011 ACCF/AHA/SCAI Guidelines which discusses competition with another angioplasty program in the same geographic area, particularly an established program with surgical back-up and that such competition MAY not be in the best interests of the community. The data we included in our prefiled testimony clearly shows that Greenwich and Stamford Hospitals are overwhelmingly serving residents of different communities. I would go so far as to say that we do not compete in the area of cardiology, despite our close geography. Our medical staff in

cardiovascular services does not overlap to any measurable degree and referral patterns to the interventional cardiologists are different. We have offered emergency angioplasty for approximately 8 years and despite the entrance of Stamford Hospital's program, we have maintained our emergency and elective transfer volume because patients want their care from Greenwich Hospital and the YNHHVC. In this case, a program at Greenwich Hospital IS in the best interest of the community because the Greenwich Hospital community has demonstrated that is where they want their care.

- Dr. Gray states that if the program at Greenwich Hospital is approved there is a risk that Stamford and Greenwich Hospital's angioplasty programs may perform less than 200 PCIs per year. For the reasons I have outlined above, we do not believe our program will impact Stamford's program due to the lack of patient and physician crossover. It is worthy to note that since the opening of White Plains Hospital's program, Stamford Hospital has not seen any decline in their angioplasty volume. According to Stamford Hospital's Petition, Stamford Hospital "...is on track to perform 277 PCIs in FY 2012" which represents a 25% increase from its 2011 volume as noted on Dr. Kiely's testimony page 32 (PCR data). Clearly, the presence of the White Plains Hospital program, which is located only 15 miles from Stamford Hospital and performed as many as 290 PCIs last year, has not had any impact on Stamford Hospital's angioplasty volumes.

- I must comment on Dr. Gray's suggestion that approval of the proposed program at Greenwich Hospital would in some way encourage physicians to feel "...pressure to refer patients for procedures to keep institutional volumes up. Occurrences like these will only drive up healthcare costs for payers and patients." Dr. Gray is suggesting that physicians may send a patient for an unnecessary procedure just to increase institutional volumes. This may be the practice at New York Presbyterian, but I can assure you that this is NOT the practice of YNHHVC physicians nor would it ever be condoned or permitted.

- Finally, I would like to put on the record that the State of New York regulations cited in Dr. Gray's testimony have no relevance in this CON application. Those regulations apply only to New York hospitals. Although they are irrelevant to this proceeding, it is interesting to note in New York State, hospitals seeking to perform angioplasty without onsite cardiac surgery must perform BOTH primary and elective (refer to Attachment V of Marna Borgstrom's rebuttal testimony). I suspect New York State incorporated this requirement because they recognize the benefits to patients by ensuring access to both types of angioplasty and the positive impact on institutional volumes.

The foregoing is my sworn testimony.

Medical Director, Greenwich Hospital Primary Angioplasty Program

Nelson Ambulance Pride in Service | Access Ambulance Service | Connecticut Handivan, Inc.

208 Quinnipiac Ave North Haven, CT 06473

July12,2012

To whom it may concern,

Nelson /Access Ambulance and Connecticut Handivan has the privilege of serving Greenwich hospital for patient transportation at ALS and BLS level care as well as wheelchair transportation.

We also staff a critical care Ambulance at Greenwich hospital to facilitate transport for any Advanced Life Support patients. The Paramedic units are equipped with ventilators and Greenwich hospital compatible IV pumps.

It will be our commitment to have an ALS ambulance on scene for pick up within the twenty (20) minute time frame of the call for all Catheterization Lab patient needed transfers to other hospitals.

We appreciate the opportunity to service Greenwich Hospital for all patient transportation, we look forward to servicing the patient's needs as a new innovative procedural department opens.

PROCEDURAL MOTIONS

STATE OF CONNECTICUT
DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS DIVISION

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S OBJECTION TO THE STAMFORD HOSPITAL'S PETITION FOR INTERVENOR STATUS & MOTION TO STRIKE TESTIMONY

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby object to the Petition for Intervenor Status With Full Procedural Rights filed by The Stamford Hospital ("TSH"), on July 12, 2012 ("Petition"). Specifically, Applicants object to TSH's request that it be allowed to submit "rebuttal testimony" in connection with the public hearing scheduled for July 17, 2012. "Rebuttal testimony" is a privilege that OHCA typically reserves for applicants, who are customarily given the last word on the record in their own applications. In addition, Applicants move to strike all references in the testimony and exhibits to the elective angioplasty CON application filed by Lawrence & Memorial Hospital ("L&M Application"). The L&M Application has not yet been deemed complete by OHCA and, as such, it is not considered an official CON request. Moreover, because OHCA evaluates and

decides each CON application on its own merits, the arguments advanced by L&M in an unrelated CON request are irrelevant to this proceeding.

TSH Is Not Entitled To Submit Rebuttal Testimony

In its Petition, TSH "seeks permission to offer rebuttal testimony" and claims that it will demonstrate the deficiencies in Applicants' proposal through "evidence ... presented in rebuttal." Petition, pp. 8 & 9. As TSH and its counsel are aware, intervenors in a contested case are not usually given the right to submit written rebuttal evidence prior to the public hearing. As an intervenor (should OHCA grant TSH this status), TSH was required to pre-file any and all testimony that it intends to present at the hearing by June 12, 2012 at noon. TSH has had access to a copy of Applicants' initial CON submission since it was filed on February 14, 2012, and has had ample time to consider and prepare its opposition. Applicants, on the other hand, will have had access to TSH's 388-page opposition document for a mere 5 days before the hearing and did not have benefit of reviewing this document prior to submitting their own testimony (which was also due at noon on June 12th). It is for this reason that Applicants are allowed an opportunity to submit a written rebuttal. Also, it is Applicants' burden of proving their case in chief for this CON request, and it is fair that they be given the last word in written submissions.

Moreover, if OHCA grants TSH full procedural rights, TSH will have an opportunity to rebut any information contained in Applicants' pre-hearing submissions through cross-examination of Applicants' witnesses. In addition, as TSH and its counsel surely know, "rebuttal" points are often raised without objection during oral hearing presentations and in response to questions posed by OHCA and the parties. For these reasons, Applicants request that TSH be denied the right to submit

or introduce, at or before the hearing, any additional written testimony or evidence beyond what was included in their June 12th filing.

All References to the L&M Elective Angioplasty CON Application Should be Stricken from the Record

TSH has included in its Petition, as well as in the testimonies of Drs. Sharon Kiely and William Gray, numerous references to the CON application submitted by L&M to establish an elective angioplasty program in New London. Reference is made in the text of the Petition at pages 6-7. Dr. Kiely mentions the L&M project in her testimony (pp. 10-11, 12) and, incredibly, attaches the 56-page CON application in that matter as an exhibit (pp. 53-109). Dr. Gray also mentions the L&M proposal in his testimony at pages 7 and 10 (page 10 makes reference to the CON application for elective angioplasty being filed by The Hospital of Central Connecticut as well).

As a threshold matter, OHCA should not consider the L&M Application because it has not yet been deemed complete. OHCA is still in the process of its completeness review and until L&M responds to any questions from the agency, the CON application remains incomplete and does not constitute an official CON request.

TSH's argument for including the L&M Application is simple – that L&M presents a better case for the addition of elective angioplasty without onsite surgery than Greenwich. However, none of what TSH proposes to say about the L&M Application is relevant to the matter before OHCA. Other than the relationships that both programs have with the Yale New Haven Heart and Vascular Center ("YNHHVC"), the proposals are entirely different. As TSH aptly points out, the programs operate at opposite ends of the state serving distinct patient populations. Allowing this type of

testimony into the record opens the door for future applicants to claim relevance of similar proposals at hospitals and facilities that are nowhere near their own.

OHCA has been clear in its policy that each CON request is evaluated on its own merits and that applications do not lend themselves to general applicability. The fact that TSH has included the L&M Application in its opposition submission is inappropriate. It is a not-so-veiled attempt by TSH to convince OHCA that it should approve only one YNHHVC satellite elective angioplasty program without onsite surgery – the one that is 90 miles away from Stamford. TSH has an obvious self-interest in defeating Applicants' proposal, which is clearly needed and which will undoubtedly improve the quality and accessibility of angioplasty services for area residents. TSH should not be allowed to distract from the real issues before this agency by testifying and cross-examining Applicants' witnesses on a CON that has no relevance to the pending application. For these reasons, Applicants request that all references to the L&M Application be stricken from the record.

WHEREFORE, for the foregoing reasons Applicants request that their Objection to TSH's Petition for Intervenor Status be sustained and their Motion to Strike be granted.

Respectfully Submitted,

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S OBJECTION TO THE ADMINISTRATIVE NOTICE OF DOCKET NO. 08-31210-CON

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby object to OHCA's decision (see Exhibit A attached) to take administrative notice of the entire record of Applicants' previous CON request for permission to establish an elective angioplasty program in Greenwich (Docket No. 08-31210-CON) (the "2008 Docket"). Applicants object to the inclusions of the 2008 Docket in the record of this matter on the grounds that (i) it is the written policy of OHCA to evaluate every CON proposal on a case-by-case basis and decide each application on its own merits; and (ii) the current application is fundamentally different than the 2008 Docket and the inclusion of outdated and irrelevant information from that docket will only serve to confuse the issues before OHCA in this proceeding.

While OHCA has the authority to take administrative notice of judicially cognizable facts, including prior orders and decisions, it has long been the policy of the agency not to take notice of prior dockets in their entirety for purposes of a hearing on a CON request. Participants in a hearing will often ask the agency to take notice of prior dockets involving their opponents so that they can cross-examine for inconsistencies. Applicants sometimes also ask OHCA to take

administrative notice of the dockets of similar proposals for purposes of comparison. OHCA's response has typically been to deny the requests for administrative notice on the grounds that each CON is unique (while giving latitude to cross-examine witnesses on select parts of relevant dockets that are included in pre-hearing submissions) – meaning prior dockets, whether they involve the same parties or the same or similar services, are irrelevant to the analysis of a CON proposal. The preamble to virtually every CON decision since 2005 includes a caveat stating that CONs do not lend themselves to general applicability and that every case is reviewed and judged on its merits.

Applicants are concerned that by taking administrative notice of the 2008 Docket, and by possibly allowing The Stamford Hospital to cross-examine Applicants' witnesses on prior submissions, the issues before OHCA will become confused and the current application will not be decided on its own merits. Much of the information contained within the 2008 Docket has changed and is no longer relevant to Applicants' elective angioplasty proposal. This includes, but is not limited to, changes in the structure of the proposed affiliation arrangement; changes to the ACCF/AHA/SCAI Guidelines recommendations for elective angioplasty without onsite surgical backup; revised need methodology; and changes in the treatment of border hospitals by OHCA for state health planning purposes. In addition, the CON laws themselves have changed since the 2008 Docket was decided and the statutory decision criteria that governed that application are not applicable to this CON request.

For these reasons, Applicants respectfully request that OHCA reconsider its decision to take administrative notice of the 2008 Docket. In the alternative, if the 2008 Docket remains a part of the record in this matter, Applicants request that any cross-examination be limited to information relevant to the 2012 elective angioplasty proposal. Applicants further request that

any information from that docket be given appropriately limited weight and consideration. This will afford Applicants' the fairest possible resolution of the current CON request.

WHEREFORE, Applicants respectfully request that their Objection to the Administrative Notice of Docket No. 08-31210-CON be granted.

Respectfully Submitted,

Ms. Jean Ahn
System Director
Yale-New Haven Hospital
Planning & Business Development Office
20 York Street (Howe 3)
New Haven, CT 06504

RE: Certificate of Need Application; Docket Number: 12-31748-CON
Yale-New Haven Hospital and Greenwich Hospital
Proposal to Establish and Operate an Elective Angioplasty
Program without Onsite Surgical Backup at Greenwich Hospital

Dear Ms. Ahn:

On February 14, 2012, the Office of Health Care Access ("OHCA") received your initial Certificate of Need ("CON") application filing on behalf of Yale-New Haven Hospital ("YNHH") and Greenwich Hospital ("Hospital") (collectively the "Applicants") for the establishment and operation of an elective angioplasty program without onsite surgical backup at the Hospital.

Note: Please be advised, administrative notice is being taken of the entire record of the prior CON application in this matter, as identified under Docket Number: 08-31210-CON. A copy of the Final Table of the Record from the aforementioned record has been attached as Exhibit I, identifying all the individual exhibits included in the record.

OHCA has reviewed the CON application and requests the following additional information pursuant to General Statutes §19a-639a(c):

Clear Public Need - pages 15 through 29

1. With respect to the state map presented on page 18 of the CON application, please provide a map legend and notes of a legible size as the application's presentation is difficult to discern.

2. With respect to the table entitled "Number of Patients Discharged Directly from GH to Another Institution for Elective Angioplasty" on page 19 of the CON application, please address the following:

    a. Identify the distance in miles and travel time between Greenwich Hospital and each of the other six hospitals to which Greenwich Hospital transfered patients requiring elective angioplasty over the last four and a quarter fiscal year period.

    b. Describe the existing physician referral patterns that have resulted in 232 patients needing elective angioplasty, not being able to access this service and being transferred to other Connecticut hospitals; 235 to Yale-New Haven Hospital and 2 to Stamford Hospital over four and a quarter fiscal year period.

3. The Applicants point out that: "... transferring patients to another facility creates an unnecessary stressful and uncomfortable situation for patients and family." Further "transferring to another facility is an increased stress for the patients and their families with regard to transportation. For some, in Greenwich Hospital's greater service area, transportation outside the service area is problematic." This being the case, why is Yale-New Haven Hospital the institution of choice when transferring a patient requiring elective angioplasty, as Stamford Hospital presents a much closer Connecticut alternative hospital site?

4. With respect to the table entitled Population Projections- Greenwich Hospital Service Area on page 27 of the CON application, please provide two tables in the same format, the first depicting the population projections for the state of Connecticut and the second depicting the population projections for the state of New York.

5. Please address the following questions regarding existing providers of elective angioplasty closest to the Hospital and its service area:

    a. Please identify all providers that currently offer Elective Angioplasty.
    b. Identify the existing providers that currently offer elective angioplasty with on-site surgical backup.
    c. What impact will this proposal have on these exiting providers financially and on their elective PCI utilization?

6. Provide a copy of the Hospital's protocols related to the proposed elective angioplasty without cardiac surgery backup. Additionally, explain any protocols that will be specific to this program.

2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention-pages 140-230

7. In regard to the Attachment VI: 2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention, please address the following questions:

a. How does the Hospital meet each of the criteria listed in Class IIa, IIb, III and tables 5 & 6?

b. How does the Hospital plan to meet the guidelines regarding the rapid transport to a cardiac surgery operating room in a nearby hospital and without hemodynamic support to transfer?

c. How do ACCF/AHA/SCAI guidelines define "nearby" hospital/operating room?

d. How does the Hospital's transport agreement with YNHH (where majority of the patients have been transferred in the past) relate to or meet the guidelines?

e. The Hospital's median time to immediate PCI for STEMI patients is 67.0 minutes. As reported in the ACC-NCDR report (Attachment XI of the CON application) all hospitals in the 90th percentile have a median time to immediate PCI for STEMI patients of 50.4 minutes. How does Hospital's median time relate to the ACCF/AHA/SCAI guidelines published in November 2011?

8. The Applicants state on page 15, that the Hospital "must address the cost-effectiveness of angioplasty services." Please address how this goal of the Applicants is consistent with the statement in Class III, which states that desires for personal or institutional financial gain…are not appropriate consideration(s) for initiation of a PCI program without on-site cardiac surgery.

9. The guidelines state that "[c]ompetition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community." Please address your proposal in relation to this statement while taking into consideration the existing providers of elective angioplasty in the Hospital's service area (and geographic) (in CT and NY).

10. Considering that the Hospital does not have access to a helicopter, explain how it expects to meet the protocols related to emergency transportation to a cardiac facility with a cardiac surgery program. In particular, discuss the Hospital's transfer agreement with its affiliate YNNH in this matter.

In responding to the questions contained in this letter, please repeat each question before providing your response. **Paginate and date** your response (i.e., each page in its entirety). Information filed after the initial CON application submission (i.e. completeness response letter, prefile testimony, late file submissions and the like) must be numbered sequentially from the Applicant's document preceding it. Please reference "Docket Number: 12-31748-CON." Submit one (1) original and five (5) hard copies of your response. In addition, please submit a scanned copy of your response including all attachments on CD in an Adobe format (.pdf) and in an MS Word format.

If you have any questions concerning this letter, please feel free to contact me or Steven W. Lazarus at (860) 418-7001.

Sincerely,

Jack A. Huber

PLACE: **410 Capitol Avenue, Third Floor Hearing Room Hartford, Connecticut**

EXHIBIT	DESCRIPTION
A	Letter from Greenwich Hospital and Yale-New Haven Hospital ("Applicants") dated July 25, 2008, enclosing Letter of Intent forms to establish and operate an elective angioplasty program at Greenwich Hospital, received by the Office of Health Care Access ("OHCA") on July 25, 2008.
B	OHCA's request for legal notification in the *Greenwich Times* and the *New Haven Register* and notification to Applicants of receipt of the Letter of Intent in the matter of the CON application under Docket Number 08 - 31210, dated July 30, 2008.
C	OHCA's letter to the Applicants dated S4eptember 12, 2008, enclosing the Certificate of Need ("CON") application forms under Docket Number 08-31210.
D	Various emails between the Applicants and OHCA beginning September 12, 2008 through November 5, 2008 in the matter of the CON application under Docket Number 08-31210.
E	Email between the Applicants and OHCA dated November 6, 2008 in the matter of the CON application under Docket Number 08-31210.
F	Letter from the Applicants dated November 21, 2008, enclosing the CON application under Docket Number 08-31210, received by OHCA on November 21, 2008.
G	OHCA's letter to the Applicants dated December 8, 2008, requesting additional information and/or clarification in the matter of the CON application under Docket Number 08-31210.

H	Applicants' responses to OHCA's letter of December 8, 2008 dated January 23, 2009, in the matter of the CON application under Docket Number 08-31210, received by OHCA on January 23, 2009.
I	OHCA's request for legal notification in the *Greenwich Times* and the *New Haven Register* and OHCA's Notice to the Applicants of the public hearing scheduled for February 24, 2009, in the matter of the CON application under Docket Number 08-31210, dated February 6, 2009.
J	OHCA's letter to the Applicants dated February 11, 2009, requesting prefile testimony and interrogatories in the matter of the CON application under Docket Number 08-31210.
K	OHCA's email to the Applicants dated February 18, 2009 confirming the hearing scheduled for February 24, 2009 in the matter of the CON application under DN 08-31210.
L	Letter from the Applicants enclosing Prefile Testimony and responses to interrogatories dated February 19, 2009 in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 19, 2009.
M	Petition of The Stamford Hospital dated February 19, 2009, requesting party status or intervenor status with full procedural rights as well as prefile testimonies and a notice of appearance of Jeffers and Ireland in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 19, 2009.
N	Email from The Stamford Hospital to OHCA dated February 20, 2009 attaching their request for status, prefile testimony and exhibits in the matter of the CON application under Docket Number: 08-31210, received by OHCA on February 20, 2009.
O	Email from OHCA to the Applicants dated February 20, 2009 forwarding the email OHCA received from The Stamford Hospital in the matter of the CON application under Docket Number 08-31210.
P	Facsimile letter from Wiggin and Dana LLP to OHCA dated February 20, 2009 noticing their appearance on behalf of the Applicants in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 20, 2009.
Q	Facsimile letter from the Applicants to OHCA dated February 23, 2009 requesting a continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210, receive by OHCA on February 23, 2009.
R	Facsimile letter from Jeffers & Ireland to OHCA dated February 22, 2009 opposing the request by the Applicants to continue or reschedule the hearing in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.

S	Facsimile letter from the Applicants to OHCA dated February 23, 2009 objecting to the request by The Stamford Hospital for party status in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
T	Facsimile letter from the Applicants to OHCA dated February 23, 2009 responding to The Stamford Hospital's objection to the Applicants request for continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
U	Letter from OHCA to the Applicants dated February 23, 2009 denying their request for continuance or rescheduling of the hearing in the matter of the CON application under Docket Number 08-31210.
V	Email from Jeffers & Ireland to OHCA dated February 23, 2009 responding to Applicants letter for request of continuance in the matter of the CON application under Docket Number 08-31210, received by OHCA on February 23, 2009.
W	OHCA's Ruling on the Petition of The Stamford Hospital to be granted intervenor status in the matter of the CON application under Docket Number 08-31210, dated February 23, 2009.

Where Applicable faxes will be used as originals.

Administrative Notice is taken of the following items:

1. Greenwich Hospital, Docket Number 07-027AR, FY 2007 Annual Reporting.
2. Yale-New Haven Hospital Docket Number 07-016AR, FY 2007 Annual Reporting
3. OHCA's Administrative Folder containing Agenda, Table of the Record etc. in the matter of the CON application under Docket Number:08-31210

Late Files requested by OHCA at the Hearing on February 24, 2009:

1. Information regarding New York's elective angioplasty.

Late File from the Applicant dated March 9, 2009, received by OHCA on March 10, 2009 in the matter of the CON application under Docket Number: 08-31210.

E-mail from OHCA to the Intervenor dated March 13, 2009 confirming due date Of March 17, 2009 for responses to the Applicants late file.

Intervenors responses dated March16, 2009 received by OHCA on March 17, 2009 in the matter of the CON application under Docket Number: 08-31210.

Email from the Applicant to OHCA confirming their response date to the Intervenors response of March 20, 2009 in the matter of the CON application under Docket Number: 08-31210.

Applicants response to the intervenors responses dated March 20, 2009 in the matter of the CON application under Docket Number 08-31210, received by OHCA on March 20, 2009 (email, faxed and hardcopy received on the same day).

Letter from the Intervenor dated March 23, 2009 responding to Applicants letter dated march 20, 2009 in the matter of the CON application under Docket Number: 08-31210, received by OHCA (fax on March 23, 2009 and hardcopy on March 24, 2009)

Letter from White Plains Hospital dated March 16, 2009 in the matter of the CON application under Docket Number: 08-31210, received by OHCA on March 23, 2009

OHCA's letter dated March 26, 2009 to all parties closing the public hearing in the matter of the CON application under Docket Number: 08-31210.

DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS DIVISION

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	JULY 16, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S MOTION TO DISQUALIFY COUNSEL FOR THE STAMFORD HOSPITAL

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, hereby move to disqualify Stephen M. Cowherd and the law firm of Jeffers Cowherd (collectively "Cowherd") from representing The Stamford Hospital ("TSH") at the public hearing on this matter scheduled for July 17, 2012[1], should the Department of Public Health Office of Health Care Access Division ("OHCA") grant TSH status in this proceeding.[2] This Motion to Disqualify is based upon the potential ethical conflict of interest that arises from Cowherd having served as a paid consultant for OHCA in connection with YNHH's CON application for the acquisition of the Hospital of St. Raphael (Docket No. 12-31747-CON) (the "YNHH/HSR Proceeding").

[1] Applicants understand that if OHCA grants this Motion to Disqualify Cowherd, a continuance of the hearing may be required so that TSH can secure alternate counsel.

[2] TSH filed a Petition For Intervenor Status With Full Procedural Rights and prefiled the testimony of several witnesses on July 12, 2012.

Factual Background

This docket concerns a request by Applicants for permission to add elective angioplasty to the suite of cardiac services available at Greenwich Hospital ("Greenwich Elective Angioplasty Program"). Greenwich and YNHH are both members of the Yale New Haven Health System ("YNHHS") and Greenwich serves as a satellite of the Yale New Haven Heart and Vascular Center ("YNHHVC"). Notice of this CON was published in the Greenwich Time on December 1, 2 and 3, 2011, and the CON Application was filed with OHCA on February 14, 2012.

On February 9, 2012, Applicant YNHH and the Hospital of St. Raphael ("HSR") filed their CON Application for the change of ownership of HSR. Soon thereafter, OHCA retained Cowherd to serve as a paid consultant with respect to the YNHH/HSR CON. According to the Jeffers Cowherd website, Attorney Cowherd's practice focuses on healthcare and administrative law, including but not limited to, work before OHCA in connection with CON matters. He represents a variety of providers, including acute care hospitals. Notably, Cowherd has represented TSH for many years. He represented TSH in 2009, when the hospital opposed Applicants' last request for permission to establish an elective angioplasty program at Greenwich (Docket No. 08-31210-CON). This representation occurred prior to Cowherd's retention by OHCA as a consultant in connection with the YNHH/HSR Proceeding.

Cowherd was one of several attorneys that OHCA considered for the YNHH/HSR engagement and he was hired over the objection of YNHH. YNHH objected to Cowherd's involvement based on the fact that he represents TSH, which competes with and has been aggressive in opposing projects proposed by Greenwich and YNHH. At the time Cowherd agreed to consult with OHCA on the YNHH/HSR Proceeding, he was aware of the Greenwich

Elective Angioplasty Program filing (which had been noticed in December of 2011) and he knew or should have known, based on past experience, that his client TSH would oppose the CON request.

Cowherd's involvement in the YNHH/HSR Proceeding afforded him unique and unprecedented access to OHCA staff in connection with their evaluation of a CON and formulation of an Agreed Settlement. He reviewed documents and provided advice to staff, the specifics of which cannot be known by Applicants given that they were not involved in the discussions. Moreover, Cowherd was privy to confidential information, not otherwise available to the public, in the discharge of his duties as advisor to OHCA. It is our understanding that Cowherd reviewed "draft" documents from the agency, which are not discoverable under the Connecticut Freedom of Information Act ("CT FOIA"), and had conversations with senior OHCA staff regarding the substance of the agency's completeness review. Cowherd also reviewed information regarding OHCA's statewide facilities planning process, which has yet to be finalized and which presumably had some relevance to OHCA's review of the YNHH/HSR CON.

Argument

Cowherd should be disqualified as counsel in this matter based on the prohibitions set forth in Rule 1.11(c) of the Connecticut Rules of Professional Conduct (see Exhibit A attached). Rule 1.11(c) provides, in pertinent part, as follows:

> [A] lawyer having information that the lawyer knows is confidential government information about a person acquired when the lawyer was a public officer or employee, may not represent a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person. As used in this Rule, "confidential government information" means information that has been obtained under governmental authority and which ... the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public.

According to its commentary, Rule 1.11 is intended to prevent attorneys who have worked with the government from obtaining an unfair advantage over their clients' adversaries as a result of information learned during the attorneys' service.

Here, Cowherd's relationship with OHCA in connection with the YNHH/HSR CON, while characterized as that of consultant, was akin to that of a staff attorney employed by the agency. In fact, Applicants' understanding is that he was hired because the agency was short-staffed, due in part to the recent departure of its in-house counsel. To the best of Applicants' knowledge, Cowherd was asked to review the CON submissions, assist in formulating completeness questions and advise OHCA regarding the application's conformance with the agency's statutes and statewide facilities planning objectives, much like the former OHCA staff attorney would have done. Cowherd's position with OHCA, however titled, gives his client an unfair advantage over Applicants in this matter.

In addition, it is clear that Cowherd was privy to "confidential government information" during his service, which OHCA has the right to withhold from the public. As previously noted, confidential government information is information that has been obtained under governmental authority and which the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public (see Rule 1.11). Cowherd had access to, and reviewed and provided comment on, initial drafts of the completeness questions issued to YNHH and HSR, which in final form had a far more "legal" tone than questions typically issued by OHCA staff (see Exhibit B attached). It is unclear whether Cowherd had access to initial drafts of the Agreed Settlement as well. These preliminary agency documents are not available to the public, including YNHH and HSR, but rather are protected from disclosure by the CT FOIA exemption found in Section 1-210(b)(1) of

the Connecticut General Statutes. Section 1-210(b)(1) provides that an agency need not disclose to the public any "[p]reliminary drafts or notes provided the public agency has determined that the public interest in withholding such documents clearly outweighs the public interest in disclosure." It has been the policy of OHCA not to disclose to the public drafts of documents, including completeness letters and decisions, which ultimately make their way into the administrative record in final form.

Moreover, Cowherd may have had access to certain documents associated with the YNHH/HSR Proceeding that were not made available to the public by agreement between the agency and the parties. These documents included several independent consulting reports obtained by the hospitals and an un-redacted version of the Asset Purchase Agreement for the transaction. OHCA staff may also have shared with Cowherd their thought processes regarding CON decision-making in general, resolution of the YNHH/HSR application specifically, and YNHHS system and service-line development. None of this information is available to the general public or to applicants and counsel who practice before the agency. This information may also be considered "confidential government information" under Rule 1.11.

Now, less than three weeks after the YNHH/HSR transaction was approved by OHCA via Agreed Settlement, Cowherd seeks to represent TSH, a competitor of Greenwich and YNHH, in opposing their CON request for an elective angioplasty satellite. However, Rule 1.11 expressly prohibits a lawyer in Cowherd's position from "represent[ing] a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person." Here, the "private client" is TSH and "that person" is YNHH, an Applicant in this matter along with its sister hospital Greenwich. The "information" at issue could include specific facts regarding YNHH and YNHHS services (including cardiac

services), as well as general OHCA priorities for system development and CONs, any of which could conceivably be used to oppose the current application. Cowherd has filed a lengthy and detailed opposition to the Greenwich Elective Angioplasty Program on behalf of TSH. Applicants have no assurance that Cowherd has not used and will not use, either intentionally or unintentionally, confidential information that he obtained by virtue of his consulting arrangement with OHCA to the material disadvantage of YNHH and Greenwich in this proceeding. As previously noted, Rule 1.11 seeks to avoid just this type of "unfair advantage" resulting from the use of inside information obtained during an attorney's government service.

Furthermore, Canon 9 of the ABA Model Code of Professional Responsibility states that an attorney shall strive to avoid "not only professional impropriety but also the appearance of impropriety" (see Exhibit C attached). The fact that Cowherd agreed to serve as a consultant to OHCA in the YNHH/HSR Proceeding, knowing full well that his client, TSH, would soon be opposing a YNHH CON request for an elective angioplasty satellite in Greenwich, gives at the very least the appearance of impropriety. Applicants and the public are left wondering whether and to what extent Cowherd has gained inside knowledge about OHCA and YNHHS that he will use for the benefit of TSH and to the material disadvantage of Applicants.

Conclusion

The Hearing Officer has the authority to make such orders as will aid in the just resolution of a contested case. Reg., Conn State Agencies, Section 19a-9-29(g). Cowherd cannot separate the information he learned serving as a consultant to OHCA in a YNHH matter from his representation of TSH in opposition to this Greenwich/YNHH CON request.

Accordingly, the interests of justice require that Stephen M. Cowherd and the law firm of Jeffers Cowherd be disqualified from representing TSH in this proceeding.[3]

WHEREFORE, Applicants respectfully request that their Motion to Disqualify Stephen M. Cowherd and the law firm of Jeffers Cowherd be granted.

Respectfully Submitted,

GREENWICH HOSPITAL
YALE-NEW HAVEN HOSPITAL

EXHIBIT A

Principles of Imputed Disqualification. The rule of imputed disqualification stated in subsection (a) gives effect to the principle of loyalty to the client as it applies to lawyers who practice in a law firm. Such situations can be considered from the premise that a firm of lawyers is essentially one lawyer for purposes of the rules governing loyalty to the client, or from the premise that each lawyer is vicariously bound by the obligation of loyalty owed by each lawyer with whom the lawyer is associated. Subsection (a) operates only among the lawyers currently associated in a firm. When a lawyer moves from one firm to another, the situation is governed by Rules 1.9 (b) and 1.10 (b).

The Rule in subsection (a) does not prohibit representation where neither questions of client loyalty nor protection of confidential information are presented. Where one lawyer in a firm could not effectively represent a given client because of strong political beliefs, for example, but that lawyer will do no work on the case and the personal beliefs of the lawyer will not materially limit the representation by others in the firm, the firm should not be disqualified. On the other hand, if an opposing party in a case were owned by a lawyer in the law firm, and others in the firm would be materially limited in pursuing the matter because of loyalty to that lawyer, the personal disqualification of the lawyer would be imputed to all others in the firm.

The Rule in subsection (a) also does not prohibit representation by others in the law firm where the person prohibited from involvement in a matter is a nonlawyer, such as a paralegal or legal secretary. Nor does subsection (a) prohibit representation if the lawyer is prohibited from acting because of events before the person became a lawyer, for example, work that the person did while a law student. Such persons, however, must be screened from any personal participation in the matter to avoid communication to others in the firm of confidential information that both the nonlawyers and the firm have a legal duty to protect. See Rules 1.0 (k) and 5.3.

Rule 1.10 (b) operates to permit a law firm, under certain circumstances, to represent a person with interests directly adverse to those of a client represented by a lawyer who formerly was associated with the firm. The Rule applies regardless of when the formerly associated lawyer represented the client. However, the law firm may not represent a person with interests adverse to those of a present client of the firm, which would violate Rule 1.7. Moreover, the firm may not represent the person where the matter is the same or substantially related to that in which the formerly associated lawyer represented the client and any other lawyer currently in the firm has material information protected by Rules 1.6 and 1.9 (c).

Rule 1.10 (c) removes imputation with the informed consent of the affected client or former client under the conditions stated in Rule 1.7. The conditions stated in Rule 1.7 require the lawyer to determine that the representation is not prohibited by Rule 1.7 (b) and that each affected client or former client has given informed consent to the representation, confirmed in writing. In some cases, the risk may be so severe that the conflict may not be cured by client consent. For a discussion of the effectiveness of client waivers of conflicts that might arise in the future, see Rule 1.7 and its Commentary. For a definition of informed consent, see Rule 1.0 (f).

Where a lawyer has joined a private firm after having represented the government, imputation is governed by Rule 1.11 (b) and (c), not this Rule. Under Rule 1.11 (d), where a lawyer represents the government after having served clients in private practice, nongovernmental employment or in another government agency, former-client conflicts are not imputed to government lawyers associated with the individually disqualified lawyer.

Where a lawyer is prohibited from engaging in certain transactions under Rule 1.8, subsection (k) of that Rule, and not this Rule, determines whether that prohibition also applies to other lawyers associated in a firm with the personally prohibited lawyer.

Rule 1.11. Special Conflicts of Interest for Former and Current Government Officers and Employees

(Amended June 26, 2006, to take effect Jan. 1, 2007.)

(a) Except as law may otherwise expressly permit, a lawyer who has formerly served as a public officer or employee of the government:

(1) is subject to Rule 1.9 (c); and

(2) shall not otherwise represent a client in connection with a matter in which the lawyer participated personally and substantially as a public officer or employee, unless the appropriate government agency gives its informed consent, confirmed in writing, to the representation.

(b) When a lawyer is disqualified from representation under subsection (a), no lawyer in a firm with which that lawyer is associated may knowingly undertake or continue representation in such a matter unless:

(1) The disqualified lawyer is timely screened from any participation in the matter and is apportioned no part of the fee therefrom; and

(2) Written notice is promptly given to the appropriate government agency to enable it to ascertain compliance with the provisions of this Rule.

(c) Except as law may otherwise expressly permit, a lawyer having information that the lawyer knows is confidential government information about a person acquired when the lawyer was a public officer or employee, may not represent a private client whose interests are adverse to that person in a matter in which the information could be used to the material disadvantage of that person. As used in this Rule, the term "confidential government information" means information that has been obtained under governmental authority and which, at the time this Rule is applied, the government is prohibited by law from disclosing to the public or has a legal privilege not to disclose and which is not otherwise available to the public. A firm with which that lawyer is associated may undertake or continue representation in the matter only if the disqualified lawyer is timely screened from any participation in the matter and is apportioned no part of the fee therefrom.

(d) Except as law may otherwise expressly permit, a lawyer currently serving as a public officer or employee:

(1) Is subject to Rules 1.7 and 1.9; and

(2) Shall not:

(i) Participate in a matter in which the lawyer participated personally and substantially while in

© Copyrighted by the Secretary of the State of the State of Connecticut

private practice or nongovernmental employment, unless the appropriate government agency gives its informed consent, confirmed in writing; or

(ii) Negotiate for private employment with any person who is involved as a party or as lawyer for a party in a matter in which the lawyer is participating personally and substantially; except that a lawyer serving as a law clerk to a judge, other adjudicative officer or arbitrator may negotiate for private employment as permitted by Rule 1.12 (b) and subject to the conditions stated in Rule 1.12 (b).

(e) As used in this Rule, the term "matter" includes:

(1) Any judicial or other proceeding, application, request for a ruling or other determination, contract, claim, controversy, investigation, charge, accusation, arrest or other particular matter involving a specific party or parties, and

(2) Any other matter covered by the conflict of interest rules of the appropriate government agency.

(P.B. 1978-1997, Rule 1.11.) (Amended June 26, 2006, to take effect Jan. 1, 2007.)

COMMENTARY: A lawyer who has served or is currently serving as a public officer or employee is personally subject to the Rules of Professional Conduct, including the prohibition against concurrent conflicts of interest stated in Rule 1.7. In addition, such a lawyer may be subject to statutes and government regulations regarding conflict of interest. Such statutes and regulations may circumscribe the extent to which the government agency may give consent under this Rule. See Rule 1.0 (f) for the definition of informed consent.

Subsections (a) (1), (a) (2) and (d) (1) restate the obligations of an individual lawyer who has served or is currently serving as an officer or employee of the government toward a former government or private client. Rule 1.10 is not applicable to the conflicts of interest addressed by this Rule. Rather, subsection (b) sets forth a special imputation rule for former government lawyers that provides for screening and notice. Because of the special problems raised by imputation within a government agency, subsection (d) does not impute the conflicts of a lawyer currently serving as an officer or employee of the government to other associated government officers or employees, although ordinarily it will be prudent to screen such lawyers.

Subsections (a) (2) and (d) (2) apply regardless of whether a lawyer is adverse to a former client and are thus designed not only to protect the former client, but also to prevent a lawyer from exploiting public office for the advantage of another client. For example, a lawyer who has pursued a claim on behalf of the government may not pursue the same claim on behalf of a later private client after the lawyer has left government service, except when authorized to do so by the government agency under subsection (a). Similarly, a lawyer who has pursued a claim on behalf of a private client may not pursue the claim on behalf of the government, except when authorized to do so by subsection (d). As with subsections (a) (1) and (d) (1), Rule 1.10 is not applicable to the conflicts of interest addressed by these subsections.

This Rule represents a balancing of interests. On the one hand, where the successive clients are a government agency and another client, public or private, the risk exists that power or discretion vested in that agency might be used for the special benefit of the other client. A lawyer should not be in a position where benefit to the other client might affect performance of the lawyer's professional functions on behalf of the government. Also, unfair advantage could accrue to the other client by reason of access to confidential government information about the client's adversary, obtainable only through the lawyer's government service. On the other hand, the rules governing lawyers presently or formerly employed by a government agency should not be so restrictive as to inhibit transfer of employment to and from the government. The government has a legitimate need to attract qualified lawyers as well as to maintain high ethical standards. Thus, a former government lawyer is disqualified only from particular matters in which the lawyer participated personally and substantially. The provisions for screening and waiver in subsection (b) are necessary to prevent the disqualification rule from imposing too severe a deterrent against entering public service. The limitation of disqualification in subsections (a) (2) and (d) (2) to matters involving a specific party or parties, rather than extending disqualification to all substantive issues on which the lawyer worked, serves a similar function.

When a lawyer has been employed by one government agency and then moves to a second government agency, it may be appropriate to treat that second agency as another client for purposes of this Rule, as when a lawyer is employed by a city and subsequently is employed by a federal agency. However, because the conflict of interest is governed by subsection (d), the latter agency is not required to screen the lawyer as subsection (b) requires a law firm to do. The question of whether two government agencies should be regarded as the same or different clients for conflict of interest purposes is beyond the scope of these Rules. See Commentary to Rule 1.13.

Subsections (b) and (c) contemplate a screening arrangement. See Rule 1.0 (*l*) (requirements for screening procedures). These subsections do not prohibit a lawyer from receiving a salary or partnership share established by prior independent agreement, but that lawyer may not receive compensation directly relating the lawyer's compensation to the fee in the matter in which the lawyer is disqualified.

Notice, including a description of the screened lawyer's prior representation and of the screening procedures employed, generally should be given as soon as practicable after the need for screening becomes apparent.

Subsection (c) operates only when the lawyer in question has knowledge of the information, which means actual knowledge; it does not operate with respect to information that merely could be imputed to the lawyer.

Subsections (a) and (d) do not prohibit a lawyer from jointly representing a private party and a government agency when doing so is permitted by Rule 1.7 and is not otherwise prohibited by law.

For purposes of subsection (e) of this Rule, a "matter" may continue in another form. In determining whether two particular matters are the same, the lawyer should consider the extent to which the matters involve the same basic facts, the same or related parties, and the time elapsed.

Rule 1.12. Former Judge, Arbitrator, Mediator or Other Third-Party Neutral

(Amended June 26, 2006, to take effect Jan. 1, 2007.)

(a) Except as stated in subsection (d), a lawyer shall not represent anyone in connection with a matter in which the lawyer participated personally as a judge or other adjudicative officer or law clerk

RE: Certificate of Need Application; Docket Number: 12-31747-CON
Proposal for Yale-New Haven Hospital's Acquisition of the Saint Raphael Healthcare System Inc. and Hospital of Saint Raphael

Dear Ms. Ahn and Ms. Estes,

On February 9, 2012, the Office of Health Care Access ("OHCA") received your initial Certificate of Need ("CON") application for Yale-New Haven Hospital's ("YNHH") acquisition of the Saint Raphael Healthcare System Inc. ("SRHS"), including the Hospital of Saint Raphael ("HSR").

OHCA has reviewed the CON application and requests additional information pursuant to General Statutes § 19a-639a(c):

Project Description and Need: Change of Ownership or Control – pages 20 through 25

1. Please describe the following:

   a. SHRHS' ownership and control of Saint Regis Health Center, Inc. d/b/a Sister Virginie Grimes Center;
   b. HSR's ownership and control of Connecticut CK Leasing, LLC;
   c. DePaul Health Services Corporation, Inc.'s ownership and control of Saint Raphael Dialysis Center Partnership; and
   d. The businesses engaged in by Connecticut CK Leasing, LLC and Saint Raphael Dialysis Center Partnership and any services they provide to inpatients or outpatients of HSR.

2. On page 21, applicants state that HSR provides "a number of community based programs" and outlines some of these programs in a list.

   Please indicate whether each of these programs is expected to continue following the acquisition. In addition, please provide information regarding all other HSR community based programs and indicate whether each of these additional programs will continue following the acquisition. If any program will be terminated as a result of or directly following the acquisition, describe the reason for such termination, how the decision was made and how the need will be met.

3. On page 22, applicants state that "[d]espite many efforts to mitigate financial losses, HSR recognized that without outside assistance and investment, it could not survive long term as a standalone entity."

   Please describe in detail the efforts HSR has taken to mitigate financial losses and provide detailed evidence supporting the conclusion that HSR could not survive as a standalone entity.

4. Applicants indicate, on page 24, that, "absent the proposed acquisition of HSR, YNHH will have to construct a 5th bed tower..." and further indicate that such tower is estimated to cost approximately $400 million and take nearly five years to complete.

   Please describe:

   a. The number and types of beds (by service category) that were estimated to be contained in the tower.
   b. How the cost and timeline estimates for the tower were determined.

5. Also on page 24, applicants state that "YNHH will make significant investments in the HSR campus to improve its facilities and technological capabilities."

   Please address the following:

   a. Describe, in detail, the nature of the facility improvements that will be made.
   b. Describe, in detail, the nature of the technological improvements that will be made.
   c. Describe how decisions will be made regarding these facility and technological improvements.
   d. Provide an estimated completion date for the improvements described in subsections (a) and (b), respectively.

6. Also on page 24, applicants state that "HSR's long term debt will be extinguished and resources will be provided to address the current Church plan pension shortfall."

   Please provide the following:

   a. The amount of long term debt that HSR currently carries and the amount that will be extinguished;
   b. The amount of the current Church plan pension shortfall and the amount that the shortfall will be reduced; and
   c. The source of the funds that will be used to make the payments described in subsections (a) and (b).

7. Please address the following:

   a. How are the current 421 operational beds at HSR allocated between medical/surgical, pediatric, obstetric, rehabilitation and psychiatric services.
   b. Would YNNH's acquisition of HSR result in any change to the current allocation of beds on the HSR campus.
   c. What would be necessary to make all of HSR's 511 licensed beds operational (up from the current 421 operational beds).
   d. Beyond the current 421 operational beds at HSR, how many additional beds could be phased into operation before the end of FY 2015, what would the likely phasing schedule be and what would be necessary to achieve this.
   e. From 10/08 to the month of applicants' completeness response, what has been the average monthly census for HSR based on both total beds and medical/surgical beds (please provide this data in chart and table form similar to that found on pps. 15-17 of YNNH's CON Application to Increase the Hospital's Licensed Bed Count by 70 under Docket No. 12-31745-CON).
   f. Assuming YNHH is licensed at 1,407 general hospital beds post-acquisition of HSR, and based on the projected inpatient utilization of both campuses, when would YNHH expect to exceed an 80% occupancy level based on average monthly census projections (please provide evidence of all assumptions and calculations on which such projection is based, and a chart of YNHH's bed need for each year until the 80% threshold is reached).
   g. Provide the same information as requested in subsection (f) above, but restrict the projection to when 80% occupancy of the combined medical/surgical beds on both campuses would be exceeded.
   h. Assuming YNHH is licensed at 1,477 general hospital beds post-acquisition of HSR, and based on the projected inpatient utilization of both campuses, when would YNHH expect to exceed an 80% occupancy level based on average monthly census projections (please provide evidence of all assumptions and calculations on which such projection is based).
   i. Provide the same information as requested in subsection (h) above, but restrict the projection to when 80% occupancy of the combined medical/surgical beds on both campuses would be exceeded.

8. On pages 24 and 25, applicants indicate that they engaged Deloitte "to identify cost savings which could be achieved through the acquisition" and that these cost savings are expected to exceed a half of a billion dollars over the next five years.

   Please provide:

   a. A copy of the Deloitte report;
   b. The applicants' cost savings plan; and
   c. An explanation of how applicants foresee that the savings will reduce costs of health care services for patients served by YNHH if the CON application is granted.

9. On page 25, applicants state that "[b]oth HSR and YNHH have focused on maintaining access and improving the quality of care despite the ever-present financial challenges of the industry."

   Please explain, in detail, HSR's efforts to maintain access and improve quality of care since 10/08.

10. Please describe, in detail, how the acquisition of HSR by YNHH will affect the following:

    a. Teaching and residency programs currently located at HSR and YNHH;
    b. Research and clinical trials conducted at HSR and YNHH;
    c. Emergency department services currently located at HSR and YNHH;
    d. Charity care and financial assistance programs currently operating at HSR and YNHH; and
    e. The rates currently charged for hospital services at HSR and YNNH.

Determination of Need by HSR – pages 26 through 27

11. Please describe, in detail, the steps that HSR took to address its financial situation. In addition, provide detailed evidence for the conclusion that HSR will be unable to achieve financial stability in the future. Please include information regarding the following cost saving efforts in the discussion:

    a. Aggressive negotiations with managed care organizations;
    b. Productivity enhancements;
    c. Supply chain cost reductions;
    d. Adjustments to fringe benefits; and
    e. Postponement of essential renovations and equipment purchases.

12. On page 26, applicants indicate that in early 2010, the SRHS Board's Ad Hoc Strategy Committee "began to explore and evaluate options to ensure continuation of the mission of Saint Raphael's and the Sisters into the future."

    Please provide evidence of the Committee's exploration and evaluation of options. Include information regarding the other options besides integration with YNHH that were explored.

13. Provide any reports prepared by Navigant Consulting relating to the analysis of health systems that it performed for HSR.

14. Provide a copy of the letter of intent signed by YNHH and HSR in March 2011.

Benefits to HSR – pages 27 through 29

15. On page 27, applicants state that HSR identified YNHH as its optimal partner for a number of reasons outlined in the application. Please address the following:

    a. Describe any clinical staff/clinical positions at HSR that would not be retained after the acquisition.
    b. Explain what Centers of Excellence would be created and located at the HSR campus.
    c. How will the HSR campus be held out/identified to the public post-acquisition by YNHH?

16. On pages 28 and 29, applicants state that "[i]n the first five years, YNHH plans to invest $129.5 million" in the HSR campus for a variety of purposes. Please address the following:

    a. Is the $129.5 million investment separate and distinct from the $160 million being paid by Buyer pursuant to Section 2.3 of the Asset Purchase Agreement set forth at Attachment III to the CON application?
    b. List the deferred capital purchases and projects on the HSR campus the investment will address.
    c. List the investments in clinical service infrastructure that will be made on the HSR campus.
    d. Explain when YNHH would expect the existing information technology systems on the HSR campus to be integrated with YNHH's and when the implementation of the Epic electronic medical record system would be completed on the HSR campus.

17. Describe, in detail, the "new, integrated organization [that] will preserve clinical services and ensure HSR's charitable assets for future generations" referenced on page 29. Please also provide the following information regarding the Charitable Funds defined at Section 5.5 of the Asset Purchase Agreement:

    a. What amount of Charitable Funds, if any, will be transferred to Buyer or Buyer's Affiliate as part of the Purchased Assets and how will they be used for the benefit of the Facilities?
    b. What amount of Charitable Funds that cannot be transferred to Buyer or Buyer's Affiliate as part of the Purchased Assets will be used by Sellers at or for the benefit of the Facilities and how will they be used?
    c. What amount of Charitable Funds shall be used by Sellers to fund activities mutually agreed upon by the parties that benefit the delivery of health care services consistent with the Directives in the greater New Haven area and how will they be used?

Determination of Need by YNHH – pages 29 through 35

18. On page 32 in Graphs I and II, respectively, applicants provided information on YNHH's occupancy based on the midnight census and the contact census for all services and for medical/surgical beds as compared to total beds and 80% occupancy levels. Please provide HSR's occupancy based on its census data from FY 2011 to FY 2012 (year to date) in the same format.

19. YNHH recently submitted a CON application to add 70 beds which will be temporarily located in its East Pavilion. Assuming that CON is granted, please explain what will happen to these 70 beds if the CON application for the acquisition of HSR is not approved and, alternatively, if the CON application for the acquisition of HSR is approved.

20. Please provide a copy of YNHH's long range financial plan showing the need for an additional 74 beds by 2016 even if 70 additional beds are added pursuant to Docket No. 12-31745-CON.

21. Please provide copies of the inpatient volume projections submitted to the Connecticut Attorney General and the Federal Trade Commission.

22. Please provide evidence of YNHH's decision-making process regarding the location of the new bed tower that has been contemplated as part of its long range financial planning efforts.

Benefits to YNHH – pages 35 through 40

23. On page 35, applicants state that "[t]he opportunity to avoid duplicative investments and focus on key strategies, such as primary care development, will enhance access to services for patients in the region."

    Please describe the discussions HSR and YNHH have had surrounding the development of primary care and the avoidance of duplication of services.

24. On page 36, applicants state that "discussions have been held with the State of Connecticut Attorney General and the Federal Trade Commission to initiate governmental approval of the transaction."

    Please describe the status of those discussions and provide a timeline for when decisions from the Attorney General's Office and the Federal Trade Commission might be expected if they have not already been rendered.

25. On page 37, applicants state that they "have worked to identify a number of options to achieve cost savings and work flow efficiencies."

    Please describe these cost savings and work flow efficiencies.

    a. Please provide additional detail regarding which subspecialties will be, or are likely to be consolidated, on one campus (indicating which campus) and include the reasoning behind each decision.
    b. What subspecialties will be, or are likely to be, offered on both campuses? Explain how these service lines were selected.

26. On page 37, applicants state that "Deloitte has estimated cost savings from clinical and business operational integrations of at least $300 million over five years."

    Please provide information that describes these cost savings in detail, including a breakdown of the approximate amount of money saved by each measure.

27. Please describe how the acquisition will improve efficiency, access to health care and quality for the area's growing elderly population.

28. Please provide an unredacted copy of the Asset Purchase Agreement and all exhibits thereto.

Quality Measures – pages 40 through 43

29. To the extent not already provided, please describe the $85 million in facility upgrades that YNHH plans to undertake on the HSR campus and the estimated amounts that will be spent in each year.

30. To the extent not already provided, please describe the type of routine capital expenditures that will amount to $25 million in expenditures over the next five years and the estimated amounts that will be spent in each year.

31. When will the EPIC installation at YNHH be complete? If the acquisition is approved, how long after Closing is it estimated that EPIC installation at HSR would begin?

Proposed Capital Expenditures/Costs and Patient Population Mix – pages 45 through 52

32. Please describe what makes up the $60,248,000 in the "Other Non-Construction (Other Asset Purchases)" line of the proposed capital expenditure chart on page 45.

33. On page 45, applicants state that specific capital costs for HSR's assets equal $147,879,000. Please provide information on how much of the remaining $12,021,000 in capital expense is being allocated to the purchase of DePaul Health Services Corporation, Inc.'s ownership interest in the Saint Raphael Magnetic Resonance Center (SRMRC).

34. Please summarize any analyses or reports from Barclays Capital, other underwriters or YNHH's financial advisors regarding YNHH's credit rating and ability to obtain the $160 million in bond financing necessary to complete the proposed acquisition.

35. On page 49, with respect to the assumptions for patient population mix, please explain why volumes for HSR are assumed to be flat through the projection period.

Financial Attachments I & II – pages 50-52 and Attachments VII and VIII

36. On page 231 (Attachment I for YNHH), please explain, in detail, the underlying assumptions for the increases in bad debt and interest expense connected with the HSR acquisition?

37. On page 234 (Attachment I for HSR), please explain, in detail, the underlying assumptions for inpatient discharges dropping in FY 2012 and remaining flat throughout the projection period without the YNHH affiliation taking place.

38. On page 234 (Attachment I for HSR), please explain, in detail, the underlying assumptions for outpatient visits increasing in FY 2012 and remaining flat throughout the projection period without the YNHH affiliation taking place.

39. On page 238, please explain the basis for the net negative adjustment to hospital inpatient and outpatient revenue due to health care reform.

40. On pages 50-51, please explain in more detail how YNHH intends to establish budget neutral agreements "with new payment terms that will not result in an adverse financial impact to the managed care payers or the self-funded employers they represent" if the affiliation occurs. Please also explain whether YNHH would be able to negotiate similar budget neutral agreements if the affiliation with HSR did not occur and how the affiliation impacts YNHH's ability to negotiate with managed care plans as well as other private health insurers.

MRI CON Questions and Responses – Appendix I

41. On page 246, applicants state that inpatient "scan volume is projected to increase in proportion to an expected increase in the average daily census (ADC) at the Saint Raphael campus following the acquisition by YNHH ... ADC is projected to increase by 40 in FY 2012, 60 in FY 2014 and 85 in FY 2015." Yet, at page 236 of the CON Application, no increase in HSR utilization is assumed. Please explain this apparent discrepancy.

42. Will there be any change in the radiologists who provide professional services interpreting the SRMRC MRI scans as a result of YNNH's acquisition of HSR?

In responding to the questions contained in this letter, please repeat each question before providing your response. Paginate and date your response. Information filed must be numbered sequentially from the applicants' document preceding it. For example, if the application concludes with page 100, your completeness response letter would begin with page 101. Please reference "Docket Number: 12-31747-CON" and submit one (1) original and five (5) hard copies of your response. In addition, please submit a scanned copy of your response, including all attachments, on CD using MS Word format or Adobe Acrobat.

Upon receipt of the responses to this letter and after incorporating the provided information into the initial submission, OHCA staff will perform a detailed review of the entire CON application. If you have any questions concerning this letter, please feel free to contact Steven W. Lazarus at OHCA at (860) 418-7012.

Sincerely,

Steven W. Lazarus
Associate Health Care Analyst

EXHIBIT C

CANON 9
A Lawyer Should Avoid Even the Appearance of Professional Impropriety

ETHICAL CONSIDERATIONS

EC 9-1 Continuation of the American concept that we are to be governed by rules of law requires that the people have faith that justice can be obtained through our legal system.[1] A lawyer should promote public confidence in our system and in the legal profession.[2]

EC 9-2 Public confidence in law and lawyers may be eroded by irresponsible or improper conduct of a lawyer. On occasion, ethical conduct of a lawyer may appear to laymen to be unethical. In order to avoid misunderstandings and hence to maintain confidence, a lawyer should fully and promptly inform his client of material developments in the matters being handled for the client. While a lawyer should guard against otherwise proper conduct that has a tendency to diminish public confidence in the legal system or in the legal profession, his duty to clients or to the public should never be subordinate merely because the full discharge of his obligation may be misunderstood or may tend to subject him or the legal profession to criticism. When explicit ethical guidance does not exist, a lawyer should determine his conduct by acting in a manner that promotes public confidence in the integrity and efficiency of the legal system and the legal profession.[3]

EC 9-3 After a lawyer leaves judicial office or other public employment, he should not accept employment in connection with any matter in which he had substantial responsibility prior to his leaving, since to accept employment would give the appearance of impropriety even if none exists.[4]

EC 9-4 Because the very essence of the legal system is to provide procedures by which matters can be presented in an impartial manner so that they may be decided solely upon the merits, any statement or suggestion by a lawyer that he can or would attempt to circumvent those procedures is detrimental to the legal system and tends to undermine public confidence in it.

EC 9-5 Separation of the funds of a client from those of his lawyer not only serves to protect the client but also avoids even the appearance of impropriety, and therefore commingling of such funds should be avoided.

EC 9-6 Every lawyer owes a solemn duty to uphold the integrity and honor of his profession; to encourage respect for the law and for the courts and the judges thereof; to observe the Code of Professional Responsibility; to act as a member of a learned profession, one dedicated to public service; to cooperate with his brother lawyers in supporting the organized bar through the devoting of his time, efforts, and financial support as his professional standing and ability reasonably permit; to conduct himself so as to reflect credit on the legal profession and to inspire the confidence, respect, and trust of his clients and of the public; and to strive to avoid not only professional impropriety but also the appearance of impropriety.[5]

EC 9-7 A lawyer has an obligation to the public to participate in collective efforts of the bar to reimburse persons who have lost money or property as a result of the misappropriation or defalcation of another lawyer, and contribution to a client's security fund is an acceptable method of meeting this obligation.[6]

DISCIPLINARY RULES

DR 9-101 Avoiding Even the Appearance of Impropriety.[7]

(A) -A lawyer shall not accept private employment in a matter upon the merits of which he has acted in a judicial capacity.[4]

(B) -A lawyer shall not accept private employment in a matter in which he had substantial responsibility while he was a public employee.[5]

(C) -A lawyer shall not state or imply that he is able to influence improperly or upon irrelevant grounds any tribunal, legislative body,[6] or public official.

DR 9-102 Preserving Identity of Funds and Property of a Client.[7]

(A) -All funds of clients paid to a lawyer or law firm, other than advances for costs and expenses, shall be deposited in one or more identifiable bank accounts maintained in the state in which the law office is situated and no funds belonging to the lawyer or law firm shall be deposited therein except as follows:

(1) -Funds reasonably sufficient to pay bank charges may be deposited therein.

(2) -Funds belonging in part to a client and in part presently or potentially to the lawyer or law firm must be deposited therein, but the portion belonging to the lawyer or law firm may be withdrawn when due unless the right of the lawyer or law firm to receive it is disputed by the client, in which event the disputed portion shall not be withdrawn until the dispute is finally resolved.

(B) -A lawyer shall:

(1 -)Promptly notify a client of the receipt of his funds, securities, or other properties.

(2) -Identify and label securities and properties of a client promptly upon receipt and place them in a safe deposit box or other place of safekeeping as soon as practicable.

(3) -Maintain complete records of all funds, securities, and other properties of a client coming into the possession of the lawyer and render appropriate accounts to his client regarding them.

(4) -Promptly pay or deliver to the client as requested by a client the funds, securities, or other properties in the possession of the lawyer which the client is entitled to receive.

NOTES

1. "Integrity is the very breath of justice. Confidence in our law, our courts, and in the administration of justice is our supreme interest. No practice must be permitted to prevail which invites towards the administration of justice a doubt or distrust of its integrity." Erwin M. Jennings Co. v. DiGenova, 107 Conn. 491, 499, 141 A. 866, 868 (1928).

2. "A lawyer should never be reluctant or too proud to answer unjustified criticism of his profession, of himself, or of his brother lawyer. He should guard the reputation of his profession and of his brother as zealously as he guards his own." Rochelle & Payne, *The Struggle for Public Understanding*, 25 TEXAS B.J. 109, 162 (1962).

3. *See* ABA CANONS OF PROFESSIONAL ETHICS, CANON 29 (1908).

4. *See* ABA CANONS OF PROFESSIONAL ETHICS, CANON 36 (1908).

5. "As said in Opinion 49, of the Committee on Professional Ethics and Grievances of the American Bar Association, page 134: 'An attorney should not only avoid impropriety but should avoid the appearance of impropriety.' " State ex rel. Nebraska State Bar Ass'n v. Richards, 165 Neb. 80, 93, 84 N.W.2d 136, 145 (1957).

"It would also be preferable that such contribution [to the campaign of a candidate for judicial office] be made to a campaign committee rather than to the candidate personally. In so doing, possible appearances of impropriety would be reduced to a minimum" *ABA Opinion* 226 (1941).

"The lawyer assumes high duties, and has imposed upon him grave responsibilities. He may be the means of much good or much mischief. Interests of vast magnitude are entrusted to him; confidence is reposed in him; life, liberty, character and property should be protected by him. He should guard, with zealous watchfulness, his own reputation, as well as that of his profession." People ex rel. Cutler v. Ford, 54 Ill. 520, 522 (1870), and also quoted in State Board of Law Examiners v. Sheldon, 43 Wyo. 522, 526, 7 P.2d 226, 227 (1932).

7. *Cf.* MODEL CODE OF PROFESSIONAL RESPONSIBILITY, EC 5-6.

8. *See* ABA CANONS OF PROFESSIONAL ETHICS, CANON 36 (1908).

"It is the duty of the judge to rule on questions of law and evidence in misdemeanor cases and examinations in felony cases. That duty calls for impartial and uninfluenced judgment, regardless of the effect on those immediately involved or others who may, directly or indirectly, be affected. Discharge of that duty might be greatly interfered with if the judge, in another capacity, were permitted to hold himself out to employment by those who are to be, or who may be, brought to trial in felony cases, even though he did not conduct the examination. His private interests as a lawyer in building up his clientele, his duty as such zealously to espouse the cause of his private clients and to defend against charges of crime brought by law enforcement agencies of which he is a part, might prevent, or even destroy, that unbiased judicial judgment which is so essential in the administration of justice.

"In our opinion, acceptance of a judgeship with the duties of conducting misdemeanor trials, and examinations in felony

cases to determine whether those accused should be bound over for trial in a higher court, ethically bars the judge from acting as attorney for the defendants upon such trial, whether they were examined by him or by some other judge. Such a practice would not only diminish public confidence in the administration of justice in both courts, but would produce serious conflict between the private interests of the judge as a lawyer, and of his clients, and his duties as a judge in adjudicating important phases of criminal processes in other cases. The public and private duties would be incompatible. The prestige of judicial office would be diverted to private benefit, and the judicial office would be demeaned thereby," *ABA Opinion* 242 (1942).

"A lawyer, who has previously occupied a judicial position or acted in a judicial capacity, should refrain from accepting employment in any matter involving the same facts as were involved in any specific question which he acted upon in a judicial capacity and, for the same reasons, should also refrain from accepting any employment which might reasonably appear to involve the same facts." *ABA Opinion* 49 (1931).

See ABA Opinion 110 (1934).

9. *See ABA Opinions* 135 (1935) and 134 (1935); *cf.* ABA CANONS OF PROFESSIONAL ETHICS, CANON 36 (1980) and *ABA Opinions* 39 (1931) and 26 (1930). *But see ABA Opinion* 37 (1931).

10. "[A statement by a governmental department or agency with regard to a lawyer resigning from its staff that includes a laudation of his legal ability] carries implications, probably not founded in fact, that the lawyer's acquaintance and previous relations with the personnel of the administrative agencies of the government place him in an advantageous position in practicing before such agencies. So to imply would not only represent what probably is untrue, but would be highly reprehensible." *ABA Opinion* 184 (1938).

11. *See* ABA CANONS OF PROFESSIONAL ETHICS, CANON 11 (1908).

"*Rule 9* . . . . A member of the State Bar shall not commingle the money or other property of a client with his own; and he shall promptly report to the client the receipt by him of all money and other property belonging to such client. Unless the client otherwise directs in writing, he shall promptly deposit his client's funds in a bank or trust company . . . in a bank account separate from his own account and clearly designated as 'Clients' Funds Account' or 'Trust Funds Account' or words of similar import. Unless the client otherwise directs in writing, securities of a client in bearer form shall be kept by the attorney in a safe deposit box at a bank or trust company . . . which safe deposit box shall be clearly designated as 'Clients' Account' or 'Trust Account' or words of similar import, and be separate from the attorney's own safe deposit box." CAL. BUSINESS AND PROFESSIONS CODE §6076 (West 1962).

"[C]ommingling is committed when a client's money is intermingled with that of his attorney and its separate identity lost so that it may be used for the attorney's personal expenses or subjected to claims of his creditors . . . . The rule against commingling was adopted to provide against the probability in some cases, the possibility in many cases, and the danger in all cases that such commingling will result in the loss of clients' money. " Black v State Bar, 57 Cal. 2d 219, 225-26, 368 P.2d 118, 122, 18 Cal. Rptr. 518, 522 (1962).

Dear Ms. Martone and Mr. Lazarus:

In response to the rebuttal testimony submitted by the Applicants in the above matter, Stamford Hospital sought to further clarify the PCI volumes at White Plains Hospital. Attached is a letter from Susan Fox, the Executive Vice President of White Plains Hospital, which revises the PCI volume data previously reported in a letter attached to Dr. Kiely's pre-file testimony. We ask that this letter be included in the record of this proceeding.

If you have any questions regarding this matter, please do not hesitate to contact us. Thank you.

Best regards,

Jason

Re: Revision to letter dated July 11, 2012 entitled, "Certificate of Need Application; Docket No. 12-31748-CON Yale New Haven Hospital and Greenwich Hospital Proposal to Establish and Elective Angioplasty Program Without Onsite Surgical Backup at Greenwich Hospital."

Dear Dr. Kiely:

In our previous letter to you dated July 11th 2012, we included incorrect statistical data in regards to our PCI volumes in 2010 and 2011. This data discrepancy was discovered upon closer review of data associated with our cardiac cath program. The third paragraph of our initial letter should be replaced with the following:

> *In fiscal year 2010 (Oct 1 2009 – Sept 30 2010) and with the support of the New York Presbyterian Health System, a total of 93 PCIs were performed at WPH (73 Inpatient, 20 Outpatient). In fiscal year 2011 (Oct 1 2010 – Sept 30 2011) 231 PCIs were performed at WPH (153 Inpatient, 78 Outpatient). In 2012, we have begun to experience a volume shift connected with a change in referral patterns by a large cardiology practice in our area; however, we have maintained our PCI volume with our fiscal year to date (Oct 2011 – May 30) resulting in 191 PCIs being performed (117 inpatient, 74 outptient).*

The above modification to our statistical data has no other impact on our original letter and conclusions. Our opposition to Greenwich Hospital's proposal to establish elective angioplasty remains unchanged.

Sincerely,

Susan Fox

Re: Certificate of Need Application; Docket Number: 12-31748-CON
Yale-New Haven Hospital and Greenwich Hospital to
Establish and Operate an Elective Angioplasty Program at Greenwich Hospital

Dear Deputy Commissioner Davis:

Enclosed please find our firm's Notice of Appearance and an original and five (5) copies of The Stamford Hospital's Petition for Intervenor Status in the above-referenced Certificate of Need Application. Also enclosed are the pre-filed testimonies of Sharon Kiely, M.D., Stamford Hospital's Senior Vice President of Medical Affairs and Chief Medical Officer, and William A. Gray, M.D., Associate Professor of Clinical Medicine at Columbia University and Director, Endovascular Services at the Columbia University Medical Center/New York Presbyterian Hospital.

Please contact the undersigned should you have any questions.

Respectfully submitted,

Stephen M. Cowherd

Enclosures

BY: STEPHEN COWHERD, ESQUIRE

RE: YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL
JULY 17, 2012

. . .Verbatim Proceedings of a hearing before the State of Connecticut, Department of Public Health, in the matter of Yale-New Haven Hospital and Greenwich Hospital, held at 410 Capitol Avenue, Hartford, Connecticut, on July 17, 2012 at 9:38 a.m. . . .

HEARING OFFICER JOANNE V. YANDOW: Good morning. Before we begin, please make sure all cell phones are turned off. This public hearing is before the Office of Health Care Access, it's Docket No. 12-31748-CON, and is being held on July 17th, 2012 to consider Yale-New Haven and Greenwich Hospitals' application to establish and operate an elective angioplasty program without outside surgical backup at Greenwich Hospital. This public hearing is being held pursuant to General Statutes Section 19a-639a and will be conducted as a contested case in accordance with the provisions of Chapter 54 of the Connecticut General Statutes, the Uniform Administrative Procedures Act.

I am Joanne V. Yandow, I'm the Hearing Officer designated by Commissioner Jewel Mullen of the

Department of Public Health to serve as the Hearing Officer for this matter. Staff members assigned to assist me in this case are Kimberly Martone, Director of Operations; Steve Lazarus, an analyst with OHCA; and Assistant Attorney General, Rosemary McGovern.

Following the hearing I will issue a proposed final decision in accordance with General Statute Section 4-179. In making my decision I will consider and make written findings concerning the principles and guidelines set forth in Section 19a-639 of the Connecticut General Statutes.

The applicants, Yale-New Haven Hospital and Greenwich Hospital, have been designated as parties in this proceeding. The Stamford Hospital has requested intervenor status in this proceeding, and I have approved the request, in part, and have designated the Stamford Hospital as an intervenor with limited rights. And that order was issued yesterday.

Are there any other persons who wish to offer testimony or make a statement in this case other than those individuals representing the applicant or the intervenor? Is there anyone present here who plans on making any public comment? Okay. Let the record show that no one has come forward.

At this time, I would like all of the individuals who are going to testify on behalf of the applicants and intervenor to stand and raise your right hand. Okay. So what I see now, and as each person comes up you will identify yourself. Dr. Sharon Kiely, Dr. William Gray, Marna Borgstrom, Henry Cabin, Christopher Howes, Frank Corvino. Okay. And I see additional people standing just so --

MS. JENNIFER L. GROVES: I don't know if you'd like us to identify them for the record? We've just brought additional --

HEARING OFFICER YANDOW: -- yeah, just so I know --

MS. GROVES: -- to answer questions if need be. And I think, Steve, you've done the same thing? Would people like to identify themselves? Would that help?

HEARING OFFICER YANDOW: -- yeah, I just want to know who's --

MS. KAREN BANOFF: Karen Banoff.

MS. GAYLE CAPOZZALO: Gayle Capozzalo.

MS. NANCY HANSON: Nancy Hanson.

MS. KATHLEEN SILARD: Kathleen Silard.

MR. DAVID SMITH: David Smith.

HEARING OFFICER YANDOW: Okay. If the Court Reporter would please -- and again, when you come up you will again identify yourself, but if the Court Reporter would please swear everyone that's been identified here?

(Witnesses sworn)

MS. ROSE McGOVERN: Good morning. Assistant Attorney General Rose McGovern. I just wanted to clarify what my role is in this proceeding. I'm advising the Hearing Officer on all procedural matters and as far as a decision that's issued by OHCA, it's OHCA's decision, I review for legal sufficiency only.

HEARING OFFICER YANDOW: And again, anyone who filed their prefiled testimony when you come up you will also adopt that testimony under oath. For all those individuals who are testifying, please make sure you printed your name and affiliation on the sign-up sheet that's been made available for this hearing. So if you haven't done that yet, please make sure you do it at a break, if you haven't done that.

At this time I will ask staff to read into the record, those documents already appearing in OHCA's table of the record in this case. All documents have been identified in the table of record for reference

purposes. Mr. Lazarus?

MR. STEVEN W. LAZARUS: Good morning. Steven Lazarus. I would like to enter into the record Exhibits A through O as identified on the table of record, placed on everybody's desk today, and we have an additional item that was e-mailed to OHCA this morning, and that's the e-mail from Jeffers Cowherd, enclosing the second letter from White Plains Hospital. And that will be identified as Exhibit P.

(Whereupon, exhibits A through P were received in full and marked as Record Exhibits.)

HEARING OFFICER YANDOW: Okay. So we have some procedural matters before we start with any testimony. I did issue an order yesterday regarding some of the motions that have been filed. I did not address in that order the motion -- the motion to strike.

So, in addition to Applicant's motion to strike we also have a motion that was filed this morning by the intervenor, Stamford Hospital, the objection to and motion to strike a portion of rebuttal testimony of Marna Borgstrom and Christopher Howes and date. I've reviewed all of the documents. At this point, what will be stricken from the record in Mr. Cowherd's filing, attachment seven to Dr. Kiely's prefiled testimony, is

the L and M, Lawrence and Memorial, CON application, Exhibit 7. That will be stricken from the record. And also with Attorney Cowherd's filings attached to Dr. Gray's prefiled testimony Exhibit 5, the New York regulations, are being stricken.

Regarding rebuttal documents filed by Yale-New Haven, attached to the testimony of Marna Borgstrom, is the draft section of the OHCA plan identified in page numbers 647 -- I'm sorry, 747 through 756 is stricken from the record. Regarding the parts of the prefiled testimony regarding these attachments, we will look at that more closely after, we will keep the record open, and we will identify what parts of the prefiled testimony related to this will be stricken and both the applicant and the intervenor will get notification from OHCA and the opportunity to file a response to that. So that will not be determined today, but after today's hearing and the record will remain open.

So, regarding Mr. Cowherd's motion that was filed this morning, the objection on the motion to strike, I then will rule -- hold on this. I'm not going to rule on it in its entirety as far as what parts of the prefile, because that has not yet been determined on what

part of the testimony. So I'm going to hold on this and rule on that after the hearing. And of course, you will get that decision.

Mr. Cowherd has filed rebuttal testimony of Dr. Sharon Kiely and rebuttal testimony of Dr. William A. Gray. You've had a chance to review this Counsel?

MS. GROVES: I have had a limited opportunity to review. As I mentioned before, I only got this document about quarter after 8:00 this morning, so I had a chance to review it, but I haven't really had a chance to discuss it with my client or process it for purposes of cross-examining witnesses, or you know, presenting responses in our hearing testimony. I think that given the fact that applicants were asked to submit their rebuttal testimony yesterday at 10:00 a.m. Attorney Cowherd had ample time to get us a rebuttal yesterday during business hours, or even last night. Like I mentioned before, I received this when I was driving up. So I feel that we're disadvantaged if this is put into the record and we are not going to have ample opportunity to review before we have to cross-examine in about half an hour.

HEARING OFFICER YANDOW: Okay. So I take it then you're objecting to these rebuttal statements?

MS. GROVES: Yes. We maintain our objection to these being entered into the record.

HEARING OFFICER YANDOW: Okay. I'm going to overrule the objection. You will have the opportunity to cross-examine the witnesses on this. I'll give you what time you need to review and you certainly will have the last word as far as, you know, rebuttal and follow-up. But you will be able to cross-examine.

MS. GROVES: Okay.

HEARING OFFICER YANDOW: As stated in my order yesterday, Mr. Cowherd, as the intervenor, has no right of cross-examination of your witnesses, but you will be able to cross-examine when his witnesses are up.

MS. GROVES: Okay. And would we have any opportunity either at or before the hearing to prepare written responses to these or just give cross-examination?

HEARING OFFICER YANDOW: Let's see -- could you -- I would prefer to do it today. I mean, you haven't looked at it yet?

MS. GROVES: I mean, I've looked at it and it may well be that it's not substantially different than what I've already seen. It may not change what we need to do, but I just want to make sure that everyone here

has had a chance to review it and perhaps if we take a five minute break before cross we can all look and see if we need -- if we think we need to do a written response.

HEARING OFFICER YANDOW: Okay.

MR. STEPHEN COWHERD: Hearing Officer Yandow, Stephen Cowherd on behalf of Stamford Hospital. If that license is granted to submit written responses to the rebuttal testimony, Stamford Hospital would respectfully request the ability to respond to whatever that response is since it is our testimony supplemental going into the record.

HEARING OFFICER YANDOW: Okay. We can address that if that comes up.

MS. GROVES: And we would, I mean, we would object to that.

HEARING OFFICER YANDOW: Okay.

MS. GROVES: Because theirs is a rebuttal. And this can go back and forth for weeks if it needs to, but I think it's fair that applicants get the last word and written permission. I think that's been a policy.

HEARING OFFICER YANDOW: We're not even there yet, so --

MS. GROVES: Yes, right.

HEARING OFFICER YANDOW: -- okay. And

then we have Mr. Cowherd also filed a response to Greenwich and Yale-New Haven Hospitals' objection to intervenors rebuttal testimony and motion to strike testimony. So again, as far as the motion to strike testimony, we're going to review the prefile. A lot of this just came in and we didn't have the time to go through all of the testimony. We've told you what attachments are being stricken and that's giving you notice of any testimony related to those attachments will be stricken. Okay?

All right. And then this document that just was handed to us, any position from applicant?

MS. GROVES: To the extent that this just corrects the letter that was previously in the record, I don't think -- I don't think we have any objection. I think it just corrects a misstatement on PCI volume at White Plains.

HEARING OFFICER YANDOW: So this is entered into the record. I believe --

MS. GROVES: But I --

HEARING OFFICER YANDOW: -- I'm sorry, go ahead. I'm sorry.

MS. GROVES: -- I would ask too, that obviously, that it not replace the letter that was in the

record, because I would like the letter to reflect that the initial letter had the incorrect volumes.

HEARING OFFICER YANDOW: It's all in there.

MS. GROVES: Okay.

HEARING OFFICER YANDOW: Any other motions? I think I've addressed them all. Is there any other motion out there that needs to be addressed?

MR. COWHERD: Not on behalf of Stamford Hospital.

HEARING OFFICER YANDOW: Okay. Just for the record, if we could have both attorneys identify themselves for the record?

MS. GROVES: I'm sorry. I'm Jennifer Groves, from Updike, Kelly and Spellacy. The only question I do have, I know that the Hearing Officer has stricken the draft -- the draft OHCA cardiac standards. I believe from my skimming this that those are referenced in this submission that Attorney Cowherd made this morning. So I'm looking at it to strike from our documents and I would assume it would be stricken from their rebuttal if that stays in as well, right?

HEARING OFFICER YANDOW: All right. Anything related to --

MS. GROVES: Okay.

HEARING OFFICER YANDOW: -- I haven't looked at it that closely. I mean, that will be determined -- you will be noticed as to what's going to be stricken and you can file responses.

MS. GROVES: Okay. Thank you. Other than that I have no --

HEARING OFFICER YANDOW: Any other housekeeping matters?

MR. COWHERD: I'll just let my colleague introduced herself for the record.

MS. CAROLYN R. LINSEY: I'm Carolyn Linsey, representing Stamford Hospital.

HEARING OFFICER YANDOW: Okay.

MS. GROVES: I do -- sorry to interrupt, but I do have one other housekeeping matter and I know that we raised this with Mr. Lazarus in an e-mail last night. Ms. Borgstrom with like if time permits to be able to leave to attend the funeral of --

MS. MARNA BORGSTROM: Sister Ann Vergeon (phonetic) used to run the Hospital of St. Raphael and her funeral is in New Jersey this afternoon.

MS. GROVES: -- and so she would need to leave by 11:00. I'm not sure, given the late hour, I

mean, I assume, we'll be through, but I was wondering if it was possible for OHCA to ask the questions of her before then so she could leave?

HEARING OFFICER YANDOW: Well, let's see where her testimony and we'll do our best and let's see where we go.

MS. GROVES: We appreciate that, thank you.

HEARING OFFICER YANDOW: Do we have an agenda?

MR. LAZARUS: Right here.

HEARING OFFICER YANDOW: Okay. Do we have any OHCA exhibits to be marked into the record?

MR. LAZARUS: Yes. We have one and I'd like to mark it as OHCA Exhibit 1. And these are the historical cardiac volumes for the state of Connecticut. They are in the record as -- submitted by I believe the applicant it might have even been the intervenors, it was taken from our website from 2002-2010. This particular exhibit will include data for 2011 as well. And I'll provide copies to both.

HEARING OFFICER YANDOW: Any objection?

MS. GROVES: The applicant has no objection.

HEARING OFFICER YANDOW: Attorney Cowherd, any objection?

MR. COWHERD: No objection.

HEARING OFFICER YANDOW: It's being marked as OHCA Exhibit 1.

(Whereupon, historical cardiac volumes were received in full and marked as OHCA Exhibit No. 1.)

HEARING OFFICER YANDOW: And I do note that in the table of record exhibits, we do know what OHCA will take administrative notice of. Of course, we will certainly, you know, read those decisions and take out what is relevant. We certainly know how to weigh the evidence and it will be determined, you know, when all of the evidence is in on whether or not notice is taken on any of those past positions. Okay? Any other objections on any Record Exhibits? Okay.

MS. GROVES: No. I'm all choked up. This is overwhelming.

(Laughter)

HEARING OFFICER YANDOW: Are you all set?

MR. LAZARUS: I'm all set. Thank you.

HEARING OFFICER YANDOW: Okay then. If we could just have a brief opening statement from applicant's counsel, just a little brief opening

statement on the proposal, and then you can call your first witness.

MS. GROVES: This is a proposal obviously to add elective angioplasty services at Greenwich Hospital as part of the Yale-New Haven Heart and Vascular Center. I think this is a proposal that's been raised before by this hospital in concert with Yale-New Haven Hospital and as everyone knows, has been denied. But we think there have been significant changes in the recommendations around elective angioplasty without on-site surgery. There are differences in sort of the way need was projected in this application. There are differences that we understand in the way that OHCA is looking at need for border hospitals, things that really made us believe that it was the right time to revisit this application.

And I think that, you know, Greenwich has the infrastructure in place, given its primary angioplasty program to treat these patients and these patients are presenting at Greenwich Hospital, as you'll hear, and we believe that it is the most cost-effective solution to allow these providers to provide this care to these patients as opposed to patient's having to, you know, to undergo unnecessary transfers and second

procedures at other hospitals. So I would introduce to you our witnesses. We're going to start with Marna Borgstrom and then she'll introduce our other witnesses. And we appreciate your time today. Thank you.

HEARING OFFICER YANDOW: Ms. Borgstrom, you've been sworn in --

MS. BORGSTROM: Yes.

MARNA BORGSTROM

Having been called as a witness, having been duly sworn, testified on her oath as follows:

HEARING OFFICER YANDOW: -- and you have two filings. The original prefiled testimony and then rebuttal prefiled testimony. Do you adopt that testimony under oath?

MS. BORGSTROM: Yes, I do.

HEARING OFFICER YANDOW: Okay. And if you want to give a statement, you don't need to read it all in, but if you want to just give sort of a brief summation of what you're prefiled testimony states?

MS. BORGSTROM: Thank you. And I will be even briefer since counsel said a lot of what I have here.

MS. GROVES: I'm sorry.

MS. BORGSTROM: No, that's great. So, Hearing Officer Yandow and members of the OHCA staff, thank you for the opportunity to present to you on this critically important certificate of need application. My name is Marna Borgstrom, and I am the Chief Executive Officer of Yale-New Haven Hospital and the President and Chief Executive Officer of the Yale-New Haven Health System.

I have the distinct privilege of introducing my colleagues who are going to speak to you today in more detail about these developments and they'll summarize our proposal quite nicely. Here with me today, speaking, are Dr. Henry Cabin, Dr. Christopher Howes and Mr. Frank Corvino. The Yale-New Haven Heart and Vascular Center is proposing the development of a satellite elective angioplasty program at Greenwich Hospital. As counsel said, although we proposed this before and it hasn't been approved, there are some new developments surrounding elective angioplasty, without cardiac surgery backup, which has led us to pursue this again.

Yale-New Haven Heart and Vascular Center is one of the leading providers of heart and vascular care. Yale University School of Medicine cardiovascular

physicians have been actively involved in primary angioplasty as Greenwich Hospital since its inception and they will continue to provide clinical oversight, direct patient care, and staff and physician education in the proposed program.

The Heart and Vascular Center has established satellite emergency angioplasty programs at Greenwich and Lawrence and Memorial Hospitals. Our position on the appropriateness and safety of freestanding interventional cardiac programs has evolved as cardiac care and related research have demonstrated the effectiveness of these programs over the last few years. It's clear that smaller volume angioplasty programs can deliver high quality and safe care assuming the proper infrastructure and the proper clinical expertise.

Consistent with our objective to provide accountable cost-effective and high-quality care we want to bring this appropriate care closer to the patient's and eliminate need for repeat procedures and hospitalizations, travel, and unnecessary stress. This especially makes sense in our satellite emergency angioplasty programs where the infrastructure is already in place at Greenwich Hospital.

As I noted, we have tried in good faith to collaborate with Stamford Hospital in today's hearing in this matter, but they have declined to pursue and are opposing the application, even though the proposed program will not negatively impact their program and the market trends were quite similar when their program was approved. We believe the time has come for patients to be offered elective angioplasty at Greenwich Hospital and I encourage you to approve this application.

I'd now like to introduce Dr. Henry Cabin, who will discuss recent medical research and changes in clinical practice guidelines that are very relevant to our proposal. Thanks very much.

HEARING OFFICER YANDOW: Let me just -- Mr. Lazarus, do you want to hold off on the questions we have of -- they said the prefiled --

MR. LAZARUS: Yes --

HEARING OFFICER YANDOW: -- okay.

MR. LAZARUS: -- unless you feel we should ask some questions now?

HEARING OFFICER YANDOW: No.

MR. LAZARUS: I think we'll probably proceed with the agenda --

HEARING OFFICER YANDOW: But I do think we

do -- will we have questions of Ms. Borgstrom, though?

MR. LASARUS: -- we do and if time gets tight we can perhaps call her up sooner.

HEARING OFFICER YANDOW: Okay. So you're not excused at this point.

MS. BORGSTROM: I understand. Thank you.

HEARING OFFICER YANDOW: All right. Okay. Could you identify yourself please?

HENRY CABIN

having been called as a witness, having been duly sworn, testified on his oath as follows:

DR. HENRY CABIN: Sure. My name is Henry Cabin. Good morning Hearing Officer Yandow.

HEARING OFFICER YANDOW: And Mr. Cabin, we do have some prefiled testimony of yours and now that you've been sworn under oath, do you adopt that testimony as your own?

DR. CABIN: Yes, I do.

HEARING OFFICER YANDOW: Okay. You can go ahead.

DR. CABIN: Good morning Hearing Officer Yandow and OHCA staff. My name is Dr. Henry Cabin and

I'm the Clinical Chief of Cardiology and a professor of medicine at the Yale University School of Medicine. I'm also the Medical Director of the Yale-New Haven Heart and Vascular Center and a practicing interventional cardiologist.

I would like to highlight some significant clinical research known as the C-PORT-E Study, which was recently completed and the results of this study, published in 2012 in the New England Journal of Medicine. This large, multi-institutional study found that there were no significant differences between the six-week mortality and in the adverse cardiac events at nine months between the two groups. The results of this study are consistent with other studies and meta-analyses that have been published.

C-PORT-E research, as well as other studies on elective angioplasty without on-site cardiac surgery led to a significant change in our society's 2011's clinical practice guidelines for angioplasty. Specifically, the modification of elective angioplasty without on-site cardiac surgery from a class 3 indication, which is not recommended, no benefit, to a class 2B, where the benefit is either equal or greater than the risk.

I want to emphasize that not all hospitals without on-site cardiac surgery are able to offer safe, high-quality, elective angioplasty services. Yale-New Haven Hospital Heart and Vascular Center's clinical expertise, resources and experience allows us to support the careful expansion of elective angioplasty, without on-site cardiac surgery, as have other tertiary programs throughout the country, such as New York Presbyterian. Our highly skilled Board certified interventional cardiologists collectively perform thousands of procedures a year. Each cardiologist in our group is required to perform a minimum of 75 per year, with most performing significantly more.

Our other clinical staff, both in New Haven and Greenwich, consist of experienced nurses, physician assistants, technicians and other support staff who have received comprehensive training in our interventional laboratory and are very comfortable treating the most acutely ill patients. Nursing and other technical staff in our satellite program at Greenwich Hospital received the same education, training and clinical oversight as the state at Yale-New Haven Hospital.

The current emergency angioplasty program

at Greenwich Hospital operates according to the same policies, procedures and protocols as our program at Yale-New Haven Hospital. And in fact, the same physicians who perform the procedure at Yale-New Haven Hospital are the ones who are performing it at Greenwich Hospital. This will continue to be the case with an elective angioplasty program. This consistency of care is very important for both physicians and patients alike and results in an optimal experience.

The proposed satellite elective angioplasty program at Greenwich Hospital offers the residence of the Greenwich service area the opportunity to receive high-quality interventional cardiac care in their local community by one of the nation's leading cardiac providers. I strongly encourage OHCA to approve this CON application.

I would like to now introduce my colleague, Dr. Christopher Howes, who will discuss the need for the proposed program and provide additional information about the Greenwich Hospital cardiac cath. lab.

HEARING OFFICER YANDOW: Good morning Dr. Howes.

CHRISTOPHER HOWES

having been called as a witness, having been duly sworn, testified on his oath as follows:

HEARING OFFICER YANDOW: We have your prefiled testimony. Now you've been sworn under oath do you adopt the testimony as your own?

DR. CHRISTOPHER HOWES: I do adopt that prefiled testimony.

HEARING OFFICER YANDOW: And you can certainly give a summation now of what your testimony is.

DR. HOWES: Thank you for the opportunity. Good morning Officer Yandow and OHCA staff. My name is Dr. Christopher Howes, and I'm an assistant professor at the Yale School of Medicine and a practicing interventional cardiologist. I'm also the Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital.

We've already heard from Dr. Cabin about the recent changes to the 2011 ACCAHIA guidelines regarding angioplasty. Unlike Dr. Gray, from New York Presbyterian, we believe these guideline changes regarding elective angioplasty, without on-site surgery are significant. Along with the results of the recent C-

PORT-E Study our opinion is that the debate is essentially over regarding the safety of elective angioplasty programs without on-site cardiac surgery as long as the programs adhere to strict program requirements as suggested in the SCAI document and that includes close oversight and clinical direction from a full-service provider.

I would like to address the topic of referring physician relationships and why we believe this program will not cause harm to the intervenor. The physicians who refer patients to the Yale-New Haven Heart and Vascular Center physicians do so because of the relationship between these physicians. And these relationships have developed and evolved over many years. Very limited relationships currently exist between these referring physicians and the interventional cardiologists at Stamford Hospital. And in fact, there is minimal crossover between Stamford and Greenwich Hospital cardiovascular physicians and their patients.

The absence of cardiovascular physician crossover between Greenwich and Stamford Hospitals is evident in the patient origin data, which was included in my testimony and shows how the top 80 percent of inpatient cardiovascular patient communities at Greenwich

Hospital are low volume communities at Stamford Hospital and the opposite is true that the high-volume communities for Stamford Hospital are in fact the low-volume communities for Greenwich. It is also significant that although Stamford Hospital was granted a CON approval to open a full service cardiac program, and has been providing elective angioplasty for several years, Greenwich angioplasty -- Greenwich Hospital's angioplasty patient volume, both their PAMI procedures, and those patients that are currently being transferred has remained relatively constant.

This proposal includes providing elective angioplasty services to patients already coming to our hospital and some other patients who are currently receiving these services in New York hospitals. We believe that the patient choice is an important factor to consider, especially in this case where we've already offered this procedure and have all the necessary infrastructure.

In addition to patient choice OHCA must consider the hardships that Greenwich Hospital elective angioplasty patients must endure by having a second hospitalization, second invasive procedure, and having to leave the local area with their family and their

physicians. These factors also add unnecessary wasted cost to the health care system.

We have included letters of support in our CON application from noninvasive cardiologists on the Greenwich Hospital staff who have indicated they are willing to refer cardiac catheterization volume to our hospital if we are able to achieve this CON. In addition, two interventional cardiologists recently provided letter stating they would bring volume between 80 and 105 angioplasty cases to Greenwich Hospital. Their case volume is above and beyond the volumes that were estimated in the original CON and unfortunately, they are unable to appear at today's hearing.

We currently staff our emergency angioplasty program with either on-site or on-call staff 24 hours a day, seven days a week, 52 weeks per year. Our staff are ready and at any given time, we provide the highest quality cardiac care to some of the sickest patients presenting with acute myocardial infarction. We just want to add our opportunity to provide this excellent cardiac care to a broader spectrum of our patients.

Now that we know from recent research and leading experts in the nation that elective angioplasty,

without on-site surgery is safe and appropriate how can we not improve the utilization of our infrastructure and improve the experience for Connecticut residents? I urge you to consider approving this program.

I would like to introduce Frank Corvino, President of Greenwich Hospital. Thank you.

HEARING OFFICER YANDOW: Good morning Mr. Corvino.

MR. FRANK CORVINO: Good morning. How are you?

HEARING OFFICER YANDOW: Fine. Thank you.

FRANK CORVINO

having been called as a witness, having been duly sworn, testify on his oath as follows:

HEARING OFFICER YANDOW: You have some prefiled testimony.

MR. CORVINO: Yes.

HEARING OFFICER YANDOW: And do you adopt that testimony as your own?

MR. CORVINO: Yes, I do. Good morning. And as you know, my name is Frank Corvino and I'm president and CEO at Greenwich Hospital. I'd like to

focus my testimony on the high level and quality and excellence of care at Greenwich Hospital and our commitment to provide the very best cost effective care to our patients who require elective angioplasty services. Our commitment to quality, service excellence, and employee satisfaction and patient satisfaction is well documented. Our efforts to consistently provide high quality and safe patient care have earned top marks from many national organizations, including the Joint Commission, the Connecticut Hospital Association, the Connecticut Quality Improvement Award Partnership, and the Leapfrog Group, just to name a few.

We are committed to this significant investment required to offer elective angioplasty in our community. In this era of health reforms and the need for all healthcare providers and health systems to provide more cost-effective services we believe this program will reduce the overall cost of angioplasty care to the Connecticut health system.

We estimate that the unnecessary costs that now result from the current restriction on elective angioplasty impact payers and patients by a total of approximately $425,000 each year. We arrive at that amount based on an average of 53 cases that are currently

transferred that could be cared for at Greenwich Hospital under an elective angioplasty program, multiplied by $8,000, which includes 7,000 for the average cost of an angioplasty admission at Yale-New Haven Hospital plus $1,000 for emergency transportation. We need to ensure that we are providing care in a cost-effective and efficient manner. It just makes sense to maximize both the use of our existing clinical capabilities, and resources, as well as to maximize the benefit and community need. There really is no downside.

I want to emphasize that this proposal is really all about patient care and patient access. It does not make sense that Greenwich Hospital is able to do the most difficult angioplasty cases and do them with excellent outcomes, I might add, and is not allowed to do the elective cases. Especially in light of the revised guidelines. It really just does not make sense for our patients.

So thank you for your time and attention, and I urge you to approve the CON application.

HEARING OFFICER YANDOW: And I believe that's all of the testimony from the applicant?

MS. GROVES: Yes, that concludes our presentation. Thank you.

HEARING OFFICER YANDOW: Okay. And before -- OHCA will have questions, but we're going to take in evidence from the intervenor before we do that.

MR. COWHERD: Thank you Hearing Officer Yandow. Our first witness will be Sharon Kiely, Chief Medical Officer for Stamford Hospital.

HEARING OFFICER YANDOW: Good morning Dr. Kiely.

SHARON KIELY

having been called as a witness, having been duly sworn, testified on her oath as follows:

DR. SHARON KIELY: Good morning. Thank you. I adopt my prefiled testimony.

HEARING OFFICER YANDOW: Prefiled and also --

DR. KIELY: (Indiscernible, talking over each other) in its entirety.

HEARING OFFICER YANDOW: -- okay. Thank you.

DR. KIELY: Good morning. Again, my name is Dr. Sharon Kiely. I'm associate vascular clinical medicine at Columbia, as well as Senior Vice President

and Chief Medical Officer at Stamford Hospital. Thank you for this opportunity to address OHCA on this important matter.

I'd like to present just a couple of highlights from my testimony. We will have a lot of time to discuss the other things in a minute. First, I think it's clear to everyone, both statewide as well as the proposed service area volumes are flat to declining in both PCI and cardiac cath. For PCI, while there are limitations in estimates about patient volumes there's no better source to estimate outpatient volume then the CHAPCR database, which shows PCI flat to slightly declining.

For cardiac cath. the stagnant trend continues. And the inpatient data from time and the utilization trends posted on OHCA's website in every way we looked at this data we did not see any trend that was going in another direction.

We agree very clearly that if a patient wants local care and that can be provided safely and effectively that they should have it. Since the time that we received approval in 2008 though White Plains Hospital has also received approval in New York to serve Westchester County elective angioplasty. We believe that

patients in the service area can get this care now. So within 10 miles to the west and six miles to the east of the service area the applicant proposes Greenwich Hospital seeks to serve in an area where there are two elective angioplasty programs as well as one full-service cardiac program, Stamford Hospital. We feel that this meets that need the community has now into the future given the current volume projections.

The applicant identifies the Connecticut service area for this elective angioplasty CON, which is identical to Stamford Hospital's primary, secondary service area. Access is just not an issue in the service area proposed in this application. In fact, both White Plains and Stamford Hospital programs are not at capacity and there is no issue of wait times that we've been able to identify. Based on the 50 patients per year currently going to Yale, local programs could assume these patients very easily.

We also agree that, while physician referral patterns are not fixed, telephone surveys and letters of intention to refer patients to program are speculative. We've learned that in our own programs. These do not estimate to true volume. Even with its inherent limitations the consistency between the various

utilization data that we have provided gave us no reason to think that volumes in these areas would grow.

Further, there's no reason that our two institutions cannot collaborate in achieving this, as we do in other areas. As a level two trauma center, Stamford has been a partner in the community in the care of most sick patients for years and in the past 21 months our trauma program has admitted over 270 patients from Greenwich. That said, Stamford Hospital maintains an open medical staff and we welcome any physician to admit and care for patients in any of our facilities. In fact, 30 percent of the cardiologists on staff at Stamford have privileges at Greenwich, 27 percent to be exact. In addition, there are other primary care providers, as well as other subspecialists.

The applicant also points out that 11 percent of their cardiologists have practices in Stamford. It's important to note that we are committed to serving the community for the long-term. This means delivering programs that the community needs. This is why we came before the agency in 2005 to address the need for elective PCI. Stamford is also preparing for the needs of the future, and as you know, we're building a new, state-of-the-art hospital for long-term benefit of

our community.

So I'll conclude with the basis of my position on this matter, which is that there is no need for this program. PCI volume is not growing. The proposed program does not improve access. There is no access issue. The proposed program is not cost-effective, in fact, there will more likely to be a potential for pressure for over utilization. It will not improve quality, is more likely to dilute the quality of the current programs that exist in the service area.

I'll leave the specifics of C-PORT-E to Dr. Gray. However, no one can argue that patients are better off without surgery on-site. The need for urgent surgery, when in fact it happens, is immediate, and cardiac surgery must be performed quickly such as in a perforated coronary artery. In no way do patients benefit from such a program without cardiac surgery as they would with one with cardiac surgery backup. And I know what I would prefer for my own family.

In conclusion, nothing has changed since 2009 when my colleagues presented their opposition to this expansion, it's really a discussion about a shift in volume and I don't believe there's any void to fill.

Thank you for this opportunity to present

this to the Agency. And now I'd like to introduce my colleague, Dr. Gray.

HEARING OFFICER YANDOW: And we'll give any opportunity for cross after they both provide their testimony and to make sure you have sufficient time to review what was filed this morning.

MS. GROVES: Um-hmm.

HEARING OFFICER YANDOW: Good morning Dr. Gray.

DR. WILLIAM GRAY: Good morning. How are you?

HEARING OFFICER YANDOW: Fine. Thank you.

WILLIAM GRAY

having been called as a witness, having been duly sworn, testified on his oath as follows:

HEARING OFFICER YANDOW: You have filed some prefiled testimony earlier in the hearing, a couple of days ago, and then also this morning. Do you adopt that testimony as your own?

DR. GRAY: I do, yes. I am William Gray, I'm associate professor of clinical medicine at New York Presbyterian Columbia University and I'm director of

vascular services there at that institution. Our institutions work closely with Stamford Hospital in the operation of both selective and open heart surgery programs. I'm here today in place of my colleague, Michael Collins, who wishes he could be here, but had a scheduling conflict. I wish he could be here --

(Laughter)

DR. GRAY: -- you wish he could be here because he's much taller and better looking. But nevertheless, I know he joins me in supporting Stamford Hospital's opposition to this CON application.

I guess my most important message in this testimony is that the science around this is still evolving and the safety and efficacy of providing PCI without surgery on-site. And this is reflected in the change in the guidelines statements, which were previously eluded to.

Prior guideline statements from 2005 demonstrated that PCI without surgery on-site, a class C recommendation, there's likely harm to doing so. That's been upgraded because of the C-PORT trial results. And as you've heard already, C-PORT trial was a randomized trial of about 18,000 patients and found there's no difference in mortality at six months and no overall

difference in efficacy at nine months, although there was a trend towards improved efficacy in sites that had surgery.

Incorporating that into the most recent guideline statement in 2011 the PCI without surgery on-site was raised from a level 3 to a level 2B, which means that there's potential benefit, that the risk doesn't outweigh the potential benefit, but there's substantial uncertainty and the level of evidence that supports that recommendation actually is still in conflict or supported by small or conflicting trials. So it's not -- it's not a level one indication as we might've hoped.

The guideline also states, and it's kind of epilogue that the PCI program without surgical on-site backup really should be intended to fill a clinical need in the community. That's well stated within the document. Competition within the same geographic area for PCI, especially with an established program without surgical backup, and I quote, "may not be in the best interest of the community." This appears to be a relevant consideration in this regard, in this case.

Based on the data discussed by Dr. Kiely it's clear that the proposed program does not fill a void in the current healthcare needs of lower Fairfield County

whose residents have ample access to PCI in the same service area as Stamford Hospital in White Plains. There's been an update released as of a month or two ago that PCI programs without surgery on-site should be established only when programs improve access to a higher level of cardiovascular care than otherwise would be available, which in this community would not be the case.

In addition to the flat or declining volume of the data from this area and from the state largely related to new therapy use Greenwich Hospital's proposed program would not likely exceed a couple of hundred cases per year and PCI volumes in Stamford and White Plains Hospital could fall below that number with the addition of Greenwich's program. I know there's an argument out there that says that there is difference in referral patterns, but in fact, you can't really fabricate procedures out of think block. These patients come from somewhere and they're fungible, and they transfer from one hospital to another. So it is a relevant consideration.

I recognize that it's been struck, but I will say that in New York State this would not be an issue by regulation. The New York State regulations would not allow a site without backup to do PCI if an

adjoining site was doing less than 300 a year.

In the end, at issue is not whether the applicant can provide excellent services, I'm sure that they can, in concert with Yale-New Haven, but whether results in the net health benefit to that community at large. I thank the Office of Health Care Access for the opportunity to speak on behalf of Stamford Hospital and I welcome any questions.

HEARING OFFICER YANDOW: Thank you. And are those your only two witnesses Attorney Cowherd?

MR. COWHERD: Those are the only two prefiled testimony and rebuttal witnesses depending on the scope of cross, there may be other witnesses, but --

HEARING OFFICER YANDOW: Okay. Well, we'll address that as it comes. Do you need time to review what's been filed?

MS. GROVES: I do. I mean, just as a wrap up matter I would like to just put an objection on the record to the reference to the (indiscernible, too far from mic.) regulations. They have been stricken in this matter. I didn't want to interrupt Dr. Gray while he was speaking. I had relatively few cross questions but I would like to have five minutes if I can to just confer with my clients. So can we take a short break? And like

I said, I don't think my cross will take long. If everyone is prepared with their questions would help us in getting Ms. Borgstrom's questions asked before 11:00 if that's possible?

HEARING OFFICER YANDOW: Okay. So will be back at 25 of.

(Off the record)

HEARING OFFICER YANDOW: Okay. We're going to do things a little out of order. OHCA does have some questions. We're going to ask some of those questions of the applicant's witnesses now, based on prefiled testimony and some of the testimony we've heard today. And then we will, you know, do cross after we finish with that. We'll sort of make a determination at that point when we're done with our questions regarding -- we're very sensitive to, you know, you need to leave. But let's get through our questions and see where we are, okay?

MS. GROVES: Okay. That's fine.

HEARING OFFICER YANDOW: All right. So we're going to go ahead with some of the OHCA questions.

MR. LAZARUS: Good morning again. This is Steven Lazarus, OHCA staff. I'll start off with a couple of questions for the intervenors first. And they're a

couple of general questions, so you can, you know, choose the best person to answer it. Okay. My first question is considering the fact that over the past three years there's only been a minimal number of transfers from Greenwich Hospital to Stamford Hospital. Can you provide a discussion as to why you feel there's a direct impact of the proposed PCI -- elective PCI program on your particular program?

HEARING OFFICER YANDOW: And if you could come up to the mic. whoever answers?

MR. LAZARUS: Yes. And please introduce yourself the first time?

DR. KIELY: I'm Dr. Sharon Kiely, Chief Medical Officer at Stamford. Could you repeat the question, please?

MR. LAZARUS: Sure. Considering the fact that over the past three years, there have been only a minimal number of transfers from Greenwich Hospital to Stamford Hospital, can you provide some discussion as to why you feel there is a direct impact of this proposed elective PCI program on your particular program?

DR. KIELY: I think on a couple of grounds. I think that first of all, we talked a little bit about the referral patterns within the community, and

how flexible those are. We've also pointed out that a third of the cardiologists on our staff have privileges at Greenwich. So I don't believe that the cases that went to Yale couldn't have been done at Stamford. I don't understand why that didn't happen, other than the referral patterns that were in place, and as I've pointed out, I think there's an opportunity for us to work locally with the patient's and the medical staffs collaboratively to think about ways to deliver care locally.

MR. LAZARUS: They mentioned that you have -- a third of the physicians have privileges at Greenwich Hospital?

DR. KIELY: Of our cardiologists.

MR. LAZARUS: Of your cardiologists?

DR. KIELY: Correct.

MR. LAZARUS: Why have they not been transferring their patients to Stamford, you know, for the past three years? What would change?

DR. KIELY: Yeah. Several of our cardiologists admit -- hospitalize patients to the hospitalist service. And I will point out in Dr. Howes' chart, where he pointed out that the top physicians who were pointing out this exact point, that the medical

staffs are distinct, 12 physicians on that list were hospitalists. Those are employees of Stamford Hospital that admit any patient, whether they are, you know, have a physician on staff at Stamford or Greenwich, or if they have no physician or are uninsured. So they take care of our clinic population, any patient that comes to the hospital. That's why they have such a large volume. And on that list 12 physicians were hospitalists.

MR. LAZARUS: And what about the cardiologists that you mentioned, do they refer to Stamford from Greenwich Hospital?

DR. KIELY: Did they refer to Stamford from Greenwich?

MR. LAZARUS: Like the patients that may have required certain services?

DR. KIELY: Yes. Certain of them do. Doctor Schuster (phonetic), a couple of others.

MR. LAZARUS: Okay. And that includes the volume that was transferred, say, the last three years?

DR. KIELY: I don't have those data, so I wouldn't be able to know who those 50 patients were that left. I would have to clarify that.

MR. LAZARUS: Okay. Following up on that question and your statement of being collaborative. The

applicants had brought up the matter having discussions with Stamford Hospital regarding a collaborative cardio program, almost like a regional approach. Can you, or somebody from Stamford Hospital, talk about -- give us details on that and talk about what happened?

DR. KIELY: Sure. I was not directly involved in these deliberations, so my colleague, David Smith, is here. David is referenced and he's here to speak about that. But I think essentially the discussions didn't go further. We have a partnership, as you know, with New York Presbyterian. New York Presbyterian knows about this. And we had asked to have some time to work with our current partner. We felt -- we had worked with them over all the years. It wasn't really something that we were going to, you know, turn our back on without exploring further, and those negotiations have not taken place, those discussions haven't taken place. But if you'd like, David certainly can answer more about that.

MR. LAZARUS: Sure, that would be great.

HEARING OFFICER YANDOW: OHCA calls Dr. David Smith to the stand.

MR. COWHERD: Just a correction for the record. Mr. Smith is not a doctor.

HEARING OFFICER YANDOW: Oh, I'm sorry, David Smith to the stand. Can we swear the witness and please?

(Witness sworn)

COURT REPORTER: Please state your name for the record.

MR. DAVID SMITH: David Smith.

COURT REPORTER: Thank you.

DAVID SMITH

having been called as a witness, having been duly sworn, testified on his oath as follows:

MR. SMITH: So, in answer to your question, we have been approached by Greenwich Hospital to support their application for a freestanding elective angioplasty program and on further reflection, we got back to them and said that we would consider supporting only within the context of a regional program, a regional collaboration, that benefited both the community at large and also help support our full-service programs, specifically our open-heart surgery program. And so we began a process of discussing how that collaboration might work.

At the same time, we had expressed some concern with our existing partner, New York Presbyterian, and began to develop a process for vetting out what those concerns were and seeing if there was an opportunity to enhance that relationship. So parallel tracks. And the relationship, the discussions with Yale, then proceeded to the development of a set of principles and a draft term sheet, which I had indicated Yale did a good job of actually addressing our concerns, however, I did then also indicate that we needed to continue to vet that set of terms and talk about internally how this program could be enhanced further to support the open-heart program. And that we don't exit existing partnerships lightly, that we had an ethical responsibility to continue to discuss with New York Presbyterian and Columbia, how they could further support our program.

And that in any case, for us to continue discussing the application would need to be withdrawn because there would be a new application where we are part of it. So, when the hearing was scheduled, we received an updated set of terms. I indicated that our CEO was on vacation, couldn't you know, really reflect on those terms, and that we needed to proceed with both these discussions to get to a point where this

collaboration could be really conceptualized and quantified. And that would be beyond any time that the hearing called for.

And that we needed to continue these discussions with New York Presbyterian and had a number of meetings scheduled. We needed to play out the process to really decide for us and for the community what was the best option for the hospital.

HEARING OFFICER YANDOW: Mr. Smith, could you just give us what your title is now? A little bit of your background and how -- what your experience is that you've based your opinion on and your role with Stamford for the intervenor?

MR. SMITH: Again, my name is David Smith, I'm a Senior Vice President for Strategy and the Chief Strategy and Network Development Officer. I've been with Stamford Hospital for 10 years. I've been a Senior V.P. for Strategy for the last 25 years in three different organizations and have worked with a number of hospitals and organizations to develop joint ventures and collaborations, both here and in Maryland.

MS. KIMBERLY MARTONE: So Mr. Smith, in your opinion, with or without the proposed program, these collaborations could continue and with the open medical

staff with transferring of patients, so there should be no reason why there wouldn't be a collaboration between the two hospitals? Or the hospital and the medical staff?

MR. SMITH: Well, there could be, although we would have to take a step backward there because given -- in light of the fact that these negotiations were to be confidential and not disclosed without mutual consent, I think we would have some concerns moving forward.

MR. LAZARUS: That's all of the questions I had for the intervenor.

HEARING OFFICER YANDOW: And, Mr. Smith, if you would please just -- you don't have to stay at the witness stand, but please stay at the hearing. There may be cross-examination later, but applicants' counsel.

MR. LAZARUS: I have a few questions and I'll start with Ms. Borgstrom. I don't know if you have your prefiled testimony in front of you? I'll try to cite the pages.

MS. BORGSTROM: Okay.

MR. LAZARUS: Starting at page 632, the first question involves a clarification. I know several times in your prefile, and this happened to be one of the times that other prefilers as well and witnesses, and a

couple of times when we see an application, it's referred to this particular CON as a satellite program of Yale-New Haven Heart and Vascular Center. And I understand that's probably some form of an internal thing, but this particular CON is not actually a CON for Yale-New Haven Hospital and Greenwich Hospital, it's not going to be on Yale-New Haven's license as a satellite location, it's going to be under Greenwich Hospital's license for service if approved?

MS. BORGSTROM: The provider number is Greenwich Hospital's provider number. If that's what you're asking?

MR. LAZARUS: Yes. Okay. I just wanted that clarification. Thank you. Also, on your testimony you state that -- I'm saying on page 632 that our vision for Yale-New Haven Heart and Vascular Center is to develop cost effective services in certain geographic locations, which will ensure delivery of high quality of patient care. Can you please explain what you meant by certain geographic locations, and if you could provide some sort of example for that?

MS. BORGSTROM: Well, our aspiration for certain of our service lines is to have a broad geographic service area. In some cases it's throughout

the state of Connecticut and in other cases we're looking at other collaborations, so it is not specifically defined. You know, I think it was to avoid being audacious and, you know, having a vision that went beyond what we could comfortably do. But, you know, it is with the belief that taking variation out of care consistency by having some of the key providers be the same in both providing oversight and providing the actual service can enhance care.

MR. LAZARUS: And so certain geographic regions, they would depend on type of service?

MS. BORGSTROM: It would depend the type of service and it would also depend on the opportunities for collaboration.

MR. LAZARUS: From page 632 and onto page 633, you say the proposed Greenwich Hospital meets -- the proposed program at Greenwich Hospital will meet or exceed all the programs, you know, requirements identified by professional organizations. When you state, meet or exceed the program requirements, and when you elude to say, and this duplicates EHE (phonetic) and ACC, do you -- is the goal to let the minimum proposed guidelines, or is this more towards the ideal as when you're talking about quality, in this particular

statement?

MS. BORGSTROM: I would defer that to Doctors Cabin and Howes to be that precise about your question, if that's all right?

MR. LAZARUS: That would be fine. But I just want to know, when you were doing your prefiled testimony what is it that you meant in that?

MS. BORGSTROM: What I meant was that we would meet or exceed the minimum guidelines for these organizations.

MR. LAZARUS: Thank you. And I will follow-up with that with Dr. Howes.

MS. BORGSTROM: Thank you.

MR. LAZARUS: Why don't we just switch over to Dr. Cabin at this point?

MS. MARTONE: One moment Ms. Borgstrom, I just have one question.

MS. BORGSTROM: Oh, yes.

MS. MARTONE: I'm sorry. He's moving very quickly. In terms of you had made a statement when you were testifying in terms of collaborating in good faith with Stamford Hospital. Did those discussions and collaborations also mean you worked in good faith with New York Presbyterian? Were they involved in the

conversations? Was there any discussion at all held? Or was it just between -- maybe, who were the entities at the table? Maybe I want to say it that way.

MS. BORGSTROM: You know, and I was not personally at these, but the discussions were among Greenwich Hospital, Stamford Hospital and Yale-New Haven.

MS. MARTONE: Okay. And that's physicians, management, all-inclusive, I'm assuming? Cardiologists and so forth? Or is it just --

MS. BORGSTROM: Yes, I believe that's correct.

MS. MARTONE: -- okay. All right. Thank you.

MR. LAZARUS: Dr. Cabin, good morning.

DR. CABIN: Good morning.

MR. LAZARUS: Can I direct you to your prefiled testimony, page 636? First of all, let me just back up a little bit. Ms. Borgstrom had responded to a question talking about what the goal would be as far as looking at national organizations and looking towards minimum guidelines, exceeding minimum guidelines. Are you of the same thought?

DR. CABIN: So, I think the minimum guidelines basically are defined by the threshold at

which outcomes are similar regardless of volume. So I think that the two issues are really the same issue. The societies say that if you achieve this minimum level then your quality, based upon studies that compare numbers of cases done at different hospitals, are comparable. If you're below that minimum, then there are issues that are raised as to whether or not your outcomes would be comparable based upon, you know, looking at large studies.

So, in my mind, what minimum means is that if you achieve that number, then you are ideal. Your outcomes are comparable to a program that did five times as many.

MR. LAZARUS: And is that -- I mean, I understand that. Is that also the goal of WNNHB? Is that like the goal, you know, for quality, you know, that was one of the statements in there I've heard, you know, that -- is that to ensure the proposed program is to exceed -- is that the quality of that aspect or is it just meeting the minimum is the goal at this point?

DR. CABIN: I'm not sure I understand the question.

MS. MARTONE: Well, what we're trying to get at Dr. Cabin is the fact that the guidelines, you

know, specifically say that institutions with a volume of fewer than 200 procedures per year, and we're actually looking at 50 actual transfers, unless in a region that is under served because of geography should carefully consider whether it should continue to offer this service. So that's kind of what we're looking at. That's a minimum standard. In looking at what the proposed program we're not really getting to even the minimum. So if you could address that concern?

DR. SMITH: So, I think the proposal is based upon an expectation that we will exceed that minimum number. And that's documented in a variety of prefiled testimonies that have been submitted. I don't think -- I know we wouldn't be going forward with this if our expectation was that we wouldn't do that number of cases. Based upon the transfers, you're absolutely right, and that's not what we based our projections upon. That's part of the projection, the other parts of the projection are based upon the fact that many patients are sent for cardiac catheterization's elsewhere because the physicians who refer those patients want to have everything done at one sitting. And I know that to be the case because they told me that, they'll send them to me at Yale. That doesn't show up. A patient who is seen

in a doctor's office in the Greenwich service area and calls me when I'm at Yale and not a Greenwich and says, this patient wants the procedure done at Yale, that wouldn't be considered in that 53 cases.

MS. GROVES: Just for clarification, she said to meet the 200 we only have 50, the existing primary cares are included in that 200 as well.

MS. MARTONE: Yes, the 30 currently being done?

MS. GROVES: Yes.

MS. MARTONE: The primary --

DR. CABIN: So, it's based upon what we're referring out, what the PAMI's are, and what our expectation is of patients who are cared for by Greenwich referring physicians who send them elsewhere, either to New York or to Yale, and also new docs, and that's been documented by the supporting letters that have been submitted.

MS. MARTONE: -- right. So then in essence, we're shifting volume from existing providers to a new program to be offered in the state?

DR. CABIN: Yeah. My sense is probably they would be shifted from high-volume programs in New York and from Yale. That's my best judgment having

worked for years in that Greenwich area, as well as working at Yale. That Yale will lose some cases, Columbia will lose some cases, New York Hospital will lose some cases. I don't anticipate any of the adjacent programs, certainly not Stamford, as you've pointed out in your questions, there are no referrals essentially, from Greenwich Hospital to Stamford Hospital. And so would we take something out of White Plains? Possibly. But I think that most of the patients would be coming out of the high-volume programs that I mentioned.

HEARING OFFICER YANDOW: Just a question. You made reference to other prefiled testimony and letters of support. Is there anything else that's been filed that you're aware of that would support your testimony?

MS. GROVES: I think the prefiles --

HEARING OFFICER YANDOW: Of the testimony.

MS. GROVES: -- the testimony and the exhibits including the letters?

HEARING OFFICER YANDOW: The letters. Is that yes, made up of the letters and testimony and stuff? I just didn't know if there were other attachments that specifically supported what your testimony is on that question?

DR. CABIN: I would include the entire scope of what we're looking at.

HEARING OFFICER YANDOW: Yeah. We'll look at the whole -- right, but I was just looking for a little -- if you had any direction, we look at everything and give it careful consideration.

MS. MARTONE: So, Dr. Cabin, just to confirm in your clinical opinion, so the clinical need for this proposed program is basically based on the fact that you know, or you've spoken to your own patients, and other physicians' patients, that would prefer to have all of their cardiac services done in one place, is that my understanding?

DR. CABIN: Yes. Yes. That's essentially what I'm saying. And the fact that I and Chris and others in our group, are in Greenwich Hospital on any given day, the Yale full-time intervention cardiologists are there because of the acute M.I. need, and we do a cath. and we can't do the elective angioplasty and now we have the backing of the national organization saying that it is okay, to me it makes no sense that we can take care of the sickest, but we can't take care of the elective patients, particularly since that's now sanctioned and exists in most other states in the United States.

MS. MARTONE: Okay. One more question, Doctor. Now in terms of access being limited, which there's been a lot of testimony about, this is an elective procedure where you have 72 hours, and correct me if I'm wrong, in your clinical expertise that patients have 72 hours to get to another program, which obviously I'm assuming is not a problem in getting to Yale from Greenwich in 72 hours. Could you address that, being an access issue?

DR. CABIN: So, you know, I think it's, you know, if you can do it at Greenwich with the exact same docs and the same safety that they would have at a place that's 30, 40 miles away, then to me it makes no sense to do that transfer. You could, you know, I've seen you at many, many hearings, for many, many years, and, you know, we used to have a limited number of programs and Yale would sit here and say, why do we need these other programs because people can drive -- and the Commission has consistently said that having local access is important. That was what was said at the Stamford hearing Danbury, Waterbury, all of those hearings that I was part of and you were part of, and the Commission has consistently said sure, you could drive from Waterbury to Yale or Danbury to Yale or Stamford to Bridgeport, you

know, and yet local access has been something that the Commission has valued. And we are now coming and saying that Greenwich also deserves that opportunity.

MS. MARTONE: And local access isn't there even with the provider six miles away and another one 11 miles away?

DR. CABIN: Right. There are a variety of reasons why patients are transferred to the hospitals that they are transferred to. It can be patient preference, physician preference and for whatever the reasons are -- we could get into that if you want, the patients are not transferred from Greenwich to Stamford.

MS. MARTONE: Okay.

MR. LAZARUS: Now, back on page 636, the second paragraph, first line. You say, not all hospitals are equipped to offer safe, high-quality, elective angioplasty services. Can you please explain what you meant by that statement?

DR. CABIN: I think that we truly value the uniqueness of what we've done at Greenwich Hospital, what Yale-New Haven Hospital and Greenwich Hospital have done in providing the exact same physicians for doing the cases at Yale doing them at Greenwich. So not only will

the Yale physicians be providing oversight by being directly there and not at a distance like some other tertiary center supervised programs, but we actually are embedded in the hospital in which we are talking about. And to me, that generates a level of quality that is unique.

MR. LAZARUS: Can you provide open samples of hospitals in Connecticut that would not fit that statement?

DR. CABIN: Yes, I could, but I won't.

(Laughter)

MR. LAZARUS: Thank you.

HEARING OFFICER YANDOW: Is that -- I mean, do you -- he's choosing not to answer. Is that --

MS. GROVES: Is that information that -- if that's information that's relevant we'll absolutely --

MR. LAZARUS: No.

DR. CABIN: You had a smile on your face, so I figured you didn't really want me --

MR. LAZARUS: No. It is a question, but if you -- feel free to answer if you wanted to, but, you know, you don't have to.

MS. GROVES: (Indiscernible, talking over each other) the types of hospitals that might not be --

DR. CABIN: -- I think there are different levels of oversight that, you know, each of these programs that have come to you have said they are sponsored, or supported, or mentored, or supervised by a tertiary center. And I think that what Yale-New Haven has done is unique. I don't think there's any other center, maybe there's one, but where the actual doctors themselves are embedded in the practice at that hospital from the mentoring, the supervising, or whatever you want to label that hospital, each one of those programs I'm hearing that doctors from tertiary centers who never set foot in the hospital testifying as to the level of quality that would be existing at that hospital. I don't know that any other program has come before you where somebody like myself, who is a professor at Yale, and runs the program at Yale, actually sleeps overnight at Greenwich Hospital on a regular basis, or Chris Howes, who comes up 40 percent of his time at Yale.

MS. MARTONE: And that's how you operate all of the satellite programs?

DR. CABIN: Yes. In the heart and vascular. I can't speak to --

MS. MARTONE: Right. Yes, I know, heart and vascular. Thank you.

DR. CABIN: -- there may be others, but that's the one I'm in.

MR. LAZARUS: I'm all set. Thank you. If I can have -- I have a couple of questions for Dr. Howes. Good morning Dr. Howes.

DR. HOWES: Good morning.

MR. LAZARUS: If I could point you to your prefiled testimony, page 671? You state on page 671 that these physicians have committed to bringing 80 to 105 angioplasty cases per year. Can you please tell us where these 80 to 105 cases currently are being serviced?

DR. HOWES: I can't say with specifics, but I can probably surmise, and you know, I think I have a pretty good sense of the, you know, local environment. Two specific physicians that have written these letters. One of the physicians currently does all of his procedures at New York Presbyterian, that was the smaller number. The other physician is an interventional cardiologist for a, you know, very large, multi-center, multi-specialty group in the Westchester area and he does cases at White Plains and at New York Presbyterian and I would be misleading if I could really tell you what the breakdown of that was, but my personal instincts is the majority of those cases are being done at New York

Presbyterian at this point. But I don't have any definitive data. Can I ask someone who has had some other discussions?

HEARING OFFICER YANDOW: Well, why don't you just tell us who, and then if we want to call that person, but you --

DR. HOWES: Okay. Some of our administrators, Marc Kosak and Brian Doran, had more specific conversations with those physicians. They might be able to say more about that.

HEARING OFFICER YANDOW: -- okay. And if we need to call them we will.

MR. LAZARUS: We'd be happy to. okay. All right. Thank you for now. And on page 671 you state that this will reduce costs of angioplasty care. Can you please elaborate a little bit on that and provide a better understanding to us of how this will reduce cost?

DR. HOWES: Right. It kind of echoes what Dr. Cabin was saying. All of us, we really want to do the best by patients and I think although there's kind of a political feel to this at the end of the day, we really are interested in patient care. And I don't think anyone in this room would compromise the patient's well-being for any of this, for volume or any of that. But that

said, we have patients that we call elective angioplasty. And sometimes those patients coming to the emergency room with stuttering chest pain and EKG changes and positive troponin, they're having a heart attack. And Ms. Martone, you're right, but technically by some criteria you can say that this could wait for 24 or 48 hours. But no interventional cardiologist in North America would wait 48 hours. We'd do an angiogram, we'd get to the bottom of it, we'd find out whether they have medical disease, cardiac surgical disease, or interventional disease.

Currently at Greenwich if that patient has ST elevation we can do an angioplasty, 20, 30 minutes later they're in the ICU, their family is there and we tell them, we aborted the heart attack. The same patient, but it's a circumflex artery and they have ST segment depression, we have to stop, we have to say, listen, we don't -- we have the capability, but we can't do it in the setting. We have to arrange transfer through an ambulance or a helicopter. We have to, you know, so there's obvious costs right there. And then there's the redundancy of care. They're going to a new hospital, they get admitted by a new nursing staff, a new medical staff, and even though we're the same group of

physicians it's reinventing the wheel for that patient and then the trauma for the family that has to, you know, travel.

And whether they have to travel five miles or 50 miles, it's a trauma. They have to kind of leave that hospital and go to the next hospital. So there's psychological costs on family, but I think you can see some of the medical costs there of the transportation costs, and the re-admitting the patient, and then they're going to go to another care plan. You have to open up another packet, it's another procedure, and you know, we have left the sheath in the artery most of the time so they can just pick up where we left off, but they're restarting the procedure. It's an inefficient redundancy.

MS. MARTONE: Now, is that because of the STEMI criteria that are established or your own protocols at Greenwich on angioplasty or both?

DR. HOWES: No. The private protocol, you know, what we were approved by this Board, you know, whenever that was, eight years ago, we have privilege to do primary angioplasty. And it's very strict criteria and as you know, we've had these discussions ourselves. We stick by those criteria, we respect the requirements,

and often the majority of patients who have a heart attack don't have a STEMI, they have a non-STEMI.

MS. MARTONE: And could you offer some expertise in terms of the new hybrid OR's that we're hearing about?

MS. GROVES: I'm sorry, before you answer the question --

MS. MARTONE: Yes?

MS. GROVES: -- is it okay if Ms. Borgstrom leaves? Do you guys have more questions of her, or should we have her stay?

MR. LAZARUS: We do have some questions that are of a general nature, but they go to the overall need of the application. So as long as, I mean, we feel that she may be the best person, but --

HEARING OFFICER YANDOW: I think right now we're going to wait until we finish with that question --

MS. GROVES: Okay.

HEARING OFFICER YANDOW: -- and then we will -- I mean, we'll leave some questions for the end of the hearing and then I will leave it up to you whether you want to, you know, that's a decision you want to make. But I think we may need her available for the questions that are coming and we are trying to -- we are

aware --

MS. GROVES: I understand. I'm sorry for interrupting. I just noticed the time. I'm sorry.

MS. MARTONE: Because the hybrid OR's appear to be a new advancement in technology, I don't know if that -- if that advancement would alleviate somewhat of this issue? So I just wanted your expertise on that.

DR. HOWES: I don't think it would have any impact on Greenwich Hospital, because, you know, if you're talking a hybrid OR then you're talking, you know, full-service program with open heart surgery capabilities. And I know Dr. Gray mentions it in his testimony, and I agree, there are cases where a hybrid case has advantage to one or the other. I think those cases that are going to have complex multi-vessel coronary disease, those are patients that we did not include in counting our numbers, those are patients that would still transfer. Those are patients that are reported in the C-PORT Study represent about 12 percent of the total population of PCI patients. There will still be some patients that are either too complex, too high-risk, or need something else that wouldn't be done at an elective center and I don't know, maybe not even

done at Stamford Hospital. Those patients might be going to New York Presbyterian right now.

So there's a role for it, it's an evolving role. You have to always sort through whether it's marketing versus a real need, but there certainly is some role for it.

MS. MARTONE: Thank you.

MR. LAZARUS: On page 672, you say, increased utilization of existing cardiac catheterization and angioplasty infrastructure is completely consistent with health reform and efforts of OHCA to improve assets and financial feasibility. Please provide a little discussion on that as far as what you base that on?

DR. HOWES: We have a full-service cath. lab that's very up-to-date. It's all -- not all, most every technology that's needed during acute intervention, because we do primary angioplasty, these are very sick patients, we've got to be able to take care of them. But the rest of the day that lab is sitting there and as Dr. Cabin said, we're full-time interventional academic cardiologists, but we're not doing elective angioplasties. The cath. lab team and the cath. lab equipment is not being fully utilized.

As this application clearly states,

there's really no incremental capital costs to moving forward with this project. All of the resources are there, so that seems like a better utilization if we can do more procedures. And from a very personal perspective I think we do a very good job. I take pride in my work, but we are limited by the fact that we do between 38 and 40 cases every year. And I really think our staff would be better if we could do elective cases as well.

As it is, again, as Dr. Cabin has said, in a very unique way our entire staff, not just our physicians, but our nurses, our x-ray techs, our scrub techs, they all go to Yale on a routine basis, because we feel we need to do that to maintain their criteria.

If you look at the ACCNCDR documents only 18 percent of all electric hospital, all elective programs, farm out their staff to keep them up to skills. This is a very unique relationship that we take seriously. And I think doing more volume and more cases will make us better.

MR. LAZARUS: Just a quick clarification. The two letters that you submitted in the part of your exhibit as part of your testimony, those physicians are not here today, right?

DR. HOWES: That's correct.

MR. LAZARUS: All right. Thank you.

DR. HOWES: I think we had relatively short notice. And they are fully clinical physicians. I think they had patient, you know, requirements.

MR. LAZARUS: Thank you.

HEARING OFFICER YANDOW: I have a couple questions. What's the plan if you need backup?

DR. HOWES: We already have backup. You know, again, we're a hospital, we have an emergency room, we have patients who have aortic dissection. It has nothing to do with angioplasty, but they need to get to the OR as quickly as possible. We have long-standing relationships where we have had to transfer patients during an acute MI. It turns out they have left main disease. So it already is in existence, and we have transfer arrangements with Westchester Medical Center, one of the forgotten entities in this whole discussion, they are in the neighborhood. We have some relationships with Greenwich, and I think there was to pursue that further and that might be --

A MALE VOICE: I think you might mean Stamford.

DR. HOWES: -- Stamford, and then obviously we have very strong transfer relationships

actually to New York Presbyterian and to Yale-New Haven Hospital. So we have arrangements to transfer patients to lots of centers. And we do it, it happens not infrequently already, not because of a complication in the care plan, but because of the clinical necessity of medical patients and we're actually fairly facile at transferring these patients out.

HEARING OFFICER YANDOW: Regarding the EMS, do you know who your primary service area responder is?

DR. HOWES: EMS?

HEARING OFFICER YANDOW: Yes. To deliver by ambulance transport?

DR. HOWES: Gems is the primary one for Greenwich and then the Westchester communities have similar --

MS. GROVES: I don't think she means to get to the hospital, who transports and things like that.

DR. HOWES: -- oh, Access Care and -- they're one transfer, and we have very strong relationship with it. They actually have an on-site presence at our hospital. And then Life Star is another entity that, you know, the air support.

HEARING OFFICER YANDOW: So you would work

with the EMS coordinator at Yale on the transport?

DR. HOWES: We do that because Yale has to know about the transfer, but we actually at the same time are taking on the transfer part from our end already. And, you know, like I said, we have very direct relationships with Access, the ambulance company that transports these patients already. And similarly, in less frequent occurrences with Life Star, which provides helicopter transport.

HEARING OFFICER YANDOW: Okay.

DR. HOWES: And, you know, we initiate those transfers at the same time that we're communicating to the referring hospital. And again, it could be -- not referring, the receiving hospital, and again, it could be Westchester Medical Center, it could be Columbia, it could be Yale.

HEARING OFFICER YANDOW: Okay. And perhaps you're not the one to answer this, but as far as on an emergency transfer and who's called regarding the statutes and regulations on transport, has any of that and consider?

MS. GROVES: I'm sorry. (Indiscernible, talking over each other).

HEARING OFFICER YANDOW: My question is

just, I mean, I know there's a letter and I believe it's attached to Dr. Howes' testimony from maybe Access --

DR. HOWES: It's Access, yes.

HEARING OFFICER YANDOW: -- and I just -- and Access -- it starts with the PSA responder and who should be called in an emergency. I'm just wondering, has that been discussed and considered?

MS. GROVES: (Indiscernible, too far from mic.).

DR. HOWES: No, no, no.

MS. GROVES: The PSA responder would be if you had to call through 911, but this is for transfers. These are arranged?

DR. HOWES: Yeah. This is what these companies provide as a service. They provide inter-hospital transfer and that's going on on a regular basis already. And we have these established relationships and, you know, not infrequently we transfer patients urgently and emergently already.

MS. GROVES: It's arranged transfer, different than if you were to pick up the phone and call 911, you're getting the primary service area responder, which would be Gems or Sims (phonetic) versus an arranged transfer and short of an emergent situation that occurs

during medical care, correct?

DR. HOWES: Yes.

HEARING OFFICER YANDOW: Any other questions of Dr. Howes?

MS. MARTONE: No.

MR. LAZARUS: Thank you. I have a couple questions of Mr. Corvino. Good morning Mr. Corvino.

MR. CORVINO: Good morning.

MR. LAZARUS: On page 681 of the prefile, you state, that this program will reduce overall costs of angioplasty care in the Connecticut health system. What did you mean by that when you state that?

MR. CORVINO: In addition to what Dr. Howes has already said, you know, when we talk about transferring patients out there is a cost to that. And I think he articulated very well in that we've got to redo another admission and there's an ambulance charge to transfer the patient. So we calculate the value of that to be somewhere around $8,000. And if you multiply that by the number of cases we transfer out it's close to half a million dollars that could be saved. Without counting all of the subjective savings that would go into the patient's psyche for not having to be transferred.

MR. LAZARUS: What's the percentage of

patients that come in for cath. or some sort of a need, an elective that's considered to be emergency transport?

MR. CORVINO: I don't have that number. Does somebody else have a number?

MR. LAZARUS: I know you mentioned -- for example, in 53 cases, for example, you have based your testimony on, those 53 cases, what's the total number of cases that you put those 53 cases on?

MS. GROVES: Are you talking about the number that still need to be transferred anyway and wouldn't be able to stay?

MR. LAZARUS: Well, is that what you're referring to in your testimony, when you say emergency transport?

MR. CORVINO: Procedures that could not be done at Greenwich under the current regulations.

MS. GROVES: Under the current protocols.

MR. LAZARUS: Okay. Under the current protocols. But I'm saying, considering that this is an elective procedure, not every -- not every procedure that can be done at the hospital is considered an emergency transport, am I correct on that?

MR. CORVINO: Can Chris answer that? He's got more expertise.

MR. LAZARUS: Sure.

DR. HOWES: Again, when we use the term elective, it is a misnomer, I mean, no one elects to have a heart procedure, you know, this is serious stuff. And there are different things. Patients who come in with an acute coronary state syndrome and are sick, and you know, may end up hypotensive with a balloon pump, they're still being called elective angioplasties in this realm, in this discussion. So they're not all elective. Now, that said, some of them are much more stable and in fact are outpatients. I would say about half of the outpatients that we do a diagnostic cath. on in Greenwich, we end up transferring because we've already put, you know, entered arterial access, we have access to the arterial system, we transfer them and they'll end up getting the angioplasty the same day. The other half, we stopped, we regroup, and they go back up to New Haven or to New York Presbyterian some other day. So that's of the outpatient elective angioplasties, about half of them.

And then about half of those patients are actually inpatient, you know, not stable patients. So I'm making these numbers up, I don't have them off the top of my head, but my sense is of those, 53 number that's being reported, I would say about three quarters

of those patients go by ambulance or helicopter or something like that. Does that answer, what your asking?

MR. LAZARUS: That helps, yes. That gets it. Thank you. Mr. Corvino, are you -- let's just say those 53 cases you mentioned, you said there is about an $8,000 cost. $1,000 for the transport and about 7,000 for the admission and angioplasty. What's made up of the $7,000 cost that you're talking about?

MR. CORVINO: You know, that's the -- that's the charge, the average charge that goes along with that procedure.

MR. LAZARUS: Would that charge --

MR. CORVINO: And, you know, it may not be one-to-one with costs at the second facility we're talking about.

MR. LAZARUS: -- would there not be a charge at your facility if the service was here?

MR. CORVINO: But it would be much less because of the lack of transportation cost.

MR. LAZARUS: So it would be a savings of $1,000, not 8,000?

MR. CORVINO: Yeah, but you're also duplicating services at the other place.

MR. LAZARUS: Okay. So you're duplicating

services, I understand --

MR. CORVINO: Plus transportation.

MR. LAZARUS: -- but only the charge for the angioplasty, if it was approved, an elective angioplasty at Greenwich Hospital would be less than 7,000?

MR. CORVINO: I don't know that we have a charge code for that yet.

MR. LAZARUS: You also made a statement on the same page that, you know, we're committed to provide services that our community have come to rely on us and will need in the future. Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?

MR. CORVINO: Well, yes. I mean, we've done many community needs assessments throughout the years. Clearly, cardiology is a very important part of any institution's make up. And with the growing population and the incidence of heart attack in the U.S., you know, it's clear to us that we, you know, we have to improve and make sure that we've got all of the services that our community relies on on a regular basis. And we have saved many lives through the primary angioplasty

program from the communities we serve. And clearly, as Dr. Howes mentioned earlier, if we are able to do elective it'll make us better.

If you go back to when United Hospital closed in New York, about seven or eight years ago, we saw a huge increase in usage of our emergency room to the point where we went from 15 percent of our patients coming from Westchester to now 43 percent of our patients coming from Westchester County in New York, that made us a better institution. It made our emergency room better. It made our clinicians better. And we anticipate the same thing will happen here.

MS. MARTONE: Now, Mr. Corvino, to your knowledge the incidents of heart disease you just mentioned, is it higher in the Greenwich -- the Greenwich service area compared to other areas of the state?

MR. CORVINO: You know, I don't know the answer to that question. But what I can tell you is that when you look at heart disease and the potential for heart attack that's probably, number one, what frightens patients the most. And we've, you know, we've noticed that even through some of our fundraising efforts, even if people are affiliated with a New York hospital and they live in a local community they're are going to rely

on that local community to deal with their heart attack, if you will, in the middle of the night. They're not going to be traveling to another place. So having a strong heart program really bolsters your position in the community's eyes as a really good institution.

So regardless of whether the incidents is higher or lower, if you've got the illness you want to know that the very best is available in your community.

MR. LAZARUS: When was the last time, Mr. Corvino, a community needs assessment was done? Because you mentioned there were several done.

MR. CORVINO: I would say in the last three or four years.

MR. LAZARUS: And does it specifically discuss cardiac services?

MR. CORVINO: Yes.

MR. LAZARUS: Would you be able to provide OHCA a copy of that?

MR. CORVINO: Sure.

MR. LAZARUS: OCHA would like to accept that as --

HEARING OFFICER YANDOW: Okay. I'd like to order that to be produced. How much time do you need to produce that?

MR. CORVINO: A couple of weeks?

HEARING OFFICER YANDOW: Okay. Two weeks from today then?

MR. LAZARUS: Two weeks from today? Okay. And we'll call that Applicant Late File 1.

Again, you state in your prefiled testimony that, you know, we need to ensure providing care in a cost-effective and efficient manner. In relation to that, could you please state to whether you think a service that may be an additional program, for example, elective PCI in the region, would that be considered cost-effective, and/or how would you consider that to be efficient?

MR. CORVINO: Well, I think that having patients be treated in their community where they go for services and not having to leave the community and have a lot of duplication is very, very important. And there is a significant amount of cost savings when patients don't have to be transferred.

You know, I -- you know, I come to you today as the CEO of Greenwich Hospital, but I also come to you as a patient and I just want to relate a story, which I related the last time we were here. In 2005 I was one of those people who had chest pain, who went to

Greenwich Hospital, who was catheterized by Dr. Howes, who was asked if I had chest pain at that moment and I gave the correct answer and said no and was shipped to Yale-New Haven in an ambulance. I can't tell you what that experience is like unless you've experienced it yourself. You've got a catheter through your groin into your heart, your being moved in an ambulance 45 miles, you don't know what the outcome is going to be, your family is worried, they're following you -- they're trying to follow the ambulance, you get to a new place, okay? And Dr. Cabin is there to do the procedure. It just makes no sense in terms of efficiency, in terms of the burden we put on patient's. If we were not doing the difficult primary angioplasty cases you could make an argument that we're not, you know, potentially we're not equipped to do this. But how can we prevent us from doing the easier cases if we're doing the elective cases -- if we're doing the more difficult cases? It just makes no sense for patient care.

And until you've been in that position it's really hard to understand that we're not just talking about numbers here, we're talking about patients and families' experience and that is very, very important. If you can have that procedure done by the

same clinicians the first place you go without two or three hours of delay, and then repeating the whole process, that is the right thing to do for people. And in my mind, that's what it comes down to.

MR. LAZARUS: Thank you.

MS. MARTONE: Now Mr. Corvino, if your cardiologist had privileges at Stamford would you have chose to go there as opposed down to Yale?

MR. CORVINO: You know, I'm not sure it's an issue of my choice. I think that in my position, I'm going to go to Greenwich, no matter what, you know?

MS. MARTONE: Yes, yes.

MR. CORVINO: And if that doesn't work, I'm going to New Haven, which is exactly what happened.

MR. LAZARUS: All right. Thank you Mr. Corvino. Now I have a couple of questions and they're general need in nature. It's up to you who you want to address.

MS. GROVES: Frank.

MR. LAZARUS: Okay. The first question would be, why does Greenwich Hospital need to provide an elective PCI service considering that its patients have access in the region to the proposed services at Yale, Stamford, and nearby New York hospitals?

MR. CORVINO: You know, let me just -- Frank Corvino, let me just try on an answer. I guess you could ask the same question of why should we do brain surgery? Why should we do spine surgery? The issue is, this is a procedure that the community needs and wants on a regular basis. I think the numbers prove it out. And for somebody to not be able to go to their local hospital and get this service in today's environment, where it's pretty common now across the country, in our minds it's just not appropriate. If there are one or two patients a year, sure, they could get access everywhere else. But, you know, this is a significant life-threatening disease that I think we should be able to provide as a community regional institution who serve so many patients every year.

MR. LAZARUS: Well, considering the percentage of Greenwich Hospital patient volumes as received from New York, being Boulder (phonetic) Hospital, why does a new provider nearby in New York, about 11 miles away, that recently started providing elective PCI here does not effect Greenwich Hospital's projected volumes for the proposed program?

MR. CORVINO: Because we just looked at the patients that got transferred -- that we transferred

out, you know, we did not look at drawing from any other community.

DR. HOWES: And again, you know, service area is a geographic map and where the patients and the physicians go are completely different. I've been at Greenwich Hospital for eight years, and I'm actually the Chief of Cardiology at Greenwich Hospital, so I have a pretty good sense of who the docs and who the patients are coming from. Although 30 percent of the Stamford cardiologist may have privileges, to my mind there's only one Stamford cardiologist who ever comes to the hospital. I know him personally, I'm friendly with him. There is an open policy, but they're just -- they're two separate worlds. And White Plains Hospital, that's a third separate world. There has been no impact on any of the hospital's behavior, patient population with that White Plains, elective angioplasty program. It's a different environment. And I agree, in Nebraska hospitals are 300 miles apart. In this area people are accustomed to choice. Within 50 miles, they have six of the greatest hospitals in the world, so you know, it's a different kind of expectation of the patient's of the physicians.

MR. LAZARUS: Since the last decision, since the last time this came up, we realize the

guidelines have changed from making this service from class 3 to class 2B, and again, there's been an additional provider in New York that's come online. What else do you think that has changed that supports the need for this proposal that makes it different from, say, three years ago?

MR. CORVINO: You know, I think one of the main issues here is that it's become accepted in community hospitals, and we cannot meet our potential to our patients if we are not allowed to do this procedure. You know, I think we are handicapped, our cardiology department is being prevented from growing and we're not able to meet the needs of the patients who come to Greenwich Hospital. And I think in light of the new guidelines, in light of the fact that we've got Yale cardiologists and Yale trained staff sitting in our institution, more than ably being able to do this, and not being allowed to do it is just a disservice to patients.

DR. HOWES: Can I comment as well?

MR. LAZARUS: Sure.

DR. HOWES: About differences in the application? I think the fundamental difference is that last application, if you recall, we were postulating it

as a pilot program. It would be a completely Yale controlled program because at that time the guidelines were less firm that this is, you know, an acceptable course. Although it was being done and is growing nationwide, you know, as a class 3 indication, and clearly now it's class 2B classification, so there was some reluctance by referring physicians, and a lot of reluctance by other interventional cardiologists if they weren't going to be part of the application. The real difference here is this is now not a class 3 indication. I feel very strongly that the referring noninvasive cardiologists 100 percent support the hospital and the program, and that will translate into referrals. Not every patient every time is going to choose to go to Greenwich, some people will still choose to go to Columbia for sure. But a lot of patience and they're referring physicians will support a program like this.

And the second thing is, these interventional cardiologist who are showing their support through their letters. The last application did not have that kind of support of -- not caths., not theoretic prorations, but they are saying actual PCIs. And that's a big difference in the application.

MS. MARTONE: So you're saying that the

cardiology community is supporting a class 2B, which is in a class 2A, where the benefits outweigh the risks, the 2B, and correct me if I'm wrong, is -- might be considered? It's not a recommendation, it just might be considered under certain conditions. So the cardiology community feels comfortable with that, you're saying to your knowledge in Connecticut?

DR. HOWES: For our hospital.

MS. MARTONE: For Yale, I should say.

DR. HOWES: For our hospital, you know, our relationships and with that change, and that criteria. In addition, the C-PORT-E trial was published after that guideline. So that guideline came out even before the largest document ever on this topic and that document only reinforces the observation.

MS. MARTONE: Right, but to my knowledge, I mean, that's only one study. And there were differences in outcomes, correct?

DR. HOWES: Actually, statistically no, they had the exact same outcome.

MS. MARTONE: The opposing testimony had suggested there were differences in outcomes. Maybe you want to address that?

DR. HOWES: A study -- a study of 18,000

patients that doesn't show a P value of statistical significance, it shows no statistical difference. You can refer to trends, but no statistician would acknowledge it.

MS. MARTONE: Okay. But --

MR. CORVINO: If I could just add to the issue of need? We were turned down in 2000 because allegedly there was no need and since then two new programs have been approved and they are doing well. So, you know, I just wanted to put that on the record.

MS. MARTONE: -- Steve, are you all done?

MR. LAZARUS: Yes, I'm all set.

A FEMALE VOICE: (Indiscernible, too far from mic.).

MS. MARTONE: Yes. Ms. Borgstrom, I don't want you to think we kept you, you know, without asking you a question, but if you could just -- you can go back to a couple of questions ago where Mr. Lazarus had asked about the need for this program considering, you know, all of the evidence that's been presented, in terms of your position overseeing the system and looking at cardiac services on a regional basis, like a system, if you could address the need with those terms?

MS. BORGSTROM: I'm going to ask you to

clarify the question. You're saying that the need from the system's perspective?

MS. MARTONE: Yeah.

MS. BORGSTROM: Yeah.

MS. MARTONE: Yeah, please.

MS. BORGSTROM: I would say more the vision and the plan for our heart and vascular center, as for many of the other service lines that we are developing, is to provide services locally, where they can be done appropriately and safely because, you know, for as many generations of changes and projected changes we've been through in healthcare, healthcare remains fundamentally a local issue. You know, people will travel very selectively for services. And so, where services can be provided cost-effectively and safely locally from a system perspective, that's something that we want to endorse. What we are trying to do throughout the system though, is use the kind of oversight that Dr. Cabin referred to in the heart and vascular services, to look at consistency in practice, whether it's at Greenwich, whether it's at Bridgeport, whether it's at New Haven, or whether it's another program like Lawrence and Memorial where we're involved, because one of the things that has made healthcare arguably as costly and

fragmented as it is, is unnecessary variation. And so we also believe that this is an opportunity, and in fact, a responsibility to provide better care at lower cost by creating better guidelines and better consistency among our providers in the system. Does that help?

MS. MARTONE: It does. So just to clarify. So in terms of cardiovascular services, the system is looking at -- as opposed to centers of excellence, looking at satellite programs that are efficient and cost-effective and they're appropriate for that area, does that send that out correctly?

MS. BORGSTROM: Yes. Yes.

MS. MARTONE: Okay.

HEARING OFFICER YANDOW: Do you have anything else for Ms. Borgstrom?

MR. LAZARUS: No. I'm all set.

HEARING OFFICER YANDOW: Okay. I just want to make counsel aware, we will have questions later on. Whether or not Ms. Borgstrom would be the best witness to answer, I'm going to leave that up to you. As far as our questions, we don't -- we believe we can get our answers from the other witnesses you have. So I'm leaving it up to you as far as whether or not you'll need Ms. Borgstrom.

MS. BORGSTROM: And I really appreciate your sensitivity and obviously this just came up over the weekend. I learned about the arrangements yesterday. And I think that with the team we have here, they can do as well, or better than I can. And I think the two people that can answer most of the questions that you could reasonably direct to me would be Frank Corvino and Gayle Capozzalo, who's our System Executive Vice President for Strategy and System Development. She was sworn in at the beginning of this hearing and is extraordinarily knowledgeable.

HEARING OFFICER YANDOW: Okay. Well, I'll leave it up to you counsel. Thank you.

MS. BORGSTROM: Thank you.

(Discussion off the record)

HEARING OFFICER YANDOW: Well, we have some follow-up, we have some questions of the intervenors' witnesses based on some of the information that we received, and I'd rather ask those questions before you do your cross, so your cross can be based on our questions too. So I'm first going to ask Professor Kielty --

A MALE VOICE: Kiely?

HEARING OFFICER YANDOW: -- Kiely, I'm

sorry, Dr. Kiely please. I'll let you ask the questions and then I might have some follow-up.

MR. LAZARUS: I just have one question and it's more of a clarification. The letters that you submitted from New York White Plains Hospital, there's not a representative here to represent them, right, it's just you submitting letters on their behalf?

DR. KIELY: That's correct.

MR. LAZARUS: Okay. Thank you. I just wanted that for the record.

HEARING OFFICER YANDOW: Okay. And I -- Dr. Kiely, you sat here through the questions that Mr. Lazarus asked, and the answers, and I just wanted to based on your opinion, do you have an opinion based on the answers you heard in the questions that were asked that you could share that would be relevant to what we have to decide?

MR. COWHERD: I'm going to -- is there a specific area? There was a lot of testimony --

HEARING OFFICER YANDOW: There was a lot and that's why I'm just leaving it there -- she sat there and I didn't know and I can't think of anything specific and I'm not going to go through every question with her. I just didn't know, based on her position and what she

does, and her opinion, if there was anything that she wanted to based on, you know, from the questions from OHCA whether or not there was something she wanted to offer?

DR. KIELY: I would just say that I think that based on what I said earlier in my documents, there are opportunities for collaboration. And we do have -- made inroads in certain -- and again, as others have testified, these are personal relationships and as those personal relationships change, as affiliations change and merge and more, this is very, very fluid. You know, we have our cardiac surgery program at Stamford and we do have referrals to that cardiac surgery program from Greenwich physicians. So again, these things take time. Relationships, you know, are what they are. And so I just underscore that because I don't think that's as fixed as it may have seemed.

HEARING OFFICER YANDOW: Okay. Do you have anything Ms. Martone?

MS. MARTONE: Yeah. Regarding the testimony or heard about the level of oversight, that the Yale physician and cardiovascular center provides --

DR. KIELY: Yes.

MS. MARTONE: -- does New York

Presbyterian provide the same level of oversight for the Stamford program?

DR. KIELY: We have a different construct, if you will. We have talented interventional cardiologists on staff and they work very, very closely together. The folks from New York Presbyterian are available at any time, but we also have biweekly sessions with them, as well as monthly conferences where the data -- because as part of that system our data is also benchmarked, not only against New York Presbyterian, we have the local -- you have the state data, but we also have benchmarking against all of the New York Presbyterian as well. So that's done routinely. All of the complications are reviewed in real-time. You know, we've had issues, for example, even where we've had physicians, you know, who we felt that their skill level needed some improvement and so we've used them to help us with that. There's something called a Focus Professional Practice Evaluation, and so we work with them through our medical staff process. So what we've done is while they're not the operators, the physicians, but they are part of our team and Dr. Collins is certainly that person largely.

HEARING OFFICER YANDOW: And he's from New

York Presbyterian?

DR. KIELY: Correct.

HEARING OFFICER YANDOW: He is. So he's the main physician -- cardiologist?

DR. KIELY: He's our main -- yes, boots on the ground at Stamford. Is known to all members of our team, our nurse managers, others, can call Dr. Collins. Dr. Collins participates regularly. If I need him, he's there.

HEARING OFFICER YANDOW: Any other questions of this witness?

MR. LAZARUS: One question. Has the Stamford Hospital seen an impact on its cardiac volumes in either program since New York White Plains Hospital came online?

DR. KIELY: You know, I have to ask one of my colleagues about that particular question. I'm not certain just off the top of my head.

HEARING OFFICER YANDOW: Do you want to ask if she knows of anyone that's here today that could answer the question?

MR. LAZARUS: Sure. If anybody else will be available to answer that, that would be fine.

HEARING OFFICER YANDOW: And if they're

sworn in.

DR. KIELY: The impact of White Plains on our volume --

HEARING OFFICER YANDOW: If you could just identify who that -- who is the person, we would ask the question.

DR. KIELY: -- I'm trying to identify --

A MALE VOICE: I am.

MR. COWHERD: The volume -- the volume numbers for Stamford Hospital's PCI program are in the CON application. Are you asking what's responsible for decreases?

MR. LAZARUS: Well, partially that, but I meant, do you -- if any of the impact that you feel is directly attributed to the New York hospital coming online?

HEARING OFFICER YANDOW: And then if not, what is to be attributed to the volume? Can you answer those questions, Dr. Kiely?

DR. KIELY: If I can understand the questions first. The question first is, I think you said, if I can paraphrase, what was the impact of White Plains Hospital opening its program on the Stamford volume? And then I think there was a slightly different

question related to the volumes. And I'd like Kathy Silard to answer those questions.

HEARING OFFICER YANDOW: Okay. Let me just -- what was your last name please?

DR. KIELY: Silard, S-I-L-A-R-D, Kathleen.

HEARING OFFICER YANDOW: Okay. Any other questions of Dr. Kiely?

MR. LAZARUS: No.

MS. MARTONE: No, not Dr. Kiely.

HEARING OFFICER YANDOW: All right.

MS. MARTONE: Thank you very much.

HEARING OFFICER YANDOW: OHCA calls Kathy Silard please? Ms. Silard, have you been sworn in?

MS. SILARD: Yes.

KATHLEEN SILARD

having been called as a witness, having been duly sworn, testified on her oath as follows:

HEARING OFFICER YANDOW: Okay. And could you just state your full name for the record please and spell your last name?

MS. SILARD: Kathleen Silard, S-I-L-A-R-D.

HEARING OFFICER YANDOW: Okay. Great.

And your title please, your position?

MS. SILARD: I'm the Executive Vice President and Chief Operating Officer at Stamford Hospital.

MR. LAZARUS: Okay. Could you please address that question, or would you like me to repeat it?

MS. SILARD: Please repeat it?

MR. LAZARUS: Okay. Considering that White Plains Hospital has come online with their cardiac program in the last year or so, have you seen any direct impact on Stamford Hospital's cardiac volumes? And if not, if there have been any declines, what would you attribute your declines to?

MS. SILARD: I would say that because of the lags in data reporting we cannot draw a direct correlation between that program coming on board and decline in the amount of cardiac volume that we're seeing either in elective angioplasty or in open-heart surgery. But what I would state is that the declines are really because of the declines across the market in the incidents of heart disease and the demand for these elective services. And that's really the reason that we are seeing the declines in our program, as is happening across the state and across the nation.

MR. LAZARUS: Thank you.

MS. MARTONE: And it appeared from the letter of intent, I think that's what it's called, in the application between the two hospitals that having access to the physicians at Yale, there was a thought, or a hope, I guess, that they would contribute volume to Stamford and the volumes would increase, is that a correct statement?

MS. SILARD: That is a correct statement. I think that as Dr. Kiely indicated, we have an open medical staff and the physicians who are in our primary and secondary market, who would have an interest in performing those procedures at Stamford Hospital and met our criteria for credentialing we would welcome them to perform those procedures.

MS. MARTONE: Thank you.

HEARING OFFICER YANDOW: Any other questions of this witness?

MR. LAZARUS: No.

HEARING OFFICER YANDOW: And of course you will have the opportunity to cross her when we're done for the open questioning. Thank you very much. And I'd like to call Dr. Gray to the stand please? And Dr. Gray, I'm just going to give you the same broad question I gave

Dr. Kiely. You sat here through the testimony, through the questions that were asked. Based on your position, do you have an opinion on any of the questions that he asked, as far as anything that sticks out that you didn't -- that wasn't covered earlier by you?

DR. GRAY: I guess I would take up the position that I agree largely with what Mr. Corvino said. That access in a community is important. I guess it really, for this panel's consideration, depends on how you define community and what the limits of the community are both geographically and territorially. He may have had a bad, and with all due respect to his experience, which sounds like it was harrowing, and to his excellent physicians, it's equally possible that because he may have come to a low-volume hospital he might have had a bad outcome.

Part of my research efforts throughout my life have been to look at outcomes in multiple different arenas. And there's nothing that you can look at, there's no procedural or surgical procedure or form of medicine that isn't axiomatically related to volume. And so while we can achieve good outcomes at C-PORT style facilities volume is king when it comes to outcomes. So while the experience may not have been terrific, it could

have easily been as bad or worse had it gone to a low-volume hospital. And it's not just the operators, it turns out to be the facilities, because it's facility preparedness as you probably well know. So I guess that's my only comment. I think it's important to kind of contextualize those experiences.

HEARING OFFICER YANDOW: Steve, do you have any questions?

MR. LAZARUS: No. Thank you.

MS. MARTONE: Did you have anything further in terms of line of questioning for New York Presbyterian, the relationship, supply any volumes or anything as such?

DR. GRAY: No, not really. I mean, I think the Connecticut data speaks for itself in terms of volumes.

HEARING OFFICER YANDOW: Okay. Does OHCA have any further questions now of any of the witnesses?

MR. LAZARUS: No.

HEARING OFFICER YANDOW: Okay. You may have some more after cross, but if you would like to call Dr. Greg, he's on the stand, are you prepared to --

MS. GROVES: (Indiscernible, too far from mic.) I don't have that many questions. You've asked

most of my questions.

HEARING OFFICER YANDOW: Okay.

MS. GROVES: So, I'll be brief. Ms. Silard, I'm just trying to get a handle, I'm sort of asking a follow-up to the question that Ms. Martone asked about the impact of the White Plains' program on Stamford Hospital's angioplasty numbers. If you look at page 10 of Dr. Kiely's testimony --

HEARING OFFICER YANDOW: Do you have -- Attorney Cowherd, do you have that there for her?

MR. COWHERD: Page 10 of Dr. Kiely's testimony?

MS. GROVES: -- okay. She says at the top of that page, it's important to note that the White Plains Hospital, elective angioplasty program began operating in 2010, making the field of elective PCI providers in the applicant's proposed service area even more crowded than it was in 2009, is that correct?

MS. SILARD: That's correct.

MS. GROVES: Okay. And in her letter, the letter that Susan Fox from White Plains Hospital submitted, she talks about the fact that their program opened in 2010 and they did -- these are the revised numbers, 90 PCIs in 2010 and then 231 PCIs in 2011 -- the

revised letter --

MR. COWHERD: The revised letter?

MS. GROVES: -- and that -- do you see that?

MS. SILARD: Yes.

MS. GROVES: Okay. And during this period of time, and I'm trying to put together -- there's some conflicting data in your application. Am I correct that Stamford's PCI volume, in fact, increased after White Plains was added to the market? Because from what I see in your testimony on page 32 of --

MS. SILARD: Well, that's her testimony.

MS. GROVES: -- I'm sorry, of Dr. Kiely's testimony, there were 38 angioplasties done at Stamford in 2010 and then Dr. Gray says 250 in 2011, and in your petition for status, it says you're on track to do 277 in 2012, is that correct?

MS. SILARD: PCRs? I would have to go and look at that data to answer correctly.

MS. GROVES: Yeah.

MR. COWHERD: Can you refer the witness to the pages Ms. Groves?

MS. GROVES: To the pages? The pages I'm looking at are on page 32 of Dr. Kiely's testimony. And

this is the PCR data says that Stamford did 238 combined -- page 32 of the --

MR. COWHERD: You're showing the PCR data, page 32, Kiely?

MS. GROVES: -- yes.

MR. COWHERD: Okay.

MS. GROVES: Am I reading this correctly? That in 2010 total procedures, inpatient and outpatient, it says Stamford do 238 elective angioplasties?

MS. SILARD: That's correct.

MS. GROVES: Okay. Now, right next to that in 2011, it says you did 220. But if you turn to the testimony of Dr. Gray, at page eight, (indiscernible, too far from mic.) --

MS. SILARD: Page eight of Dr. Gray's?

MS. GROVES: -- I'm sorry, Dr. Gray.

MS. SILARD: Okay.

MS. GROVES: So on that page in the second to last paragraph, do you see where it says, if I'm reading this correctly, Stamford Hospital performed 250 PCIs in 2011, total?

MS. SILARD: Um-hmm.

MS. GROVES: So you've gone from 238, based on this, to 250. And then looking back again in

your Counsel's petition for testimony -- or petition for status, I believe he references the fact that you're on track to perform 277 in 2012 and that's at page five of the petition.

MR. COWHERD: Page?

MS. GROVES: Five of the petition. I'm sorry, I'm jumping all over the place, of the petition for status.

MR. COWHERD: Petition for status?

MS. GROVES: Yes.

MR. COWHERD: We don't have it.

MS. GROVES: Okay. Do you see that in paragraph three?

MS. SILARD: Yes.

MS. GROVES: Okay. So based on what we just looked at from 2010 when the White Plains program came to this already crowded market, Stamford's angioplasty volume went from 238 to 250 to 277?

MR. COWHERD: I'm going to object. I've let this go because in the interest of moving forward, but Ms. Silard is first of all being asked repetitive questions from Dr. Kiely's testimony. Ms. Groves is accurate on what she's pointing to, but nonetheless, Dr. Kiely is familiar with the different data sources that

she's pointing to and the limitations that are inherent in some of those. We're not disputing the numbers, but Ms. Groves is asking questions of a witness who did not provide testimony on these issues, Dr. Kiely did. Flipping back to Dr. Gray's testimony, Dr. Gray did, but Ms. Silard didn't. So in the interest of just getting a full vetting of the facts here I think the witness who submitted the prefiled testimony in which these figures are contained should be answering the question, not somebody who did not --

HEARING OFFICER YANDOW: I'm going to make my ruling. You will have the opportunity for redirect. If she can answer the question I'm going to allow it. So I'm going to overrule the objection.

MS. GROVES: Okay. And the only reason the questions were being addressed to Ms. Silard is because when Ms. Martone asked who had the most knowledge of the impact of the White Plains program on Stamford, Dr. Kiely said Ms. Silard should answer this question. She's answered my question. I just wanted to confirm the fact that those numbers suggest that there has been an increase in volume over those three years, which he confirmed.

HEARING OFFICER YANDOW: I made my ruling.

The question was asked. Do you withdraw the question? Are you --

MS. GROVES: Then you can answer that question. Do the numbers that I have just shown you show that there's been an increase angioplasty volume at Stamford Hospital from 2010 to the present?

MS. SILARD: Yes. But not correlated to the White Plains equation.

MS. GROVES: Okay. But it was a yes or no question. So you've answered my question. And I have no additional questions for you. Thank you. I do just have a few questions for Dr. Gray.

Good morning Dr. Gray. On page one of your testimony you state -- I'll just let you get there, that New York Presbyterian has worked closely with Stamford Hospital in the operation of selected angioplasty and open-heart surgery programs, is that correct?

DR. GRAY: Um-hmm.

MS. GROVES: Dr. Gray, do you --

COURT REPORTER: I'm sorry, you need to --

DR. GRAY: I'm sorry. I'll sit up. Yes.

COURT REPORTER: -- thank you.

MS. GROVES: -- Dr. Gray, do you

personally perform any elective angioplasty procedures at Stamford Hospital?

DR. GRAY: No.

MS. GROVES: Okay. Do you know if any of your New York Presbyterian colleagues perform -- personally perform elective angioplasty at Stamford Hospital?

DR. GRAY: No.

MS. GROVES: Okay. Do any of your New York Presbyterian colleagues take primary angioplasty call at Stamford Hospital?

DR. GRAY: They may have in the past, but I'm not certain about now.

MS. GROVES: Okay. Now flipping to page eight of your testimony, in the middle of that page, the paragraph that begins, first, given the lack of volume growth, you testified that there is a very real risk that Greenwich will not exceed the 200 PCIs per year required by the guidelines if approved. You don't know for certain that they won't exceed 200, correct?

DR. GRAY: I don't know for certain.

MS. GROVES: Okay. And further down, you suggest that there's also a very real risk that if the Greenwich program is approved that both White Plains and

Stamford will see their PCI volume drop below 200, is that correct?

DR. GRAY: That's correct.

MS. GROVES: But you don't know for certain if that will happen, correct?

DR. GRAY: I don't know for sure.

MS. GROVES: And in fact, based on the testimony that was just given, the documents in the record in this matter demonstrate that Stamford's volumes -- angioplasty volumes went up when White Plains was approved, correct? And if you don't know, you don't know.

DR. GRAY: Yeah. The answer is, according to the numbers we see here it did. But it would be hard to prove a negative. Who knows how much higher they may have gone.

MS. GROVES: Right. Understand. I have no further questions. Thank you.

HEARING OFFICER YANDOW: Okay. Did you have any questions of Dr. Kiely?

MS. GROVES: No, I don't think.

HEARING OFFICER YANDOW: Okay. Redirect?

MR. COWHERD: I'd like to call Dr. Kiely. Dr. Kiely in Stamford's efforts to try and get an

estimate of PCI volume in the various surface areas covered were there any issues that Stamford experienced in compiling the data?

MS. GROVES: I'm going to object. I mean, this is redirect examination and so my understanding is it can only be based upon the questions that I asked of the witness. I mean, I didn't ask any questions of Dr. Kiely, but if he's redirecting on the questions to Dr. Silard --

HEARING OFFICER YANDOW: We did -- OHCA asked questions. I'm going to allow redirect of OHCA's questions.

MR. COWHERD: Right. And in addition, I think the instruction was redirect could be made on this issue. So I'm asking Dr. Kiely, who submitted the testimony, to speak to that.

DR. KIELY: Would you mind repeating that question?

MR. COWHERD: Yes. My question is, in compiling the PCI volume data for purposes of determining volume in the service areas did Stamford Hospital experience any problems or obstacles in compiling that data?

DR. KIELY: The obstacles were working

with the data sets that are available, which you know, have different reporting requirements, different -- some are voluntary, so in the PCR data, I think about my prefile as well as my testimony today, I mentioned that they're just slightly different data sets. And so -- but what was striking was that in no cut of the data, no parsing of the data did we find any volumes increasing in any of the service areas.

MR. COWHERD: Okay. Dr. Kiely, can you speak to the physicians who now perform angioplasty procedures at Stamford Hospital, their affiliations and backgrounds?

DR. KIELY: Sure. I certainly would -- the cardiologists who largely do our call coverage for the elective -- or the primary angioplasty program and part of a call schedule for the greater part of I think close to eight or 10 years, physicians work collaboratively to cover calls as well as other hospital responsibilities. The primary individuals are Dr. Tom Nero (phonetic). Tom also on staff at Greenwich Hospital. Dr. Ted Portney (phonetic), Ted is with Cardiology Associates, which is in the larger Bridgeport area as well, Norwalk. And Dr. Corvia (phonetic), who is an employee of Stamford Hospital. So among those doctors

in particular, there's been collaboration around PCI. In particular, and testimony to their teamwork really is the fact that they have been able to drop our time to PCI to extraordinary levels, close to 60 minutes from door to balloon time in working with outside EMS services and others. And this has been a collaboration certainly with the New York Presbyterian team. And so those three physicians from three completely different groups have collaborated to really drive this team to where it is right now.

And in fact, our door to balloon times I will add, since January of '11 have been 100 percent less than 90 minutes through this incredible teamwork, which includes nurses, as well as EMS and our in-hospital services.

MR. COWHERD: I have no further redirect of Dr. Kiely.

HEARING OFFICER YANDOW: Okay. Redirect of the other witnesses?

MR. COWHERD: Of the other Stamford --

HEARING OFFICER YANDOW: Dr. Gray was called. We also -- do you have any questions of Dr. Gray?

MR. COWHERD: -- no.

HEARING OFFICER YANDOW: No. Okay. All right. Recross?

MR. COWHERD: No.

HEARING OFFICER YANDOW: Does OHCA?

(Discussion off the record)

HEARING OFFICER YANDOW: We'll just take a five minute break, we'll be back at quarter after.

(Off the record)

HEARING OFFICER YANDOW: I have one question. I'm going to let -- do you have --

MR. LAZARUS: I have one question for the applicant.

HEARING OFFICER YANDOW: -- okay.

MR. LAZARUS: Following up on those two letters that were submitted, I believe part of Dr. Howes' prefiled testimony from the two physicians, talking about the 8,200 implied. Beyond the letters is there some sort of contract with them that the hospital has or is it just the letters at this point that you have the commitment?

MR. CORVINO: Just the letters. Frank Corvino. That's all we have is the letters. There is no contractual arrangement.

MR. LAZARUS: All right. Nothing further.

HEARING OFFICER YANDOW: Dr. Howes, do you

have something to say?

DR. HOWES: Yeah. I think it's hard for physicians to commit to a theoretical concept. And I think that some of what we see, there are other physicians who do the procedures at not New York Presbyterian, but New York Hospital, who have expressed interest and may also join on if it comes to be, but they're just reluctant to give a commitment to something that's theoretical and they, you know, it's out there in the ether space or whatever. So -- and I think they're being honest, but other than that we can't say any more about it.

MR. LAZARUS: Do they have privileges at Greenwich Hospital at the moment?

DR. HOWES: Oh, yes.

MR. LAZARUS: They do, okay.

MS. MARTONE: So as you stated in your testimony, he's just had discussions about them wanting to bring their patients to the Greenwich facility? That's kind of what you stated in your testimony. So they prefer the setting of Greenwich Hospital? They prefer -- what more that they're not currently getting?

DR. HOWES: They can't do -- they can't do the procedure at Greenwich. These are, you know,

patients in the Westchester, northeastern Westchester communities, Larchmont, you know, Rye, that currently they end up going and having a diagnostic and elective angioplasty in New York City. And if they have the opportunity locally, they have admitting privileges to this hospital, they think a portion of their practice would respond to that.

MR. CORVINO: I could just add? Greenwich Hospital has the highest patient satisfaction of any hospital in the area and that has allowed us to draw from many areas, and including, you know, clearly Greenwich is our main area, but you know, patient satisfaction is high and there are patients who want to come to Greenwich who can't because of the current regulations.

HEARING OFFICER YANDOW: And just -- and I'm not sure which -- I'll start with Dr. Howes, and perhaps if there's another witness that has testified that wants to add to this, I'll allow it. The question, look beyond the guidelines, and we, you know, OHCA's job is to see that there's a clear public need by statute. So we've heard about the guidelines. So, beyond the guideline, beyond just a local need or having local convenience, cost efficiencies and beyond a shift of volume with picking, you know, from the other hospitals,

is there anything else -- and I know this is just simplifying it, but, you know, to establish clear public need?

DR. HOWES: I am a clinician, you know? I think all of us, the physicians here are clinicians. We take care of patients and that's what we take seriously. Every day of my life I have to go through this discussion, and this permutation of where are you going to have your procedure? And are we going to have to transfer you? And it's very disruptive to the continuity of care that patient and their family.

And one thing we haven't talked about is that patients with coronary disease, the vast majority of these patients are elderly and you're talking about doing an elective, let's really say it, outpatient elective diagnostic cath. on an 80-year-old, it's much easier for them to stay two miles from home at the hospital that they've been going to for the last 25 years with the same primary care physician and the same cardiologist. There is a need there for those patients to stay with their physicians. And so from a very personal perspective, my need is to take care of my patients and provide the quality that I'm confident that we provide and will continue to provide and that they can't get that service

when we're they're providing that service for similar patients. We have patients in the hospital, sharing a hospital bedroom, one guy has a primary angioplasty that night and, you know, he's had this procedure, and then the next guy came in with unstable angina, rather than a heart attack, and we say, we're sorry, we have to send you up to New Haven or down to Presbyterian and then, you know, we have to decide do we do a diagnostic cath. or not do the diagnostic cath.?

The other thing about those 53 patients that we transferred, those are the patients that got caths. at Greenwich Hospital and we confirmed they need and angioplasty. There are other patients who've transferred out but don't get the cath. and, you know, they do still translate into reed aspirizations (phonetic).

HEARING OFFICER YANDOW: Okay. Mr. Corvino, to have any comments on the (indiscernible, interference on mic.).

MR. CORVINO: Not anything more than we've already established I don't think. In that this is a service that will be utilized by the people and citizens of Greenwich and, you know, we need to be able to provide it for them because it's the right thing to do and it is

safe. We have invested an awful lot of money in this primary angioplasty program. These great clinicians do not come cheap and we have spent the capital on getting the cath. labs ready. Everything is there. We need to increase the utilization, make it more cost-effective, and allow us to do the easy cases when we're already doing the more difficult ones.

HEARING OFFICER YANDOW: Any follow up?

A FEMALE VOICE: No.

HEARING OFFICER YANDOW: Okay. I asked earlier if there was any public comment. Is there anyone here that has arrived during the morning that wants to provide public comment? Okay. The record will show that no one has come forward and that no one has signed up. Now I'd like to allow closing remarks. Attorney Cowherd?

MR. COWHERD: Thank you Hearing Officer Yandow. Thank you OHCA staff for the opportunity to make this closing argument on behalf of the Stamford Hospital. There's been a mountain of papers submitted to you in this proceeding, but it doesn't obscure the facts. One fact is that the law of Connecticut requires that the applicant in its certificate of need bears the burden of proof. The applicants, Greenwich Hospital and Yale, have failed to carry their burden that there is sufficient

volume in the service area to warrant the establishment of another elective PCI program in Fairfield County. To me, OHCA Exhibit 1, and the declining volumes say at all. You see the trend. But I have a lot more to say.

OHCA appropriately asked what would be the impact of Greenwich Hospital continuing to treat the patients that it transfers to Yale and bypasses Stamford if this application were approved. The problem with that and the impact on Stamford is that that estimate is 53 cases per year. You cannot support an elective angioplasty program on 53 cases per year. And look at the data, even those transferred cases have been declining since 2009.

So then applicants say, well, we're going to get these 80 to 105 cases from these other providers, West Med and Dr. Munson. Take a look at West Med's estimate three years ago when it said it would transfer 100 PCIs to Greenwich's program. That estimate now is 50 to 75. As much as a 50 percent reduction in volume. Let's take a look at Dr. Munson. Dr. Munson is an employed physician of Columbia's doctors group, the same group generally as employs Dr. Gray, who's here today, speaking on behalf of New York Presbyterian Columbia Medical Center in opposing this application. How likely

do we think that the 30 cases from Dr. Munson are coming?

Now, OHCA asked Dr. Cabin where the volume would be coming from. He said, high-volume centers. The West Med letter specifically states, we're going to take this volume from another hospital out-of-state and transfer it to Greenwich. There is testimony in the record that West Med's volume is at White Plains Hospital. So much for Dr. Howes' statements, these are three separate worlds. They don't effect each other. That's a volume shift. Dr. Cabin admitted that there was a volume shift here.

Ms. Groves tried to make a point that Stamford Hospital doesn't know whether it's volume will go up or down because of this program. Well, that's generally true, nobody can tell. But it's most likely the providers that are directly in the service area that are going to be impacted by the volume shift and the creation of this third unnecessary program within 16 mile radius. So when that happens, the house of cards starts tumbling down. If the volume is not reached with this promised volume from New York, which Mr. Corvino just said, that promise is as good as the paper that it's printed on, where do they start looking for volume in a static market? It starts being exactly what the

consensus documents say that shouldn't happen. These programs start cannibalizing each other and with the two programs in the service area who are doing less than 400 cases, they're not the high volume, Dr. Cabin can't predict that it's coming from the high-volume hospitals, because there is no certainty to that. And it's these low-volume, or are doing better than the 200 threshold hospitals, that are most likely to see the volume trend. And when that happens that proportion of volume is greater to them. And so then we set up the scenario where exactly we're looking at 200 under performing -- 200 level or under that performing PCI programs that are elective in the service area.

Another fact in this matter is that the applicant must prove clear public need for a proposal and satisfy the other CON guidelines. Those are under 19(a)-639(a) and the most relevant here are being that the applicant must demonstrate that the proposal will have a positive impact on access, quality and cost efficiencies for healthcare delivery in the region. The applicant must show that the identified population has a need for the services and the proposal will not result in the unnecessary duplication of existing services.

The applicants have not shown a clear

public need for their proposal because residents of the proposed service area already have two providers within the service area and then, what you can only describe as an abundance of riches in terms of the number of programs surrounding that service area, including three other, not just Stamford Hospital, three other full service programs that serve Fairfield County. It was the volume and the other providers in the area that OHCA focused on three years ago when volumes were higher for PCI, that determined this application could not be approved. Nothing's changed.

Well, one thing's changed. We've got another provider in the service area in White Plains Hospital. People in remote locations of the state would be happy with half the access to elective angioplasty services that residents of this service area already have. And the applicants have not carried their burden of showing that a single one of these many programs has any capacity problems in terms of quickly providing care to patients.

Yale and Greenwich have not shown that the quality of care is going to be improved by this proposal. To the contrary, they are advocating a model that the expert consensus documents the 2011 guidelines and the

2012 update say -- well, let's take the guideline. It's a class 2B recommendation, meaning the benefit is greater than or equal to the risk and these programs are only appropriate when they will clearly fill a void in the healthcare needs of the community.

The other guideline is exactly the same, the 2012 consensus document. The cardiology community should foster these programs only when such programs improve access to a higher level of care than would otherwise be available. You've got four full-service programs with no evidence in the record that they are not providing high-quality care to patients already in this service area.

The consensus documents are important. These are experts in the field. They have no stake in this particular CON. And they are using words like benefit may be equal to the risk and elective PCI without surgical backup must clearly fill a void and only appropriate when a higher level of cardiovascular care can be achieved.

Now, the experts here have determined that it's only appropriate to provide these services in this model under certain conditions. Yale and Greenwich have failed to show that the residents of the service area are

receiving anything but high quality care from what's in that geographic region right now. So OHCA has to ask itself, why should any risk at all be taken in establishing a program of this kind in this service area where there's already an abundance of providers. What void is being filled by putting in the service area an elective PCI program without cardiac surgery? There is none.

Far from improving the quality the same expert guidelines state that competition with another PCI provider, especially one that is a full-service provider in the geographic area, may not be in the best interest of the community. And that's because it is just common sense. Somebody said it, that complications are rare, but when they happen an elective PCI without a surgical backup team immediately available is going to result in possible exacerbation of that complication to the detriment of the patients.

Again, the experts who have no stake in this game -- if you look at Dr. Gray's testimony in Exhibit 2, page E39, have said that a small but valid fraction of patients undergoing elective PCI will experience a life-threatening complication that could be managed with the immediate on-site availability of

cardiac surgical procedures -- cardiac surgical support, excuse me, but cannot be managed effectively by urgent transfer. These complications haven't gone away. If you go back to the 2011 guidelines and you turn to page 159 and 160 they talk about all the possible complications from a PCI procedure.

The applicants have not shown a clear public need for their proposal because these residents are already well served. Yale and Greenwich make the, I think, nonsensical point that because Stamford's program in fiscal year 2012 may be able to reverse its course in recent years and have an upswing in PCI volumes and the W -- White Plains' program, that we provided the most up to date data that we could, is above 200 cases that that justifies the addition of a third program in the service area. If the overall volume in the service area in the state is not increasing, and we all know that applicants tried every which way to find growth and couldn't, they don't refute any of the data that's been provided by Stamford Hospital in this proceeding, then as Dr. Cabin said it's just volume shift. If you have the same finite amount of cases then any additional volume, I mean, at one hospital in the service area is to the detriment of another. You can't predict where this volume is going to

go from.

Any need for an additional capacity in the service area has been filled by both Stamford and White Plains' programs and there's simply no room for another provider in this such a concentrated area of 16 miles from each other. In a static shrinking market, one provider cannot grow without the expense of the other, and no one should be happy if that volume comes from a hospital anywhere, in Connecticut or New York, if it could result in a diminution in quality.

Lastly, applicants have not shown that their proposal is cost-efficient. The estimated $425,000 annually that Mr. Corvino says would be saved by patients and payers by not having to transfer those 53 cases to Yale-New Haven Hospital will be more than offset by the risk of over utilization if these low-volume programs have to compete against each other. It'll also be offset significantly if there is an exacerbation of even one complication in what Dr. Howes said is serious stuff, a coronary intervention procedure. If even one complication that could have been avoided by immediate on-site cardiac surgery were to occur, what's the cost to the patient and the health care system then?

The result of all of this is that Yale and

Greenwich have also failed to carry their burden of identifying that patients in this service area need the proposed elective PCI program without cardiac surgery on-site and that the project does not result in what it is, an unnecessary duplication of existing or approved healthcare service. OHCA has stated in precedent decisions that convenience does not equate to need. That is clear, that the convenience of 53 patients cannot merit the establishment of a program.

I've spent time up to this point, talking about what the applicants haven't shown. I just want to sum up what they have shown. They've shown that this proposal is driven in large part by the financial gains that Greenwich Hospital will realize by being able to subsidize their primary angioplasty program. A program they voluntarily established with elective angioplasty procedures. One look at page 15, the three primary factors on which they are determining need, tells you all you have to know on that score. And one look at page 164 of the 2011 guidelines, which is attachment six to their application, tells you that this is a wholly inappropriate basis for establishing an elective PCI program without on-site surgery in a service area.

For Yale and Greenwich to take the

position that the language about having to clearly fill a void, and that you should not establish a elective PCI program without on-site cardiac surgery, in the 2011 guidelines is basically ludicrous. They said that this was irrelevant to their application because they were proposing a class 2B instead of a class 3 harm, just not no benefit, possible harm under that classification. And so they said, that admonishment was only for class 3 programs. Well, I think if you read Dr. Gray's testimony he tells you exactly why that can't be the case.

I give you a couple of other sections maybe to look --

MS. GROVES: I'm going to at this point -- I'm sorry to interrupt, but I'm going to have to object. I mean, I think the order that OHCA made in this case was the applicant would give a, quote, unquote, "brief closing remark," which in OHCA parlance typically means two to three minutes, okay? Attorney Cowherd is going through -- his client had 10 minutes to present, he's now been spending 20 minutes arguing on behalf of his client. And we've prepared a brief remark for Mr. Corvino to give as we have in past CON hearings. I think this is entirely inappropriate, and I think Attorney Cowherd needs to conclude his closing expeditiously.

MR. COWHERD: -- there was no time limit set on the remarks.

HEARING OFFICER YANDOW: I'm going to make my ruling. Overruled. You can continue. You will have as long as you -- you will have whatever you need to make your closing argument.

MR. COWHERD: Appreciate it. So we were on what the guidelines say and don't say. Take a look at sections 5.21 -- 5.2.1, excuse me, and 5.2.2, and determine for yourselves whether the discussions under class 3, after they talk about the class 3 recommendation, pertains only to that specific recommendation rather than the recommendations that precede it. It's clear that the applicant's position on this has no merit.

The applicant's have also shown that they are in full control of remedying the situation where elective PCI patients who want to be treated locally are transferred instead 47 miles away to Yale-New Haven Hospital. Stamford's program, Dr. Kiely said, is ready, willing and able, as it was three years ago when the invitation was made for their interventionalist to apply for privileges, that invitation to my knowledge was ever taken up, it still outstanding. You can treat the

patients who you want to locally at Stamford Hospital. Your attendings are also welcome if they want to follow the patient.

This proceeding and the so-called cardiac wars -- the cardiac wars that have preceded it in this state also shows how misguided Dr. Howes' statements are that these hospitals don't compete with each other. He provides data that supposedly says that, look, their docs don't admit to our hospital. He neglects to tell OHCA that 12 of those doctors are hospitalists, they're not out in the community, they have no ability to direct patients anywhere but to their employer. When a physician in the community either -- the patient is unassigned, the physician in the community does not want to follow the patient into the hospital --

HEARING OFFICER YANDOW: I just want to make sure we get your argument is based on evidence that is in there and you're not putting in --

MR. COWHERD: -- it's in Dr. Kiely's rebuttal testimony.

HEARING OFFICER YANDOW: -- okay.

MR. COWHERD: For purposes of clarification on the evidence though we were busy bees yesterday, so we said 10 hospitalists. It's actually 12,

and we can provide the documentation to support that.

The truth of the matter is that service area residents are not stamped as Stamford Hospital patients and Greenwich Hospital patients as much as the applicants would like that to be the case. Referral patterns do influence where patients go, but those referral patterns change. In the blink of an eye, a cardiology group gets acquired by a hospital. A big referring cardiologist changes employers or a cardiac interventionist does the same thing, or there is a formation of an ACO that requires the primary care doc and the specialist to provide integrated services. That's going to create volume shifts.

The Yale system acquired a cardiology group recently in the Bridgeport area. There are other discussions in the Bridgeport area of another large cardiology group being acquired by a hospital. What is that going to do to the dynamic of these commitments of procedures from --

MS. GROVES: I'm going to object again. This is not information that is in the record. He's testifying.

HEARING OFFICER YANDOW: Yeah. And I don't want -- and I said that already, so if it's about

anything that I've stricken, you know, already, or evidence that's not in to the testimony I don't want to hear any of that in a closing argument as summation of the evidence. So if you could conclude in the next few minutes?

MR. COWHERD: Okay. I will. I will. I'll just then show, you know, if you look at the comparison --

HEARING OFFICER YANDOW: I will sustain the objection as far as evidence coming in that's, you know, as testimony from Counsel.

MR. COWHERD: -- withdrawn as to that. I think my point's proven by, look at Dr. Munson's letterhead. Three years ago affiliated with Westchester Medical Center, now with Columbia. That's the point. The point is, nothing is static in this healthcare environment today. Physicians are looking to align and with the cost pressures on hospitals the need to expand market share is ever present. That Stamford has a large share of the cardiology market in Stamford and that Greenwich Hospital presently has a large share of the cardiology market in Greenwich means nothing, means nothing. If approved, Greenwich Hospital is not going to erect billboards on I-95 that say, hey, all you folks

from Stamford and from Darien, you keep going to Stamford Hospital, and you folks from Rye and Port Chester, you come to our new program.

Likewise, Stamford is not going to be turning away patients from any of the service areas. These hospitals, if approved, are going to compete hammer and tong like they are in this proceeding. And because we agree, we agree wholeheartedly with what OHCA stated in its CON determination a few years ago that applicants cite. That OHCA does not have CON jurisdiction over what happens in New York. OHCA cannot control what's in New York. So if these referrals from New York don't materialize, for whatever reason, a new provider, these shifts that I've talked about, then the results could be devastating to programs in Fairfield County, because everybody is going to train their eyes on that service area population.

HEARING OFFICER YANDOW: If you could just take -- take a few -- I was interested in the evidence before when the objection came, but as far as argument, we'll certainly make that assessment. For the next few minutes if you could wrap up any evidence you haven't addressed and close?

MR. COWHERD: -- I will. Okay. In

closing, I'm there, this proposal does nothing to improve access, quality or cost efficiencies. In addition, Yale and Greenwich seek to establish an elective angioplasty program without cardiac surgical backup in a geographic site that the relevant clinical literature clearly finds to be inappropriate. Part of OHCA's mission is to help prevent excess capacity and under utilization of medical facilities. Limit the proliferation of services that would undermine the ability of other providers to maintain viability and lower the overall cost to the health care system by limiting duplication of services.

Three years ago OHCA followed these exact same policies and made the right decision in denying Greenwich and Yale's proposal, citing the decline in PCI volume and an abundance of providers in the service area. Nothing's changed. Those declines continue. Exhibit one is really all you need to look at. And, one more provider exists. OHCA should make the same decision on this application again and deny it. Thanks for your time.

COURT REPORTER: Attorney, if you would bring the microphone (indiscernible, interference on mic.).

MS. GROVES: Mr. Corvino is giving the

statement on behalf of Greenwich.

MR. CORVINO: Okay. Thank you Commissioners. Thank you all. I never went to closing argument school, so my closing argument will be a little different. I must have been at a different hearing this morning and for the past four hours because I think that the evidence is quite the opposite of what has been portrayed. And I think what you've heard over the last 20 minutes is an attempt to deflect attention from the facts and the truth, because, quite the opposite of what was said is true.

I guess we can distort numbers anyway we want to distort them to make them fit our needs, but we never talked about 53 cases. We talked about meeting the minimum standards and that other cases would come from other physicians. We have come in 2000, we've come in 2008, we've come in 2011, we come in 2012 again, because this program is very important to us. It has -- the primary angioplasty program that we provide has consistent unparalleled quality and what we are proposing is without any additional investment. We have already expended the funds. To say that we are doing this for financial improvement of three or $400,000 on a $330,000,000 budget is preposterous. We've already made

the investment and we feel this is a program that is absolutely essential for our community.

Every time that we have come new programs have been approved. We've been denied, other programs have been approved, those programs have done well I might add. As we mentioned in the beginning Greenwich Hospital tried to collaborate with Stamford Hospital in the area of cardiac services and they withdrew from the discussion. There was no confidentiality agreement signed. If there was we certainly would not have violated it. We have proven that we meet all the requirements, the class 2B requirements for elective angioplasty, without on-site surgery programs.

We have repeatedly tried to gain approval to offer cardiac services that are requested by our patient and physician community and that are cost-effective. We have submitted the CON again now, because as we have shown, there have been significant changes in the angioplasty environment. Elective angioplasty programs without on-site cardiac surgery exist all over the country and in the northeast. The clinical guidelines have changed and no longer view elective angioplasty programs without on-site cardiac surgery as a class 3 recommendation. With proper program development

and clinical oversight and expertise, elective angioplasty programs without on-site cardiac surgery can be safely provided.

I would also like to state that this program is unique. I cannot impress upon that enough. When we talk about risk in a community hospital we have minimized that risk to as low as it can possibly be minimized. We have trained, highly qualified cardiovascular interventionists from Yale-New Haven on site 24/7. They have chosen our equipment. They have in-serviced our nurses. They provide the program at Greenwich. And to think that there's a risk in coming to our community hospital, when the environment other than having a cardiac OR next door is identical to what is at Yale-New Haven is just an unfair characterization.

Our volume projections have been conservative. And to a large degree include cases already coming to the hospital that we have transferred out. Our conservative projections will allow the program to achieve the necessary institutional volumes as recommended by clinical practice guidelines. Our volumes do not assume a shift of cases from any Connecticut provider, particularly the intervenor, as demonstrated in the data that we supplied. There is no reason to assume

that practice referral patterns are going to change. If patients are not being referred to a particular institution now there's no reason to think that that's going to happen. Especially in this era of consolidation, systemization and system formation.

We talked about there being no capital cost required to institute this program. We offer this program again, and I can't repeat this enough, to patients who are more acutely ill than we are asking for, more acutely ill than we are asking for. And if you look at our quality it has been impeccable. By offering this program we also eliminate many of the costs with patients having to undergo two invasive procedures.

And I will tell you that with reference to my own situation I did not go to a low-volume provider in the beginning because we had Dr. Howes, we had Dr. Cabin working at Greenwich Hospital, and others, who do hundreds of these procedures a year. So, the geography is the issue, but the provider is not the issue. And I think that what is also critical is that even when Stamford's program was approved PCI volumes were declining. And it seems that, you know, we're in a position where we can provide this great service, we already have everything in place and our patients are

being shut out of this market. And I think that the time has really come for OHCA to approve this application.

It's what's happening across the country, it's what safe for patients, and I just urge you to think about the patient experience, number one. And to think about the mechanics of this program and how great it is. We don't have people in our program who just show up and are affiliates who get their name put on the letterhead, we have dedicated interventional cardiologists from an institution like Yale-New Haven Medical Center who live at our institution 24/7, who are housed at our institution 24/7.

And I asked you to look at this with an open mind from the patient's perspective. Thank you very much for your attention.

HEARING OFFICER YANDOW: Thank you. So we have the late file exhibit coming within two weeks from today.

MR. LAZARUS: Two weeks from today.

HEARING OFFICER YANDOW: We have -- OHCA will go through the testimony to see what needs to be stricken regarding those attachments. Any other matters that need to -- so even though the hearing ends today the record is remaining open for those limited purposes at

this time. Okay? All right. So we will close for today.

Whereupon, the hearing adjourned at 1:09 p.m.)

Re: Docket No. 12-31748-CON
Proposal to Establish & Operate an Elective Angioplasty Program at Greenwich Hospital

Dear Hearing Officer Yandow,

This office represents Greenwich Hospital and Yale-New Haven Hospital in connection with the above-referenced CON request. Attached is a copy of my clients' Reply to Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission. An original and two (2) copies of the reply have been sent via Federal Express for Monday delivery.

Please let me know if you require anything further.

Very truly yours,

Jennifer L. Groves

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	)	DOCKET NO. 12-31748-CON
	)	AUGUST 10, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S REPLY TO INTERVENOR STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE APPLICANTS' LATE FILE SUBMISSION

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, submit this reply to the Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission, dated August 2, 2012 ("Objection"). The Objection, which is replete with inaccuracies and omissions and is not supported by law or the practices of OHCA, should be overruled and The Stamford Hospital's ("TSH") Motion to Strike should be denied.

TSH makes the following claims and arguments in its Objection: (1) Applicants failed to serve TSH with a copy of their late file submission; (2) Applicants' late file submission does not include a "community needs assessment" and therefore is non-responsive to OHCA's request; (3) Applicants are not entitled to late file any information that existed at the time of the initial CON submissions and could have been included in those submissions; (4) Applicants seeks to modify the

sworn testimony given by Greenwich Hospital President Frank Corvino at the July 17, 2012 public hearing; (5) Applicants' late file submission improperly references information already in the record of this matter; and (6) Applicants' late file submission does not support a clear public need for an elective angioplasty program at Greenwich Hospital. Each and every one of TSH's claims and arguments is without merit. None should be considered by OHCA in evaluating this proposal.

1. Applicants Served TSH With a Copy of Their Late File Submission

TSH claims that Applicants "failed to contemporaneously serve" the hospital with their late file submission and that TSH "only recently learned" of the filing (Objection, p. 2). Applicants hand delivered their late file submission to OHCA on Friday, July 27th, four days before the July 31st filing deadline set by Hearing Officer Yandow. Also on July 27th, Applicants sent Attorney Stephen M. Cowherd, counsel of record for TSH, a copy of the late file submission via United States mail. Service by United States mail is permitted by Section 19a-9-6(c) of the Regulations of Connecticut State Agencies. This is the same form of service used by Attorney Cowherd to transmit the Objection to the undersigned counsel. In the unlikely event that Attorney Cowherd did not receive Applicants' mailing, TSH was clearly able to obtain a copy of the Late File submission from OHCA and had sufficient time to formulate and file a response.

2. Applicants Have Provided OHCA With "Community Needs Assessments" and Other Information Responsive To the Agency's Request

TSH goes to great lengths arguing that the documents submitted by Applicants as late file do not constitute a "community needs assessment" and are not responsive to OHCA's request. This argument fails on both fronts. First, there are no specific requirements for a "community needs

assessment" set forth in any of the OHCA statutes or regulations, so TSH cannot claim that the requirements have not been met. Second, the documents provided by Applicants were entirely responsive to OHCA's request, which is apparent if you read the complete public hearing transcript around the question and not just the excerpt attached by TSH.

TSH makes the bold and entirely unsubstantiated statement that "[n]ot a single one of Applicants' submissions qualifies as a community needs assessment" for the CON proposal (Objection, p. 3). However, nowhere in its filing does TSH explain what a "community needs assessment" is and why Applicants' submissions are not considered community needs assessments. This is because the OHCA statutes and regulations do not prescribe a specific form of community needs assessment. Assessing community need is a process left to Applicants, who have the burden of supporting their request for permission to establish a service and proving their case-in-chief for a CON. For TSH to claim that the studies and assessments included in Applicants' late file submission are not community needs assessments, without providing any support for that proposition, is meaningless.

Moreover, Applicants' late file submission was entirely responsive to OHCA's request for information. A more complete excerpt of the public hearing transcript is attached as Exhibit A. It shows that the question regarding whether Greenwich Hospital conducted a community needs assessment originated with OHCA Analyst Steven Lazarus' review of Mr. Corvino's prefile testimony. Mr. Lazarus cites to (paraphrases) the following statement made by Mr. Corvino on page 682 of his testimony:

> *We are committed to providing the services that our communities have come to rely on us for and will need in the future.*

Mr. Lazarus then goes on to ask:

> *Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?*

Finally, Mr. Corvino responds:

> *Well, yes. I mean, we've done many community needs assessments throughout the years.*

Applicants' submission to OHCA included a number of documents, which comprise the "community needs assessment" to which Mr. Corvino was referring. These include studies done by or in association with Greenwich Hospital, which show among other things, that the community relies on Greenwich for cardiac care. The significance of each document to Applicants' assessment of "community need" is explained in the late file submission. These are analyses, studies and surveys that Greenwich Hospital relied on in making the decision to pursue an elective angioplasty program. They reflect the needs and preferences of the patient and physician communities around cardiac services and, by extension, the proposed program. It is true that some of this information was already provided in the CON, however, Applicants thought it would be worth highlighting and/or clarifying the information for OHCA, as it supports community need for the proposal. OHCA has historically given applicants tremendous latitude in determining what information is responsive to requests for supporting documentation in a CON proceeding (i.e. needs assessments, market share analyses, public health information, etc.) and Applicants ask that they be afforded the same latitude in this matter.

3. Applicants Are Entitled To Late File Information Upon OHCA's Request

TSH argues that Applicants should be precluded from offering the late file submission as evidence because the information should have been included in their CON application. As support, TSH cites the OHCA Policies & Procedures, which provided that all supporting evidence should be attached to the application and referenced therein. However, the very nature of a late file submission is to provide "late" evidence, after the CON has been deemed completed and the public hearing has taken place, at OHCA's request. As TSH and its counsel are well aware, OHCA often asks for information in a late file that existed at the time an application was filed (i.e. historical volume), but that was not included in the CON submissions. Here, OHCA asked for information that it knew to be as much as 3 to 4 years old (see Exhibit A attached). The agency clearly understood in making its request that the information could have been provided previously, but was not. Still, OHCA made the request of Applicants and they have responded, as ordered.

4. Applicants Do Not Seek To Modify the Sworn Testimony of Frank Corvino

TSH claims that by way of the late file submission, Applicants are attempting to modify the sworn testimony of Mr. Corvino through testimony from Gayle Capozzalo, Executive Vice President, Strategy and System Development for the Yale New Haven Health System. However, the very language of Ms. Capozzalo's letter belies this claim. Regarding Mr. Corvino's testimony about the community needs assessment, she states that upon further discussion with Mr. Corvino, "he indicated he was referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program." Mr. Corvino was simply clarifying what he meant when he offered to provide OHCA with

a "community needs assessment." As President and CEO of Greenwich Hospital, Mr. Corvino relied on planning and development staff to provide OHCA with the details of the assessments. Applicants do not claim that Mr. Corvino misspoke at the hearing, nor are they trying to alter the substance of his testimony in any way. The purpose of Ms. Capozzalo's letter was simply to clarify which documents Mr. Corvino was referring to when he said that several "community needs assessments" had been conducted over the years involving cardiac services.

5. Late File Information Already In the Record Should Not Be Stricken

Applicants included reference in their late file submission to certain information already contained in the record of this matter, either directly or through OHCA's administrative notice of past dockets. This information was included to show that Applicants had, in fact, assessed "community need" in advance of this CON application being filed. Applicants wanted to make this clear to OHCA, particularly given the agency's request for a copy of any "community needs assessment" undertaken by Greenwich Hospital. Reference to this information in the late file submission is not in any way prejudicial to TSH, which had an opportunity to rebut the information the first time it was presented, as well as through its latest submission.

6. Applicants' Late File Submission Supports the Clear Public Need For an Elective Angioplasty Program at Greenwich Hospital

TSH argues that the late file information submitted by Applicants has no relevance to an assessment of "community need" for the cardiac services that are the subject of the CON. Applicants stand by their submission and the relevance of each document contained therein to their evaluation of need for an elective angioplasty program at Greenwich Hospital. The information is reflective of a

need and desire on the part of physicians and patients to have access to high-quality elective angioplasty services within their community, where they are presenting for cardiac services now even without an elective angioplasty program in place. TSH's suggestion that Greenwich Hospital did not conduct any "community needs assessment," and that this somehow justifies denying the CON request, is not supported by the evidence.

WHEREFORE, for the foregoing reasons Applicants request that Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission be overruled/denied.

Respectfully Submitted,

GREENWICH HOSPITAL
YALE-NEW HAVEN HOSPITAL

EXHIBIT A

during medical care, correct?

DR. HOWES: Yes.

HEARING OFFICER YANDOW: Any other questions of Dr. Howes?

MS. MARTONE: No.

MR. LAZARUS: Thank you. I have a couple questions of Mr. Corvino. Good morning Mr. Corvino.

MR. CORVINO: Good morning.

MR. LAZARUS: On page 681 of the prefile, you state, that this program will reduce overall costs of angioplasty care in the Connecticut health system. What did you mean by that when you state that?

MR. CORVINO: In addition to what Dr. Howes has already said, you know, when we talk about transferring patients out there is a cost to that. And I think he articulated very well in that we've got to redo another admission and there's an ambulance charge to transfer the patient. So we calculate the value of that to be somewhere around $8,000. And if you multiply that by the number of cases we transfer out it's close to half a million dollars that could be saved. Without counting all of the subjective savings that would go into the patient's psyche for not having to be transferred.

MR. LAZARUS: What's the percentage of

patients that come in for cath. or some sort of a need, an elective that's considered to be emergency transport?

MR. CORVINO: I don't have that number. Does somebody else have a number?

MR. LAZARUS: I know you mentioned -- for example, in 53 cases, for example, you have based your testimony on, those 53 cases, what's the total number of cases that you put those 53 cases on?

MS. GROVES: Are you talking about the number that still need to be transferred anyway and wouldn't be able to stay?

MR. LAZARUS: Well, is that what you're referring to in your testimony, when you say emergency transport?

MR. CORVINO: Procedures that could not be done at Greenwich under the current regulations.

MS. GROVES: Under the current protocols.

MR. LAZARUS: Okay. Under the current protocols. But I'm saying, considering that this is an elective procedure, not every -- not every procedure that can be done at the hospital is considered an emergency transport, am I correct on that?

MR. CORVINO: Can Chris answer that? He's got more expertise.

MR. LAZARUS: Sure.

DR. HOWES: Again, when we use the term elective, it is a misnomer, I mean, no one elects to have a heart procedure, you know, this is serious stuff. And there are different things. Patients who come in with an acute coronary state syndrome and are sick, and you know, may end up hypotensive with a balloon pump, they're still being called elective angioplasties in this realm, in this discussion. So they're not all elective. Now, that said, some of them are much more stable and in fact are outpatients. I would say about half of the outpatients that we do a diagnostic cath. on in Greenwich, we end up transferring because we've already put, you know, entered arterial access, we have access to the arterial system, we transfer them and they'll end up getting the angioplasty the same day. The other half, we stopped, we regroup, and they go back up to New Haven or to New York Presbyterian some other day. So that's of the outpatient elective angioplasties, about half of them.

And then about half of those patients are actually inpatient, you know, not stable patients. So I'm making these numbers up, I don't have them off the top of my head, but my sense is of those, 53 number that's being reported, I would say about three quarters

of those patients go by ambulance or helicopter or something like that. Does that answer, what your asking?

MR. LAZARUS: That helps, yes. That gets it. Thank you. Mr. Corvino, are you -- let's just say those 53 cases you mentioned, you said there is about an $8,000 cost. $1,000 for the transport and about 7,000 for the admission and angioplasty. What's made up of the $7,000 cost that you're talking about?

MR. CORVINO: You know, that's the -- that's the charge, the average charge that goes along with that procedure.

MR. LAZARUS: Would that charge --

MR. CORVINO: And, you know, it may not be one-to-one with costs at the second facility we're talking about.

MR. LAZARUS: -- would there not be a charge at your facility if the service was here?

MR. CORVINO: But it would be much less because of the lack of transportation cost.

MR. LAZARUS: So it would be a savings of $1,000, not 8,000?

MR. CORVINO: Yeah, but you're also duplicating services at the other place.

MR. LAZARUS: Okay. So you're duplicating

services, I understand --

MR. CORVINO: Plus transportation.

MR. LAZARUS: -- but only the charge for the angioplasty, if it was approved, an elective angioplasty at Greenwich Hospital would be less than 7,000?

MR. CORVINO: I don't know that we have a charge code for that yet.

MR. LAZARUS: You also made a statement on the same page that, you know, we're committed to provide services that our community have come to rely on us and will need in the future. Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?

MR. CORVINO: Well, yes. I mean, we've done many community needs assessments throughout the years. Clearly, cardiology is a very important part of any institution's make up. And with the growing population and the incidence of heart attack in the U.S., you know, it's clear to us that we, you know, we have to improve and make sure that we've got all of the services that our community relies on on a regular basis. And we have saved many lives through the primary angioplasty

program from the communities we serve. And clearly, as Dr. Howes mentioned earlier, if we are able to do elective it'll make us better.

If you go back to when United Hospital closed in New York, about seven or eight years ago, we saw a huge increase in usage of our emergency room to the point where we went from 15 percent of our patients coming from Westchester to now 43 percent of our patients coming from Westchester County in New York, that made us a better institution. It made our emergency room better. It made our clinicians better. And we anticipate the same thing will happen here.

MS. MARTONE: Now, Mr. Corvino, to your knowledge the incidents of heart disease you just mentioned, is it higher in the Greenwich -- the Greenwich service area compared to other areas of the state?

MR. CORVINO: You know, I don't know the answer to that question. But what I can tell you is that when you look at heart disease and the potential for heart attack that's probably, number one, what frightens patients the most. And we've, you know, we've noticed that even through some of our fundraising efforts, even if people are affiliated with a New York hospital and they live in a local community they're are going to rely

on that local community to deal with their heart attack, if you will, in the middle of the night. They're not going to be traveling to another place. So having a strong heart program really bolsters your position in the community's eyes as a really good institution.

So regardless of whether the incidents is higher or lower, if you've got the illness you want to know that the very best is available in your community.

MR. LAZARUS: When was the last time, Mr. Corvino, a community needs assessment was done? Because you mentioned there were several done.

MR. CORVINO: I would say in the last three or four years.

MR. LAZARUS: And does it specifically discuss cardiac services?

MR. CORVINO: Yes.

MR. LAZARUS: Would you be able to provide OHCA a copy of that?

MR. CORVINO: Sure.

MR. LAZARUS: OCHA would like to accept that as --

HEARING OFFICER YANDOW: Okay. I'd like to order that to be produced. How much time do you need to produce that?

RE: Certificate of Need Application; Docket Number: 12-31748-CON
Greenwich Hospital and Yale-New Haven Hospital
Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup
at Greenwich Hospital

Dear Attorney Groves:

Enclosed please find a copy of the Proposed Final Decision rendered by Hearing Officer Joanne V. Yandow, Esq. in the above-referenced case.

Pursuant to Connecticut General Statutes § 4-179, Greenwich Hospital and Yale-New Haven Hospital, the parties in this matter, may request the opportunity to file exceptions or a brief or a request to present an oral argument, in writing, with the Deputy Commissioner, OHCA of the Department within twenty-one (21) days from the mailing of the decision, or by December 11, 2012. If no such request is received by this date, the Deputy Commissioner will take those rights to be waived and will render a Final Decision in this matter.

If you wish to expedite the process and avoid the necessity that the Deputy Commissioner await the expiration of the aforementioned fourteen days, you may submit a written statement to the Deputy Commissioner affirmatively waiving those rights.

Sincerely,

Kimberly R. Martone
Director of Operations

Copy: Stephen M. Cowherd, Jeffers and Cowherd, PC.

Office of Health Care Access
Certificate of Need Application

Proposed Final Decision

Applicant:	**Greenwich Hospital and Yale-New Haven Hospital**
Docket Number:	**12-31748-CON**
Project Title:	**Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital**

Project Description: Greenwich Hospital and Yale-New Haven Hospital propose to establish and operate an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure.

Nature of Proceedings: On June 20, 2012, the Office of Health Care Access ("OHCA") received the Certificate of Need ("CON") application from Greenwich Hospital and Yale-New Haven Hospital to establish an elective angioplasty program without onsite backup at Greenwich Hospital, with no associated capital expenditure. The Applicants are health care facilities or institutions as defined by Section 19a-630 of the Connecticut General Statutes ("General Statutes").

Pursuant to General Statutes § 19a-638, a public hearing regarding the CON application was held on July 17, 2012. On July 2, 2012, the Applicant was notified of the date, time, and place of the hearing. On July 3, 2012, a notice to the public announcing the hearing was published in *The Greenwich Times*. Attorney Joanne V. Yandow served as Hearing Officer. The hearing was conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the General Statutes) and General Statutes § 19a-638.

By petition dated July 12, 2012, The Stamford Hospital requested Party or, in the alternative, Intervenor status with full rights of cross-examination regarding the Applicants' CON application. The Hearing Officer denied the request of The Stamford Hospital for Party status and designated The Stamford Hospital as an Intervenor with limited rights of participation.

The Hearing Officer heard testimony from the Applicants' witnesses and the Intervenor's witnesses and, in rendering this decision, considered the entire record of the proceeding. The public hearing record was closed on September 6, 2012.

OHCA's authority to review and approve, modify, or deny the CON application is established by General Statutes § 19a-638. The provisions of this section, as well as the principles and guidelines set forth in General Statutes § 19a-639, were fully considered by OHCA in its review.

Findings of Fact

1. Greenwich Hospital is a not-for-profit 174-bed acute care hospital located at 5 Perryridge Road in Greenwich, Connecticut. Exhibit A, p. 573 (CON Application).

2. Yale-New Haven Hospital is a not-for-profit, acute care hospital located at 20 York Street, New Haven, Connecticut. Exhibit A, p. 575 (CON Application).

3. The Yale-New Haven Heart and Vascular Center provides elective and emergency ("primary") angioplasty at Yale-New Haven Hospital and has established satellite primary angioplasty programs at Greenwich Hospital and Lawrence & Memorial Hospital in New London, Connecticut. Exhibit H, pp. 629&632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale-New Haven Health System and CEO of Yale New Haven Hospital); OHCA CON Final Decision, DN: 03-30148.

4. Angioplasty is historically a procedure in which a balloon tipped catheter is advanced to an artery narrowed from the buildup of cholesterol-laden plaque, but has been expanded to include other devices that serve as adjuncts to the balloon catheter, such as stents. Percutaneous coronary intervention ("PCI") also refers to this broader group of technologies. PCI for patients that present on an emergency basis with ST-segment elevation MI or new onset left bundle branch block is referred to as a "primary" PCI. Other PCI procedures are referred to as "elective" PCI. *See*, OHCA CON Final Decision, DN: 08-31210.

5. As part of Yale-New Haven Heart and Vascular Center, Greenwich Hospital currently provides diagnostic cardiac services including echocardiography, nuclear cardiac imaging, stress testing, cardiac CT angiography, and diagnostic cardiac catheterization. Greenwich Hospital also provides PCI angioplasty services for patients that present on an emergency basis with artery blockage in the heart. Exhibit A, pp. 22-23 (CON Application).

6. The primary angioplasty program at Greenwich Hospital received permanent status approval from OHCA on July 25, 2008, after completion of a 3-year demonstration project. Exhibit A, p. 22 (CON Application); OHCA CON Final Decision, DN: 03-30148.

7. Elective angioplasty is the same procedure as primary angioplasty but is typically a scheduled procedure (within 72 hours) and is not an emergency. *See*, OHCA CON Final Decision, DN: 08-31210.

8. The Applicants are proposing to establish an elective angioplasty program at Greenwich Hospital without an on-site open heart surgery program. Exhibit A, p. 14 (CON Application).

9. The Applicants define the population to be served through this proposal as the residents of the towns that comprise 85% of Greenwich Hospital's inpatient volume. The Applicants claim that the proposed service area ("PSA") is as follows:

Table I: Greenwich Hospital's PSA for Elective PCI

State	Towns
Connecticut	Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston, Westport and Wilton
New York	Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneek, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Pound Ridge, Purchase, Rye Scarsdale, South Salem, West Harrison and White Plains

Exhibit A, p. 24 (CON Application).

10. The Stamford Hospital ("Stamford Hospital"), the Intervenor in this matter, performs cardiovascular services, including primary and elective PCIs. *See*, OHCA CON Final Decision, DN: 04-30374.

11. The Applicants claim that based on the 2011 inpatient cardiovascular discharge volume by patients' towns of origin for Stamford Hospital and Greenwich Hospital, cardiovascular patients at Greenwich Hospital are the low volume communities for Stamford Hospital. Specifically, the communities of Greenwich, Port Chester and Rye comprise 80% of Greenwich Hospital's cardiovascular patient population but only 4.6% of Stamford Hospital's cardiovascular patient population. Additionally, patients who live in the city of Stamford and the town of Darien comprise 88% of Stamford Hospital's cardiovascular patient volume but only comprise 7% of Greenwich Hospital's cardiovascular patients. Exhibit H, pp. 668-669 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

12. In 2010, OHCA issued a decision denying Greenwich Hospital's first proposal to establish and operate elective angioplasty program without on-site open heart surgery. The proposal was denied because the projected volume included New York patients, there was insufficient evidence to support the projected volumes, and there was an existing provider of elective PCI and full service cardiac program in the service area (Stamford Hospital). CON Final Decision 08-31210-CON.

13. In or about January 2012, White Plains Hospital in White Plains, New York began offering elective angioplasty service. . Exhibit I, p. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

14. Stamford Hospital and White Plains Hospital are currently providing elective angioplasty procedures in Greenwich Hospital's claimed PSA. Exhibit A, p. 28 (CON Application).

15. White Plains Hospital states it services most of the Westchester County towns identified by the Applicants as towns in Greenwich Hospital's PSA. Exhibit I, page, 49 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

16. The Applicants assert that Greenwich Hospital is already performing angioplasty on more acutely ill patients through its primary angioplasty program and the staff and physicians are well prepared to perform elective angioplasty for less acute patients. Exhibit A, p. 14 (CON Application).

17. The Medical Director of the cardiac services program at Greenwich Hospital is appointed by Yale University School of Medicine, Department of Cardiology and is a member of the Yale School of Medicine's interventional cardiology faculty. Exhibit A, p. 14 (CON Application).

18. The Applicants claim that the previous OHCA approval for the primary PCI demonstrated clear public need for emergency angioplasty services at Greenwich Hospital and that the current proposal expands upon that approval to demonstrate that the same population, from which Greenwich Hospital's primary angioplasty patients originate, also have a clear need for access to their provider of choice for high quality elective angioplasty services. Exhibit A, p. 15 (CON Application).

19. The Applicants claim that the clear public need for this proposal is supported by the following three key factors:

    a. Local access to elective angioplasty care at Greenwich Hospital is needed and appropriate;
    b. Greenwich Hospital must address the cost-effectiveness of angioplasty services; and
    c. The proposed program will improve the quality of elective angioplasty services provided to Greenwich Hospital's PSA patients.

    Exhibit A, p. 15 (CON Application).

20. The Applicants assert that significant stress and strain are placed on Greenwich Hospital patients and their families when they receive either a diagnostic catheterization or an emergency angioplasty and then must undergo an elective angioplasty at another facility. Exhibit H, p. 671 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

21. In November 2011, the American College of Cardiology/American Heart Association/The Society for Cardiovascular Angiography and Interventions ("ACC/AHA/SCAI") updated their guidelines regarding PCI without on-site surgical backup. These guidelines are intended to assist healthcare providers in clinical decision making by describing a range of generally acceptable approaches to the diagnosis, management, and prevention of specific diseases or condition. Exhibit A, pp. 139-239 (CON Application).

22. The Applicants claim that an elective PCI program at Greenwich Hospital would fall within the ACC/AHA/SCAI updated guidelines. Exhibit H, pp. 635-636 (prefiled testimonoy of Henry Cabin, MD, Clinical Chief of Cardiology at Yale School of Medicine and Medical Director of Yale-New Haven Heart and Vascular Center).

23. The ACC/AHA/SCAI updated guidelines recommend, in part, that:
> elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection.

Exhibit A, p. 164 (CON Application).

24. The ACC/AHA/SCAI guidelines also recommend, in part, that:
> [i]t is only appropriate to consider initiation of a PCI program without on-site backup if the program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

Exhibit A, p. 164 (CON Application).

25. It is found that although OHCA is not bound to the ACC/AHA/SCAI guidelines, these guidelines are instructive. *See*, CON Final Decision 08-31210-CON.

26. The Applicants claim that angioplasty has become a fairly routine procedure, often performed in an outpatient setting at much lower risk than used to exist. Exhibit H, p. 632. (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale-New Haven Hospital).

27. The Applicants claim that this proposal eliminates the need for two invasive procedures, diagnostic cardiac catheterization and elective angioplasty, which adds hospital costs, clinical risk and expensive medical transportation costs. Exhibit H, pp.

632 and 671 (prefiled testimonies of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital, and Christopher Howes, MD, Chief of Cardiology and Medical Director of the angioplasty program at Greenwich Hospital).

28. The Applicants assert that Yale School of Medicine cardiovascular physicians have been actively involved in the primary angioplasty program at Greenwich Hospital since its inception and will continue to provide clinical oversight, direct patient care, and staff and physician education at the proposed program. Exhibit H, p. 632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital).

29. The Applicants state that Greenwich Hospital participates in the National Cardiovascular Data Registry NCDR-CathPCI Registry. Exhibit A, p. 36 (CON Application).

30. According to the Applicants, since Fiscal Year ("FY") 2008, 272 patients presented at Greenwich Hospital for elective angioplasty service. A total of 246 of the 272 patients were transferred to other providers for elective PCI. The following table illustrates the total of transfers by provider:

Table II: Historical Greenwich Hospital Elective PCI Transfers

FY	Yale	Westchester Medical Center	Cornell	Columbia	Stamford	West Haven VA	Total Transfers
2008	44	1	0	0	0	0	45
2009	71	0	1	1	1	0	74
2010	51	0	2	0	1	0	54
2011	53	0	2	1	0	1	57
2012*	16	0	0	0	0	0	16
Totals	**235**	**1**	**5**	**2**	**2**	**1**	**246**

*Number of transfers between 10/1/11 and 12/31/11

Note: The remaining 26 patients were discharged and referred for elective angioplasty at a future time. Exhibit A, p. 19 (CON Application).

31. The Applicants identified the following historical primary angioplasty volumes for Greenwich Hospital for FYs 2008-2011:

Table III: Greenwich Hospital Historical Primary PCI

	FY 2008	FY 2009	FY 2010	FY 2011
Greenwich Hospital	40	40	32	38

Exhibit A, p. 30 (CON Application).

32. Greenwich Hospital's angioplasty volume projections:

Table IV: Greenwich Hospital Projected Primary and Elective PCI

	FY 2012	FY 2013	FY 2014
Primary Angioplasty	38	38	38
Elective Angioplasty	**53**	**53**	**53**
New Referred Elective PCI	105	126	151
Total	196	217	242

Exhibit A, p. 31 (CON Application).

33. The Applicants based the projected primary angioplasty volumes on historical volumes, which have remained fairly steady for the past few years. The projected elective angioplasty volumes have been based on the historical elective angioplasty patients transferred to other facilities. Exhibit A, pp. 32-34 (CON Application).

34. The Applicants claim that half of the outpatients that have a diagnostic catheterization performed at Greenwich Hospital are transferred to other facilities for elective PCI. Exhibit H, p. 669-671 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

35. The Applicants state that an increase in the PCI patient volume will result from the addition of New York interventional cardiologists who currently do not practice at Greenwich Hospital but have referral relationships with Greenwich Hospital medical staff and would utilize and refer elective angioplasty to Greenwich Hospital. Exhibit H, pp. 670-671, 675-676 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

36. Although the Applicants provided letters of support from the two (2) physicians from the State of New York who state they would offer elective PCI at Greenwich Hospital if that were an option, the projected new PCI volumes are speculative and appear to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital. *See*, Exhibit H, page 671 &675-679 (prefiled testimony of Christopher Howes, M.D Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

37. Stamford Hospital claims that elective angioplasty volumes are flat to declining in the State, with no volume growth in the Applicants' proposed service area, and therefore, there is no clear public need for the establishment of elective angioplasty program without onsite surgical back up at Greenwich Hospital. Exhibit K, p. 1 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

38. The following table illustrates the historical overall statewide PCI (primary and elective combined) discharges by provider between Federal Fiscal Years ("FFY") 2002-2011:

Table V: PCI discharges by provider, FFYs 2002-2011

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	FFY 05-07 (3-yr)* % Change	FFY 09-11 (3-yr) % Change	FFY 10-11 (1-yr) % Change
Bridgeport	1,191	1,249	1,288	1,052	692	560	580	428	379	298	-47%	-30%	-21%

***Source**: CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.*

ICD-9-CM Procedure Codes: .66, 36.01, 36.02, 36.05, 36.06 and 36.07
Please note: unduplicated counts utilizing all procedure codes
*This column in OHCA's Exhibit 1, Table 2A, was mislabeled. No data from this column was relied upon to support the findings in this decision.

39. The statewide inpatient PCI volumes demonstrate the following: a five year historical decline of 1% between FY 2007-2011; a 12% overall decline between FY 2009 and 2011; and an 11% decline in statewide PCI volume between FY 2010-2011. *See,* Table V, above.

40. Stamford Hospital's PCI discharges have declined 15% between FY 2009-2011 and, therefore, Stamford Hospital has capacity to serve the needs of the community. *See*, Table V, above.

41. The Intervenor claims that discharges of residents from Greenwich Hospital's service area from Connecticut and New York hospitals show that from FY 2009 through 2011, inpatient ("I/P") cardiac catheterization and PCI volumes have decreased in the service area:

Table VI: FY 2009-2011, I/P PCI Volume in proposed Service Area

State	FY 2009	FY 2010	FY 2011
CT Service Area	598	610	429
NY Service Area	844	775	772
Total	**1,442**	**1,385**	**1,201**

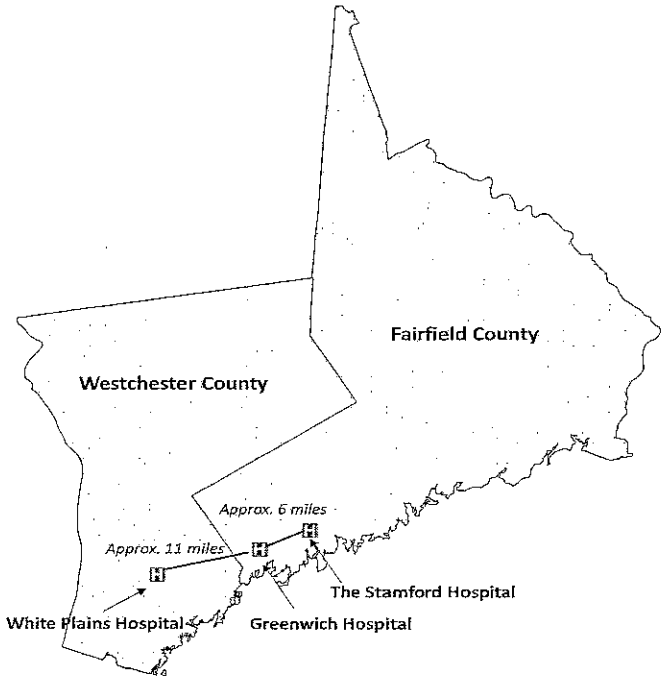
Exhibit K, p. 8 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

42. In light of the historical elective PCI transfers from Greenwich Hospital to existing providers and the declining statewide PCI volumes, OHCA finds that the Applicants have not provided sufficient evidence to support its projected PCI utilizations.

43. A letter from White Plains Hospital states that its elective PCI program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area that would indicate patients are not receiving timely care. Exhibit I, pp. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

44. White Plains Hospital is located approximately ten (10) miles west of Greenwich Hospital. If this application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other. Exhibit K, p. 10 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

45. The map illustrates the location of Greenwich Hospital and the existing providers such as Stamford Hospital and White Plains Hospital, in Greenwich Hospital's proposed service area and their approximate distance to Greenwich Hospital:



46. There is no capital expenditure associated with this proposal. Exhibit A, p. 21(CON Application).

47. The Applicants assert that they estimate the unnecessary costs that now result and impact payers and patients total approximately $425,000 each year. This amount is based on an average of 53 elective angioplasty cases currently transferred that could be cared for by a Greenwich Hospital's elective angioplasty program multiplied by $8,000 ($7,000 for the average cost of an angioplasty admission at Yale New Haven Hospital plus $1,000 for emergency transportation). Exhibit H, p. 79 (prefiled testimony of Frank Corvino, President and CEO of Greenwich Hospital).

48. Greenwich Hospital's projected incremental revenue from operations, total operating expense and gain from operations associated with the CON proposal are as follows:

Table VII: Financial Projections Incremental to the Project

Description	FY 2013	FY 2014	FY 2015
Incremental Revenue from Operations	$2,935	$3,413	$3,976
Incremental Total Operating Expense	$2,353	$2,744	$3,222
Incremental Gain from Operations	**$582**	**$669**	**$756**

Note: figures are in thousands.
Exhibit A, p. 577 (CON Application).

49. The current and three-year projected payer mix for Greenwich Hospital is as follows:

Table VIII: Current & Three-Year Projected Payer Mix

Description	Current	Year 1	Year 2	Year 3
Medicare*	40.5%	40.5%	40.5%	40.5%
Medicaid*	5.4%	5.4%	5.4%	5.4%
CHAMPUS and TriCare				
Total Government	**45.9%**	**45.9%**	**45.9%**	**45.9%**
Commercial Insurers*	48.7%	48.7%	48.7%	48.7%
Self Pay	5.4%	5.4%	5.4%	5.4%
Workers Compensation	0%	0%	0%	0%
Total Non-Government	**54.1%**	**54.1%**	**54.1%**	**54.1%**
Total Payer Mix	**100%**	**100%**	**100%**	**100%**

* Includes managed care activity.
Exhibit A, p. 40 (CON Application).

50. The Applicants assert that Greenwich Hospital's primary angioplasty services are costing Greenwich Hospital approximately $1.78 million per year, as Greenwich Hospital has to pay Yale School of Medicine to provide 24/7 physician staffing for its existing program. The primary angioplasty program results in significant staffing costs to cover approximately 40 primary angioplasty cases treated at Greenwich Hospital each year. Utilizing the same physicians to perform elective angioplasty would be a cost-effective and efficient approach and would reduce the costs per case from the arrangement. Exhibit A, p. 20 (CON Application).

51. The Applicants claim that the proposed elective angioplasty program is cost effective as it maximizes use of the existing high-cost infrastructure of the primary angioplasty program and permits existing and available highly qualified expert physicians and staff to perform both primary and elective angioplasties for which they have been trained and are qualified to perform. In addition, as noted in the application, System-wide integration, coordination of care practices and standardization, more cost effectiveness and evidence-based care will be provided. Exhibit A, pp. 40-41 (CON Application).

52. OHCA is currently in the process of establishing its policies and standards as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations adopted by OHCA. (General Statutes § 19a-639(a)(1)).

53. OHCA is currently in the process of establishing the statewide facilities and services plan ("the plan"). The plan was not a published document at the time of this proposal was filed; however, even if the plan is published by the time this final decision is issued, it has no bearing on the outcome of this matter, as the Applicants have not sufficiently demonstrated a clear public need for this proposal. (General Statutes § 19a-639(a)(2)).

54. There is insufficient evidence to establish that there is a clear public need for the Applicants' proposal. (General Statutes § 19a-639(a)(3)).

55. The Applicants have not satisfactorily demonstrated how this proposal will impact the financial strength of the health care system in this state. (General Statutes § 19a-639(a)(4)).

56. The Applicants have failed to satisfactorily demonstrate that their proposal would improve the accessibility of health care delivery in the region but they have satisfactorily demonstrated a potential improvement in quality and cost effectiveness. (General Statutes § 19a-639(a)(5)).

57. The Applicants have shown that there would be no change to the provision of health care services to the relevant populations and payer mix. (General Statutes § 19a-639(a)(6)).

58. The Applicants have satisfactorily identified the population to be served by their proposal but have failed to satisfactorily demonstrate that this population has a need as proposed. (General Statutes § 19a-639(a)(7)).

59. The historical elective PCI discharges in the service area do not support this proposal. (General Statutes § 19a-639(a)(8)).

60. The Applicants have failed to satisfactorily demonstrate that their proposal would not result in an unnecessary duplication of existing elective PCI services in the area. (General Statutes § 19a-639(a)(9)).

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in General Statutes § 19a-639(a) and the Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Goldstar Medical Services, Inc., et al. v. Department of Social Services,* 288 Conn. 790 (2008); *Steadman v. SEC*, 450 U.S. 91, 101 S.Ct. 999, *reh'g den.*, 451 U.S. 933 (1981); *Bender v. Clark*, 744 F.2d 1424 (10th Cir. 1984); *Sea Island Broadcasting Corp. v. FCC*, 627 F.2d 240, 243 (D.C. Cir. 1980).

Greenwich Hospital is a 174-bed acute care hospital located at 5 Perryridge Road in Greenwich and Yale-New Haven Hospital is an acute care hospital located at 20 York Street in New Haven. Greenwich Hospital and Yale New Haven Hospital (collectively known as "Applicants") are proposing to establish and operate an elective angioplasty program without onsite surgical backup located at Greenwich Hospital. FFs 1, 2, 8.

Currently, Greenwich Hospital, as a satellite of Yale New Haven Hospital's Yale-New Haven Heart and Vascular Center, provides cardiac catheterization and primary (emergency) angioplasty services. Greenwich Hospital does not have an on-site open heart surgery program. FF 4-6.

The Applicants argue that there is a clear public need for elective angioplasty ("elective PCI") at Greenwich Hospital and that such a program would fall within the ACCF/AHA/SCAI updated guidelines regarding elective PCI without on-site surgical backup. FFs 18, 19, 21, 22. The ACCF/AHA/SCAI guidelines now state that elective PCI might be considered in hospitals without on-site cardiac, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection. FF 23.

The Applicants claim there is clear public need based on three key factors: local access, cost-effectiveness and improved quality. FF 19. Greenwich Hospital has transferred approximately 57 patients annually (between FYs 2008-2011) that required elective angioplasties to other providers over the each of the past three fiscal years. FF 30. Additionally, the Applicants claim that two new physicians (currently practicing in Westchester County, NY) will refer new angioplasty patients to Greenwich Hospital, if approved. FF 35.

Although the Applicants claim that there is need for elective PCI in the proposed service area, there are currently two providers of elective angioplasty service within its proposed service area, Stamford Hospital and White Plains Hospital. FFs 14, 44, 45. Each of the existing providers of elective angioplasty is approximately 6 and 11 miles away from Greenwich Hospital. FFs 44, 45. A letter from White Plains Hospital in Westchester County, NY, stated that its elective angioplasty program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area. FF 43. Additionally, historical PCI discharge data shows that Stamford Hospital also has capacity to serve the needs of the community. FFs 37-40. Furthermore, based on OHCA's statewide hospital discharges, it's clear that since FY 2009,

the cardiac catheterization volume has declined 10% and the combined (emergent and elective) angioplasty volumes declined 12% at Connecticut providers. FFs 38-40.

The ACCF/AHA/SCAI updated guidelines state:

> It is only appropriate to consider initiation of a PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

FF 24. Regarding the proposal at hand, there is insufficient evidence to establish a void in the needs of the community for elective PCI services and that the Applicants' proposal is in the best interests of the community.

Based on the statewide decline at all Connecticut providers of cardiac catheterization and angioplasty programs, the speculative projected new cases, and the fact that there are two (2) existing providers currently providing elective PCI in Greenwich Hospital's proposed service area and that these providers have capacity to fulfill the needs of the community, OHCA finds there is access to elective angioplasty service for the residents within Greenwich Hospital's proposed service area and, further, that the Applicants failed to demonstrate and provide evidence of a clear public need for this proposal. Based upon the lack of sufficient evidence demonstrating that the Applicants' proposed project fulfills a clear public need for elective PCI, OHCA is unable to conclude that the Applicants' financial projections and volumes upon which they are based are reasonable and achievable, or that the project is financially feasible.

Based upon the foregoing Findings of Fact and Discussion, I respectfully recommend that the Certificate of Need application of Greenwich Hospital and Yale-New Haven Hospital for the establishment of an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure, be **DENIED**.

Respectfully submitted,

CERTIFICATE

I, Paul Landman, a Notary Public in and for the State of Connecticut, and President of Post Reporting Service, Inc., do hereby certify that, to the best of my knowledge, the foregoing record is a correct and verbatim transcription of the audio recording made of the proceeding hereinbefore set forth.

I further certify that neither the audio operator nor I are attorney or counsel for, nor directly related to or employed by any of the parties to the action and/or proceeding in which this action is taken; and further, that neither the audio operator nor I are a relative or employee of any attorney or counsel employed by the parties, thereto, or financially interested in any way in the outcome of this action or proceeding.

In witness whereof I have hereunto set my hand and do so attest to the above, this 24th day of July, 2012.

Paul Landman

Good morning Steve-

I just wanted to let you know that the Late File submission for the above referenced docket will be delivered to OHCA via courier today. A copy will also be sent (via US mail) to Attorney S. Cowherd.

Please let me know if you have any questions. Thank you. Karen

Re: Certificate of Need Application (CON); Docket Number 12-31748
Proposal to Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital – Late File Submission

Dear Hearing Officer Yandow:

As requested at the Public Hearing held on July 17, 2012 regarding the above referenced CON application, the following documents are being provided as Late File #1. OHCA staff asked Mr. Corvino whether Greenwich Hospital had performed any community needs assessments and Mr. Corvino replied in the affirmative. Upon further discussion with Mr. Corvino, he indicated he was referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program. A description of each analysis and/or report is provided below and relevant components have been attached.

- Market Strategies Consumer Survey:
  - Greenwich Hospital contracted with Market Strategies International, a market research company, to conduct a telephone and web survey in the summer of 2011. Some of the content of that survey involved cardiac services. The results of the survey highlight that Yale New Haven Health System/Greenwich Hospital is the preferred health care provider in a number of clinical areas, including the treatment of heart disease. This is quite significant since the survey was conducted well after Stamford Hospital established its full-service cardiac program. This survey provides additional support for Mr. Corvino's comments regarding the community's preference for access to cardiac services at Greenwich Hospital. Key pages from the survey report are provided in *Attachment I.*

- Navigant Physician Needs Assessment:
    - Greenwich Hospital contracted with Navigant Consulting to assess community needs for physicians in Greenwich Hospital's service area. Navigant determined that there is a deficit of 3.0 full time equivalent physicians in the area of invasive-interventional cardiologists. This deficit is projected to grow to 7.9 FTEs by 2017. The need for additional invasive/interventional cardiologists also supports the need for these services in the Greenwich Hospital service area. Key pages of this assessment are included in *Attachment II.*
- Physician Telephone Survey:
    - As described in the CON application on applicant pages 31-34 and 703, Greenwich Hospital's Planning Director personally contacted 18 physicians currently on Greenwich Hospital's medical staff in the area of cardiology and one internal medicine practice. These physicians were asked to estimate the number of cardiac catheterization patients they would send to Greenwich Hospital if it could offer elective angioplasty. *Attachment III* includes more detail about the physician survey and serves as another supporting analysis for the proposed elective angioplasty program. These 18 physicians have patients who require invasive cardiac procedures, would prefer to use Greenwich Hospital, but are sent elsewhere because of the absence of elective angioplasty.
- United Way Community Needs Assessment:
    - In January, 2011, the Greenwich United Way Community Planning Council published a comprehensive assessment of human service needs. Although this very broad and comprehensive assessment is not focused on cardiac services, the report does identify that the largest number of deaths for Greenwich residents was caused by heart and circulatory disease. A link to the full report can be accessed at http://www.unitedway-greenwich.com/needs-assessment2011-es.pdf.

In addition, the Applicants would like to highlight some information already included in the above referenced CON application and DN: 08-31210 which further contribute to Mr. Corvino's comments regarding community need.

- Other Physician and Patient Support:
    - Although part of both the above referenced CON application (see applicant pages 125-138, 675-676) and DN: 08-31210-CON (see applicant pages 119-125 and patient letters included in *Attachment IV*), letters of support from both patients and physicians also reinforce public need for the program. The Applicants would like to reiterate the presence of these letters in both CON applications and request OHCA consider them along with the other supporting data and information.
- Cardiovascular Health Statistics:
    - Public need for the proposed program is also supported by compelling statistics which identify the significance of heart disease. The Applicants would like to

direct OHCA to pages 24 – 26 of the CON application where relevant statistics on heart disease, hospitalizations, and deaths are provided for the state overall and Fairfield County. Fairfield County's heart disease death rate was higher than the rates in New Haven, Middlesex, Hartford and Litchfield counties and it had the third highest 65+ heart disease hospitalization rate per 1,000 in Connecticut.

The Applicants hope that the following materials are satisfactory to OHCA and want to thank you for your time and effort on the Applicants' behalf. Please do not hesitate to contact me with any questions or concerns.

Sincerely,

Gayle L. Capozzalo
Executive Vice President, Strategy and System Development

Enclosures

ATTACHMENT I

MARKET STRATEGIES CONSUMER SURVEY

Methodology

For the 2011 wave, Market Strategies conducted 2,301 telephone and web interviews from July 15, 2011, to August 7, 2011 among consumers:

Service Area	Sample Size	Sample Error
Yale-New Haven Hospital's Primary Service Area	384	+/-5.0% sample error at the 95% confidence level
Yale-New Haven Hospital's Secondary Service Area	383	+/-5.0% sample error at the 95% confidence level
Bridgeport Hospital's Primary Service Area	384	+/-5.0% sample error at the 95% confidence level
Bridgeport Hospital's Secondary Service Area	383	+/-5.0% sample error at the 95% confidence level
Greenwich Hospital's Primary Service Area	383	+/-5.0% sample error at the 95% confidence level
Greenwich Hospital's Secondary Service Area	384	+/-5.0% sample error at the 95% confidence level

The definition of each market area is shown on the following page. The data was weighted by geography to proportionately represent the distribution of the population. The telephone sample is a Random Digit Dial (RDD) design to ensure an equal probability of reaching unlisted as well as listed households. The sample is drawn Population-Proportionate-To-Size (PPS) across each geographic area to allow for proportionate representation. The sample for the web-based surveys is an online consumer panel. The mix of final completes was approximately 500 phone and 250 web completes for each hospital.

Respondents are consumers who are the adult head-of-the-household (i.e., 18 years or older), responsible for health care decisions for the household, and who reside in the defined market areas. Consumers with someone in their household who works within the healthcare industry or for a market research firm or an advertising agency were also excluded from the study.

Methodology

Service Area	Zip Codes
Greenwich Hospital Primary Market Area	10528, 10538, 10543, 10573, 10580, 06807, 06820, 06830, 06831, 06836, 06840, 06870, 06878, 06901, 06902, 06903, 06905, 06906, 06907
Greenwich Hospital Secondary Market Area	10504, 10506, 10507, 10576, 10577, 10583, 10601, 10603, 10604, 10605, 10606, 10607, 10801, 10804, 10805, 06850, 06851, 06853, 06854, 06855, 06880, 06883, 06897, 06852, 06856, 06857, 06858, 06859, 06860, 10590, 10802, 10530, 10536, 10549, 10550, 10552, 10553

MARKETSTRATEGIES INTERNATIONAL

Key Findings
Greenwich Hospital Leadership – Primary Service Area

Greenwich Hospital remains the service preference leader in the primary service area despite Stamford's improved ratings over time

- Greenwich continues to be the unaided awareness leader, however awareness of Stamford's offerings grows year over year
- Greenwich preference ratings strengthen for *maternity services, radiology and imaging, rare medical condition treatment,* and *heart disease*
- Stamford also makes directional improvements to challenge Greenwich for *rare medical condition* and *heart disease* treatment
- Overall, the competition between Greenwich and Stamford Hospitals remains close over time

	Attribute	Greenwich Hospital	Lead / Closest Competitor	Competitor	Ranked by Gap
Aware	Total Unaided	76 +3	61^ +8	Stamford	15
	Top-of-Mind Unaided	38 -3	33 +3		5
Preference	Maternity Services	45 +4	26	Stamford	19
	Age 65+	42	28		14
	Radiology or Imaging	34 +5	21 -5		13
	Women's Health	38	26		12
	Emergency Room	42	33		9
	Pediatric Services	33	24		9
	Rare Medical Condition	20 +3	16 +3		4
	Heart Disease	25 +4	24 +3		1
	Cancer Treatment	18	30	Sloan	-12

^ Indicates a significant difference at the 95% confidence level between the 2010 and 2011 scores. Faded numbers reference directional change >2% and circles identify potential opportunities to strengthen position.

Key Findings

Greenwich Hospital Leadership – Primary Service Area

As with service preferences, consumers also consider Greenwich and Stamford Hospitals close competitors on key brand positioning metrics

- Greenwich makes a dramatic improvement in consumers' impression of their *health education* offerings in 2011
- The gap between Greenwich and Stamford remains widest year over year on *caring and compassionate doctors, nurses and staff*

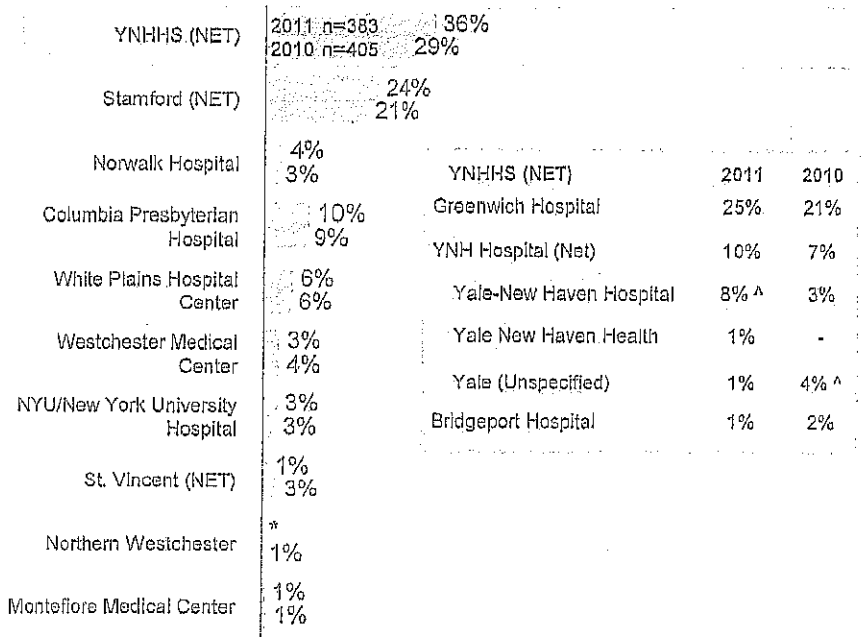
Attribute		Greenwich Hospital	Lead / Closest Competitor	Competitor	Ranked by Gap
Attributes	Health Education	37 +5	20 +3	Stamford	7
	Caring and compassion	35	19		6
	Highest quality care	30 -4	18 -4		2
	Having expert physicians	22 -3	15		7
	Cares About Entire Community	29	23		3
Overall Preference		41	26	Stamford	5

^ Indicates a significant difference at the 95% confidence level between the 2010 and 2011 scores. Faded numbers reference change >2% and circles identify potential opportunities to strengthen position.

Primary service area consumers prefer to be *treated for heart disease* either at Greenwich (25%) or Stamford (24%). Secondary service area consumers do not have a strong of a preference for *heart disease treatment*, although most mention Norwalk (16%).

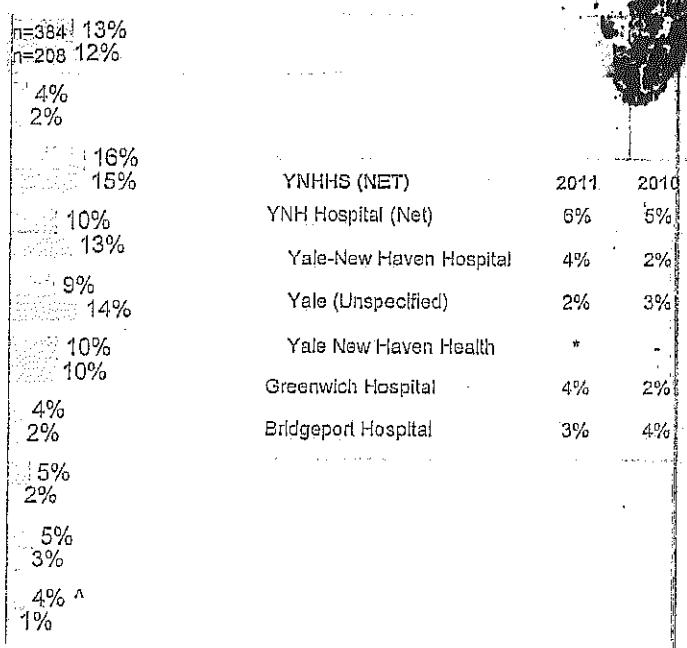
Heart Disease Preference

Primary Service Area



YNHHS (NET)	2011	2010
Greenwich Hospital	25%	21%
YNH Hospital (Net)	10%	7%
Yale-New Haven Hospital	8% ^	3%
Yale New Haven Health	1%	-
Yale (Unspecified)	1%	4% ^
Bridgeport Hospital	1%	2%

Secondary Service Area



YNHHS (NET)	2011	2010
YNH Hospital (Net)	6%	5%
Yale-New Haven Hospital	4%	2%
Yale (Unspecified)	2%	3%
Yale New Haven Health	*	-
Greenwich Hospital	4%	2%
Bridgeport Hospital	3%	4%

* Indicates less than 1%.
^ Indicates a significant difference at the 95% confidence level between the 2010 and 2011 scores.
Q4. If you or someone in your household had to be treated in a hospital for HEART DISEASE, what area hospital would you PREFER?

NAVIGANT PHYSICIAN NEEDS ASSESSMENT

NAVIGANT

30 S. Wacker Dr., Suite 3100
Chicago, IL 60606
312.583.4100 phone
312.583.4101 fax

Greenwich Hospital
Draft 2012 Community Needs Assessment
May 15, 2012

Introduction

Navigant has been asked by Greenwich Hospital to evaluate the current and future FTE demand and supply for physicians in the following specialties in the service area for Greenwich Hospital:

Primary Care	Medical Specialties	Surgical Specialties
Internal Medicine	Cardiology	CT Surgery
OB/Gyn	Endocrinology	Colorectal Surgery
Pediatrics	Gastroenterology	ENT
	Hematology-Oncology	General Surgery
	Nephrology	Neurosurgery
	Neurology	Oncology Surgery
	Pulmonary Medicine	Orthopedics
	Rheumatology	Spine Surgery
		Urology
		Vascular Surgery

Greenwich Hospital has requested and intends to use this evaluation by Navigant for the purpose of structuring Greenwich Hospital's physician recruitment programs in compliance with the federal Stark law (42 USC Section 1395nn), the federal anti-kickback statute (42 USC Section 1320a-7b) and the federal laws governing tax-exempt organizations.

Market Definition

Greenwich Hospital's Primary Service Area is comprised of the lowest number of contiguous zip codes located within the surrounding areas that account for at least 75% of Greenwich Hospital's inpatient admissions for the most recent 12 months available. In addition, Greenwich Hospital identified a Secondary Service Area (SSA) for study within this report. Please refer to Attachment A for a complete zip code listing of both areas. To determine the current population, Navigant utilized demographic data provided by Claritas, a nationally recognized

provider of demographic and other market intelligence information. Using data from these sources, the following current population was identified:

Population [1]	Greenwich Hospital PSA [2]		Greenwich Hospital SSA [2]	
	2012	2017	2012	2017
Total	404,136	409,242	407,622	411,616
65+	56,488	61,988	55,786	62,771
% 65+	14.0%	15.1%	13.7%	15.2%

[1] Source: Claritas – Data updated and projected based on 2010 Census.
[2] Zip Code Definition found in Attachment A

Assessing community need for a particular specialty involves calculating current and future demand on a FTE basis for each physician specialty, then comparing demand against current and projected physician FTE supply located and practicing within the service area.

Current Regional Service Area Physician Demand

To assess community needs for physician for the defined service area, Navigant performed a quantitative analysis using our customized actuarial-data based model for prediction physician demand. Based on the current demographic profile and specific healthcare market characteristics of the defined service area population, Navigant applied actuarially based use rates and MGMA practice capacity benchmarks to estimate the total number of FTEs by specialty required to serve the needs of the community.

Greenwich Hospital's service areas are located within the New York/Connecticut metropolitan area. Therefore an adjustment was made to reflect the healthcare utilization within the states of New York and Connecticut and is included in the model inputs.

Current Regional Service Area Supply

A physician roster of all FTEs for each of the selected specialties practicing in the market was created through the integration of information provided by Greenwich Hospital and information obtained by Navigant from American Medical Information, a division of InfoUSA. Additionally, other sources such as large local payer directories and competitor physician rosters were consulted to locate and aggregate all physicians that are practicing in Greenwich

Greenwich Hospital's Total Service Area (PSA+SSA)

Greenwich Hospital Total Service Area Specialty	2012 Demand (FTEs)	2017 Demand (FTEs)	2012 Supply (FTEs)	2017 Supply (FTEs)	2012 Surplus/ Deficit	2017 Surplus/ Deficit
Cardiology - Medical	21.0	22.6	66.2	48.4	45.2	25.8
Cardiology - Invasive & Interventional	16.1	17.3	13.2	9.3	(3.0)	(7.9)
Cardiology - EP	12.3	13.3	2.9	2.8	(9.4)	(10.6)

Attachment D

Overview of Navigant's Demand Calculation Methodology

Drivers of Physician Demand

Physician demand is defined as the number of physician FTEs by specialty required in a market to meet the healthcare needs of a community. The four primary drivers of physician demand include:

1.) Physician Utilization
   ⇒ How often do people visit a physician on an outpatient basis in a year?
2.) Market Demographics
   ⇒ Because different age and sex cohorts require different medical attention, what is the projected male/female population aged 85 years and older, 65-84 years, 45-64 years, 15-44 years and 0-14 years?
3.) Payor Mix
   ⇒ What is the mix of Commercial, Medicare and Medicaid/Public Aid in a community and how does this impact physician utilization?
4.) Physician Office Capacity (FTE)
   ⇒ How many patients does a typical full-time physician (by specialty) see in his/her office in a year?

1.) Physician Utilization

In order to project physician demand, it is necessary to understand how often people visit a physician on an outpatient basis in a year. Navigant worked with Milliman, a leading actuarial firm, to collect and analyze physician utilization rates. In general, the utilization data is based on Milliman USA's research, which is comprised of national data collected from insurance companies/HMOs and government sources. More specifically,

- The commercial encounter estimates are based on Milliman's recently updated research on professional costs by physician specialty and the Milliman USA Health Cost Guidelines. Milliman constructed a database from nationwide commercial group data from 10 HMOs, representing roughly 2.5 million members. Milliman's Health Cost Guidelines are widely recognized as a leading tool in the industry.
- The Medicare utilization data by specialty are primarily based on data obtained from the Centers for Medicare and Medicaid Services (CMS), which represents utilization in a fee-for-service environment and Milliman's Ages 65 and Over Health Cost Guidelines.
- The Medicaid encounter estimates are based on Milliman's research on professional costs by physician specialty and other Milliman research. Milliman constructed the database from Medicaid data from ten HMOs, representing 500,000 members.

Because certain CPT codes may not equate to a single outpatient encounter at a physician's office, the data were adjusted by specialty based on the judgment of Milliman's clinical division. Milliman's clinical division conducted thorough research and analysis at the CPT level to develop office encounter conversion factors by specialty and service category.

2.) Market Demographics

The second driver of demand is market demographics. The utilization rates in the database are based on a defined population and age mix. Because different age cohorts require different medical attention, the utilization rates need to be adjusted to reflect the age mix of the market being analyzed.

The Navigant Physician Requirements model adjusts the utilization rates for all specialties based on the market's percentage of male and female population over 85 years, 65-84 years, 45-64 years, 15-44 years, and under 15 years of age.

3.) Payor Mix

The third driver of demand is payor mix in the market. The utilization rates in the database contain three levels of utilization, one for commercial population (all ages and sex cohorts up to age 64), one for Medicare (both 65-84 and 85+), and one for Medicaid populations (all ages and sex cohorts up to age 64). Because different payor categories access health care differently and at different levels, the utilization rates need to be adjusted to reflect the payor mix appropriate for the market.

4.) Physician Office or Work Capacity

The fourth driver of physician demand is physician office or work capacity. Physician office capacity is the number of patients the typical physician can see in his/her office in a year,or other comparable unit of work productivity. Navigant collected office capacity assumptions by specialty from the 2011 MGMA Compensation and Production Survey based on 2010 median data. This data is updated yearly upon receipt of the most recent MGMA study.

Physician to Population Ratios

Methodology: Based on the four drivers of demand, the number of physician FTEs by specialty per 100,000 population is calculated.

Market Demand → Office Encounters per 100,000 population

Physician Capacity → Expected annual office visits per Physician FTE

= Physician Requirements per 100,000 Population (FTEs)

Example: Medical Cardiology

Office Encounters per 100,000 population → 5,630

Expected annual office visits per Physician FTE → 1,748

= 3.2

Sources: Telephone surveys conducted in September 2011
Greenwich Hospital Finance Department Data

Note: Physician F is Cardiovascular Services of Greenwich and represents the patients sent directly to Yale

In September 2011, Greenwich Hospital conducted a telephone survey of cardiologists currently on the Hospital's medical staff. The Hospital also included in its survey the internal medicine practice on the medical staff that refers patients directly for cardiac catheterizations. The surveyed physicians have practices located in Greenwich, Connecticut or in Westchester County, New York. When asked where they currently send patients for cardiac catheterizations, the physicians cited Yale-New Haven Hospital, White Plains Hospital, Columbia, Cornell and Westchester Medical Center.

Physicians were asked to provide the number patients they refer to any facility on an annual basis for cardiac catheterizations. The physicians were asked for the number of patients they currently send to Greenwich Hospital annually for cardiac catheterizations. This was compared to the statistics available in the Greenwich Hospital database and the database statistics were used in the chart above. The physicians were then asked to estimate the number of additional cardiac catheterization patients they would send to

Greenwich Hospital that they currently do not send to Greenwich Hospital for care if the Hospital received approval to offer elective angioplasty without surgical backup and given the cardiac interventionalists on staff at Greenwich Hospital.

Based on the survey responses for the physicians, a calculation was made for each physician of the number of new cardiac catheterizations that each physician would send to Greenwich Hospital if the Hospital provided elective angioplasty. Each calculation was based on the physician's responses and any cardiac catheterizations currently seen at Greenwich Hospital were excluded so that double counting of cardiac catheterizations did not occur. Of the surveyed physicians, twelve (including the cardiology practice discussed below) physicians indicated they would bring new cases to the Hospital. Of the six physicians who do not show any additional volume, two of those physicians already send all their cardiac catheterization patients to Greenwich Hospital. Thus they do not have any additional cardiac patients to send to the Hospital so are listed as "NA". Two of the physicians practice primarily in Manhattan facilities. Two of the physicians are part of a large multi-specialty practice and are discussed below.

Of note, five of the surveyed physicians belong to a large multi-specialty practice in Westchester County. These physicians were asked for additional volume they would send based on the current cardiac interventionalists at Greenwich Hospital. The physicians each gave various volumes but also indicated they would be likely to send more patients if the cardiac interventionalist who is part of their practice was also on the Greenwich Hospital medical staff. As discussed in the CON, the cardiac interventionalist would be able to join Greenwich Hospital's medical staff and perform angioplasties subject to the policies and procedures of the Yale New Haven Heart and Vascular Center (YNHHVC). The cardiac interventionalist of the large multi-specialty practice subsequently submitted a letter to Greenwich Hospital indicating he would send angioplasties to Greenwich Hospital. Any additional cardiac catheterizations from the physicians as a result of their cardiac interventionalist joining the Greenwich Hospital medical staff were not included in the survey results and, therefore, were not double counted in the letter submitted by the cardiac interventionalist. Thus, the letter represents additional angioplasties to Greenwich Hospital not included in the projections included in the CON.

In addition to the above survey data, the cardiology practice that is part of the YNHHS cardiology program at Greenwich Hospital researched the number of patients each year that they send directly to Yale for cardiac catheterizations instead of to Greenwich Hospital. These patients numbered 25, 22, 21 and 25 in FY08-11 respectively for an average of 24 per year. These patients would use Greenwich Hospital if the Hospital provided elective angioplasty services and were, therefore, included in the survey results above listed as Physician F.

Based on the survey results and information above, 257 additional cardiac catheterizations were estimated to be sent to Greenwich Hospital for care if the Hospital provided elective angioplasty services.

The tables below summarize the CON projections as were previously provided.

Angioplasty Volumes at Greenwich Hospital
Historical and Projected Volumes

Volumes	FY08 Actual	FY09 Actual	FY10 Actual	FY11 Actual	Year 1	Year 2	Year 3
Primary Angioplasty Cases	40	40	32	38	38	38	38
Elective Angioplasty Cases To Be Performed at GH (currently sent to other facilities)	0	0	0	0	53	53	53
Elective Angioplasty Cases Transferred or Referred to Another Facility	54	79	64	59	0	0	0
New Referred Angioplasty Cases from Physicians	NA	NA	NA	NA	105	126	151
Total	94	119	96	97	196	217	242
Variance					99	21	25

Volumes	Year 1	Year 2	Year 3
Inpatient Angioplasties (89.6%)	176	194	217
Outpatient Angioplasties (10.4%)	20	23	25
Total	196	217	242

Source: CHIME database

Greenwich Hospital used the results of the physician survey as well as other data to project the angioplasty volume expected at Greenwich Hospital if the CON for elective angioplasty were approved. The angioplasty projections include primary angioplasty cases currently treated at the Hospital and elective angioplasty cases currently not treated at the Hospital.

Greenwich Hospital currently provides primary angioplasty to patients that meet the criteria for care. For the past several fiscal years, this volume has remained fairly stable. In FY11, the Hospital had 38 primary angioplasty cases. This is the same number as the four year average number of cases. This volume was projected to remain stable over the next several years.

While the Hospital does not provide elective angioplasty at this time, there are patients who present to the Hospital each year that require elective angioplasty. These patients are either transferred or referred to another facility for care. The number of transfers or referrals for the past four fiscal years has been 54, 79, 64 and 59 respectively. Over the past four fiscal years, on average there had been 64 patients per year either transferred or referred to another facility for care. With the approval of this application, Greenwich Hospital would be able to provide elective angioplasty to the majority of these patients and thus save the patients an unnecessary transfer or referral to another facility. These patients are already part of the Greenwich Hospital physician referral patterns established at the Hospital that would continue when the Hospital is approved to provide elective angioplasty care. However, there is a small portion of patients that would need to be transferred or referred to another facility even if Greenwich Hospital was approved to provide elective angioplasty.

In the CPORT E trial, of patients who underwent primary angioplasty, 12% were excluded from randomization after consenting to the study, representing the subgroup who would be transferred to another facility. In reviewing the cases in FY09-11 that were either transferred or referred for care to another facility, it was felt that some of the cases would have been transferred or referred even if Greenwich Hospital was approved to provide elective angioplasty. These percentages for FY09-11 were respectively 12%, 16% and 22% for a three year average of 16.6%. For the projection of elective angioplasty at Greenwich Hospital, the conservative estimate of 16.6% was used, i.e. 83.4% of patients who had been transferred or referred to another facility in the past would be able to receive care at Greenwich Hospital. This percentage applied to the average of 64 patients per year transferred or referred to another facility yielded 53 patients in Year 1 who would be able to stay and receive their care at Greenwich Hospital. Again, to be conservative, this volume was projected to remain stable over the next several years.

Therefore, in Years 1, 2, and 3, there are 91 patients per year (38 emergency angioplasties and 53 elective patients currently transferred or referred elsewhere) who are projected to have either elective or emergency angioplasties at Greenwich Hospital. The projected 91 patients per year are based on the Hospital's actual historical experience and are patients who have come to Greenwich Hospital to seek care.

As discussed above, the Hospital conducted a telephone survey of cardiologists currently on the Hospital's medical staff as well as the large internal medicine practices on the medical staff who refer directly for cardiac catheterizations. These physicians were also asked to estimate the number of additional patients they would send to Greenwich Hospital. Lastly, the cardiology practice that is part of the YNHHS cardiology program at Greenwich Hospital estimated an average of 24 patients per year that would use Greenwich Hospital if the Hospital provided elective angioplasty services. Based on the information above, 257 additional cardiac catheterizations were estimated to be sent to Greenwich Hospital for care if the Hospital provided elective angioplasty services.

In order to estimate the number of angioplasties resulting from the additional cardiac catheterizations, the ratio of angioplasties to cardiac catheterizations was analyzed.

Since primary angioplasties and elective angioplasties have the same codes, it was not possible to separate them into two categories so angioplasty volume includes both primary and elective angioplasty cases. Angioplasty volume and cardiac catheterization volume includes both inpatient and outpatient cases. New York angioplasty and cardiac catheterization outpatient historical volumes were not available from the state of New York for CY08 and for CY11 only the first five months of inpatient and outpatient data was available. Therefore, CY11 New York data was flat line projected to estimate the entire year.

The ratios of angioplasties to cardiac catheterizations were determined for Greenwich Hospital (35.4%), Yale-New Haven Hospital (45.3%), the state of Connecticut (36.3%) and the Greenwich Hospital service area (41.2%). The Greenwich Hospital average included patients transferred or referred to another facility. While the program at Greenwich Hospital will follow all of the policies, procedures and guidelines of the Yale-New Haven Heart and Vascular Center, the New Haven facility is a tertiary hospital and may see a higher rate of angioplasty/sicker patients. To be conservative, an average ratio (41.0%) of the Yale-New Haven Hospital ratio and state of Connecticut ratio was used to estimate the number of angioplasties resulting from the cardiac catheterizations. The 41.0% ratio was applied to the 257 potential cardiac catheterizations to yield an estimated 105 new referred angioplasty cases to Greenwich Hospital in Year 1 from cardiologists on the Hospital medical staff who would previously have sent the cases either to Yale-New Haven Hospital or a New York hospital. It is expected that this volume would increase 21 and 25 angioplasties respectively in Years 2 and 3 as the Greenwich Hospital program becomes established. The increases would represent less than 1 angioplasty per year from the cardiologists on the medical staff of Greenwich Hospital. Since the patients will be referred by the cardiologists on the Greenwich Hospital medical staff, it is expected that the majority of patients will be from New York or Greenwich, Connecticut. The increase in volume will results from several factors including the addition of New York interventional cardiologists who currently do not practice at Greenwich Hospital but have referral relationships with the cardiologists on the Hospital medical staff, increased physician comfort with elective angioplasty care at the Hospital and patient preference for the high quality care offered at Greenwich Hospital. In FY11, inpatient angioplasties were 89.6% of total angioplasties according to the latest available data from the CHIME database. This percentage was used to estimate the distribution of angioplasties at Greenwich Hospital.

February 20, 2009

Dear Commissioner Vogel:

I am forwarding to you by fax letters that have been written to you by patients from Greenwich Hospital in support of the proposed Elective Angioplasty program. These patients are unable to participate in the hearing in Hartford on February 24, 2009 and asked that their letters be delivered to you.

Thank you.

Sincerely,

George Pawlush

Re: Elective Angioplasty Program
Greenwich Hospital

Dear Commissioner Vogel,

I am writing to you to request your support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient and as a family member of a cardiac patient (my father), it is very important to me and my family that elective angioplasty be available close to home. The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where we can be followed and cared for by our own doctors. Greenwich Hospital is our hospital of choice. It is proximate to our homes. Being required to go to another hospital for this procedure is very stressful and burdensome, especially to family members. More important, we lose the continuity of care provided by our own doctors.

I was recently hospitalized this past holiday season after failing a stress test in my doctor's office. I had a mild heart attack seven months earlier in Florida where angioplasty was performed and heart damage was virtually nil (luckily the hospital was 5 minutes from my location). In my most recent experience, I was hospitalized on a Tuesday evening the week before Christmas. I was confronted with the choice of having a catheterization in Greenwich Hospital to see whether and where angioplasty was needed (all involved were confident that it was required) requiring a second procedure at another hospital location for the angioplasty to remove any blockages or to be transported to another hospital where the catheterization and angioplasty could be performed as part of the same procedure. I viewed this as no choice and had to leave my doctors and seek

the required procedures at another hospital, with unfamiliar doctors, an hour away from my home. I spent two additional nights in a hospital for a total of three nights (where only one was needed to complete the procedure through discharge) because Greenwich Hospital was not permitted to perform this lifesaving (albeit elective) procedure. My doctors routinely perform these procedures at their other affiliated hospitals. Not only was this a waste of valuable professional time, hospital staff services and resources and but I was caused to expend co-pays for 2 hospitals, other professional care and transportation to the new hospital. Most important, it subjected me to an additional level of risk, i.e. not only the potential risk of undergoing somewhat duplicative invasive procedures for the catheterization and follow-up angioplasty (which I avoided) but the risk attendant to a delay in having the procedure performed and the required transport to another hospital. Thankfully, my doctor's staff and the hospital staff were extremely competent which provided for a smooth, seemless transition to the new hospital.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt that the hospital can provide the same high quality for an elective angioplasty program. It is my opinion, as a patient and a member of the community served by Greenwich Hospital, that the current status that the Hospital is operating under is stressful and inordinately risky and the community would be much better served and more confident in our hospital if the elective angioplasty program was approved.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Peter F. Sisca

ROBERT C. WILLIS

February 17, 2009

Honorable Cristine A. Vogel, Commissioner
Office of Health Care Access
410 Capitol Ave.
MS #13HCA
PO Box 340308
Hartford, CT 06134-0308

Dear Commissioner Vogel,

I am writing to you to express my urgent support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient, it is indeed very important to me as well as my family that elective angioplasty be available close to home. The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where I can be followed by my own doctors. Greenwich Hospital is my hospital of choice. The idea of going to another hospital for this procedure is very stressful and a burden to me and my family. Most importantly, if I am forced to go to another hospital, we would lose the continuity of care provided by my own doctors.

Having had two cardiac events in 2008, that required transfer from Greenwich Hospital to Yale New-Haven Hospital, I can personally attest to the enormous stress of a one hour ambulance ride coupled with the further stress of a new hospital and staff. I should also comment that my family was forced to travel this distance several times a day during my hospital stay. It is an unpleasant experience for the entire family.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt in my mind that the hospital can provide the same high quality for an elective angioplasty program.

I would appreciate an immediate approval of Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Robert C. Willis

PO Box 340308
Hartford, CT 06134-0308

Dear Commissioner Vogel,

I am writing to you to express my support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient it is very important to me and my family that elective angioplasty be available close to home. The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where we can be followed by our own doctors. Greenwich Hospital is our hospital of choice. The idea of going to another hospital for this procedure is very stressful and a burden to me and my family. Most importantly if we are forced to go to another hospital, we would lose the continuity of care provided by our own doctors.

Please know my own situation and when making your decision do take into consideration my own reasons to have an angioplasty program at Greenwich Hospital:

- Twice I have been taken to Greenwich Hospital and then sent to Yale by ambulance through heavy traffic. This is hardly safe for a heart patient.
- Each time I have a need for an angiogram I have to go all the way to Yale even if it is then determined that I do not need the angioplasty after all. I have about two angiograms a year.
- I have missed work and lost income several times because I had to go all the way to Yale.
- When I did have angioplastys at Yale I had to have someone drive me there (about1 hour) and then come back to bring me back home when I was done. This means someone else had to take time off from work also.

- The nearest hospital that recently started doing angioplastys is Stamford Hospital but we are not familiar with it at all. I really don't want to change my Greenwich Hospital doctor at this stage and after he has known me and my case for over ten years.

- I have had many complications since my bypass in 2005 and would be very uncomfortable with another doctor who did not know me and my whole history. I had been to two other cardiologists before I was comfortable with my present doctor.

- We need our cardio care to be convenient for us and not have to travel miles or deal with new doctors . This is not something to be taken lightly.

- Several Greenwich Hospital doctors already perform angioplastys at Yale on a regular basis. They are qualified to do the same in Greenwich.

- Greenwich Hospital is the one we always use. We have the hospital. We need it to be full service for us heart patients so it properly meets our needs. We really need you establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt that the hospital can provide the same high quality for an elective angioplasty program.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Rameela Patel

PO Box 340308
Hartford, CT 06134-0308

Dear Commissioner Vogel,

I am writing to you to express my support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient, it is very important to me and my family that elective angioplasty be available close to home The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where we can be followed by our own doctors. Greenwich Hospital is our hospital of choice. The idea of going to another hospital for this procedure is very stressful and a burden to me and my family. Most importantly if we are forced to go to another hospital, we would lose the continuity of care provided by our own doctors.

Please consider my personal situation when making your decision and please establish an angioplasty program at Greenwich Hospital.

- It was suggested that I have an angiogram at Greenwich and then if it was determined that I needed angioplasty I would be sent to Yale by ambulance with the catheter and an anesthesia iv already in me. This is not a safe situation for a heart patient. What if there was traffic or an accident on the way to Yale?

- It is my understanding that between Bridgeport and New Haven there are at least four full service hospitals providing every aspect of cardio treatment. In our area Stamford hospital is the only other hospital that does angioplastys and my cardiologist does not work there

- I have six stents (angioplastys) and have needed emergency treatment on many occasions. I have had to go to Greenwich hospital and then be transferred to Yale. It would have been less traumatic for me to be treated at Greenwich hospital.

- Greenwich hospital should serve its community. It should not have to send its patients to another hospital.

- Cardio care is serious, sensitive and long drawn out. I really don't want to switch from a doctor who has treated me for over ten years and knows my history and knows me well.

- We would really appreciate your allowing Greenwich Hospital to provide us with the services we need. Several Greenwich doctors also perform the same angioplasty procedure at Yale, they are experienced and well qualified.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt that the hospital can provide the same high quality for an elective angioplasty program.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Salim Patel

February 17, 2009

Dear Commissioner Vogel,

I am writing to you to express my support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient, it is very important to me and my family that elective angioplasty be available close to home The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where we can be followed by our own doctors. Greenwich Hospital is our hospital of choice. The idea of going to another hospital for this procedure is very stressful and a burden to me and my family. Most impoitantly if we are forced to go to another hospital, we would lose the continuity of care provided by our own doctors.

In my own personal experience, when I had to undergo a procedure to see if my arteries were blocked they had to do a catherization (die test). Once they did the catherization (die test) and they found I needed a stent I had to have that procedure done in New Haven. There fore, I had to remain lying flat and not moving until I got to New Haven and the second procedure was preformed. The first procedure in Greenwich was in the morning. By the time I got to New Haven for a stent to be put into place it was in the evening. Traffic was at a stand still and my wife was in a car behind the ambulette. The traffic was so bad that the monitors and batteries in the ambulette were going dead. There was not any air conditioning in the ambulette and they ended up having to put the sirens and lights on to get there after a while. My wife traveling

behind me was a emotional wreck by the time we got to New Haven. If the ambulette was in an accident I could have bled to death. The thought of having to go through that all over again is stressful for all involved. If I had the opportunity to have it all done in Greenwich it would have been less of a burden on my family and friends that I had to involve because it was in New Haven. It was my understanding that if I was just 10% more blocked that Greenwich could have done the procedure right there as an emergency basis. I am not sure what the difference is. A person can die on the way to another hospital because of the stress involved in going from one place to another, not to mention the discomfort of not being able to move that part of your body for so many hours. Once I got to New Haven I met with a Doctor that did not know me and I in turn did not know him either. I would have been more comfortable if my own Doctor that started the procedure had been able to finish it.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt that the hospital can provide the same high quality for an elective angioplasty program.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Peter K. Knudsen

Dear Commissioner Vogel,

I am writing to you to express my support for Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New-Haven Heart and Vascular Center.

As a cardiac patient it is very important to me and my family that elective angioplasty be available close to home The proposed program would ensure that the procedure is administered by highly skilled interventional cardiologists at Greenwich Hospital where we can be followed by our own doctors. Greenwich Hospital is our hospital of choice. The idea of going to another hospital for this procedure is very stressful and a burden to me and my family. Most importantly if we are forced to go to another hospital, we would lose the continuity of care provided by our own doctors.

The difference between elective and emergency may seem trivial, however, here is my real life example of the vast difference: on Monday at 6pm my cardiologist said that he was certain that I had blockage in my artery and needed immediate surgery the next day. I was scheduled to go to Yale Tuesday at 7am. He said, "go home...if you have a heart attack tonight I can operate in Greenwich on an emergency basis, otherwise I'll see you at Yale tomorrow." I'm not sure what was worse: the stress of waiting for a heart attack to happen at home so that I could be treated immediately or the stress of waiting what felt like a lifetime to drive to Yale and be treated.

I'm 45. I had 95% blockage in the LAD. I don't smoke, drink or have genetic problems. I have no other blockage. Chances are between 45 and say 75, despite a good diet, exercise and lower stress, I may be back. I would like to go to Greenwich.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. There is no doubt that the hospital can provide the same high quality for an elective angioplasty program.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Stephen J. Petuck

Honorable Cristine A. Vogel, Commissioner

February 19, 2009

Dear Commissioner Vogel,

I am writing to express my support for the Greenwich Hospital's application to establish an elective angioplasty program as a satellite of the Yale New Haven Heart and Vascular Center.

I recently had to be transported to Yale New Have Hospital to have an angioplasty performed. The circumstances were not life-threatening; I had an angiogram which resulted in a blockage at Greenwich Hospital. Rather than completing the process with an angioplasty, it was required that I be transported to Yale New Haven. At the time I was stable and this was part of routine procedure. However, having to go far from home to undergo this procedure was very stressful to me and my family. It seems to me that transporting patients for routine procedures could be avoided by simply implementing the angioplasty program.

Greenwich Hospital has proven its ability to provide emergency angioplasty services under life-threatening circumstances. It would seem that there is no doubt that the hospital can provide the same high quality for an elective program.

As a cardiac patient, it is critical to me and my family that angioplasty be available to me close to home. The proposed program would ensure that the procedure is administered by highly skilled cardiologists at Greenwich Hospital where patients could be monitored by their own physicians. Greenwich Hospital is most convenient to my home and the hospital of my choice. More importantly, if I have no other option but to go to another hospital, I would be losing continuity of care provided by my own physicians.

Please approve Greenwich Hospital's application to offer elective angioplasty services.

Sincerely,

Ed Nelson

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	August 2, 2012

INTERVENOR STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE APPLICANTS' LATE FILE SUBMISSION

Pursuant to Regulations of Connecticut State Agencies (R.C.S.A.) § 19a-9-6(c)(3), Intervenor The Stamford Hospital hereby objects to and moves to strike Applicants' Late File 1 and accompanying correspondence, dated July 26, 2012 (collectively, "Late File 1") submitted on behalf of Applicants Yale-New Haven Hospital ("YNHH") and Greenwich Hospital ("Greenwich"). Applicants have failed to file a copy of a community needs assessment for cardiac services as ordered by OHCA. (Transcript, pages 82-83, Attachment A) Instead, Applicants attempt to modify Greenwich CEO Frank Corvino's sworn testimony at the Public Hearing that Greenwich had conducted such an assessment within the past four years and to submit other documents which they claim support the need for the proposed elective angioplasty program. As more fully set forth below, since the material submitted is non-responsive to OHCA's order, Late File 1 should be stricken in its entirety and OHCA should find that no community needs assessment was done in connection with Applicants' proposal.

OHCA'S REQUEST FOR COPY OF COMMUNITY NEEDS ASSESSMENT

At the Public Hearing, Mr. Corvino testified that Greenwich had done several community needs assessments, the last one specifically discussing cardiac services having been completed within the previous three to four years (*see* Transcript, pages 82-83, Attachment A). OHCA staff then asked Mr. Covino if Greenwich would be able to provide OHCA with a copy of this community needs assessment and Mr. Corvino responded in the affirmative. *Id.* Hearing Officer Yandow then ordered that a copy of Greenwich's community needs assessment be submitted as Applicants' Late File 1 within two weeks. *Id.*

APPLICANTS' LATE FILE 1

Because Applicants' failed to contemporaneously serve Stamford Hospital with Late File 1 as contemplated by R.C.S.A. § 19a-9-6(c), Intervenor only recently learned of the letter from YNHH's Executive Vice President for Strategy and System Development addressed to Hearing Officer Yandow which attempts to explain that when Mr. Corvino testified that Greenwich had conducted a community needs assessment for cardiac services within the last three or four years, he was actually "referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program." Correspondence from Gayle Capozzalo to Hearing Officer Yandow, dated July 26, 2012. Intervenor respectfully points out that a witness' sworn testimony at public hearing cannot be modified by a letter from another member of Applicants' staff. Accordingly, Ms. Capozzalo's correspondence purporting to clarify Mr. Corvino's testimony should be stricken.

It is clear from Applicants' Late File 1 submission that, contrary to Mr. Corvino's testimony (Transcript, pages 82-83, Attachment A), Greenwich has not undertaken a community

needs assessment for cardiac services. In the absence of a document responsive to OHCA's request, Applicants seek to late file other documents which they claim support their Application, as follows: (1) a Marketstrategies consumer survey; (2) a draft Navigant Consulting report on physician supply in the Greenwich service area; (3) a document with a footer dated July 20, 2012 (three days after the public hearing) that expands on the telephone survey referenced at page 33 of Applicants' CON Application; (4) a 2011 Greenwich United Way Community Planning Council report that Applicants appear to have had no hand in producing (only an internet link to this document was provided); and (5) a series of patient letters from 2009 apparently written in support of Applicants proposal under Docket No. 08-31210-CON that OHCA previously denied.

LATE FILE 1 IS WHOLLY UNRESPONSIVE

Not a single one of Applicants' submissions qualifies as a community needs assessment for cardiac services generally, no less a needs assessment for the hospital-based elective angioplasty program they have proposed. To the degree that Applicants believe the non-responsive materials in Late File 1 support their proposal, the documents should have been included in their CON Application.

OHCA's Policies and Procedures at Section VIII(a)(5) specifically requires that "[t]he [CON] application form should be filled out in its entirety and all supporting documents should be attached to the application and referenced as either an attachment or exhibit in the order in which they appear in the application." (emphasis added) The Applicants had every opportunity to submit materials supporting their Application prior to the Public Hearing, and in fact, some of the material contained in Late File 1 is duplicative of material previously furnished. To submit this largely unsupported documentation now as a non-responsive Late File exhibit is improper and ignores the procedural rules OHCA has established.

Additionally, as noted above, the material contained in Late File 1 has no relevance to assessing community need for the cardiac services that are the subject of the CON Application. The first attached document is a marketing survey which purports to reflect consumer preference for hospital providers in the Greenwich area and the close competition between Greenwich and Stamford Hospitals for cardiac patients, but it says nothing about the need for services. The second document is a consultant's report apparently prepared as part of Greenwich's physician recruiting programs which does not speak to community need for any hospital-based services. The third document provides additional information regarding Applicants' physician telephone survey which again does not speak to "community need" for the proposed service. The link to the United Way document, which does not appear to have any association with Applicants, also does not speak to any needs for elective angioplasty, and the letters relating to the previous CON Application that OHCA denied in 2009 certainly do not qualify as a community needs assessment. In sum, submitting these extraneous materials now, under the veil that they somehow relate to a community needs assessment, is unresponsive to OHCA's request and improper.

Finally, Ms. Cappozzalo's letter argues that other information in the record supports Mr. Corvino's testimony. Once again, there is nothing in the record to support Mr. Corvino's sworn testimony at the Public Hearing that Greenwich undertook a community needs assessment for cardiac services within the last four years. Ms. Cappozzalo's arguments are non-responsive to OHCA's order and should be stricken as well.

CONCLUSION

WHEREFORE, for the foregoing reasons, Intervenor's objection should be sustained and Applicants' Late File 1 should be stricken in its entirety and OHCA should find no community needs assessment was done in connection with Applicants' proposal.

on that local community to deal with their heart attack, if you will, in the middle of the night. They're not going to be traveling to another place. So having a strong heart program really bolsters your position in the community's eyes as a really good institution.

So regardless of whether the incidents is higher or lower, if you've got the illness you want to know that the very best is available in your community.

MR. LAZARUS: When was the last time, Mr. Corvino, a community needs assessment was done? Because you mentioned there were several done.

MR. CORVINO: I would say in the last three or four years.

MR. LAZARUS: And does it specifically discuss cardiac services?

MR. CORVINO: Yes.

MR. LAZARUS: Would you be able to provide OHCA a copy of that?

MR. CORVINO: Sure.

MR. LAZARUS: OCHA would like to accept that as --

HEARING OFFICER YANDOW: Okay. I'd like to order that to be produced. How much time do you need to produce that?

MR. CORVINO: A couple of weeks?

HEARING OFFICER YANDOW: Okay. Two weeks from today then?

MR. LAZARUS: Two weeks from today? Okay. And we'll call that Applicant Late File 1.

Again, you state in your prefiled testimony that, you know, we need to ensure providing care in a cost-effective and efficient manner. In relation to that, could you please state to whether you think a service that may be an additional program, for example, elective PCI in the region, would that be considered cost-effective, and/or how would you consider that to be efficient?

MR. CORVINO: Well, I think that having patients be treated in their community where they go for services and not having to leave the community and have a lot of duplication is very, very important. And there is a significant amount of cost savings when patients don't have to be transferred.

You know, I -- you know, I come to you today as the CEO of Greenwich Hospital, but I also come to you as a patient and I just want to relate a story, which I related the last time we were here. In 2005 I was one of those people who had chest pain, who went to

BEFORE THE OFFICE OF HEALTH CARE ACCESS DIVISION OF THE DEPARTMENT OF PUBLIC HEALTH	:	Docket No. 12-31748-CON
IN RE APPLICATION OF YALE-NEW HAVEN HOSPITAL AND GREENWICH HOSPITAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	:	August 2, 2012

INTERVENOR STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE APPLICANTS' LATE FILE SUBMISSION

Pursuant to Regulations of Connecticut State Agencies (R.C.S.A.) § 19a-9-6(c)(3), Intervenor The Stamford Hospital hereby objects to and moves to strike Applicants' Late File 1 and accompanying correspondence, dated July 26, 2012 (collectively, "Late File 1") submitted on behalf of Applicants Yale-New Haven Hospital ("YNHH") and Greenwich Hospital ("Greenwich"). Applicants have failed to file a copy of a community needs assessment for cardiac services as ordered by OHCA. (Transcript, pages 82-83, Attachment A) Instead, Applicants attempt to modify Greenwich CEO Frank Corvino's sworn testimony at the Public Hearing that Greenwich had conducted such an assessment within the past four years and to submit other documents which they claim support the need for the proposed elective angioplasty program. As more fully set forth below, since the material submitted is non-responsive to OHCA's order, Late File 1 should be stricken in its entirety and OHCA should find that no community needs assessment was done in connection with Applicants' proposal.

OHCA'S REQUEST FOR COPY OF COMMUNITY NEEDS ASSESSMENT

At the Public Hearing, Mr. Corvino testified that Greenwich had done several community needs assessments, the last one specifically discussing cardiac services having been completed within the previous three to four years (*see* Transcript, pages 82-83, Attachment A). OHCA staff then asked Mr. Covino if Greenwich would be able to provide OHCA with a copy of this community needs assessment and Mr. Corvino responded in the affirmative. *Id.* Hearing Officer Yandow then ordered that a copy of Greenwich's community needs assessment be submitted as Applicants' Late File 1 within two weeks. *Id.*

APPLICANTS' LATE FILE 1

Because Applicants' failed to contemporaneously serve Stamford Hospital with Late File 1 as contemplated by R.C.S.A. § 19a-9-6(c), Intervenor only recently learned of the letter from YNHH's Executive Vice President for Strategy and System Development addressed to Hearing Officer Yandow which attempts to explain that when Mr. Corvino testified that Greenwich had conducted a community needs assessment for cardiac services within the last three or four years, he was actually "referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program." Correspondence from Gayle Capozzalo to Hearing Officer Yandow, dated July 26, 2012. Intervenor respectfully points out that a witness' sworn testimony at public hearing cannot be modified by a letter from another member of Applicants' staff. Accordingly, Ms. Capozzalo's correspondence purporting to clarify Mr. Corvino's testimony should be stricken.

It is clear from Applicants' Late File 1 submission that, contrary to Mr. Corvino's testimony (Transcript, pages 82-83, Attachment A), Greenwich has not undertaken a community

needs assessment for cardiac services. In the absence of a document responsive to OHCA's request, Applicants seek to late file other documents which they claim support their Application, as follows: (1) a Marketstrategies consumer survey; (2) a draft Navigant Consulting report on physician supply in the Greenwich service area; (3) a document with a footer dated July 20, 2012 (three days after the public hearing) that expands on the telephone survey referenced at page 33 of Applicants' CON Application; (4) a 2011 Greenwich United Way Community Planning Council report that Applicants appear to have had no hand in producing (only an internet link to this document was provided); and (5) a series of patient letters from 2009 apparently written in support of Applicants proposal under Docket No. 08-31210-CON that OHCA previously denied.

LATE FILE 1 IS WHOLLY UNRESPONSIVE

Not a single one of Applicants' submissions qualifies as a community needs assessment for cardiac services generally, no less a needs assessment for the hospital-based elective angioplasty program they have proposed. To the degree that Applicants believe the non-responsive materials in Late File 1 support their proposal, the documents should have been included in their CON Application.

OHCA's Policies and Procedures at Section VIII(a)(5) specifically requires that "[t]he [CON] application form should be filled out in its entirety and all supporting documents should be attached to the application and referenced as either an attachment or exhibit in the order in which they appear in the application." (emphasis added) The Applicants had every opportunity to submit materials supporting their Application prior to the Public Hearing, and in fact, some of the material contained in Late File 1 is duplicative of material previously furnished. To submit this largely unsupported documentation now as a non-responsive Late File exhibit is improper and ignores the procedural rules OHCA has established.

Additionally, as noted above, the material contained in Late File 1 has no relevance to assessing community need for the cardiac services that are the subject of the CON Application. The first attached document is a marketing survey which purports to reflect consumer preference for hospital providers in the Greenwich area and the close competition between Greenwich and Stamford Hospitals for cardiac patients, but it says nothing about the need for services. The second document is a consultant's report apparently prepared as part of Greenwich's physician recruiting programs which does not speak to community need for any hospital-based services. The third document provides additional information regarding Applicants' physician telephone survey which again does not speak to "community need" for the proposed service. The link to the United Way document, which does not appear to have any association with Applicants, also does not speak to any needs for elective angioplasty, and the letters relating to the previous CON Application that OHCA denied in 2009 certainly do not qualify as a community needs assessment. In sum, submitting these extraneous materials now, under the veil that they somehow relate to a community needs assessment, is unresponsive to OHCA's request and improper.

Finally, Ms. Cappozzalo's letter argues that other information in the record supports Mr. Corvino's testimony. Once again, there is nothing in the record to support Mr. Corvino's sworn testimony at the Public Hearing that Greenwich undertook a community needs assessment for cardiac services within the last four years. Ms. Cappozzalo's arguments are non-responsive to OHCA's order and should be stricken as well.

CONCLUSION

WHEREFORE, for the foregoing reasons, Intervenor's objection should be sustained and Applicants' Late File 1 should be stricken in its entirety and OHCA should find no community needs assessment was done in connection with Applicants' proposal.

Re: Docket No. 12-31748-CON
Proposal to Establish & Operate an Elective Angioplasty Program at Greenwich Hospital

Dear Hearing Officer Yandow,

This office represents Greenwich Hospital and Yale-New Haven Hospital in connection with the above-referenced CON request. Attached is a copy of my clients' Reply to Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission. An original and two (2) copies of the reply have been sent via Federal Express for Monday delivery.

Please let me know if you require anything further.

Very truly yours,

Jennifer L. Groves

STATE OF CONNECTICUT
DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS DIVISION

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	AUGUST 10, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S REPLY TO INTERVENOR STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE APPLICANTS' LATE FILE SUBMISSION

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, submit this reply to the Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission, dated August 2, 2012 ("Objection"). The Objection, which is replete with inaccuracies and omissions and is not supported by law or the practices of OHCA, should be overruled and The Stamford Hospital's ("TSH") Motion to Strike should be denied.

TSH makes the following claims and arguments in its Objection: (1) Applicants failed to serve TSH with a copy of their late file submission; (2) Applicants' late file submission does not include a "community needs assessment" and therefore is non-responsive to OHCA's request; (3) Applicants are not entitled to late file any information that existed at the time of the initial CON submissions and could have been included in those submissions; (4) Applicants seeks to modify the

sworn testimony given by Greenwich Hospital President Frank Corvino at the July 17, 2012 public hearing; (5) Applicants' late file submission improperly references information already in the record of this matter; and (6) Applicants' late file submission does not support a clear public need for an elective angioplasty program at Greenwich Hospital. Each and every one of TSH's claims and arguments is without merit. None should be considered by OHCA in evaluating this proposal.

1. Applicants Served TSH With a Copy of Their Late File Submission

TSH claims that Applicants "failed to contemporaneously serve" the hospital with their late file submission and that TSH "only recently learned" of the filing (Objection, p. 2). Applicants hand delivered their late file submission to OHCA on Friday, July 27th, four days before the July 31st filing deadline set by Hearing Officer Yandow. Also on July 27th, Applicants sent Attorney Stephen M. Cowherd, counsel of record for TSH, a copy of the late file submission via United States mail. Service by United States mail is permitted by Section 19a-9-6(c) of the Regulations of Connecticut State Agencies. This is the same form of service used by Attorney Cowherd to transmit the Objection to the undersigned counsel. In the unlikely event that Attorney Cowherd did not receive Applicants' mailing, TSH was clearly able to obtain a copy of the Late File submission from OHCA and had sufficient time to formulate and file a response.

2. Applicants Have Provided OHCA With "Community Needs Assessments" and Other Information Responsive To the Agency's Request

TSH goes to great lengths arguing that the documents submitted by Applicants as late file do not constitute a "community needs assessment" and are not responsive to OHCA's request. This argument fails on both fronts. First, there are no specific requirements for a "community needs

assessment" set forth in any of the OHCA statutes or regulations, so TSH cannot claim that the requirements have not been met. Second, the documents provided by Applicants were entirely responsive to OHCA's request, which is apparent if you read the complete public hearing transcript around the question and not just the excerpt attached by TSH.

TSH makes the bold and entirely unsubstantiated statement that "[n]ot a single one of Applicants' submissions qualifies as a community needs assessment" for the CON proposal (Objection, p. 3). However, nowhere in its filing does TSH explain what a "community needs assessment" is and why Applicants' submissions are not considered community needs assessments. This is because the OHCA statutes and regulations do not prescribe a specific form of community needs assessment. Assessing community need is a process left to Applicants, who have the burden of supporting their request for permission to establish a service and proving their case-in-chief for a CON. For TSH to claim that the studies and assessments included in Applicants' late file submission are not community needs assessments, without providing any support for that proposition, is meaningless.

Moreover, Applicants' late file submission was entirely responsive to OHCA's request for information. A more complete excerpt of the public hearing transcript is attached as Exhibit A. It shows that the question regarding whether Greenwich Hospital conducted a community needs assessment originated with OHCA Analyst Steven Lazarus' review of Mr. Corvino's prefile testimony. Mr. Lazarus cites to (paraphrases) the following statement made by Mr. Corvino on page 682 of his testimony:

> *We are committed to providing the services that our communities have come to rely on us for and will need in the future.*

Mr. Lazarus then goes on to ask:

> *Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?*

Finally, Mr. Corvino responds:

> *Well, yes. I mean, we've done many community needs assessments throughout the years.*

Applicants' submission to OHCA included a number of documents, which comprise the "community needs assessment" to which Mr. Corvino was referring. These include studies done by or in association with Greenwich Hospital, which show among other things, that the community relies on Greenwich for cardiac care. The significance of each document to Applicants' assessment of "community need" is explained in the late file submission. These are analyses, studies and surveys that Greenwich Hospital relied on in making the decision to pursue an elective angioplasty program. They reflect the needs and preferences of the patient and physician communities around cardiac services and, by extension, the proposed program. It is true that some of this information was already provided in the CON, however, Applicants thought it would be worth highlighting and/or clarifying the information for OHCA, as it supports community need for the proposal. OHCA has historically given applicants tremendous latitude in determining what information is responsive to requests for supporting documentation in a CON proceeding (i.e. needs assessments, market share analyses, public health information, etc.) and Applicants ask that they be afforded the same latitude in this matter.

3. Applicants Are Entitled To Late File Information Upon OHCA's Request

TSH argues that Applicants should be precluded from offering the late file submission as evidence because the information should have been included in their CON application. As support, TSH cites the OHCA Policies & Procedures, which provided that all supporting evidence should be attached to the application and referenced therein. However, the very nature of a late file submission is to provide "late" evidence, after the CON has been deemed completed and the public hearing has taken place, at OHCA's request. As TSH and its counsel are well aware, OHCA often asks for information in a late file that existed at the time an application was filed (i.e. historical volume), but that was not included in the CON submissions. Here, OHCA asked for information that it knew to be as much as 3 to 4 years old (see Exhibit A attached). The agency clearly understood in making its request that the information could have been provided previously, but was not. Still, OHCA made the request of Applicants and they have responded, as ordered.

4. Applicants Do Not Seek To Modify the Sworn Testimony of Frank Corvino

TSH claims that by way of the late file submission, Applicants are attempting to modify the sworn testimony of Mr. Corvino through testimony from Gayle Capozzalo, Executive Vice President, Strategy and System Development for the Yale New Haven Health System. However, the very language of Ms. Capozzalo's letter belies this claim. Regarding Mr. Corvino's testimony about the community needs assessment, she states that upon further discussion with Mr. Corvino, "he indicated he was referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program." Mr. Corvino was simply clarifying what he meant when he offered to provide OHCA with

a "community needs assessment." As President and CEO of Greenwich Hospital, Mr. Corvino relied on planning and development staff to provide OHCA with the details of the assessments. Applicants do not claim that Mr. Corvino misspoke at the hearing, nor are they trying to alter the substance of his testimony in any way. The purpose of Ms. Capozzalo's letter was simply to clarify which documents Mr. Corvino was referring to when he said that several "community needs assessments" had been conducted over the years involving cardiac services.

5. Late File Information Already In the Record Should Not Be Stricken

Applicants included reference in their late file submission to certain information already contained in the record of this matter, either directly or through OHCA's administrative notice of past dockets. This information was included to show that Applicants had, in fact, assessed "community need" in advance of this CON application being filed. Applicants wanted to make this clear to OHCA, particularly given the agency's request for a copy of any "community needs assessment" undertaken by Greenwich Hospital. Reference to this information in the late file submission is not in any way prejudicial to TSH, which had an opportunity to rebut the information the first time it was presented, as well as through its latest submission.

6. Applicants' Late File Submission Supports the Clear Public Need For an Elective Angioplasty Program at Greenwich Hospital

TSH argues that the late file information submitted by Applicants has no relevance to an assessment of "community need" for the cardiac services that are the subject of the CON. Applicants stand by their submission and the relevance of each document contained therein to their evaluation of need for an elective angioplasty program at Greenwich Hospital. The information is reflective of a

need and desire on the part of physicians and patients to have access to high-quality elective angioplasty services within their community, where they are presenting for cardiac services now even without an elective angioplasty program in place. TSH's suggestion that Greenwich Hospital did not conduct any "community needs assessment," and that this somehow justifies denying the CON request, is not supported by the evidence.

WHEREFORE, for the foregoing reasons Applicants request that Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission be overruled/denied.

Respectfully Submitted,

GREENWICH HOSPITAL
YALE-NEW HAVEN HOSPITAL

EXHIBIT A

during medical care, correct?

DR. HOWES: Yes.

HEARING OFFICER YANDOW: Any other questions of Dr. Howes?

MS. MARTONE: No.

MR. LAZARUS: Thank you. I have a couple questions of Mr. Corvino. Good morning Mr. Corvino.

MR. CORVINO: Good morning.

MR. LAZARUS: On page 681 of the prefile, you state, that this program will reduce overall costs of angioplasty care in the Connecticut health system. What did you mean by that when you state that?

MR. CORVINO: In addition to what Dr. Howes has already said, you know, when we talk about transferring patients out there is a cost to that. And I think he articulated very well in that we've got to redo another admission and there's an ambulance charge to transfer the patient. So we calculate the value of that to be somewhere around $8,000. And if you multiply that by the number of cases we transfer out it's close to half a million dollars that could be saved. Without counting all of the subjective savings that would go into the patient's psyche for not having to be transferred.

MR. LAZARUS: What's the percentage of

patients that come in for cath. or some sort of a need, an elective that's considered to be emergency transport?

MR. CORVINO: I don't have that number. Does somebody else have a number?

MR. LAZARUS: I know you mentioned -- for example, in 53 cases, for example, you have based your testimony on, those 53 cases, what's the total number of cases that you put those 53 cases on?

MS. GROVES: Are you talking about the number that still need to be transferred anyway and wouldn't be able to stay?

MR. LAZARUS: Well, is that what you're referring to in your testimony, when you say emergency transport?

MR. CORVINO: Procedures that could not be done at Greenwich under the current regulations.

MS. GROVES: Under the current protocols.

MR. LAZARUS: Okay. Under the current protocols. But I'm saying, considering that this is an elective procedure, not every -- not every procedure that can be done at the hospital is considered an emergency transport, am I correct on that?

MR. CORVINO: Can Chris answer that? He's got more expertise.

MR. LAZARUS: Sure.

DR. HOWES: Again, when we use the term elective, it is a misnomer, I mean, no one elects to have a heart procedure, you know, this is serious stuff. And there are different things. Patients who come in with an acute coronary state syndrome and are sick, and you know, may end up hypotensive with a balloon pump, they're still being called elective angioplasties in this realm, in this discussion. So they're not all elective. Now, that said, some of them are much more stable and in fact are outpatients. I would say about half of the outpatients that we do a diagnostic cath. on in Greenwich, we end up transferring because we've already put, you know, entered arterial access, we have access to the arterial system, we transfer them and they'll end up getting the angioplasty the same day. The other half, we stopped, we regroup, and they go back up to New Haven or to New York Presbyterian some other day. So that's of the outpatient elective angioplasties, about half of them.

And then about half of those patients are actually inpatient, you know, not stable patients. So I'm making these numbers up, I don't have them off the top of my head, but my sense is of those, 53 number that's being reported, I would say about three quarters

of those patients go by ambulance or helicopter or something like that. Does that answer, what your asking?

MR. LAZARUS: That helps, yes. That gets it. Thank you. Mr. Corvino, are you -- let's just say those 53 cases you mentioned, you said there is about an $8,000 cost. $1,000 for the transport and about 7,000 for the admission and angioplasty. What's made up of the $7,000 cost that you're talking about?

MR. CORVINO: You know, that's the -- that's the charge, the average charge that goes along with that procedure.

MR. LAZARUS: Would that charge --

MR. CORVINO: And, you know, it may not be one-to-one with costs at the second facility we're talking about.

MR. LAZARUS: -- would there not be a charge at your facility if the service was here?

MR. CORVINO: But it would be much less because of the lack of transportation cost.

MR. LAZARUS: So it would be a savings of $1,000, not 8,000?

MR. CORVINO: Yeah, but you're also duplicating services at the other place.

MR. LAZARUS: Okay. So you're duplicating

services, I understand --

MR. CORVINO: Plus transportation.

MR. LAZARUS: -- but only the charge for the angioplasty, if it was approved, an elective angioplasty at Greenwich Hospital would be less than 7,000?

MR. CORVINO: I don't know that we have a charge code for that yet.

MR. LAZARUS: You also made a statement on the same page that, you know, we're committed to provide services that our community have come to rely on us and will need in the future. Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?

MR. CORVINO: Well, yes. I mean, we've done many community needs assessments throughout the years. Clearly, cardiology is a very important part of any institution's make up. And with the growing population and the incidence of heart attack in the U.S., you know, it's clear to us that we, you know, we have to improve and make sure that we've got all of the services that our community relies on on a regular basis. And we have saved many lives through the primary angioplasty

program from the communities we serve. And clearly, as Dr. Howes mentioned earlier, if we are able to do elective it'll make us better.

If you go back to when United Hospital closed in New York, about seven or eight years ago, we saw a huge increase in usage of our emergency room to the point where we went from 15 percent of our patients coming from Westchester to now 43 percent of our patients coming from Westchester County in New York, that made us a better institution. It made our emergency room better. It made our clinicians better. And we anticipate the same thing will happen here.

MS. MARTONE: Now, Mr. Corvino, to your knowledge the incidents of heart disease you just mentioned, is it higher in the Greenwich -- the Greenwich service area compared to other areas of the state?

MR. CORVINO: You know, I don't know the answer to that question. But what I can tell you is that when you look at heart disease and the potential for heart attack that's probably, number one, what frightens patients the most. And we've, you know, we've noticed that even through some of our fundraising efforts, even if people are affiliated with a New York hospital and they live in a local community they're are going to rely

on that local community to deal with their heart attack, if you will, in the middle of the night. They're not going to be traveling to another place. So having a strong heart program really bolsters your position in the community's eyes as a really good institution.

So regardless of whether the incidents is higher or lower, if you've got the illness you want to know that the very best is available in your community.

MR. LAZARUS: When was the last time, Mr. Corvino, a community needs assessment was done? Because you mentioned there were several done.

MR. CORVINO: I would say in the last three or four years.

MR. LAZARUS: And does it specifically discuss cardiac services?

MR. CORVINO: Yes.

MR. LAZARUS: Would you be able to provide OHCA a copy of that?

MR. CORVINO: Sure.

MR. LAZARUS: OCHA would like to accept that as --

HEARING OFFICER YANDOW: Okay. I'd like to order that to be produced. How much time do you need to produce that?

IN RE: ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM AT GREENWICH HOSPITAL	)	DOCKET NO. 12-31748-CON
	)	AUGUST 10, 2012

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S REPLY TO INTERVENOR STAMFORD HOSPITAL'S OBJECTION TO AND MOTION TO STRIKE APPLICANTS' LATE FILE SUBMISSION

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), Applicants in the above-referenced matter, submit this reply to the Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission, dated August 2, 2012 ("Objection"). The Objection, which is replete with inaccuracies and omissions and is not supported by law or the practices of OHCA, should be overruled and The Stamford Hospital's ("TSH") Motion to Strike should be denied.

TSH makes the following claims and arguments in its Objection: (1) Applicants failed to serve TSH with a copy of their late file submission; (2) Applicants' late file submission does not include a "community needs assessment" and therefore is non-responsive to OHCA's request; (3) Applicants are not entitled to late file any information that existed at the time of the initial CON submissions and could have been included in those submissions; (4) Applicants seeks to modify the

sworn testimony given by Greenwich Hospital President Frank Corvino at the July 17, 2012 public hearing; (5) Applicants' late file submission improperly references information already in the record of this matter; and (6) Applicants' late file submission does not support a clear public need for an elective angioplasty program at Greenwich Hospital. Each and every one of TSH's claims and arguments is without merit. None should be considered by OHCA in evaluating this proposal.

1. Applicants Served TSH With a Copy of Their Late File Submission

TSH claims that Applicants "failed to contemporaneously serve" the hospital with their late file submission and that TSH "only recently learned" of the filing (Objection, p. 2). Applicants hand delivered their late file submission to OHCA on Friday, July 27th, four days before the July 31st filing deadline set by Hearing Officer Yandow. Also on July 27th, Applicants sent Attorney Stephen M. Cowherd, counsel of record for TSH, a copy of the late file submission via United States mail. Service by United States mail is permitted by Section 19a-9-6(c) of the Regulations of Connecticut State Agencies. This is the same form of service used by Attorney Cowherd to transmit the Objection to the undersigned counsel. In the unlikely event that Attorney Cowherd did not receive Applicants' mailing, TSH was clearly able to obtain a copy of the Late File submission from OHCA and had sufficient time to formulate and file a response.

2. Applicants Have Provided OHCA With "Community Needs Assessments" and Other Information Responsive To the Agency's Request

TSH goes to great lengths arguing that the documents submitted by Applicants as late file do not constitute a "community needs assessment" and are not responsive to OHCA's request. This argument fails on both fronts. First, there are no specific requirements for a "community needs

assessment" set forth in any of the OHCA statutes or regulations, so TSH cannot claim that the requirements have not been met. Second, the documents provided by Applicants were entirely responsive to OHCA's request, which is apparent if you read the complete public hearing transcript around the question and not just the excerpt attached by TSH.

TSH makes the bold and entirely unsubstantiated statement that "[n]ot a single one of Applicants' submissions qualifies as a community needs assessment" for the CON proposal (Objection, p. 3). However, nowhere in its filing does TSH explain what a "community needs assessment" is and why Applicants' submissions are not considered community needs assessments. This is because the OHCA statutes and regulations do not prescribe a specific form of community needs assessment. Assessing community need is a process left to Applicants, who have the burden of supporting their request for permission to establish a service and proving their case-in-chief for a CON. For TSH to claim that the studies and assessments included in Applicants' late file submission are not community needs assessments, without providing any support for that proposition, is meaningless.

Moreover, Applicants' late file submission was entirely responsive to OHCA's request for information. A more complete excerpt of the public hearing transcript is attached as Exhibit A. It shows that the question regarding whether Greenwich Hospital conducted a community needs assessment originated with OHCA Analyst Steven Lazarus' review of Mr. Corvino's prefile testimony. Mr. Lazarus cites to (paraphrases) the following statement made by Mr. Corvino on page 682 of his testimony:

> *We are committed to providing the services that our communities have come to rely on us for and will need in the future.*

Mr. Lazarus then goes on to ask:

> *Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?*

Finally, Mr. Corvino responds:

> *Well, yes. I mean, we've done many community needs assessments throughout the years.*

Applicants' submission to OHCA included a number of documents, which comprise the "community needs assessment" to which Mr. Corvino was referring. These include studies done by or in association with Greenwich Hospital, which show among other things, that the community relies on Greenwich for cardiac care. The significance of each document to Applicants' assessment of "community need" is explained in the late file submission. These are analyses, studies and surveys that Greenwich Hospital relied on in making the decision to pursue an elective angioplasty program. They reflect the needs and preferences of the patient and physician communities around cardiac services and, by extension, the proposed program. It is true that some of this information was already provided in the CON, however, Applicants thought it would be worth highlighting and/or clarifying the information for OHCA, as it supports community need for the proposal. OHCA has historically given applicants tremendous latitude in determining what information is responsive to requests for supporting documentation in a CON proceeding (i.e. needs assessments, market share analyses, public health information, etc.) and Applicants ask that they be afforded the same latitude in this matter.

3. Applicants Are Entitled To Late File Information Upon OHCA's Request

TSH argues that Applicants should be precluded from offering the late file submission as evidence because the information should have been included in their CON application. As support, TSH cites the OHCA Policies & Procedures, which provided that all supporting evidence should be attached to the application and referenced therein. However, the very nature of a late file submission is to provide "late" evidence, after the CON has been deemed completed and the public hearing has taken place, at OHCA's request. As TSH and its counsel are well aware, OHCA often asks for information in a late file that existed at the time an application was filed (i.e. historical volume), but that was not included in the CON submissions. Here, OHCA asked for information that it knew to be as much as 3 to 4 years old (see Exhibit A attached). The agency clearly understood in making its request that the information could have been provided previously, but was not. Still, OHCA made the request of Applicants and they have responded, as ordered.

4. Applicants Do Not Seek To Modify the Sworn Testimony of Frank Corvino

TSH claims that by way of the late file submission, Applicants are attempting to modify the sworn testimony of Mr. Corvino through testimony from Gayle Capozzalo, Executive Vice President, Strategy and System Development for the Yale New Haven Health System. However, the very language of Ms. Capozzalo's letter belies this claim. Regarding Mr. Corvino's testimony about the community needs assessment, she states that upon further discussion with Mr. Corvino, "he indicated he was referring to several analyses which have been conducted either by or in association with Greenwich Hospital which he feels support public need for the requested elective angioplasty program." Mr. Corvino was simply clarifying what he meant when he offered to provide OHCA with

a "community needs assessment." As President and CEO of Greenwich Hospital, Mr. Corvino relied on planning and development staff to provide OHCA with the details of the assessments. Applicants do not claim that Mr. Corvino misspoke at the hearing, nor are they trying to alter the substance of his testimony in any way. The purpose of Ms. Capozzalo's letter was simply to clarify which documents Mr. Corvino was referring to when he said that several "community needs assessments" had been conducted over the years involving cardiac services.

5. Late File Information Already In the Record Should Not Be Stricken

Applicants included reference in their late file submission to certain information already contained in the record of this matter, either directly or through OHCA's administrative notice of past dockets. This information was included to show that Applicants had, in fact, assessed "community need" in advance of this CON application being filed. Applicants wanted to make this clear to OHCA, particularly given the agency's request for a copy of any "community needs assessment" undertaken by Greenwich Hospital. Reference to this information in the late file submission is not in any way prejudicial to TSH, which had an opportunity to rebut the information the first time it was presented, as well as through its latest submission.

6. Applicants' Late File Submission Supports the Clear Public Need For an Elective Angioplasty Program at Greenwich Hospital

TSH argues that the late file information submitted by Applicants has no relevance to an assessment of "community need" for the cardiac services that are the subject of the CON. Applicants stand by their submission and the relevance of each document contained therein to their evaluation of need for an elective angioplasty program at Greenwich Hospital. The information is reflective of a

need and desire on the part of physicians and patients to have access to high-quality elective angioplasty services within their community, where they are presenting for cardiac services now even without an elective angioplasty program in place. TSH's suggestion that Greenwich Hospital did not conduct any "community needs assessment," and that this somehow justifies denying the CON request, is not supported by the evidence.

WHEREFORE, for the foregoing reasons Applicants request that Intervenor Stamford Hospital's Objection to and Motion to Strike Applicants' Late File Submission be overruled/denied.

Respectfully Submitted,

during medical care, correct?

DR. HOWES: Yes.

HEARING OFFICER YANDOW: Any other questions of Dr. Howes?

MS. MARTONE: No.

MR. LAZARUS: Thank you. I have a couple questions of Mr. Corvino. Good morning Mr. Corvino.

MR. CORVINO: Good morning.

MR. LAZARUS: On page 681 of the prefile, you state, that this program will reduce overall costs of angioplasty care in the Connecticut health system. What did you mean by that when you state that?

MR. CORVINO: In addition to what Dr. Howes has already said, you know, when we talk about transferring patients out there is a cost to that. And I think he articulated very well in that we've got to redo another admission and there's an ambulance charge to transfer the patient. So we calculate the value of that to be somewhere around $8,000. And if you multiply that by the number of cases we transfer out it's close to half a million dollars that could be saved. Without counting all of the subjective savings that would go into the patient's psyche for not having to be transferred.

MR. LAZARUS: What's the percentage of

patients that come in for cath. or some sort of a need, an elective that's considered to be emergency transport?

MR. CORVINO: I don't have that number. Does somebody else have a number?

MR. LAZARUS: I know you mentioned -- for example, in 53 cases, for example, you have based your testimony on, those 53 cases, what's the total number of cases that you put those 53 cases on?

MS. GROVES: Are you talking about the number that still need to be transferred anyway and wouldn't be able to stay?

MR. LAZARUS: Well, is that what you're referring to in your testimony, when you say emergency transport?

MR. CORVINO: Procedures that could not be done at Greenwich under the current regulations.

MS. GROVES: Under the current protocols.

MR. LAZARUS: Okay. Under the current protocols. But I'm saying, considering that this is an elective procedure, not every -- not every procedure that can be done at the hospital is considered an emergency transport, am I correct on that?

MR. CORVINO: Can Chris answer that? He's got more expertise.

MR. LAZARUS: Sure.

DR. HOWES: Again, when we use the term elective, it is a misnomer, I mean, no one elects to have a heart procedure, you know, this is serious stuff. And there are different things. Patients who come in with an acute coronary state syndrome and are sick, and you know, may end up hypotensive with a balloon pump, they're still being called elective angioplasties in this realm, in this discussion. So they're not all elective. Now, that said, some of them are much more stable and in fact are outpatients. I would say about half of the outpatients that we do a diagnostic cath. on in Greenwich, we end up transferring because we've already put, you know, entered arterial access, we have access to the arterial system, we transfer them and they'll end up getting the angioplasty the same day. The other half, we stopped, we regroup, and they go back up to New Haven or to New York Presbyterian some other day. So that's of the outpatient elective angioplasties, about half of them.

And then about half of those patients are actually inpatient, you know, not stable patients. So I'm making these numbers up, I don't have them off the top of my head, but my sense is of those, 53 number that's being reported, I would say about three quarters

of those patients go by ambulance or helicopter or something like that. Does that answer, what your asking?

MR. LAZARUS: That helps, yes. That gets it. Thank you. Mr. Corvino, are you -- let's just say those 53 cases you mentioned, you said there is about an $8,000 cost. $1,000 for the transport and about 7,000 for the admission and angioplasty. What's made up of the $7,000 cost that you're talking about?

MR. CORVINO: You know, that's the -- that's the charge, the average charge that goes along with that procedure.

MR. LAZARUS: Would that charge --

MR. CORVINO: And, you know, it may not be one-to-one with costs at the second facility we're talking about.

MR. LAZARUS: -- would there not be a charge at your facility if the service was here?

MR. CORVINO: But it would be much less because of the lack of transportation cost.

MR. LAZARUS: So it would be a savings of $1,000, not 8,000?

MR. CORVINO: Yeah, but you're also duplicating services at the other place.

MR. LAZARUS: Okay. So you're duplicating

services, I understand --

MR. CORVINO: Plus transportation.

MR. LAZARUS: -- but only the charge for the angioplasty, if it was approved, an elective angioplasty at Greenwich Hospital would be less than 7,000?

MR. CORVINO: I don't know that we have a charge code for that yet.

MR. LAZARUS: You also made a statement on the same page that, you know, we're committed to provide services that our community have come to rely on us and will need in the future. Was there a community needs assessment done for you to figure out what the community needs? Was there a study that the hospital had performed?

MR. CORVINO: Well, yes. I mean, we've done many community needs assessments throughout the years. Clearly, cardiology is a very important part of any institution's make up. And with the growing population and the incidence of heart attack in the U.S., you know, it's clear to us that we, you know, we have to improve and make sure that we've got all of the services that our community relies on on a regular basis. And we have saved many lives through the primary angioplasty

program from the communities we serve. And clearly, as Dr. Howes mentioned earlier, if we are able to do elective it'll make us better.

If you go back to when United Hospital closed in New York, about seven or eight years ago, we saw a huge increase in usage of our emergency room to the point where we went from 15 percent of our patients coming from Westchester to now 43 percent of our patients coming from Westchester County in New York, that made us a better institution. It made our emergency room better. It made our clinicians better. And we anticipate the same thing will happen here.

MS. MARTONE: Now, Mr. Corvino, to your knowledge the incidents of heart disease you just mentioned, is it higher in the Greenwich -- the Greenwich service area compared to other areas of the state?

MR. CORVINO: You know, I don't know the answer to that question. But what I can tell you is that when you look at heart disease and the potential for heart attack that's probably, number one, what frightens patients the most. And we've, you know, we've noticed that even through some of our fundraising efforts, even if people are affiliated with a New York hospital and they live in a local community they're are going to rely

on that local community to deal with their heart attack, if you will, in the middle of the night. They're not going to be traveling to another place. So having a strong heart program really bolsters your position in the community's eyes as a really good institution.

So regardless of whether the incidents is higher or lower, if you've got the illness you want to know that the very best is available in your community.

MR. LAZARUS: When was the last time, Mr. Corvino, a community needs assessment was done? Because you mentioned there were several done.

MR. CORVINO: I would say in the last three or four years.

MR. LAZARUS: And does it specifically discuss cardiac services?

MR. CORVINO: Yes.

MR. LAZARUS: Would you be able to provide OHCA a copy of that?

MR. CORVINO: Sure.

MR. LAZARUS: OCHA would like to accept that as --

HEARING OFFICER YANDOW: Okay. I'd like to order that to be produced. How much time do you need to produce that?

RE: Certificate of Need Application; Docket Number: 12-31748-CON
Greenwich Hospital and Yale-New Haven Hospital
Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup
at Greenwich Hospital

Dear Attorney Groves:

Enclosed please find a copy of the Proposed Final Decision rendered by Hearing Officer Joanne V. Yandow, Esq. in the above-referenced case.

Pursuant to Connecticut General Statutes § 4-179, Greenwich Hospital and Yale-New Haven Hospital, the parties in this matter, may request the opportunity to file exceptions or a brief or a request to present an oral argument, in writing, with the Deputy Commissioner, OHCA of the Department within twenty-one (21) days from the mailing of the decision, or by December 11, 2012. If no such request is received by this date, the Deputy Commissioner will take those rights to be waived and will render a Final Decision in this matter.

If you wish to expedite the process and avoid the necessity that the Deputy Commissioner await the expiration of the aforementioned fourteen days, you may submit a written statement to the Deputy Commissioner affirmatively waiving those rights.

Sincerely,

Kimberly R. Martone
Director of Operations

Copy: Stephen M. Cowherd, Jeffers and Cowherd, PC.

Office of Health Care Access
Certificate of Need Application

Proposed Final Decision

Applicant:	**Greenwich Hospital and Yale-New Haven Hospital**
Docket Number:	**12-31748-CON**
Project Title:	**Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital**

Project Description: Greenwich Hospital and Yale-New Haven Hospital propose to establish and operate an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure.

Nature of Proceedings: On June 20, 2012, the Office of Health Care Access ("OHCA") received the Certificate of Need ("CON") application from Greenwich Hospital and Yale-New Haven Hospital to establish an elective angioplasty program without onsite backup at Greenwich Hospital, with no associated capital expenditure. The Applicants are health care facilities or institutions as defined by Section 19a-630 of the Connecticut General Statutes ("General Statutes").

Pursuant to General Statutes § 19a-638, a public hearing regarding the CON application was held on July 17, 2012. On July 2, 2012, the Applicant was notified of the date, time, and place of the hearing. On July 3, 2012, a notice to the public announcing the hearing was published in *The Greenwich Times*. Attorney Joanne V. Yandow served as Hearing Officer. The hearing was conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the General Statutes) and General Statutes § 19a-638.

By petition dated July 12, 2012, The Stamford Hospital requested Party or, in the alternative, Intervenor status with full rights of cross-examination regarding the Applicants' CON application. The Hearing Officer denied the request of The Stamford Hospital for Party status and designated The Stamford Hospital as an Intervenor with limited rights of participation.

The Hearing Officer heard testimony from the Applicants' witnesses and the Intervenor's witnesses and, in rendering this decision, considered the entire record of the proceeding. The public hearing record was closed on September 6, 2012.

OHCA's authority to review and approve, modify, or deny the CON application is established by General Statutes § 19a-638. The provisions of this section, as well as the principles and guidelines set forth in General Statutes § 19a-639, were fully considered by OHCA in its review.

Findings of Fact

1. Greenwich Hospital is a not-for-profit 174-bed acute care hospital located at 5 Perryridge Road in Greenwich, Connecticut. Exhibit A, p. 573 (CON Application).

2. Yale-New Haven Hospital is a not-for-profit, acute care hospital located at 20 York Street, New Haven, Connecticut. Exhibit A, p. 575 (CON Application).

3. The Yale-New Haven Heart and Vascular Center provides elective and emergency ("primary") angioplasty at Yale-New Haven Hospital and has established satellite primary angioplasty programs at Greenwich Hospital and Lawrence & Memorial Hospital in New London, Connecticut. Exhibit H, pp. 629&632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale-New Haven Health System and CEO of Yale New Haven Hospital); OHCA CON Final Decision, DN: 03-30148.

4. Angioplasty is historically a procedure in which a balloon tipped catheter is advanced to an artery narrowed from the buildup of cholesterol-laden plaque, but has been expanded to include other devices that serve as adjuncts to the balloon catheter, such as stents. Percutaneous coronary intervention ("PCI") also refers to this broader group of technologies. PCI for patients that present on an emergency basis with ST-segment elevation MI or new onset left bundle branch block is referred to as a "primary" PCI. Other PCI procedures are referred to as "elective" PCI. *See*, OHCA CON Final Decision, DN: 08-31210.

5. As part of Yale-New Haven Heart and Vascular Center, Greenwich Hospital currently provides diagnostic cardiac services including echocardiography, nuclear cardiac imaging, stress testing, cardiac CT angiography, and diagnostic cardiac catheterization. Greenwich Hospital also provides PCI angioplasty services for patients that present on an emergency basis with artery blockage in the heart. Exhibit A, pp. 22-23 (CON Application).

6. The primary angioplasty program at Greenwich Hospital received permanent status approval from OHCA on July 25, 2008, after completion of a 3-year demonstration project. Exhibit A, p. 22 (CON Application); OHCA CON Final Decision, DN: 03-30148.

7. Elective angioplasty is the same procedure as primary angioplasty but is typically a scheduled procedure (within 72 hours) and is not an emergency. *See*, OHCA CON Final Decision, DN: 08-31210.

8. The Applicants are proposing to establish an elective angioplasty program at Greenwich Hospital without an on-site open heart surgery program. Exhibit A, p. 14 (CON Application).

9. The Applicants define the population to be served through this proposal as the residents of the towns that comprise 85% of Greenwich Hospital's inpatient volume. The Applicants claim that the proposed service area ("PSA") is as follows:

Table I: Greenwich Hospital's PSA for Elective PCI

State	Towns
Connecticut	Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston, Westport and Wilton
New York	Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneek, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Pound Ridge, Purchase, Rye Scarsdale, South Salem, West Harrison and White Plains

Exhibit A, p. 24 (CON Application).

10. The Stamford Hospital ("Stamford Hospital"), the Intervenor in this matter, performs cardiovascular services, including primary and elective PCIs. *See*, OHCA CON Final Decision, DN: 04-30374.

11. The Applicants claim that based on the 2011 inpatient cardiovascular discharge volume by patients' towns of origin for Stamford Hospital and Greenwich Hospital, cardiovascular patients at Greenwich Hospital are the low volume communities for Stamford Hospital. Specifically, the communities of Greenwich, Port Chester and Rye comprise 80% of Greenwich Hospital's cardiovascular patient population but only 4.6% of Stamford Hospital's cardiovascular patient population. Additionally, patients who live in the city of Stamford and the town of Darien comprise 88% of Stamford Hospital's cardiovascular patient volume but only comprise 7% of Greenwich Hospital's cardiovascular patients. Exhibit H, pp. 668-669 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

12. In 2010, OHCA issued a decision denying Greenwich Hospital's first proposal to establish and operate elective angioplasty program without on-site open heart surgery. The proposal was denied because the projected volume included New York patients, there was insufficient evidence to support the projected volumes, and there was an existing provider of elective PCI and full service cardiac program in the service area (Stamford Hospital). CON Final Decision 08-31210-CON.

13. In or about January 2012, White Plains Hospital in White Plains, New York began offering elective angioplasty service. . Exhibit I, p. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

14. Stamford Hospital and White Plains Hospital are currently providing elective angioplasty procedures in Greenwich Hospital's claimed PSA. Exhibit A, p. 28 (CON Application).

15. White Plains Hospital states it services most of the Westchester County towns identified by the Applicants as towns in Greenwich Hospital's PSA. Exhibit I, page, 49 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

16. The Applicants assert that Greenwich Hospital is already performing angioplasty on more acutely ill patients through its primary angioplasty program and the staff and physicians are well prepared to perform elective angioplasty for less acute patients. Exhibit A, p. 14 (CON Application).

17. The Medical Director of the cardiac services program at Greenwich Hospital is appointed by Yale University School of Medicine, Department of Cardiology and is a member of the Yale School of Medicine's interventional cardiology faculty. Exhibit A, p. 14 (CON Application).

18. The Applicants claim that the previous OHCA approval for the primary PCI demonstrated clear public need for emergency angioplasty services at Greenwich Hospital and that the current proposal expands upon that approval to demonstrate that the same population, from which Greenwich Hospital's primary angioplasty patients originate, also have a clear need for access to their provider of choice for high quality elective angioplasty services. Exhibit A, p. 15 (CON Application).

19. The Applicants claim that the clear public need for this proposal is supported by the following three key factors:

    a. Local access to elective angioplasty care at Greenwich Hospital is needed and appropriate;
    b. Greenwich Hospital must address the cost-effectiveness of angioplasty services; and
    c. The proposed program will improve the quality of elective angioplasty services provided to Greenwich Hospital's PSA patients.

    Exhibit A, p. 15 (CON Application).

20. The Applicants assert that significant stress and strain are placed on Greenwich Hospital patients and their families when they receive either a diagnostic catheterization or an emergency angioplasty and then must undergo an elective angioplasty at another facility. Exhibit H, p. 671 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

21. In November 2011, the American College of Cardiology/American Heart Association/The Society for Cardiovascular Angiography and Interventions ("ACC/AHA/SCAI") updated their guidelines regarding PCI without on-site surgical backup. These guidelines are intended to assist healthcare providers in clinical decision making by describing a range of generally acceptable approaches to the diagnosis, management, and prevention of specific diseases or condition. Exhibit A, pp. 139-239 (CON Application).

22. The Applicants claim that an elective PCI program at Greenwich Hospital would fall within the ACC/AHA/SCAI updated guidelines. Exhibit H, pp. 635-636 (prefiled testimonoy of Henry Cabin, MD, Clinical Chief of Cardiology at Yale School of Medicine and Medical Director of Yale-New Haven Heart and Vascular Center).

23. The ACC/AHA/SCAI updated guidelines recommend, in part, that:
> elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection.

Exhibit A, p. 164 (CON Application).

24. The ACC/AHA/SCAI guidelines also recommend, in part, that:
> [i]t is only appropriate to consider initiation of a PCI program without on-site backup if the program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

Exhibit A, p. 164 (CON Application).

25. It is found that although OHCA is not bound to the ACC/AHA/SCAI guidelines, these guidelines are instructive. *See*, CON Final Decision 08-31210-CON.

26. The Applicants claim that angioplasty has become a fairly routine procedure, often performed in an outpatient setting at much lower risk than used to exist. Exhibit H, p. 632. (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale-New Haven Hospital).

27. The Applicants claim that this proposal eliminates the need for two invasive procedures, diagnostic cardiac catheterization and elective angioplasty, which adds hospital costs, clinical risk and expensive medical transportation costs. Exhibit H, pp.

632 and 671 (prefiled testimonies of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital, and Christopher Howes, MD, Chief of Cardiology and Medical Director of the angioplasty program at Greenwich Hospital).

28. The Applicants assert that Yale School of Medicine cardiovascular physicians have been actively involved in the primary angioplasty program at Greenwich Hospital since its inception and will continue to provide clinical oversight, direct patient care, and staff and physician education at the proposed program. Exhibit H, p. 632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital).

29. The Applicants state that Greenwich Hospital participates in the National Cardiovascular Data Registry NCDR-CathPCI Registry. Exhibit A, p. 36 (CON Application).

30. According to the Applicants, since Fiscal Year ("FY") 2008, 272 patients presented at Greenwich Hospital for elective angioplasty service. A total of 246 of the 272 patients were transferred to other providers for elective PCI. The following table illustrates the total of transfers by provider:

Table II: Historical Greenwich Hospital Elective PCI Transfers

FY	Yale	Westchester Medical Center	Cornell	Columbia	Stamford	West Haven VA	Total Transfers
2008	44	1	0	0	0	0	45
2009	71	0	1	1	1	0	74
2010	51	0	2	0	1	0	54
2011	53	0	2	1	0	1	57
2012*	16	0	0	0	0	0	16
Totals	**235**	**1**	**5**	**2**	**2**	**1**	**246**

*Number of transfers between 10/1/11 and 12/31/11

Note: The remaining 26 patients were discharged and referred for elective angioplasty at a future time. Exhibit A, p. 19 (CON Application).

31. The Applicants identified the following historical primary angioplasty volumes for Greenwich Hospital for FYs 2008-2011:

Table III: Greenwich Hospital Historical Primary PCI

	FY 2008	FY 2009	FY 2010	FY 2011
Greenwich Hospital	40	40	32	38

Exhibit A, p. 30 (CON Application).

32. Greenwich Hospital's angioplasty volume projections:

Table IV: Greenwich Hospital Projected Primary and Elective PCI

	FY 2012	FY 2013	FY 2014
Primary Angioplasty	38	38	38
Elective Angioplasty	**53**	**53**	**53**
New Referred Elective PCI	105	126	151
Total	196	217	242

Exhibit A, p. 31 (CON Application).

33. The Applicants based the projected primary angioplasty volumes on historical volumes, which have remained fairly steady for the past few years. The projected elective angioplasty volumes have been based on the historical elective angioplasty patients transferred to other facilities. Exhibit A, pp. 32-34 (CON Application).

34. The Applicants claim that half of the outpatients that have a diagnostic catheterization performed at Greenwich Hospital are transferred to other facilities for elective PCI. Exhibit H, p. 669-671 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

35. The Applicants state that an increase in the PCI patient volume will result from the addition of New York interventional cardiologists who currently do not practice at Greenwich Hospital but have referral relationships with Greenwich Hospital medical staff and would utilize and refer elective angioplasty to Greenwich Hospital. Exhibit H, pp. 670-671, 675-676 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

36. Although the Applicants provided letters of support from the two (2) physicians from the State of New York who state they would offer elective PCI at Greenwich Hospital if that were an option, the projected new PCI volumes are speculative and appear to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital. *See*, Exhibit H, page 671 &675-679 (prefiled testimony of Christopher Howes, M.D Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

37. Stamford Hospital claims that elective angioplasty volumes are flat to declining in the State, with no volume growth in the Applicants' proposed service area, and therefore, there is no clear public need for the establishment of elective angioplasty program without onsite surgical back up at Greenwich Hospital. Exhibit K, p. 1 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

38. The following table illustrates the historical overall statewide PCI (primary and elective combined) discharges by provider between Federal Fiscal Years ("FFY") 2002-2011:

Table V: PCI discharges by provider, FFYs 2002-2011

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	FFY 05-07 (3-yr)* % Change	FFY 09-11 (3-yr) % Change	FFY 10-11 (1-yr) % Change

***Source**: CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.*

ICD-9-CM Procedure Codes: .66, 36.01, 36.02, 36.05, 36.06 and 36.07
Please note: unduplicated counts utilizing all procedure codes
*This column in OHCA's Exhibit 1, Table 2A, was mislabeled. No data from this column was relied upon to support the findings in this decision.

39. The statewide inpatient PCI volumes demonstrate the following: a five year historical decline of 1% between FY 2007-2011; a 12% overall decline between FY 2009 and 2011; and an 11% decline in statewide PCI volume between FY 2010-2011. *See,* Table V, above.

40. Stamford Hospital's PCI discharges have declined 15% between FY 2009-2011 and, therefore, Stamford Hospital has capacity to serve the needs of the community. *See*, Table V, above.

41. The Intervenor claims that discharges of residents from Greenwich Hospital's service area from Connecticut and New York hospitals show that from FY 2009 through 2011, inpatient ("I/P") cardiac catheterization and PCI volumes have decreased in the service area:

Table VI: FY 2009-2011, I/P PCI Volume in proposed Service Area

State	FY 2009	FY 2010	FY 2011
CT Service Area	598	610	429
NY Service Area	844	775	772
Total	**1,442**	**1,385**	**1,201**

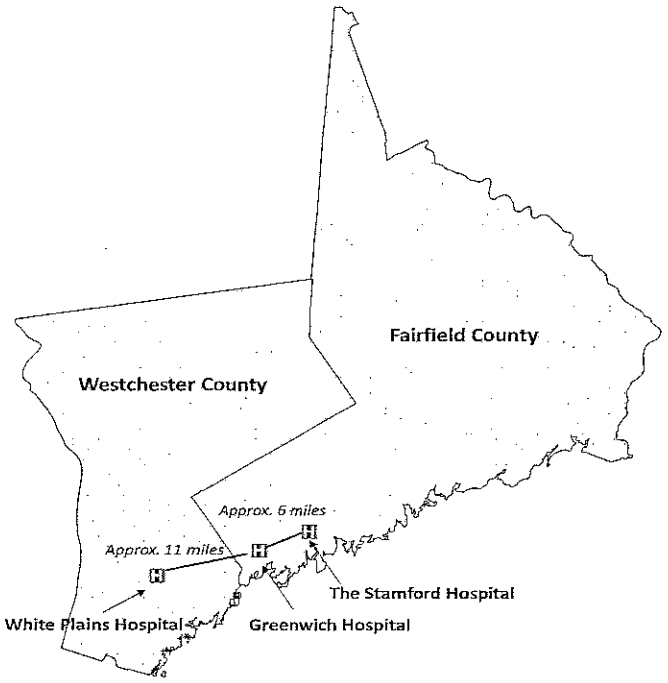
Exhibit K, p. 8 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

42. In light of the historical elective PCI transfers from Greenwich Hospital to existing providers and the declining statewide PCI volumes, OHCA finds that the Applicants have not provided sufficient evidence to support its projected PCI utilizations.

43. A letter from White Plains Hospital states that its elective PCI program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area that would indicate patients are not receiving timely care. Exhibit I, pp. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

44. White Plains Hospital is located approximately ten (10) miles west of Greenwich Hospital. If this application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other. Exhibit K, p. 10 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

45. The map illustrates the location of Greenwich Hospital and the existing providers such as Stamford Hospital and White Plains Hospital, in Greenwich Hospital's proposed service area and their approximate distance to Greenwich Hospital:



46. There is no capital expenditure associated with this proposal. Exhibit A, p. 21(CON Application).

47. The Applicants assert that they estimate the unnecessary costs that now result and impact payers and patients total approximately $425,000 each year. This amount is based on an average of 53 elective angioplasty cases currently transferred that could be cared for by a Greenwich Hospital's elective angioplasty program multiplied by $8,000 ($7,000 for the average cost of an angioplasty admission at Yale New Haven Hospital plus $1,000 for emergency transportation). Exhibit H, p. 79 (prefiled testimony of Frank Corvino, President and CEO of Greenwich Hospital).

48. Greenwich Hospital's projected incremental revenue from operations, total operating expense and gain from operations associated with the CON proposal are as follows:

Table VII: Financial Projections Incremental to the Project

Description	FY 2013	FY 2014	FY 2015
Incremental Revenue from Operations	$2,935	$3,413	$3,976
Incremental Total Operating Expense	$2,353	$2,744	$3,222
Incremental Gain from Operations	**$582**	**$669**	**$756**

Note: figures are in thousands.
Exhibit A, p. 577 (CON Application).

49. The current and three-year projected payer mix for Greenwich Hospital is as follows:

Table VIII: Current & Three-Year Projected Payer Mix

Description	Current	Year 1	Year 2	Year 3
Medicare*	40.5%	40.5%	40.5%	40.5%
Medicaid*	5.4%	5.4%	5.4%	5.4%
CHAMPUS and TriCare				
Total Government	**45.9%**	**45.9%**	**45.9%**	**45.9%**
Commercial Insurers*	48.7%	48.7%	48.7%	48.7%
Self Pay	5.4%	5.4%	5.4%	5.4%
Workers Compensation	0%	0%	0%	0%
Total Non-Government	**54.1%**	**54.1%**	**54.1%**	**54.1%**
Total Payer Mix	**100%**	**100%**	**100%**	**100%**

* Includes managed care activity.
Exhibit A, p. 40 (CON Application).

50. The Applicants assert that Greenwich Hospital's primary angioplasty services are costing Greenwich Hospital approximately $1.78 million per year, as Greenwich Hospital has to pay Yale School of Medicine to provide 24/7 physician staffing for its existing program. The primary angioplasty program results in significant staffing costs to cover approximately 40 primary angioplasty cases treated at Greenwich Hospital each year. Utilizing the same physicians to perform elective angioplasty would be a cost-effective and efficient approach and would reduce the costs per case from the arrangement. Exhibit A, p. 20 (CON Application).

51. The Applicants claim that the proposed elective angioplasty program is cost effective as it maximizes use of the existing high-cost infrastructure of the primary angioplasty program and permits existing and available highly qualified expert physicians and staff to perform both primary and elective angioplasties for which they have been trained and are qualified to perform. In addition, as noted in the application, System-wide integration, coordination of care practices and standardization, more cost effectiveness and evidence-based care will be provided. Exhibit A, pp. 40-41 (CON Application).

52. OHCA is currently in the process of establishing its policies and standards as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations adopted by OHCA. (General Statutes § 19a-639(a)(1)).

53. OHCA is currently in the process of establishing the statewide facilities and services plan ("the plan"). The plan was not a published document at the time of this proposal was filed; however, even if the plan is published by the time this final decision is issued, it has no bearing on the outcome of this matter, as the Applicants have not sufficiently demonstrated a clear public need for this proposal. (General Statutes § 19a-639(a)(2)).

54. There is insufficient evidence to establish that there is a clear public need for the Applicants' proposal. (General Statutes § 19a-639(a)(3)).

55. The Applicants have not satisfactorily demonstrated how this proposal will impact the financial strength of the health care system in this state. (General Statutes § 19a-639(a)(4)).

56. The Applicants have failed to satisfactorily demonstrate that their proposal would improve the accessibility of health care delivery in the region but they have satisfactorily demonstrated a potential improvement in quality and cost effectiveness. (General Statutes § 19a-639(a)(5)).

57. The Applicants have shown that there would be no change to the provision of health care services to the relevant populations and payer mix. (General Statutes § 19a-639(a)(6)).

58. The Applicants have satisfactorily identified the population to be served by their proposal but have failed to satisfactorily demonstrate that this population has a need as proposed. (General Statutes § 19a-639(a)(7)).

59. The historical elective PCI discharges in the service area do not support this proposal. (General Statutes § 19a-639(a)(8)).

60. The Applicants have failed to satisfactorily demonstrate that their proposal would not result in an unnecessary duplication of existing elective PCI services in the area. (General Statutes § 19a-639(a)(9)).

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in General Statutes § 19a-639(a) and the Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Goldstar Medical Services, Inc., et al. v. Department of Social Services,* 288 Conn. 790 (2008); *Steadman v. SEC*, 450 U.S. 91, 101 S.Ct. 999, *reh'g den.*, 451 U.S. 933 (1981); *Bender v. Clark*, 744 F.2d 1424 (10th Cir. 1984); *Sea Island Broadcasting Corp. v. FCC*, 627 F.2d 240, 243 (D.C. Cir. 1980).

Greenwich Hospital is a 174-bed acute care hospital located at 5 Perryridge Road in Greenwich and Yale-New Haven Hospital is an acute care hospital located at 20 York Street in New Haven. Greenwich Hospital and Yale New Haven Hospital (collectively known as "Applicants") are proposing to establish and operate an elective angioplasty program without onsite surgical backup located at Greenwich Hospital. FFs 1, 2, 8.

Currently, Greenwich Hospital, as a satellite of Yale New Haven Hospital's Yale-New Haven Heart and Vascular Center, provides cardiac catheterization and primary (emergency) angioplasty services. Greenwich Hospital does not have an on-site open heart surgery program. FF 4-6.

The Applicants argue that there is a clear public need for elective angioplasty ("elective PCI") at Greenwich Hospital and that such a program would fall within the ACCF/AHA/SCAI updated guidelines regarding elective PCI without on-site surgical backup. FFs 18, 19, 21, 22. The ACCF/AHA/SCAI guidelines now state that elective PCI might be considered in hospitals without on-site cardiac, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection. FF 23.

The Applicants claim there is clear public need based on three key factors: local access, cost-effectiveness and improved quality. FF 19. Greenwich Hospital has transferred approximately 57 patients annually (between FYs 2008-2011) that required elective angioplasties to other providers over the each of the past three fiscal years. FF 30. Additionally, the Applicants claim that two new physicians (currently practicing in Westchester County, NY) will refer new angioplasty patients to Greenwich Hospital, if approved. FF 35.

Although the Applicants claim that there is need for elective PCI in the proposed service area, there are currently two providers of elective angioplasty service within its proposed service area, Stamford Hospital and White Plains Hospital. FFs 14, 44, 45. Each of the existing providers of elective angioplasty is approximately 6 and 11 miles away from Greenwich Hospital. FFs 44, 45. A letter from White Plains Hospital in Westchester County, NY, stated that its elective angioplasty program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area. FF 43. Additionally, historical PCI discharge data shows that Stamford Hospital also has capacity to serve the needs of the community. FFs 37-40. Furthermore, based on OHCA's statewide hospital discharges, it's clear that since FY 2009,

the cardiac catheterization volume has declined 10% and the combined (emergent and elective) angioplasty volumes declined 12% at Connecticut providers. FFs 38-40.

The ACCF/AHA/SCAI updated guidelines state:

> It is only appropriate to consider initiation of a PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

FF 24. Regarding the proposal at hand, there is insufficient evidence to establish a void in the needs of the community for elective PCI services and that the Applicants' proposal is in the best interests of the community.

Based on the statewide decline at all Connecticut providers of cardiac catheterization and angioplasty programs, the speculative projected new cases, and the fact that there are two (2) existing providers currently providing elective PCI in Greenwich Hospital's proposed service area and that these providers have capacity to fulfill the needs of the community, OHCA finds there is access to elective angioplasty service for the residents within Greenwich Hospital's proposed service area and, further, that the Applicants failed to demonstrate and provide evidence of a clear public need for this proposal. Based upon the lack of sufficient evidence demonstrating that the Applicants' proposed project fulfills a clear public need for elective PCI, OHCA is unable to conclude that the Applicants' financial projections and volumes upon which they are based are reasonable and achievable, or that the project is financially feasible.

Based upon the foregoing Findings of Fact and Discussion, I respectfully recommend that the Certificate of Need application of Greenwich Hospital and Yale-New Haven Hospital for the establishment of an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure, be **DENIED**.

Respectfully submitted,

Re: Greenwich Hospital
Establish & Operate an Elective Angioplasty program Without Onsite Surgical Backup at Greenwich Hospital
Docket No. 12-31748-CON

Dear Deputy Commissioner Davis:

Pursuant to Section 4-179(a) of the Connecticut General Statutes, Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants"), parties in the above-referenced CON proceeding, request the opportunity to file exceptions and briefs and present oral argument to the Department of Public Health regarding the Proposed Final Decision, dated November 20, 2012. Both Greenwich and YNHH are adversely affected by the Proposed Final Decision, which denies Applicants the right to establish and operate an elective angioplasty program at Greenwich Hospital. Per our discussions with OHCA staff, upon receipt of this letter a date will be assigned for the filing of exceptions and briefs, and oral argument will be scheduled sometime thereafter.

Thank you for your consideration of this request.

Very truly yours,

Frank Corvino

Re: Proposal to Establish Elective Angioplasty Program at Greenwich Hospital
Docket No. 12-31748-CON

Dear Deputy Commissioner Davis,

This office represents Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants") in connection with the above-referenced CON Application to establish an elective angioplasty program in Greenwich. We are in receipt of your letter scheduling oral argument on the Proposed Final Decision for January 16, 2013. We appreciate this opportunity to be heard and will submit our exceptions and brief to you by January 11, 2013, as requested.

The purpose of this letter is to confirm that the right to submit exceptions and a brief and to present oral argument on the Proposed Final Decision is limited to the ***parties*** in this matter only. Specifically, we are requesting confirmation that The Stamford Hospital ("TSH"), which was designated as an intervenor with limited rights for purposes of the July 16, 2012 public hearing, will not be allowed to make a written submission and/or to argue before the Deputy Commissioner on January 16th.

Section 4-179 of the Connecticut General Statutes provides, in pertinent part, as follows:

> When in an agency proceeding, a majority of the members of the agency who are to render the final decision have not heard the matter or read the record, the decision if adverse to a party, shall not be rendered until a proposed final decision is served upon the parties, and an opportunity is afforded ***for each party adversely affected*** to file exceptions and present briefs and oral argument to the members of the agency who are to render the final decision (emphasis added).

In addition, Section 19a-9-29(h) of the Regulations of Connecticut State Agencies (Department of Public Health Rules of Practice) states:

> ***Any party*** who wishes to challenge a proposed final decision under section 4-179 of the Connecticut General Statutes shall file exceptions or a brief or request oral argument within twenty-one (21) days of the mailing of the decision. ***Any party*** who wishes to present a brief or requests oral argument in support of a proposed final decision shall do so within thirty-five (35) days of the mailing of the decision (emphasis added).

Moreover, the November 20, 2012 letter from Office of Health Care Access ("OHCA") Director of Operations Kimberly Martone enclosing the Proposed Final Decision states that "Greenwich and Yale-New Haven Hospital, ***the parties in this matter***, may request the opportunity to file exceptions or a brief or to request to present an oral argument (emphasis added)."

Based upon the statutes and regulations pursuant to which oral argument on a Proposed Final Decision is authorized, it is clear that only parties – in this case Greenwich and YNHH – have a right to participate at this stage in an OHCA administrative proceeding. Applicants seek confirmation that TSH will not be allowed to participate on January 16th (either through written submission or oral presentation) so that we can properly prepare for the argument.

Thank you in advance for your consideration of this request.

Very truly yours,

Jennifer L. Groves

Re: Proposal to Establish Elective Angioplasty Program at Greenwich Hospital
Docket No. 12-31748-CON

Dear Deputy Commissioner Davis,

This office represents Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH") (collectively "Applicants") in connection with the above-referenced CON Application to establish an elective angioplasty program in Greenwich. Enclosed please find an original and two (2) copies of Applicants' Exceptions to Proposed Final Decision. Marna Borgstrom, CEO of YNHH and President and CEO of the Yale-New Haven Health System, and Frank Corvino, President and CEO of Greenwich Hospital, will accompany me to argue these exceptions on January 16, 2013.

Please feel free to contact me with any questions. We look forward to meeting with you.

Very truly yours,

Jennifer L. Groves

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S PROPOSAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM WITHOUT ON-SITE SURGICAL BACKUP AT GREENWICH HOSPITAL	)	DOCKET NO. 12-31748-CON
	)	JANUARY 11, 2013

EXCEPTIONS TO PROPOSED FINAL DECISION

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH"), Applicants in the above-referenced Certificate of Need ("CON") proceeding, submit the following Exceptions to the Proposed Final Decision rendered by the Office of Health Care Access ("OHCA"), through Hearing Officer Joanne V. Yandow, on November 20, 2012 (the "Proposed Final Decision"). Applicants intend to appear before Deputy Commissioner Lisa Davis on January 16, 2013, and present oral argument on these Exceptions.

I. Introduction

Greenwich and YNHH seek approval from OHCA to establish and operate an elective angioplasty program at Greenwich Hospital (the "Elective Angioplasty Program"). Greenwich is a short-term acute care hospital and an affiliate of the Yale-New Haven Health System ("YNHHS") (CON Application, p. 14). Greenwich offers a broad array of cardiac services in conjunction with the Yale-New Haven Heart and Vascular Center ("YNHHVC"), including a satellite primary angioplasty program (the "Primary Angioplasty Program"), which was

approved by OHCA on a permanent basis in July of 2008, after completion of a three-year demonstration project (Docket No. 03/08-30148; CON Application, pp. 14-15).

Greenwich has all of the infrastructure and staff in place to perform primary or "emergency" angioplasty procedures and has been performing these procedures on critically ill patients since 2005. Primary angioplasty patients are typically more difficult to care for and present greater risks than elective angioplasty patients given the emergent nature of their conditions. Greenwich Hospital has provided these patients with superior care for almost eight years, even without the availability of onsite cardiac surgical backup. Applicants now request permission to provide these same types of procedures (utilizing the staff and equipment already in place) on an elective basis, in more routine less emergent cases (Proposed Final Decision, FF 16; CON Application, pp. 14-15 & 40; Completeness Question Responses, p. 599; Testimony of Christopher Howes, M.D., p. 671; July 16, 2012 Public Hearing Transcript, pp. 19, 59, 70, 84 & 88).

Despite the fact that Greenwich does not have an Elective Angioplasty Program, patients continue to present at the Hospital in need of these critical healthcare services (CON Application, pp. 19 & 32; Completeness Question Responses, p. 589). The patients who present to Greenwich Hospital and require elective angioplasty are for the most part transferred to YNHH, where they received these services from the exact same physicians who would have performed the procedures at Greenwich if elective angioplasty was authorized. Greenwich service area resident have the right to receive cardiac care from the provider of their choosing, and they consistently choose Greenwich Hospital and the YNHHVC. This proposal would simply allow them to obtain this care within their community.

Applicants first applied for a full-service cardiac program at Greenwich Hospital, including elective angioplasty, in 2000 (Docket No. 00-520) (Public Hearing Transcript, pp. 91 & 138). The 2000 CON request was denied, largely based on a lack of "clear public need" for the proposal (Final Decision, Docket No. 00-520; Public Hearing Transcript, p. 91). However in the ensuing years, OHCA approved full-service cardiac programs, including elective angioplasty, at numerous hospitals throughout western Connecticut.[1] This included approval of a full-service cardiac program at The Stamford Hospital ("TSH") in 2006, located just six miles from Greenwich Hospital and within the service area where OHCA found there to be no need for these exact services (Rebuttal Testimony of Marna Borgstrom, p. 720; Public Hearing Transcript, p. 139). TSH was granted a CON at a time when angioplasty volumes were in decline – the primary reason why the Hearing Officer proposes to deny the current CON Application for an Elective Angioplasty Program at Greenwich (Proposed Final Decision, FF 37; Borgstrom Rebuttal Testimony, pp. 699-701). Now the existence of TSH's program (as well as a White Plains Hospital program established in 2010) is being used to support OHCA's position that there is no need for this proposal and that it will result in the unnecessary duplication of services, just as it was in 2010 when Applicants' second request to establish an Elective Angioplasty Program at Greenwich was denied (Docket No. 08-31210-CON) (Proposed Final Decision, FF 10, 13, 14, 15, 37, 40, 43, 44, 45, 53, 54, 58 & 60).

The Hearing Officer proposes to deny Applicants' most recent request for a CON primarily on the grounds that there is no "clear public need" for an Elective Angioplasty Program at Greenwich (Proposed Final Decision, FF 53, 54 & 58). We respectfully disagree

[1] Danbury Hospital, Docket No. 03-30143; Waterbury Hospital, St. Mary's Hospital & John Dempsey Hospital, Docket No. 03-30167; The Stamford Hospital, Docket No. 04-30374.

with the Hearing Officer's analysis of "clear public need," which overlooks such crucial factors as existing patient preference and physician referral patterns; credible evidence that area physicians will bring additional volume to Greenwich; the lack of overlap in the cardiac service areas of Greenwich and other elective angioplasty providers; and the clinical need for elective angioplasty services in Greenwich to ensure the quality of cardiac care and the safety of patients in the region, all of which is documented throughout Applicants' CON submissions and hearing testimony.

In addition, the Hearing Officer relies too heavily on the "clear public need" criteria set forth in Section 19a-639(a)(3) of the Connecticut General Statutes, to the exclusion of the other, equally relevant CON guidelines and principles that must be considered by the agency. Applicants respectfully disagree with a number of findings made by the Hearing Officer with respect to the remaining Section 19a-639(a) decision criteria (Proposed Final Decision, FF 53, 55, 56, 59 & 60). All of the Section 19a-639(a) criteria were thoroughly satisfied and the totality of the evidence supports approval of this CON Application. Applicants have shown not only that there is a clear public need for an Elective Angioplasty Program at Greenwich, but that such a program would improve the quality, accessibility and cost-effectiveness of healthcare in the region. It honors a patient's right to choose and it will not adversely impact existing providers of elective angioplasty services. Moreover, this program will help to strengthen Greenwich Hospital financially, making it good public policy and consistent with OHCA's statutory mission to ensure, among other things, the financial strength of the healthcare system statewide. For these reasons, Applicants' proposal should be approved.

II. Exceptions

Applicants take exception with numerous Findings of Fact contained within the Proposed Final Decision. These Findings of Fact center mostly around the Section 19a-639(a) decision criteria and are set forth below. Arguments in support of these exceptions are presented in Section III of this brief.

FF 12: *In 2010, OHCA issued a decision denying Greenwich Hospital's first proposal to establish and operate elective angioplasty program without on-site open heart surgery. The proposal was denied because the projected volume included New York patients, there was insufficient evidence to support the projected volumes, and there was an existing provider of elective PCI and full service cardiac program in the service area (Stamford Hospital).*

FF 14: *Stamford Hospital and White Plains Hospital are currently providing elective angioplasty procedures in Greenwich Hospital's claimed PSA.*

FF 36: *Although Applicants provided letters of support from the two (2) physicians from the state of New York who state they would offer elective PCI at Greenwich Hospital if that were an option, the projected new PCI volumes are speculative and appear to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital.*

FF 40: *Stamford Hospital's PCI discharges have declined 15% between FY 2009-2011 and, therefore, Stamford Hospital has capacity to serve the needs of the community.*

FF 42: *In light of the historical elective PCI transfers from Greenwich Hospital to existing providers and the declining statewide PCI volumes, OHCA finds that the Applicants have not provided sufficient evidence to support its projected PCI utilizations.*

FF 43: *A letter from White Plains Hospital states that its elective PCI program presently has capacity to service the needs of the community and they are not aware of any backlog of cases in their service area that would indicate patients are not receiving timely care.*

FF 44: *White Plains Hospital is located approximately ten (10) miles west of Greenwich Hospital. If this application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other.*

FF 45: *The map illustrates the location of Greenwich Hospital and the existing providers such as Stamford Hospital and White Plains Hospital, in Greenwich Hospital's proposed service area and their approximate distance to Greenwich Hospital.*

FF 53: *OHCA is currently in the process of establishing the statewide facilities and services plan ("the plan"). The plan was not a published document at the time of this*

proposal was filed; however, even if the plan is published by the time this final decision is issued, it has no bearing on the outcome of this matter, as the Applicants have not sufficient demonstrated a clear public need for this proposal.

FF 54: *There is insufficient evidence to establish that there is a clear public need for the Applicants' proposal.*

FF 55: *The Applicants have not satisfactorily demonstrated how this proposal will impact the financial strength of the health care system in this state.*

FF 56: *The Applicants have failed to satisfactorily demonstrate that their proposal would improve the accessibility of health care delivery in the region but they have satisfactorily demonstrated a potential improvement in quality and cost effectiveness.*

FF 58: *The Applicants have satisfactorily identified the population to be served by their proposal but have failed to satisfactorily demonstrate that this population has a need as proposed.*

FF 59: *The historical elective PCI discharges in the service area do not support this proposal.*

FF 60: *The Applicants have failed to satisfactorily demonstrate that their proposal would not result in any unnecessary duplication of existing elective PCI services in the area.*

Applicants also take exception with how these Findings of Fact are interpreted in the Discussion section of the Proposed Final Decision.

In addition, there are certain Findings of Fact that Applicants believe support their proposal and were not given due weight by the Hearing Officer. These Findings of Fact are discussed in the Argument section below.

III. Argument

A. Consideration of the Section 19a-639(a) Guidelines & Principles

Sections 19a-639(a)(1) through 19a-639(a)(9) of the Connecticut General Statutes set forth the guidelines and principles that must be used by OHCA in evaluating CON proposals. Section 19a-639(a) states that "[i]n any deliberations involving a certificate of need application filed pursuant to section 19a-638, the office shall take into consideration and make written

findings concerning" the guidelines and principles contained within the statute.[2] These guidelines and principles are more commonly known as the "statutory decision criteria" for CON applications. Although OHCA is required to consider and make written findings concerning each of the guidelines and principles set forth in Section 19a-639(a), the statute does not contain an express requirement that an applicant demonstrate a specific level of compliance with every stated criteria. Nor does the statute authorize OHCA to give substantial weight to one of the criteria to the exclusion of all others or to fail to make findings with respect to one of the criteria because another has not been met to the agency's satisfaction. If OHCA makes findings on the statutory decision criteria consistent with the evidence in the record, and considers all of these findings together, the CON Application should be approved.

[2] Conn. Gen. Stat. § 19a-639(a) provides in its entirety: In any deliberations involving a certificate of need application filed pursuant to section 19a-638, the office shall take into consideration and make written findings concerning each of the following guidelines and principles: (1) Whether the proposed project is consistent with any applicable policies and standards adopted in regulations by the office; (2) The relationship of the proposed project to the state-wide health care facilities and services plan; (3) Whether there is a clear public need for the health care facility or services proposed by the applicant; (4) Whether the applicant has satisfactorily demonstrated how the proposal will impact the financial strength of the health care system in the state; (5) Whether the applicant has satisfactorily demonstrated how the proposal will improve quality, accessibility and cost effectiveness of health care delivery in the region; (6) The applicant's past and proposed provision of health care services to relevant patient populations and payer mix; (7) Whether the applicant has satisfactorily identified the population to be served by the proposed project and satisfactorily demonstrated that the identified population has a need for the proposed services; (8) The utilization of existing health care facilities and health care services in the service area of the applicant; and (9) Whether the applicant has satisfactorily demonstrated that the proposed project shall not result in an unnecessary duplication of existing or approved health care services or facilities.

i. Applicants' Demonstrated a Clear Public Need For This Proposal

In this case, the Hearing Officer made a number of factual findings in support of her conclusion that there is no clear public need for Applicants' proposal (Conn. Gen. Stat. §19a-639(a)(3)) (Proposed Final Decision, FF 42, 53, 54 & 58). Applicants take exception with these findings as set forth below:

- Applicants' Projections Are Supported By Evidence.

  In Finding of Fact 35, the Hearing Officer acknowledges that a percentage of the projected elective angioplasty volume at Greenwich Hospital will result from the addition of New York interventional cardiologists who do not practice at Greenwich currently, but have referral relationships with the medical staff and will utilize the Hospital for elective angioplasty if a program is approved (Howes Testimony, pp. 670-671 & 675-676). Although Applicants provided letters of support from two of these New York physicians, OHCA found that their projected PCI volumes were speculative and appear to represent a shift of elective PCI patients from one area provider to Greenwich (Proposed Final Decision, FF 36).

  As a threshold matter, projections by their very nature are speculative. Applicants provided letters of support from named physicians, which included firm commitments to perform an identifiable number of elective angioplasties at Greenwich Hospital each year (Howes Testimony, pp. 675-676). OHCA has historically allowed providers to establish projected volume through letters from physicians indicating that they will refer/perform a certain number of procedures if a CON is approved. For example, this is common in CON applications for the acquisition of major imaging equipment or the addition of owners to an

ambulatory surgery center. In fact, OHCA will often accept projected volume attributable to anonymous physicians because in this competitive healthcare environment, many physicians are hesitant to publically support one provider when they work with many. Moreover, Applicants explained to the Hearing Officer that physicians typically will not make formal commitments (beyond a letter of support) unless and until a CON for a new service is approved (Public Hearing Transcript, p. 117).

In addition, while the Hearing Officer calls Applicants' letter evidence "speculative," a letter offered by Susan Fox, Executive Vice President of White Plains Hospital ("White Plains"), is taken as entirely true and accurate (Proposed Final Decision, FF 13-15, 36 & 43; Testimony of Sharon Kiely, M.D., pp. 49-50).[3] This letter caused the Hearing Officer to conclude that White Plains has the "capacity to serve the needs of the community," without any critical analysis of the unsubstantiated claims made by Ms. Fox (Proposed Final Decision, FF 43).

Moreover, the evidence in the record does not support the Hearing Officer's conclusion that the projected volume from New York interventional cardiologists "appears to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital (emphasis added)" (Proposed Final Decision, FF 36). Neither TSH nor White Plains (via TSH) introduced any evidence that the cases promised by Drs. Newman and Hjemdahi-Monsen in their letters of support for this proposal were cases that would otherwise be performed at their facilities

[3] This letter was offered through Intervenor TSH. White Plains did not petition for status and Ms. Fox did not attend the hearing and testify.

(Howes Testimony, pp. 675-676). In fact, these are cases that we know to be performed for the most part at large New York City hospitals, including New York Presbyterian (Completeness Question Responses, p. 591; Public Hearing Transcript, pp. 57-58, 64-65). Moreover, the letters from Drs. Newman and Hjemdahi-Monsen state specifically that they would bring procedures to Greenwich that they currently treat at hospitals outside of Connecticut (Howes Testimony, pp. 675-676). Accordingly, there is no proof that this proposal will result in a shift of volume from a smaller Connecticut provider such as TSH or that it would impact TSH (or White Plains) in any way.

- Excess Capacity At Existing Providers Is Unsubstantiated and Irrelevant.

We respectfully disagree with the Hearing Officer's conclusion that TSH and White Plains have capacity to serve the elective angioplasty needs of the community (Proposed Final Decision, FF 40 & 43). These conclusions were drawn based upon a recent decline in TSH's inpatient PCI volume and the above-referenced letter from Susan Fox attesting to White Plains' capacity. No further analysis has been done regarding if and how these providers could and would meet the elective angioplasty needs of the Greenwich community. It is worth nothing that this decline in TSH's inpatient PCI volume may be attributable to the migration of more PCI cases to an outpatient setting.

The reality is there is minimal overlap between the service areas of TSH and Greenwich for cardiac services. The Hearing Officer acknowledges this in Finding of Fact 11, wherein she found that 80% of Greenwich's cardiovascular patients come from Greenwich, Port Chester and Rye, while only 4.6% of TSH's

cardiovascular patients originate from these towns. Conversely, 88% of TSH's cardiovascular patients come from Stamford and Darien, while only 7% of Greenwich's cardiovascular patients originate from these towns (Proposed Final Decision, FF 11; Howes Testimony, pp. 669-670).

OHCA cannot force a change in patient preference and physician referral patterns for cardiac services (Howes Rebuttal Testimony, pp. 668-671). The TSH and White Plains programs have been operational for years and yet patients continue to present at Greenwich Hospital in need of elective angioplasty services (CON Application, pp. 19 & 32; Completeness Question Responses, p. 589; Howes Rebuttal Testimony, pp. 762-763). Thus, even if there is excess capacity at TSH and/or White Plains, which has not been established as fact, this should not be considered in evaluating the needs of patients who choose Greenwich over either of these hospitals and who, if no program is available in Greenwich, will travel as far as New York City for their cardiac care (Howes Testimony, pp. 657-676; Public Hearing Transcript, pp. 57-58 & 64-65).

- Existence of Multiple Providers In Area Does Not Mean There Is No Need.

The Hearing Officer's determination that there is no clear public need for this proposal is based, in part, on the fact that if Greenwich Hospital offered elective angioplasty there would be three elective angioplasty providers within 16 miles of each other (Proposed Final Decision, FF 44 & 45). However, there are other areas in the state where three or more elective angioplasty providers operate within a similar radius. OHCA has approved full-service cardiac programs at John Dempsey Hospital, Hartford Hospital and St. Francis Hospital and Medical

Center, which are located less than 10 miles from each other (see Exhibit A attached). In addition, OHCA has approved full-service cardiac programs at YNHH (and the former Hospital for St. Raphael – now YNHH), Bridgeport Hospital and St. Vincent's Medical Center. The distance between the farthest of these locations is just over 20 miles (see Exhibit B attached). Note also that in these areas of the state, travel within a 10 to 20 mile radius is considerably easier and faster than traveling within the 16 mile radius between Stamford and White Plains, which experiences significant traffic and delays at various times throughout the day. Thus, the fact that approval of Applicants' proposal would result in three elective angioplasty providers being located within a 16 mile radius (one of which is a New York provider whose revenues do not support the financial strength of the Connecticut healthcare system) should not be determinative of a lack of clear public need.

- Flat PCI Volumes Do Not Mean There Is No Clear Public Need For Program.

The Hearing Officer found that the flat to declining elective angioplasty volumes in the state and proposed service area do not support establishment of an additional elective angioplasty program (Proposed Final Decision, FF 59). This was an argument raised by TSH in opposition to Applicants' proposal. However, the Hearing Officer has overlooked the equally important fact that when TSH sought and received approval for its full-service cardiac program, which includes elective angioplasty, PCI volumes were also declining statewide and in the service area (Borgstrom Rebuttal Testimony, pp. 699-701). If this factor were determinative of need, then TSH's CON application should have been denied.

But it was not denied, rather that CON was approved based on factors such as improved accessibility, continuity of care and improved quality of cardiac services (Borgstrom Rebuttal Testimony, pp. 701 & 732-733). These are the same factors that were raised by Applicants in support of a program at Greenwich. They speak less of a numerical demand for services and more to a clinical demand for care. That demand exists in terms of a patient's right to receive critical cardiac healthcare services at the provider of his/her choice (Howes Rebuttal Testimony, pp. 668-671); in the physical and mental stress that results for patients and families when they are transferred out of Greenwich Hospital for elective angioplasty (Proposed Final Decision, FF 20; CON Application, pp. 19-20; Completeness Question Responses, pp. 589 & 599); and in the physical risks and excess costs associated with having duplicate cardiac procedures, all of which were documented throughout Applicants CON submissions and hearing testimony (Proposed Final Decision, FF 27 & 47; CON Application, p. 40; Public Hearing Transcript, pp. 30-31, 66-67 & 76). Applicants therefore request that in the interest of fairness and consistency in decision making, OHCA reconsider its findings in this regard.

Based on the foregoing and all of the evidence in the record, Applicants have established a clear public need for the proposed Elective Angioplasty Program at Greenwich Hospital. Applicants respectfully request that Findings of Fact 12, 14, 36, 40, 42-45, 53, 54 58 and 59, and any discussion arising from those Findings of Fact, be revised accordingly.

ii. Applicants Met The Remaining Applicable Statutory Decision Criteria

Applicants also take exception with a number of the Findings of Fact relative to the remaining Section 19a-639(a) decision criteria, as set forth below.

a. Financial Strength of the Healthcare System

The Hearing Officer found that Applicants failed to satisfactorily demonstrate how the proposal will impact the financial strength of the healthcare system in this state (Conn. Gen. Stat. §19a-639(a)(4)) (Proposed Final Decision, FF 55). However, Applicants have introduced sufficient evidence to demonstrate that the proposed elective angioplasty program will have a positive financial impact on Greenwich Hospital and, as such, on the healthcare system as a whole.

As a threshold matter, this statutory guideline is relatively new. It was introduced in 2010, when CON laws were completely overhauled by the legislature. In 2012, OHCA attempted to revise this guideline out of Section 19a-639(a). The rationale given by OHCA staff was that the agency "does not have the data to properly evaluate the financial impact of the CON proposal on the state's healthcare system" and "CON applicants struggle to produce evidence demonstrating the impact of the proposal on the state's health care system" (Public Health Committee Testimony, dated March 7, 2012, attached as Exhibit C). Historically, OHCA has allowed providers to demonstrate compliance with this guideline by introducing evidence regarding the positive financial impact of a proposal on a healthcare facility as a result of cost-savings, increased revenue and the like (see i.e. Docket Nos. 11-31736-CON & 12-31750-CON). Anything that improves a hospital or healthcare facility's financial position and/or streamlines

care appears to impact favorable on the financial strength of the institution and the healthcare system as a whole.[4]

Applicants offered evidence to support a finding that the proposed Elective Angioplasty Program will benefit both Greenwich Hospital and its patients financially and, therefore, impact favorably on the financial strength of the healthcare system. This includes evidence, referenced by OHCA in the Proposed Final Decision, that the existence of elective angioplasty at Greenwich would reduce the need for patient transfers and duplicate procedures, which in turn reduces healthcare costs (Proposed Final Decision, FF 47; CON Application, p. 40; Frank Corvino's Testimony, p. 681-682; Public Hearing Transcript, pp. 30-31, 67 & 76, 79-80). In addition, Applicants submitted evidence that the inclusion of elective angioplasty cases would reduce some of the financial burden attributable to the maintenance of staff and infrastructure for primary angioplasty cases (Proposed Final Decision, FF 50 & 51; CON Application pp. 20 & 40-41; Completeness Question Responses, pp. 598-599). Given the broad manner in which this statutory provision has been interpreted by OHCA, a finding should have been made in favor of Applicants. Applicants respectfully request that Finding of Fact 55, and any discussion arising from that Finding of Fact, be revised accordingly.

[4] Note also that there are a number of 2012 CON approvals that make no mention of this particular decision criteria, therefore, failure to meet it should not, in and of itself, be used as a basis for denial (i.e. Docket Nos. 12-1759-CON; 11-31734-CON; and 11-31730-CON).

b. Accessibility, Quality and Cost-Effectiveness of Healthcare

The Hearing Officer correctly found that Applicants demonstrated a potential improvement in quality and cost-effectiveness with the proposed Elective Angioplasty Program, but erred in finding no evidence that the proposal would improve the accessibility of healthcare delivery in the region (Proposed Final Decision, FF 56). Applicants take exception with this finding for several reasons.

First, any time a hospital adds a healthcare service it enhances access to care. Elective angioplasty is not available at Greenwich Hospital despite the fact that many patients attempt to access this service at the Hospital each year. These patients are denied access and as result, experience considerable stress and incur additional costs associated with the receipt elective angioplasty services elsewhere (CON Application, pp. 19-20, 32; Completeness Question Responses, pp. 589 & 599; Public Hearing Transcript, pp. 19, 66-67, 86, 119-120). Drs. Newman and Hjemdahi-Monsen indicated in their letters of support for this proposal that their patients desire local access to elective angioplasty services, access that is not currently available (Howes Testimony, pp. 675-676). If Greenwich had an elective angioplasty program, these individuals would have access to this critical healthcare service at the hospital of their choosing in their community, where care can be provided appropriately and safely – in this case, a hospital affiliated one of the nation's leading cardiac providers (Public Hearing Transcript, pp. 24, 92). This is improved accessibility of healthcare.

Moreover, while there are no current regulations that define "accessibility" for CON purposes, the former OHCA regulations define this term to include

"accessibility to medically underserved individuals who often experience the greatest difficult in obtaining equitable access to health services" (Regulations of Connecticut State Agencies, §19a-643-71). Increasing access to a hospital-based service inevitably increases access for the underserved, including uninsured individuals, as well as Medicare and Medicaid patients. As the payer mix projections in Applicants' CON submissions show, the Elective Angioplasty Program would be comprised of 45.9% Medicare/Medicaid patients and 5.4% uninsured patients (CON Application, p. 40).

c. Decline in Elective PCI Is Not Basis For Denial of CON

Section 19a-639(a)(8) of the General Statutes requires OHCA to consider and make findings regarding the "utilization of existing health care facilities and health care services" in the service area. In this regard, the Hearing Officer made findings with respect to the historic utilization of PCI services, which are set forth in Findings of Fact 38 through 42 and 55. Ultimately, the Hearing Officer found that Applicants had not provided sufficient evidence to support their projected PCI utilization and that historical elective PCI discharges in the service area do not support this proposal (Proposed Final Decision, FF 42 & 59). Applicants take exception with these findings.

Specifically, Applicants take exception with the Hearing Officer's conclusion that declining PCI volumes indicate that there is no clear public need for an Elective Angioplasty Program at Greenwich. As previously mentioned, Applicants have projected volume that is supported by evidence in the record. Applicants' volume projections are based on historical primary angioplasty

volume and elective angioplasty transfers, as well as an informal survey of referring physicians and letters from New York physicians indicating that they would perform cases at Greenwich if this CON is approved. These letters should be afforded the same weight, and considered equally as credible, as the letter from Susan Fox of White Plains, which the Hearing Officer cites throughout her decision (Proposed Final Decision, FF 13, 15 & 43).

Moreover, although PCI volume is declining, it was also declining leading up to 2006, when TSH was given permission to establish a full-service cardiac program including elective angioplasty (Borgstrom Rebuttal Testimony, pp. 699-701). Even with declining PCI volume and an elective angioplasty program at TSH, patients continue to present at Greenwich Hospital in consistent numbers each year in need of these services (CON Application, p. 19-22 & 32; Completeness Question Responses, p. 589; Public Hearing Transcript, p. 27). There is clearly a need for elective angioplasty in the Greenwich area among this patient population, which is not being met by area providers. In evaluating this proposal, OHCA should consider not only this need, but those same factors it considered in evaluating TSH's application – namely, whether the program would improve accessibility, quality and continuity of care (Borgstrom Rebuttal Testimony, pp. 701 & 732-733).

In addition, as mentioned above, the Hearing Officer's finding that TSH has the capacity to meet all community need for elective angioplasty is not supported by evidence in the record (Proposed Final Decision, FF 40). For these reasons, Applicants ask OHCA to find that utilization of elective PCI services – in

particular, the continued attempts by area residents to access these services at Greenwich Hospital – supports approval of this CON request. Finding of Fact 59, and any discussion related thereto, should be revised accordingly.

d. This Proposal Will Not Result in an Unnecessary Duplication of Services

OHCA is required by Section 19a-639(a)(9) to make findings with respect to whether a proposal results in the unnecessary duplication of existing healthcare services. Applicants take exception with the Hearing Officer's finding that they failed to show that unnecessary duplication of services will not result from the addition of elective angioplasty at Greenwich Hospital (Proposed Final Decision, FF 60). As previously mentioned, the Hearing Officer concedes in Finding of Fact 11 that there is virtually no overlap for cardiovascular services between Greenwich and TSH. The disparity in patient towns of origin is significant (Howes Testimony, pp. 668-671; Howes Rebuttal Testimony, pp. 762-763). If Greenwich and TSH are not providing cardiac services to the same patient populations, then the addition of an Elective Angioplasty Program at Greenwich will not result in the unnecessary duplication of services. Moreover, there is no evidence in the record that definitively establishes a service area for elective angioplasty at White Plains, therefore the Hearing Officer cannot conclude that a Greenwich program would duplicate services available at this New York hospital. As previously noted, the geographic proximity of programs is not sufficient evidence that services are duplicative and unnecessary at any given location. Connecticut has thriving cardiac programs at many hospitals in close proximity to each other (i.e. John Dempsey Hospital/Hartford Hospital/St. Francis Hospital &

Medical Center; Yale-New Haven Hospital/Bridgeport Hospital/St. Vincent's Medical Center).

In addition, there is evidence in the record that this proposal would in fact avoid the unnecessary duplication of services. As OHCA acknowledged in the Proposed Final Decision, payers and patients incur unnecessary costs of approximately $425,000 per year as a result of the need to be transferred from Greenwich Hospital to another provider for elective angioplasty (Proposed Final Decision, FF 47; CON Application, p. 40; Corvino Testimony, pp. 681-682; Public Hearing Transcript, pp. 30-31, 66-67 & 76). If Greenwich was authorized to provide this service, these duplicate procedures and costs would be avoided. For these reasons, OHCA should find that Applicants have adduced evidence that this proposal will not result in the unnecessary duplication of services. Finding of Fact 60, and any discussion related thereto, should be revised accordingly.

iii. OHCA's Decision Relied Too Heavily On The Clear Public Need Criteria

The Hearing Officer based her decision to deny Applicants' request for permission to establish an Elective Angioplasty Program at Greenwich almost entirely on her conclusion that there is no clear public need for the proposal. Even assuming this is the case, which Applicants dispute, the Hearing Officer should not have relied on one of the Section 19a-639(a) criteria to the exclusion of all others. As previously mentioned, Section 19a-639(a) requires OHCA to make written finding on each of the guidelines and principles set forth in the statute, but it does not require a specific level of compliance with every one of these criteria. Nor does it allow the agency to make decisions based on one of the criteria only or to fail to make findings on certain criteria. OHCA is obligated to review CON proposals based upon all of the factors that the

legislature deemed relevant and to base its decisions on the totality of evidence. Applicants have shown that there is a clear public need for an Elective Angioplasty Program at Greenwich and there is ample additional evidence in the record to support approval of this proposal. To deny Applicants' CON request would be clearly erroneous in view of the reliable, probative and substantial evidence on the whole record.

The Hearing Officer acknowledges that this proposal will potentially improve the quality and cost-effectiveness of cardiac care in the Greenwich area (Proposed Final Decision, FF 56). Enhanced quality of care is probably the most significant benefit of this CON proposal. The Greenwich Hospital cardiac program is part of the YNHHVC – an integrated model whereby the interventional cardiologists who perform angioplasty at Greenwich also perform cases at YNHH, the highest volume angioplasty provider with the most advanced cardiac program in the state (Proposed Final Decision, FF 3, 5 & 28; Borgstrom Testimony, p.. 672). The Hearing Officer does not give adequate weight to these key facts in recommending that the CON for an Elective Angioplasty Program at Greenwich be denied. Yet the practical effect of denial is to deprive Greenwich area residents in need of elective angioplasty of local access to the resources and professional expertise of the YNHHVC.

Moreover, both the quality and cost-effectiveness of care are enhanced by having an Elective Angioplasty Program at Greenwich, which avoids the need for patient transfers and duplicate procedures (Proposed Final Decision, FF 56). As Dr. Henry Cabin, Clinical Chief of Cardiology at the Yale University School of Medicine and Medical Director of the YNHHVC, testified at the public hearing on this matter, elective angioplasty would be performed at Greenwich Hospital by the exact same physicians who perform the procedure at YNHH, and it can be done as safely at Greenwich as at YNHH (Public Hearing Transcript, p. 60). It therefore

makes little sense, either from a cost or patient safety perspective, to deny patients local access to these services (Public Hearing Transcript, p. 60).[5]

As discussed above, the evidence demonstrates that the Elective Angioplasty Program will also improve the accessibility of cardiac care in the region. Increased patient access is inextricably linked with issues of quality and cost-effectiveness of care. Providing patients with local access to care is not just a convenience issue. It will truly enhance the quality of care for those patients who will continue to present at Greenwich in need of elective angioplasty, and who will insist that these services be provided by the highly qualified and experienced physicians and staff of the YNHHVC. As noted above, it makes little sense to allow the Greenwich-based YNHHVC physicians to perform elective angioplasty on Greenwich patients in New Haven, but not in their own community.

Increased access will also have a positive impact on the costs associated with obtaining and providing angioplasty services. OHCA cannot ignore the fact that when patients need to be transferred from Greenwich to another facility for elective angioplasty, which could safely and competently be performed at Greenwich, this costs patients, payers and the system as a whole more money. In addition, the Primary Angioplasty Program at Greenwich is a necessary but extremely costly program to operate on a continuous basis. The addition of an Elective Angioplasty Program at Greenwich, with more procedure volume over which to spread these fixed costs, will make the provision of angioplasty services more cost-effective for the Hospital. All of this will in turn have a positive financial impact on Greenwich Hospital and the state's healthcare system.

---

[5] The Hearing Officer does not appear to be concerned, from a quality perspective, with the lack of onsite surgical backup at Greenwich. In fact, she suggests that White Plains, which has an elective angioplasty program without onsite surgery, is an appropriate alternative provider to meet the demand for these services in the Greenwich area.

Moreover, the Elective Angioplasty Program at Greenwich will not result in the unnecessary duplication of services because, as the evidence in the record clearly shows, there is minimal overlap in the cardiovascular patient populations at Greenwich and TSH. While it is true that PCI volume is in moderate decline, the present situation is no different that the situation that existed in 2006, when OHCA approved TSH's request for a CON to establish a full-service cardiac program. OHCA approved that application based upon factors including improved accessibility, quality and continuity of care – these are the same factors that support approval of Applicants' request. Applicants ask OHCA to reconsider and acknowledge the substantial benefits to patients, payers and the healthcare system that will result from a Final Decision approving this proposal.

B. Approval of This CON Is Sound Public Policy & Consistent With OHCA's Mission

Approving Applicants' request to establish an Elective Angioplasty Program at Greenwich Hospital is consistent with OHCA's statutory mission to promote the availability of cost-effective care and to ensure the financial strength of the healthcare delivery system in this state (Conn. Gen. Stat, Section 19a-637). The Hearing Officer's suggestion that White Plain has capacity to handle patients (presumably including Connecticut residents) in need of elective angioplasty is contrary to OHCA's mission in that it encourages the outmigration to New York of healthcare services and revenues. This is particularly troubling at a time when Connecticut hospitals are experiencing rising costs and declining revenue, all while trying to maintain their ability to provide core hospital services to their communities.

In addition, denial of this CON Application limits patient choice for critical health care services. Greenwich area residents have spoken and their preference is to obtain cardiac services through Greenwich Hospital and the YNHHVC. Given the nature of the services involved,

patients should not be forced to obtain care at an alternate provider. Moreover, patients should not be placed in a situation where they are expected to travel unreasonably long distances to obtain elective angioplasty services at the provider of their choosing.

IV. Requested Relief

In light of the foregoing, Applicants respectfully request the following relief:

- That OHCA revise the various Findings of Fact listed in the Exceptions section above, and any language within the Discussion section of the Proposed Final Decision based on the erroneous factual findings.

- That OHCA determine, specifically, that there is a clear public need for this proposal, that it will enhance the accessibility, quality and cost-effectiveness of healthcare and improve the financial strength of the healthcare delivery system, and that it will not result in the unnecessary duplication of services.

- That OHCA issue a Final Decision approving Applicants' request for a CON to establish an Elective Angioplasty Program at Greenwich Hospital.

In the alternative, Applicants ask that OHCA consider granting provisional approval of the proposed Elective Angioplasty Program under whatever terms the agency and Applicants agree are necessary to measure the need for this program and its impact on the healthcare delivery system. Any provisional approval might be similar to the approval given for the Primary Angioplasty Program at Greenwich (see Docket No. 03/08-30148), via Agreed Settlement, which included initial approval for a period of three years in order to validate that Applicants' projections (and minimum ACC/AHA/SCAI Guidelines volumes) had been

achieved. Applicants would agree to submit volume data to OHCA so that a similar analysis can be undertaken regarding the Elective Angioplasty Program. OHCA could also collect and analyze outcome and other relevant data to determine whether the proposal has met the programmatic requirements of the ACC/AHA/SCAI Guidelines. The submission of data would allow the agency to evaluate the proposed Elective Angioplasty Program at Greenwich Hospital and determine whether it should be given permanent status. Applicants are confident that all projections will be met and all measure will be achieved, proving that the proposal is necessary and fulfills the guidelines and principles set forth in Section 19a-639(a).

V. Conclusion

For all of the foregoing reasons, Applicants urges the Deputy Commissioner to revise the Findings of Fact and issue a Final Decision approving the proposed Elective Angioplasty Program at Greenwich Hospital. In the alternative, Applicants welcome a conversation with OHCA staff regarding the possibility of a provisional approval that will allow the agency to validate the need for the proposal and its impact on the accessibility, quality and cost-effectiveness of healthcare – cardiovascular services in particular – in the Greenwich Area. This program is critical to Greenwich Hospital patients and the time has come for it to be approved.

EXHIBIT C

STATE OF CONNECTICUT

DEPARTMENT OF PUBLIC HEALTH

TESTIMONY PRESENTED BEFORE THE COMMITTEE ON PUBLIC HEALTH
March 7, 2012

Kimberly Martone, Director of Operations, Office of Health Care Access, 860-418-7029

House Bill – Bill 5321 - An Act Concerning the Office of Health Care Access and the Certificate of Need Process

---

The Department of Public Health would like to provide the following information in favor of House Bill 5321. We thank the Committee for choosing to take up the Department's proposal. Below is information on the provisions contained in the bill.

Section 1

The Department's Office of Health Care Access (OHCA) is proposing to replace the phrase "how the proposal will impact the financial strength of the health care system in the state" within §19a-639(a)(4) of the General Statutes with "that the proposal is financially feasible for the applicant." In evaluating Certificate of Need (CON) applications, OHCA can verify and measure the effect a CON proposal has on the applicant by reviewing the financial status of the applicant; however, OHCA does not have the data to properly evaluate the financial impact of the CON proposal on the state's health care system. Moreover, CON applicants struggle to produce evidence demonstrating the impact of the proposal on the state's health care system. It is also worth noting that the majority of the CON proposals received and reviewed by OHCA over the past year involve the acquisition of imaging equipment, the establishment of substance abuse/mental health services, and transfer of ownership of a health care facility. Such proposals do not lend themselves to an easy demonstration of their impact on the financial strength of the health care system statewide.

Prior to the changes implemented under Public Act 10-179, OHCA evaluated the financial feasibility of the proposal rather than looking at the impact on the entire state. This financial feasibility evaluation is a more realistic guideline and most applicants are able to produce financial documents and analysis demonstrating that a particular proposal is financially feasible.

Section 2

OHCA proposes to amend the proposed language in this section by deleting "after the date the office closes the public hearing" in line 49 and substituting "following the close of the hearing record." This is to clarify the closing of the hearing record as opposed to the actual public hearing. At the public hearing, OHCA often orders additional evidence be provided after the public hearing has ended. Once the information is received by OHCA, it then *closes* the hearing record through a letter. Therefore, the proposed language clarifies when the hearing record is legally closed as well as the day on which the 60 day review period for OHCA to render a decision begins.

Certificate of Need Application

Proposed Final Decision

Applicant:	**Greenwich Hospital and Yale-New Haven Hospital**
Docket Number:	**12-31748-CON**
Project Title:	**Establish and Operate an Elective Angioplasty Program without Onsite Surgical Backup at Greenwich Hospital**

Project Description: Greenwich Hospital and Yale-New Haven Hospital propose to establish and operate an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure.

Nature of Proceedings: On June 20, 2012, the Office of Health Care Access ("OHCA") received the Certificate of Need ("CON") application from Greenwich Hospital and Yale-New Haven Hospital to establish an elective angioplasty program without onsite backup at Greenwich Hospital, with no associated capital expenditure. The Applicants are health care facilities or institutions as defined by Section 19a-630 of the Connecticut General Statutes ("General Statutes").

Pursuant to General Statutes § 19a-638, a public hearing regarding the CON application was held on July 17, 2012. On July 2, 2012, the Applicant was notified of the date, time, and place of the hearing. On July 3, 2012, a notice to the public announcing the hearing was published in *The Greenwich Times*. Attorney Joanne V. Yandow served as Hearing Officer. The hearing was conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the General Statutes) and General Statutes § 19a-638.

By petition dated July 12, 2012, The Stamford Hospital requested Party or, in the alternative, Intervenor status with full rights of cross-examination regarding the Applicants' CON application. The Hearing Officer denied the request of The Stamford Hospital for Party status and designated The Stamford Hospital as an Intervenor with limited rights of participation.

The Hearing Officer heard testimony from the Applicants' witnesses and the Intervenor's witnesses and, in rendering this decision, considered the entire record of the proceeding. The public hearing record was closed on September 6, 2012.

OHCA's authority to review and approve, modify, or deny the CON application is established by General Statutes § 19a-638. The provisions of this section, as well as the principles and guidelines set forth in General Statutes § 19a-639, were fully considered by OHCA in its review.

Findings of Fact

1. Greenwich Hospital is a not-for-profit 174-bed acute care hospital located at 5 Perryridge Road in Greenwich, Connecticut. Exhibit A, p. 573 (CON Application).

2. Yale-New Haven Hospital is a not-for-profit, acute care hospital located at 20 York Street, New Haven, Connecticut. Exhibit A, p. 575 (CON Application).

3. The Yale-New Haven Heart and Vascular Center provides elective and emergency ("primary") angioplasty at Yale-New Haven Hospital and has established satellite primary angioplasty programs at Greenwich Hospital and Lawrence & Memorial Hospital in New London, Connecticut. Exhibit H, pp. 629&632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale-New Haven Health System and CEO of Yale New Haven Hospital); OHCA CON Final Decision, DN: 03-30148.

4. Angioplasty is historically a procedure in which a balloon tipped catheter is advanced to an artery narrowed from the buildup of cholesterol-laden plaque, but has been expanded to include other devices that serve as adjuncts to the balloon catheter, such as stents. Percutaneous coronary intervention ("PCI") also refers to this broader group of technologies. PCI for patients that present on an emergency basis with ST-segment elevation MI or new onset left bundle branch block is referred to as a "primary" PCI. Other PCI procedures are referred to as "elective" PCI. *See*, OHCA CON Final Decision, DN: 08-31210.

5. As part of Yale-New Haven Heart and Vascular Center, Greenwich Hospital currently provides diagnostic cardiac services including echocardiography, nuclear cardiac imaging, stress testing, cardiac CT angiography, and diagnostic cardiac catheterization. Greenwich Hospital also provides PCI angioplasty services for patients that present on an emergency basis with artery blockage in the heart. Exhibit A, pp. 22-23 (CON Application).

6. The primary angioplasty program at Greenwich Hospital received permanent status approval from OHCA on July 25, 2008, after completion of a 3-year demonstration project. Exhibit A, p. 22 (CON Application); OHCA CON Final Decision, DN: 03-30148.

7. Elective angioplasty is the same procedure as primary angioplasty but is typically a scheduled procedure (within 72 hours) and is not an emergency. *See*, OHCA CON Final Decision, DN: 08-31210.

8. The Applicants are proposing to establish an elective angioplasty program at Greenwich Hospital without an on-site open heart surgery program. Exhibit A, p. 14 (CON Application).

9. The Applicants define the population to be served through this proposal as the residents of the towns that comprise 85% of Greenwich Hospital's inpatient volume. The Applicants claim that the proposed service area ("PSA") is as follows:

Table I: Greenwich Hospital's PSA for Elective PCI

State	Towns
Connecticut	Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston, Westport and Wilton
New York	Armonk, Bedford, Bedford Hills, Harrison, Hartsdale, Katonah, Larchmont, Mamaroneek, Mount Kisco, Mount Vernon, New Rochelle, Port Chester, Pound Ridge, Purchase, Rye Scarsdale, South Salem, West Harrison and White Plains

Exhibit A, p. 24 (CON Application).

10. The Stamford Hospital ("Stamford Hospital"), the Intervenor in this matter, performs cardiovascular services, including primary and elective PCIs. *See*, OHCA CON Final Decision, DN: 04-30374.

11. The Applicants claim that based on the 2011 inpatient cardiovascular discharge volume by patients' towns of origin for Stamford Hospital and Greenwich Hospital, cardiovascular patients at Greenwich Hospital are the low volume communities for Stamford Hospital. Specifically, the communities of Greenwich, Port Chester and Rye comprise 80% of Greenwich Hospital's cardiovascular patient population but only 4.6% of Stamford Hospital's cardiovascular patient population. Additionally, patients who live in the city of Stamford and the town of Darien comprise 88% of Stamford Hospital's cardiovascular patient volume but only comprise 7% of Greenwich Hospital's cardiovascular patients. Exhibit H, pp. 668-669 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

12. In 2010, OHCA issued a decision denying Greenwich Hospital's first proposal to establish and operate elective angioplasty program without on-site open heart surgery. The proposal was denied because the projected volume included New York patients, there was insufficient evidence to support the projected volumes, and there was an existing provider of elective PCI and full service cardiac program in the service area (Stamford Hospital). CON Final Decision 08-31210-CON.

13. In or about January 2012, White Plains Hospital in White Plains, New York began offering elective angioplasty service. . Exhibit I, p. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

14. Stamford Hospital and White Plains Hospital are currently providing elective angioplasty procedures in Greenwich Hospital's claimed PSA. Exhibit A, p. 28 (CON Application).

15. White Plains Hospital states it services most of the Westchester County towns identified by the Applicants as towns in Greenwich Hospital's PSA. Exhibit I, page, 49 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

16. The Applicants assert that Greenwich Hospital is already performing angioplasty on more acutely ill patients through its primary angioplasty program and the staff and physicians are well prepared to perform elective angioplasty for less acute patients. Exhibit A, p. 14 (CON Application).

17. The Medical Director of the cardiac services program at Greenwich Hospital is appointed by Yale University School of Medicine, Department of Cardiology and is a member of the Yale School of Medicine's interventional cardiology faculty. Exhibit A, p. 14 (CON Application).

18. The Applicants claim that the previous OHCA approval for the primary PCI demonstrated clear public need for emergency angioplasty services at Greenwich Hospital and that the current proposal expands upon that approval to demonstrate that the same population, from which Greenwich Hospital's primary angioplasty patients originate, also have a clear need for access to their provider of choice for high quality elective angioplasty services. Exhibit A, p. 15 (CON Application).

19. The Applicants claim that the clear public need for this proposal is supported by the following three key factors:

    a. Local access to elective angioplasty care at Greenwich Hospital is needed and appropriate;
    b. Greenwich Hospital must address the cost-effectiveness of angioplasty services; and
    c. The proposed program will improve the quality of elective angioplasty services provided to Greenwich Hospital's PSA patients.

    Exhibit A, p. 15 (CON Application).

20. The Applicants assert that significant stress and strain are placed on Greenwich Hospital patients and their families when they receive either a diagnostic catheterization or an emergency angioplasty and then must undergo an elective angioplasty at another facility. Exhibit H, p. 671 (prefiled testimony of Christopher Howes, MD, Chief of Cardiology and Medical Director of the primary angioplasty program at Greenwich Hospital).

21. In November 2011, the American College of Cardiology/American Heart Association/The Society for Cardiovascular Angiography and Interventions ("ACC/AHA/SCAI") updated their guidelines regarding PCI without on-site surgical backup. These guidelines are intended to assist healthcare providers in clinical decision making by describing a range of generally acceptable approaches to the diagnosis, management, and prevention of specific diseases or condition. Exhibit A, pp. 139-239 (CON Application).

22. The Applicants claim that an elective PCI program at Greenwich Hospital would fall within the ACC/AHA/SCAI updated guidelines. Exhibit H, pp. 635-636 (prefiled testimonoy of Henry Cabin, MD, Clinical Chief of Cardiology at Yale School of Medicine and Medical Director of Yale-New Haven Heart and Vascular Center).

23. The ACC/AHA/SCAI updated guidelines recommend, in part, that:
> elective PCI might be considered in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection.

Exhibit A, p. 164 (CON Application).

24. The ACC/AHA/SCAI guidelines also recommend, in part, that:
> [i]t is only appropriate to consider initiation of a PCI program without on-site backup if the program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

Exhibit A, p. 164 (CON Application).

25. It is found that although OHCA is not bound to the ACC/AHA/SCAI guidelines, these guidelines are instructive. *See*, CON Final Decision 08-31210-CON.

26. The Applicants claim that angioplasty has become a fairly routine procedure, often performed in an outpatient setting at much lower risk than used to exist. Exhibit H, p. 632. (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale-New Haven Hospital).

27. The Applicants claim that this proposal eliminates the need for two invasive procedures, diagnostic cardiac catheterization and elective angioplasty, which adds hospital costs, clinical risk and expensive medical transportation costs. Exhibit H, pp.

632 and 671 (prefiled testimonies of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital, and Christopher Howes, MD, Chief of Cardiology and Medical Director of the angioplasty program at Greenwich Hospital).

28. The Applicants assert that Yale School of Medicine cardiovascular physicians have been actively involved in the primary angioplasty program at Greenwich Hospital since its inception and will continue to provide clinical oversight, direct patient care, and staff and physician education at the proposed program. Exhibit H, p. 632 (prefiled testimony of Marna Borgstrom, President and CEO of Yale New Haven Health System and CEO of Yale New Haven Hospital).

29. The Applicants state that Greenwich Hospital participates in the National Cardiovascular Data Registry NCDR-CathPCI Registry. Exhibit A, p. 36 (CON Application).

30. According to the Applicants, since Fiscal Year ("FY") 2008, 272 patients presented at Greenwich Hospital for elective angioplasty service. A total of 246 of the 272 patients were transferred to other providers for elective PCI. The following table illustrates the total of transfers by provider:

Table II: Historical Greenwich Hospital Elective PCI Transfers

FY	Yale	Westchester Medical Center	Cornell	Columbia	Stamford	West Haven VA	Total Transfers
2008	44	1	0	0	0	0	45
2009	71	0	1	1	1	0	74
2010	51	0	2	0	1	0	54
2011	53	0	2	1	0	1	57
2012*	16	0	0	0	0	0	16
Totals	**235**	**1**	**5**	**2**	**2**	**1**	**246**

*Number of transfers between 10/1/11 and 12/31/11

Note: The remaining 26 patients were discharged and referred for elective angioplasty at a future time. Exhibit A, p. 19 (CON Application).

31. The Applicants identified the following historical primary angioplasty volumes for Greenwich Hospital for FYs 2008-2011:

Table III: Greenwich Hospital Historical Primary PCI

	FY 2008	FY 2009	FY 2010	FY 2011
Greenwich Hospital	40	40	32	38

Exhibit A, p. 30 (CON Application).

32. Greenwich Hospital's angioplasty volume projections:

Table IV: Greenwich Hospital Projected Primary and Elective PCI

	FY 2012	FY 2013	FY 2014
Primary Angioplasty	38	38	38
Elective Angioplasty	**53**	**53**	**53**
New Referred Elective PCI	105	126	151
Total	196	217	242

Exhibit A, p. 31 (CON Application).

33. The Applicants based the projected primary angioplasty volumes on historical volumes, which have remained fairly steady for the past few years. The projected elective angioplasty volumes have been based on the historical elective angioplasty patients transferred to other facilities. Exhibit A, pp. 32-34 (CON Application).

34. The Applicants claim that half of the outpatients that have a diagnostic catheterization performed at Greenwich Hospital are transferred to other facilities for elective PCI. Exhibit H, p. 669-671 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

35. The Applicants state that an increase in the PCI patient volume will result from the addition of New York interventional cardiologists who currently do not practice at Greenwich Hospital but have referral relationships with Greenwich Hospital medical staff and would utilize and refer elective angioplasty to Greenwich Hospital. Exhibit H, pp. 670-671, 675-676 (prefiled testimony of Christopher Howes, Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

36. Although the Applicants provided letters of support from the two (2) physicians from the State of New York who state they would offer elective PCI at Greenwich Hospital if that were an option, the projected new PCI volumes are speculative and appear to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital. *See*, Exhibit H, page 671 &675-679 (prefiled testimony of Christopher Howes, M.D Chief of Cardiology of Angioplasty Program at Greenwich Hospital).

37. Stamford Hospital claims that elective angioplasty volumes are flat to declining in the State, with no volume growth in the Applicants' proposed service area, and therefore, there is no clear public need for the establishment of elective angioplasty program without onsite surgical back up at Greenwich Hospital. Exhibit K, p. 1 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

38. The following table illustrates the historical overall statewide PCI (primary and elective combined) discharges by provider between Federal Fiscal Years ("FFY") 2002-2011:

Table V: PCI discharges by provider, FFYs 2002-2011

Hospital	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	FFY 05-07 (3-yr)* % Change	FFY 09-11 (3-yr) % Change	FFY 10-11 (1-yr) % Change
Bridgeport	1,191	1,249	1,288	1,052	692	560	580	428	379	298	-47%	-30%	-21%

Source: *CT Department of Public Health Office of Health Care Access Inpatient Acute Care Hospital Database.*

ICD-9-CM Procedure Codes: .66, 36.01, 36.02, 36.05, 36.06 and 36.07
Please note: unduplicated counts utilizing all procedure codes
*This column in OHCA's Exhibit 1, Table 2A, was mislabeled. No data from this column was relied upon to support the findings in this decision.

39. The statewide inpatient PCI volumes demonstrate the following: a five year historical decline of 1% between FY 2007-2011; a 12% overall decline between FY 2009 and 2011; and an 11% decline in statewide PCI volume between FY 2010-2011. *See,* Table V, above.

40. Stamford Hospital's PCI discharges have declined 15% between FY 2009-2011 and, therefore, Stamford Hospital has capacity to serve the needs of the community. *See*, Table V, above.

41. The Intervenor claims that discharges of residents from Greenwich Hospital's service area from Connecticut and New York hospitals show that from FY 2009 through 2011, inpatient ("I/P") cardiac catheterization and PCI volumes have decreased in the service area:

Table VI: FY 2009-2011, I/P PCI Volume in proposed Service Area

State	FY 2009	FY 2010	FY 2011
CT Service Area	598	610	429
NY Service Area	844	775	772
Total	**1,442**	**1,385**	**1,201**

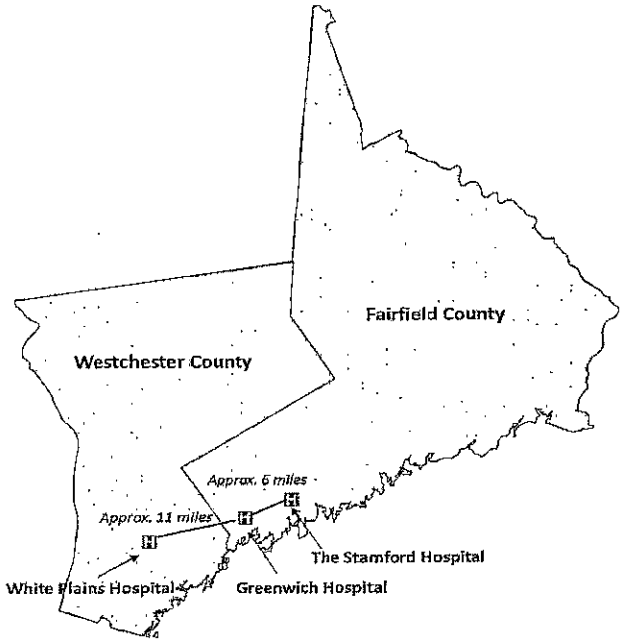
Exhibit K, p. 8 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

42. In light of the historical elective PCI transfers from Greenwich Hospital to existing providers and the declining statewide PCI volumes, OHCA finds that the Applicants have not provided sufficient evidence to support its projected PCI utilizations.

43. A letter from White Plains Hospital states that its elective PCI program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area that would indicate patients are not receiving timely care. Exhibit I, pp. 49-50 (Intervenor's prefiled documents, letter from Susan Fox, Executive Vice President, White Plains Hospital).

44. White Plains Hospital is located approximately ten (10) miles west of Greenwich Hospital. If this application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other. Exhibit K, p. 10 (Intervenor's prefiled testimony of Sharon Kiely, M.D., Senior Vice President of Medical Affairs and Chief Medical Officer for Stamford Hospital).

45. The map illustrates the location of Greenwich Hospital and the existing providers such as Stamford Hospital and White Plains Hospital, in Greenwich Hospital's proposed service area and their approximate distance to Greenwich Hospital:



46. There is no capital expenditure associated with this proposal. Exhibit A, p. 21(CON Application).

47. The Applicants assert that they estimate the unnecessary costs that now result and impact payers and patients total approximately $425,000 each year. This amount is based on an average of 53 elective angioplasty cases currently transferred that could be cared for by a Greenwich Hospital's elective angioplasty program multiplied by $8,000 ($7,000 for the average cost of an angioplasty admission at Yale New Haven Hospital plus $1,000 for emergency transportation). Exhibit H, p. 79 (prefiled testimony of Frank Corvino, President and CEO of Greenwich Hospital).

48. Greenwich Hospital's projected incremental revenue from operations, total operating expense and gain from operations associated with the CON proposal are as follows:

Table VII: Financial Projections Incremental to the Project

Description	FY 2013	FY 2014	FY 2015
Incremental Revenue from Operations	$2,935	$3,413	$3,976
Incremental Total Operating Expense	$2,353	$2,744	$3,222
Incremental Gain from Operations	**$582**	**$669**	**$756**

Note: figures are in thousands.
Exhibit A, p. 577 (CON Application).

49. The current and three-year projected payer mix for Greenwich Hospital is as follows:

Table VIII: Current & Three-Year Projected Payer Mix

Description	Current	Year 1	Year 2	Year 3
Medicare*	40.5%	40.5%	40.5%	40.5%
Medicaid* CHAMPUS and TriCare	5.4%	5.4%	5.4%	5.4%
Total Government	**45.9%**	**45.9%**	**45.9%**	**45.9%**
Commercial Insurers*	48.7%	48.7%	48.7%	48.7%
Self Pay	5.4%	5.4%	5.4%	5.4%
Workers Compensation	0%	0%	0%	0%
Total Non-Government	**54.1%**	**54.1%**	**54.1%**	**54.1%**
Total Payer Mix	**100%**	**100%**	**100%**	**100%**

* Includes managed care activity.
Exhibit A, p. 40 (CON Application).

50. The Applicants assert that Greenwich Hospital's primary angioplasty services are costing Greenwich Hospital approximately $1.78 million per year, as Greenwich Hospital has to pay Yale School of Medicine to provide 24/7 physician staffing for its existing program. The primary angioplasty program results in significant staffing costs to cover approximately 40 primary angioplasty cases treated at Greenwich Hospital each year. Utilizing the same physicians to perform elective angioplasty would be a cost-effective and efficient approach and would reduce the costs per case from the arrangement. Exhibit A, p. 20 (CON Application).

51. The Applicants claim that the proposed elective angioplasty program is cost effective as it maximizes use of the existing high-cost infrastructure of the primary angioplasty program and permits existing and available highly qualified expert physicians and staff to perform both primary and elective angioplasties for which they have been trained and are qualified to perform. In addition, as noted in the application, System-wide integration, coordination of care practices and standardization, more cost effectiveness and evidence-based care will be provided. Exhibit A, pp. 40-41 (CON Application).

52. OHCA is currently in the process of establishing its policies and standards as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations adopted by OHCA. (General Statutes § 19a-639(a)(1)).

53. OHCA is currently in the process of establishing the statewide facilities and services plan ("the plan"). The plan was not a published document at the time of this proposal was filed; however, even if the plan is published by the time this final decision is issued, it has no bearing on the outcome of this matter, as the Applicants have not sufficiently demonstrated a clear public need for this proposal. (General Statutes § 19a-639(a)(2)).

54. There is insufficient evidence to establish that there is a clear public need for the Applicants' proposal. (General Statutes § 19a-639(a)(3)).

55. The Applicants have not satisfactorily demonstrated how this proposal will impact the financial strength of the health care system in this state. (General Statutes § 19a-639(a)(4)).

56. The Applicants have failed to satisfactorily demonstrate that their proposal would improve the accessibility of health care delivery in the region but they have satisfactorily demonstrated a potential improvement in quality and cost effectiveness. (General Statutes § 19a-639(a)(5)).

57. The Applicants have shown that there would be no change to the provision of health care services to the relevant populations and payer mix. (General Statutes § 19a-639(a)(6)).

58. The Applicants have satisfactorily identified the population to be served by their proposal but have failed to satisfactorily demonstrate that this population has a need as proposed. (General Statutes § 19a-639(a)(7)).

59. The historical elective PCI discharges in the service area do not support this proposal. (General Statutes § 19a-639(a)(8)).

60. The Applicants have failed to satisfactorily demonstrate that their proposal would not result in an unnecessary duplication of existing elective PCI services in the area. (General Statutes § 19a-639(a)(9)).

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in General Statutes § 19a-639(a) and the Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Goldstar Medical Services, Inc., et al. v. Department of Social Services*, 288 Conn. 790 (2008); *Steadman v. SEC*, 450 U.S. 91, 101 S.Ct. 999, *reh'g den.*, 451 U.S. 933 (1981); *Bender v. Clark*, 744 F.2d 1424 (10th Cir. 1984); *Sea Island Broadcasting Corp. v. FCC*, 627 F.2d 240, 243 (D.C. Cir. 1980).

Greenwich Hospital is a 174-bed acute care hospital located at 5 Perryridge Road in Greenwich and Yale-New Haven Hospital is an acute care hospital located at 20 York Street in New Haven. Greenwich Hospital and Yale New Haven Hospital (collectively known as "Applicants") are proposing to establish and operate an elective angioplasty program without onsite surgical backup located at Greenwich Hospital. FFs 1, 2, 8.

Currently, Greenwich Hospital, as a satellite of Yale New Haven Hospital's Yale-New Haven Heart and Vascular Center, provides cardiac catheterization and primary (emergency) angioplasty services. Greenwich Hospital does not have an on-site open heart surgery program. FF 4-6.

The Applicants argue that there is a clear public need for elective angioplasty ("elective PCI") at Greenwich Hospital and that such a program would fall within the ACCF/AHA/SCAI updated guidelines regarding elective PCI without on-site surgical backup. FFs 18, 19, 21, 22. The ACCF/AHA/SCAI guidelines now state that elective PCI might be considered in hospitals without on-site cardiac, provided that appropriate planning for program development has been accomplished and rigorous clinical and angiographic criteria are used for proper patient selection. FF 23.

The Applicants claim there is clear public need based on three key factors: local access, cost-effectiveness and improved quality. FF 19. Greenwich Hospital has transferred approximately 57 patients annually (between FYs 2008-2011) that required elective angioplasties to other providers over the each of the past three fiscal years. FF 30. Additionally, the Applicants claim that two new physicians (currently practicing in Westchester County, NY) will refer new angioplasty patients to Greenwich Hospital, if approved. FF 35.

Although the Applicants claim that there is need for elective PCI in the proposed service area, there are currently two providers of elective angioplasty service within its proposed service area, Stamford Hospital and White Plains Hospital. FFs 14, 44, 45. Each of the existing providers of elective angioplasty is approximately 6 and 11 miles away from Greenwich Hospital. FFs 44, 45. A letter from White Plains Hospital in Westchester County, NY, stated that its elective angioplasty program presently has capacity to serve the needs of the community and they are not aware of any backlog of cases in their service area. FF 43. Additionally, historical PCI discharge data shows that Stamford Hospital also has capacity to serve the needs of the community. FFs 37-40. Furthermore, based on OHCA's statewide hospital discharges, it's clear that since FY 2009,

the cardiac catheterization volume has declined 10% and the combined (emergent and elective) angioplasty volumes declined 12% at Connecticut providers. FFs 38-40.

The ACCF/AHA/SCAI updated guidelines state:

> It is only appropriate to consider initiation of a PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community. Competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community.

FF 24. Regarding the proposal at hand, there is insufficient evidence to establish a void in the needs of the community for elective PCI services and that the Applicants' proposal is in the best interests of the community.

Based on the statewide decline at all Connecticut providers of cardiac catheterization and angioplasty programs, the speculative projected new cases, and the fact that there are two (2) existing providers currently providing elective PCI in Greenwich Hospital's proposed service area and that these providers have capacity to fulfill the needs of the community, OHCA finds there is access to elective angioplasty service for the residents within Greenwich Hospital's proposed service area and, further, that the Applicants failed to demonstrate and provide evidence of a clear public need for this proposal. Based upon the lack of sufficient evidence demonstrating that the Applicants' proposed project fulfills a clear public need for elective PCI, OHCA is unable to conclude that the Applicants' financial projections and volumes upon which they are based are reasonable and achievable, or that the project is financially feasible.

Based upon the foregoing Findings of Fact and Discussion, I respectfully recommend that the Certificate of Need application of Greenwich Hospital and Yale-New Haven Hospital for the establishment of an elective angioplasty program without onsite surgical backup at Greenwich Hospital, with no associated capital expenditure, be **DENIED**.

Respectfully submitted,

11/20/12

Re: Proposal to Establish Elective Angioplasty Program at Greenwich Hospital
Docket No. 12-31748-CON

Dear Deputy Commissioner Davis,

This office represents Greenwich Hospital and Yale-New Haven Hospital (collectively "Applicants") in connection with the above-referenced CON Application to establish an elective angioplasty program in Greenwich. Enclosed please find an original and two (2) copies of Applicants' Petition for Reconsideration of the Final Decision issued by the Office of Health Care Access on January 31, 2013.

Thank you in advance for your consideration of this request.

Very truly yours,

Jennifer L. Groves

OFFICE OF HEALTH CARE ACCESS

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S PROPOSAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM WITHOUT ON-SITE SURGICAL BACKUP AT GREENWICH HOSPITAL	DOCKET NO. 12-31748-CON
	FEBRUARY 15, 2013

PETITION FOR RECONSIDERATION OF FINAL DECISION

In accordance with Section 4-181a(a)(1) of the Connecticut General Statutes, Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH"), Applicants in the above-referenced Certificate of Need ("CON") proceeding, submit this Petition for Reconsideration of the Final Decision issued by the Office of Health Care Access ("OHCA") on January 31, 2013 ("Final Decision"). Applicants sought permission from OHCA to establish and operate an elective angioplasty program at Greenwich Hospital (the "Elective Angioplasty Program") in conjunction with the Yale-New Haven Heart and Vascular Center ("YNHHVC"). OHCA denied Applicants' CON request.

As discussed herein, the Final Decision contains errors of fact and law that should be corrected by the agency. These include erroneous findings with regard to whether Applicants submitted sufficient evidence to meet the criteria for issuance of a CON set forth in Section 19a-639(a) of the General Statutes. In addition, new evidence has been discovered, which materially affects the merits of this CON Application and which for good reason was not presented in the

agency proceeding. This includes the Agreed Settlement, entered into between OHCA and Lawrence & Memorial Hospital ("L&M") on February 4, 2013, authorizing the addition of an elective angioplasty program at L&M, also in conjunction with YNHH and the Yale School of Medicine ("YSM") (the "L&M Agreed Settlement").

I. Background

This is the third request to OHCA for permission to establish and operate an Elective Angioplasty Program at Greenwich Hospital. Greenwich is a short-term acute care hospital and an affiliate of the Yale-New Haven Health System ("YNHHS") (CON Application, p. 14). Greenwich offers a broad array of cardiac services in conjunction with the YNHHVC, including a primary angioplasty program (the "Primary Angioplasty Program"), which was approved by OHCA on a permanent basis in July of 2008 (Docket No. 03/08-30148; CON Application, pp. 14-15). L&M also operates a primary angioplasty program in conjunction with the YNHHVC (the "L&M Primary Angioplasty Program"), which is staffed, equipped and operated in the exact same manner, and according to the same policies, procedures and protocols, as the program at Greenwich (see Docket No. 04-30297-CON) (L&M Agreed Settlement, FF 5).

Greenwich has all of the infrastructure and staff in place to perform primary or "emergency" angioplasty procedures and has been performing these procedures on critically ill patients since 2005. Applicants now request permission to provide these same types of procedures (utilizing the staff and equipment already in place) on an elective basis, in more routine, less emergent cases (Final Decision, FF 16; CON Application, pp. 14-15 & 40; Completeness Question Responses, p. 599; Testimony of Christopher Howes, M.D., p. 671; July 16, 2012 Public Hearing Transcript, pp. 19, 59, 70, 84 & 88). Despite the fact that Greenwich does not have an Elective Angioplasty Program, patients continue to present at the Hospital in

need of these critical healthcare services (CON Application, pp. 19 & 32; Completeness Question Responses, p. 589). The patients who present to Greenwich Hospital and require elective angioplasty are for the most part transferred to YNHH, where they receive these services from the exact same physicians who would have performed the procedures at Greenwich if elective angioplasty was authorized.

Each request for permission to establish an Elective Angioplasty Program at Greenwich has been denied because according to OHCA, there is no "clear public need" for a program of this type in the Greenwich service area (see Final Decision, Docket No. 00-520; Final Decision, Docket No. 08-31210; Final Decision, Docket No. 12-31748-CON). Notwithstanding the foregoing, OHCA has approved a number of full-service cardiac programs in Connecticut (including a program at The Stamford Hospital ("TSH") just six miles from Greenwich) in the years since Greenwich's first request was denied. The Greenwich denials, which have been focused primarily on need, disregard the positive impact that an Elective Angioplasty Program at Greenwich Hospital would have on the accessibility, quality and cost-effectiveness of cardiac care in the region. It is these very factors that contributed to OHCA's recent approval of an elective angioplasty program at L&M, to be supported by the YNHHVC.

On November 20, 2012, the Hearing Officer in this matter issued a Proposed Final Decision recommending denial of Applicants' CON request (the "Proposed Final Decision"). On January 11, 2013, Applicants filed Exceptions to the Proposed Final Decision and a brief in support of their positions (copy attached as Exhibit A). Therein, Applicants argued that all of the Section 19a-639(a) CON decision criteria had been satisfied, and that based on the totality of the evidence record the CON should have been approved.

Applicants presented oral argument on the Exceptions on January 16, 2013. Two weeks later, OHCA issued a Final Decision denying the CON request. This Final Decision made no modifications to the Findings of Fact or conclusions of law in the Proposed Final Decision, as requested by Applicants. The L&M Agreed Settlement was signed four (4) days after the Final Decision was issued.

For the reasons set forth in the Exceptions, as well as in this Petition for Reconsideration, Applicants respectfully request that the agency reconsider its findings and issue a Reconsidered Final Decision approving the CON.

II. Legal Standard For Reconsideration

Section 4-181a of the General Statutes provides that a petition for reconsideration of an OHCA final decision may be filed within fifteen (15) days of the date of personal delivery or mailing of the decision. Grounds for reconsideration include that: (A) An error of fact or law should be corrected; (B) new evidence has been discovered, which materially affects the merits of the case and which for good reasons was not presented in the agency proceeding; or (C) other good cause for reconsideration has been shown. If a petition for reconsideration is filed, OHCA must decide within twenty-five (25) days whether it will reconsider the decision. The agency may also review a final decision *sua sponte* within forty (40) days of issuance.

If OHCA decides to reconsider a final decision, either at the request of a party or of its own accord, it must proceed in a reasonable time to conduct such additional proceedings as may be necessary to render a decision modifying, affirming or reversing the final decision. Any decision made after reconsideration must be issued no later than ninety (90) days following the date on which the agency decides to reconsider the final decision.

III. Argument

OHCA should reconsider the Final Decision and approve Applicants' CON request for several reasons. First, Applicants respectfully submit that OHCA erred in finding that the Section 19a-639(a) guidelines and principles were not satisfied in this case. The arguments in support of this claim are summarized below and are discussed at length in the Exceptions attached as Exhibit A. Second, new evidence has come to light since the record was closed in the Greenwich-YNHH CON, which materially affects this case and should be considered by OHCA. This evidence includes an Agreed Settlement between OHCA and L&M, dated February 4, 2013, approving an elective angioplasty program at that hospital (copy attached as Exhibit B). The L&M Agreed Settlement acknowledges the benefits – in terms of accessibility, quality and cost-effectiveness of care, in particular – of operating an elective angioplasty program at a community hospital in conjunction with the YNHHVC. These same arguments were raised by Applicants in support of their CON request and were not given due weight by OHCA. Applicants' Elective Angioplasty Program will bring the same benefits to the Greenwich community that the L&M program will bring to the New London community. These benefits justify approving the CON requests filed by both hospitals.

A. OHCA Erred In Concluding That the Section 19a-639(a) Criteria Have Not Been Met

Applicants continue to believe that OHCA erred in finding that certain of the Section 19a-639(a) CON decision criteria were not satisfied in this proceeding. As set forth in greater detail in the Exceptions attached as Exhibit A, Applicants maintain that they established a clear public need for the proposed Elective Angioplasty Program at Greenwich; that the proposal will impact favorably on the financial strength of the healthcare system; that the Elective Angioplasty Program will increase access to care; and that their proposal will not result in the unnecessary

duplication of services. Applicants also maintain that those CON guidelines and principles that have been firmly established – namely, that this proposal will improve the accessibility, quality and cost-effectiveness of cardiac care – when considered with other evidence in the record, support approval of this CON.

The arguments contained in the Exceptions are summarized briefly below:

i. Applicants Demonstrated a Clear Public Need for the Elective Angioplasty Program

- Applicants' angioplasty volume projections were supported by evidence. They were comprised of primary angioplasty cases, historical elective angioplasty transfers and incremental volume from New York interventional cardiologists with patients residing in the Greenwich area.
- There is no evidence in the record to support OHCA's conclusion that the projected elective angioplasty volume is a shifting of elective PCI patients from an area provider to Greenwich Hospital. This new volume will include cases currently performed at hospitals as far away as New York City.
- There is no evidence in the record to support OHCA's conclusion that TSH and White Plains Hospital have sufficient excess capacity to meet the elective angioplasty needs of the Greenwich community. OHCA erred in finding that a decline in TSH's inpatient angioplasty volume signals an excess of capacity (versus a simple shift of volume to an outpatient setting). Nor has OHCA given appropriate weight to the almost complete lack in overlap in the cardiovascular service areas of Greenwich Hospital and TSH.
- The existence of multiple providers in the region does not mean that there is no need for an Elective Angioplasty Program at Greenwich. There are other areas in the state where multiple providers are approved to operate full-service cardiac programs (i.e. Hartford and New Haven/Bridgeport).
- A decline in PCI volume in the Greenwich area does not mean that the proposed Elective Angioplasty Program is not needed. TSH's program was approved at a time when PCI volume was declining statewide. In addition, as discussed in more detail below, OHCA found that there is a clear public need for L&M's elective program despite a recent decline in elective transfers from that hospital.

ii. Applicants Established That the Proposal Will Impact Favorably on the Financial Strength of the Healthcare System

- Applicants offered evidence to support a finding that the proposed Elective Angioplasty Program will benefit patients any payers financially by reducing costs associated with patient transfers and duplicate procedures.
- Applicants offered evidence to support a finding that the proposed Elective Angioplasty Program will benefit and strengthen Greenwich Hospital financially by

providing additional revenue over which to spread the fixed costs associated with the Primary Angioplasty Program (including $1.78 million in professional fees).

iii. The Elective Angioplasty Program Will Improve the Accessibility, Quality and Cost-effectiveness of Cardiac Care in the Greenwich Service Area

- OHCA correctly concluded that the proposed Elective Angioplasty Program, which was to be operated in conjunction with the YNHHVC with its institutional and individual experience and expertise, would potentially improve the quality of cardiac care in the region.
- OHCA correctly concluded that the proposed Elective Angioplasty Program would potentially enhance the cost-effectiveness of care by reducing transfer and duplicate procedure costs and offsetting some of the fixed costs associated with the Primary Angioplasty Program at Greenwich.
- OHCA should have concluded that the proposed Elective Angioplasty Program would improve accessibility by making a critical healthcare service available at a community hospital where many individuals try to obtain this care every year. In addition, the establishment of an Elective Angioplasty Program at an acute-care hospital such as Greenwich increases access for Medicare and Medicaid patients.

iv. A Modest Decline in PCI Volume Is Not Determinative of Need for the Elective Angioplasty Program

- Applicants have projected volume based on historical utilization/transfers and confirmed additional volume from New York interventional cardiologists. These projections support need, regardless of whether PCI volume is declining.
- PCI volume was declining when TSH's CON for a full-service cardiac program was approved. Similarly, L&M's elective angioplasty transfers have declined in recent years, yet their elective program was just approved by OHCA.

v. The Elective Angioplasty Program Will Not Result In the Unnecessary Duplication of Services

- There is virtually no overlap in the cardiovascular service areas of Greenwich Hospital and TSH. Without overlap in patient populations, the proposed Elective Angioplasty Program cannot duplicate the program at TSH.
- The proposed Elective Angioplasty Program will eliminate the need for patient transfers and duplicate procedures, which may be considered the unnecessary duplication of services.

Applicants also argued that OHCA relied too heavily on the "clear public need" CON decision criteria to the exclusion of other, equally important guidelines and principles. OHCA must consider each of the Section 19a-639(a) CON criteria in reaching its decision. Here,

OHCA acknowledges that the proposal will potentially improve the quality of care and she is correct. The YNHHVC is an integrated model whereby interventional cardiologists perform procedures both at Greenwich and YNHH, which has one of the busiest and most advanced cardiac programs in the state. By denying this CON request, OHCA is denying Greenwich patients local access to the resources and professional expertise of the YNHHVC. OHCA also disregarded significant findings with respect to the cost-effectiveness of this proposal. As discussed below, OHCA acknowledges in the L&M Agreed Settlement that having an elective program at a community hospital reduces the costs (and risks) associated with transfers and duplicate procedures. It also allows a hospital to spread the fixed overhead costs associated with an emergency angioplasty program over greater case volume.

Respectfully, OHCA was incorrect in many of its findings relative to the Section 19a-639(a) guidelines and principles. The agency also erred in denying the CON Application based primarily on clear public need, while ignoring the significant enhancements to patient access and the quality and cost-effectiveness of care that would result from having an Elective Angioplasty Program in Greenwich. For these reasons, OHCA should reconsider the Final Decision, modify the Findings of Fact as necessary and issue a Reconsidered Final Decision approving Applicants' request.

B. The L&M Agreed Settlement Is New Evidence That Should Be Considered By OHCA

On August 31, 2012, several months after Applicants initiated this CON proceeding, L&M filed a CON Application requesting permission to establish an elective angioplasty program without onsite surgery, to be supported by YNHH and the YSM (the "L&M Elective Angioplasty Program") (L&M Agreed Settlement, FF 2 & 3). A public hearing was held in

December of 2012, and on February 4, 2013, OHCA and L&M entered into an Agreed Settlement authorizing the L&M Elective Angioplasty Program.

The L&M Elective Angioplasty Program is in essence the same program that Greenwich Hospital sought permission to establish. Both Greenwich and L&M are community hospitals that provide emergency angioplasty in conjunction with the YNHHVC (Final Decision, FF 3; L&M Agreed Settlement, FF 5); both hospitals seek to expand their angioplasty programs to include more routine, elective cases (Final Decision, FF 3, 6-8; L&M Agreed Settlement, FF 5); both elective programs would be fully supported by YNHH and the YSM (Final Decision, FF 17, 28; L&M Agreed Settlement, FF 5, 6); the interventional cardiologists from both community hospitals perform procedures at YNHH, gaining invaluable experience at one of the state's busiest and most advanced cardiac programs (Exceptions, p. 21; L&M Agreed Settlement, FF 17); both elective programs would employ the same YNHH/YSM interventional cardiologists and clinical staff that support their emergency programs (Final Decision, FF 28; L&M Agreed Settlement, FF 28); both hospitals argued that there is a need to expand their programs to include an elective component based in part on existing transfer volume and the need to more efficiently use resources (Final Decision, FF 32-33, 47, 50 & 51; L&M Agreed Settlement, FF 19-21, 33 & 34); both argued that expanding elective would improve access to, and the quality of, cardiac care for their patients (Exceptions, pp. 21-22; L&M Agreed Settlement, FF 29); both also argued that the expansion would be cost-effective and beneficial to patients, payers and the hospitals (Final Decision, FF 47, 50-51; L&M Agreed Settlement, FF 30, 33 & 34).

Applicants understand that OHCA reviews each CON request on its own merits and that CON Applications do not lend themselves to general applicability due to the unique facts of each case. That being said, it is difficult to understand how OHCA could reach the conclusions that it

reached with respect to the Section 19a-639(a) criteria in the Greenwich-YNHH elective angioplasty CON, and then reach such vastly different conclusions with respect to the identical program at L&M. Applicants respectfully request that OHCA reconsider its findings and conclusions in the Greenwich CON in light of the L&M Agreed Settlement. This new evidence affects the merits of this CON proceeding and could not have been presented in the contested case, given the fact that the L&M Agreed Settlement was issued after the Final Decision.

Applicants have set forth below findings from the L&M Agreed Settlement that are inconsistent with the Greenwich-YNHH Final Decision and which should be reconsidered by OHCA:

i. Quality of Care

OHCA found that the elective program at L&M will use the same YNHH/YSM interventional cardiologists and clinical staff that currently support the hospital's primary program (L&M Agreed Settlement, FF 28). OHCA also found that quality would be enhanced for patients who are transferred for elective angioplasty and are therefore at greater risk of infections, bleeding complications and other adverse events associated with multiple procedures at two facilities (L&M Agreed Settlement, FF 29). These findings were used to support the conclusion that the L&M Elective Angioplasty Program will improve the quality of healthcare in the region (L&M Agreed Settlement, FF 40). This ultimately contributed to the approval of L&M's proposal.

Applicants introduced the same evidence of involvement and support for the proposed Elective Angioplasty Program by YNHH/YSM physicians and staff, which OHCA acknowledged (Final Decision, FF 17, 28). Applicants also made the same arguments throughout their CON submissions regarding the enhancements to quality that come not only

from a YNHH/YSM-affiliated program, but from the ability to avoid unnecessary transfers and the risks and complications associated therewith. Notwithstanding the presentation of nearly identical evidence about a program supported by the same academic medical center as the L&M program, OHCA found only the "potential" that the Greenwich program would improve quality of care for patients. OHCA did not consider this "potential" improvement in the quality of care sufficient to support approval of the CON, contrary to its findings in the L&M proceeding. Finding of Fact 56 should be revised accordingly, and this revised finding should be considered as a basis for approving Applicants' proposal.

ii. Cost-Effectiveness of Care

OHCA found that the L&M Elective Angioplasty Program would reduce the cost per case for angioplasty while using the same YNHH physicians, thus reducing the burden on the hospital of the $1.45 million professional fee it pays in connection with coverage for the L&M Primary Angioplasty Program (L&M Agreed Settlement, FF 33). OHCA also found that eliminating transfers for elective PCI would reduce costs to the healthcare system from duplicate testing and other redundant costs (L&M Agreed Settlement, FF 30). OHCA further found that there were no additional capital or overhead costs associated with the L&M Elective Angioplasty Program, which improves the cost-effectiveness of PCI services in general (L&M Agreed Settlement, FF 34). These findings were used to support the conclusion that the L&M Elective Angioplasty Program will improve the cost-effectiveness of healthcare in the region (L&M Agreed Settlement, FF 40). This ultimately contributed to the approval of L&M's proposal.

Applicants introduced the same evidence regarding the cost-effectiveness of care with their proposal. Specifically, Applicants claimed that patient transfers for elective angioplasty resulted in approximately $425,000 in unnecessary costs each year, which would be avoided if elective

cases were allowed at Greenwich Hospital (Final Decision, FF 47). Applicants also claimed that utilizing the same physicians to perform elective angioplasty cases would help to offset overhead costs (including $1.78 million in professional fees) associated with the Primary Angioplasty Program (Final Decision, FF 50-51). Unlike the L&M Agreed Settlement, OHCA found only that "Applicants asserted" or "Applicants claimed" these facts to be true and that they could "potentially" improve the cost-effectiveness of healthcare. Given that Greenwich has produced the exact same evidence of program costs savings as L&M, the disparate treatment by OHCA is unwarranted. Finding of Fact 56 should be revised accordingly, and this revised finding should be considered as support for approval of this CON.

iii. Financial Strength & Financial Feasibility

OHCA found that there was no additional capital or overhead cost associated with the L&M Elective Angioplasty Program, which appears to support its conclusion that the project is financially feasible (L&M Agreed Settlement, FF 34 & 39). Greenwich introduced the same evidence regarding the lack of additional capital or overhead cost associated with its Elective Angioplasty Program (Final Decision, FF 46). However, OHCA did not conclude that the Greenwich proposal was financially feasible. Instead, OHCA found that Applicants did not satisfactorily demonstrate how the Elective Angioplasty Program would impact the financial strength of the state's healthcare system (Final Decision, FF 55). The CON law in effect at the time of the Greenwich Final Decision (and the L&M Agreed Settlement) states that Applicants must show either that their program improves the financial strength of the healthcare system or that it is financially feasible for the Applicants. Conn. Gen. Stat. 19a-639(a)(4). Applicants maintain that they demonstrated how their proposal would improve the financial strength of the healthcare system. And like L&M, they have also demonstrated that the project is financially

feasible in that it has no associated capital expenditure or costs. For these reasons, the conclusions drawn by OHCA in Finding of Fact 55 are incorrect and should be revised. A revised finding would further support approval of this CON.

iv. Clear Public Need

It is worth noting that certain factors used to establish a clear public need for the L&M Elective Angioplasty Program were considered differently by OHCA in evaluating the Greenwich-YNHH CON request. For example, Applicants' CON request was denied in part based on a modest decline in PCI volume in the service area (Final Decision, FF 38-39, 59). However, OHCA appears to have disregarded a thirty-one percent (31%) decline in elective angioplasty transfers at L&M between 2010 and 2011, and a projected fifteen percent (15%) decline between 2011 and 2012, in determining that there is a need for this service in New London (L&M Agreed Settlement, FF 19). Applicants assume that this is due to a host of other factors (including improved accessibility, quality and cost-effectiveness of care) that justified approving L&M's proposal.

In addition, OHCA found there to be a clear public need for the L&M Elective Angioplasty Program based in part on the fact that New London County has high heart-disease-related death and hospitalization rates and a growing population over the age of 65 (L&M Agreed Settlement, FF 15 & 16). Applicants provided identical evidence (in the form of Centers for Disease Control and Prevention maps), which shows that Fairfield County has equally high heart-disease-related death and hospitalization rates (CON Application, p. 26). In addition, Applicants provided evidence that its service area population over the age of 65 is expected to increase significantly between 2011 and 2016 (CON Application, p. 27). These factors, which were important to OHCA's assessment of need in the L&M CON, were seemingly overlooked by the agency in

evaluating the Greenwich-YNHH submissions. If they support need for an elective angioplasty program in New London County, they support need for such a program in Fairfield County as well.

IV. Conclusion

For all of the foregoing reasons, Applicants respectfully request that OHCA reconsider the Final Decision, revise its findings and issue a Reconsidered Final Decision approving the proposed Elective Angioplasty Program at Greenwich Hospital. Approval of Applicants' proposal is consistent with the Section 19a-639(a) guidelines and principles and the reasoning behind OHCA's approval of the L&M CON request – namely, that the addition of elective angioplasty services to a YNHHVC-supported program that is already authorized and equipped to provide emergency angioplasty services will increase patient access and significantly enhance the quality and cost-effectiveness of healthcare.

Respectfully Submitted,

GREENWICH HOSPITAL
YALE-NEW HAVEN HOSPITAL

GREENWICH HOSPITAL AND YALE-NEW HAVEN HOSPITAL'S PROPOSAL TO ESTABLISH AND OPERATE AN ELECTIVE ANGIOPLASTY PROGRAM WITHOUT ON-SITE SURGICAL BACKUP AT GREENWICH HOSPITAL	)	DOCKET NO. 12-31748-CON
	)	JANUARY 11, 2013

EXCEPTIONS TO PROPOSED FINAL DECISION

Greenwich Hospital ("Greenwich") and Yale-New Haven Hospital ("YNHH"), Applicants in the above-referenced Certificate of Need ("CON") proceeding, submit the following Exceptions to the Proposed Final Decision rendered by the Office of Health Care Access ("OHCA"), through Hearing Officer Joanne V. Yandow, on November 20, 2012 (the "Proposed Final Decision"). Applicants intend to appear before Deputy Commissioner Lisa Davis on January 16, 2013, and present oral argument on these Exceptions.

I. Introduction

Greenwich and YNHH seek approval from OHCA to establish and operate an elective angioplasty program at Greenwich Hospital (the "Elective Angioplasty Program"). Greenwich is a short-term acute care hospital and an affiliate of the Yale-New Haven Health System ("YNHHS") (CON Application, p. 14). Greenwich offers a broad array of cardiac services in conjunction with the Yale-New Haven Heart and Vascular Center ("YNHHVC"), including a satellite primary angioplasty program (the "Primary Angioplasty Program"), which was

approved by OHCA on a permanent basis in July of 2008, after completion of a three-year demonstration project (Docket No. 03/08-30148; CON Application, pp. 14-15).

Greenwich has all of the infrastructure and staff in place to perform primary or "emergency" angioplasty procedures and has been performing these procedures on critically ill patients since 2005. Primary angioplasty patients are typically more difficult to care for and present greater risks than elective angioplasty patients given the emergent nature of their conditions. Greenwich Hospital has provided these patients with superior care for almost eight years, even without the availability of onsite cardiac surgical backup. Applicants now request permission to provide these same types of procedures (utilizing the staff and equipment already in place) on an elective basis, in more routine less emergent cases (Proposed Final Decision, FF 16; CON Application, pp. 14-15 & 40; Completeness Question Responses, p. 599; Testimony of Christopher Howes, M.D., p. 671; July 16, 2012 Public Hearing Transcript, pp. 19, 59, 70, 84 & 88).

Despite the fact that Greenwich does not have an Elective Angioplasty Program, patients continue to present at the Hospital in need of these critical healthcare services (CON Application, pp. 19 & 32; Completeness Question Responses, p. 589). The patients who present to Greenwich Hospital and require elective angioplasty are for the most part transferred to YNHH, where they received these services from the exact same physicians who would have performed the procedures at Greenwich if elective angioplasty was authorized. Greenwich service area resident have the right to receive cardiac care from the provider of their choosing, and they consistently choose Greenwich Hospital and the YNHHVC. This proposal would simply allow them to obtain this care within their community.

Applicants first applied for a full-service cardiac program at Greenwich Hospital, including elective angioplasty, in 2000 (Docket No. 00-520) (Public Hearing Transcript, pp. 91 & 138). The 2000 CON request was denied, largely based on a lack of "clear public need" for the proposal (Final Decision, Docket No. 00-520; Public Hearing Transcript, p. 91). However in the ensuing years, OHCA approved full-service cardiac programs, including elective angioplasty, at numerous hospitals throughout western Connecticut.[1] This included approval of a full-service cardiac program at The Stamford Hospital ("TSH") in 2006, located just six miles from Greenwich Hospital and within the service area where OHCA found there to be no need for these exact services (Rebuttal Testimony of Marna Borgstrom, p. 720; Public Hearing Transcript, p. 139). TSH was granted a CON at a time when angioplasty volumes were in decline – the primary reason why the Hearing Officer proposes to deny the current CON Application for an Elective Angioplasty Program at Greenwich (Proposed Final Decision, FF 37; Borgstrom Rebuttal Testimony, pp. 699-701). Now the existence of TSH's program (as well as a White Plains Hospital program established in 2010) is being used to support OHCA's position that there is no need for this proposal and that it will result in the unnecessary duplication of services, just as it was in 2010 when Applicants' second request to establish an Elective Angioplasty Program at Greenwich was denied (Docket No. 08-31210-CON) (Proposed Final Decision, FF 10, 13, 14, 15, 37, 40, 43, 44, 45, 53, 54, 58 & 60).

The Hearing Officer proposes to deny Applicants' most recent request for a CON primarily on the grounds that there is no "clear public need" for an Elective Angioplasty Program at Greenwich (Proposed Final Decision, FF 53, 54 & 58). We respectfully disagree

[1] Danbury Hospital, Docket No. 03-30143; Waterbury Hospital, St. Mary's Hospital & John Dempsey Hospital, Docket No. 03-30167; The Stamford Hospital, Docket No. 04-30374.

with the Hearing Officer's analysis of "clear public need," which overlooks such crucial factors as existing patient preference and physician referral patterns; credible evidence that area physicians will bring additional volume to Greenwich; the lack of overlap in the cardiac service areas of Greenwich and other elective angioplasty providers; and the clinical need for elective angioplasty services in Greenwich to ensure the quality of cardiac care and the safety of patients in the region, all of which is documented throughout Applicants' CON submissions and hearing testimony.

In addition, the Hearing Officer relies too heavily on the "clear public need" criteria set forth in Section 19a-639(a)(3) of the Connecticut General Statutes, to the exclusion of the other, equally relevant CON guidelines and principles that must be considered by the agency. Applicants respectfully disagree with a number of findings made by the Hearing Officer with respect to the remaining Section 19a-639(a) decision criteria (Proposed Final Decision, FF 53, 55, 56, 59 & 60). All of the Section 19a-639(a) criteria were thoroughly satisfied and the totality of the evidence supports approval of this CON Application. Applicants have shown not only that there is a clear public need for an Elective Angioplasty Program at Greenwich, but that such a program would improve the quality, accessibility and cost-effectiveness of healthcare in the region. It honors a patient's right to choose and it will not adversely impact existing providers of elective angioplasty services. Moreover, this program will help to strengthen Greenwich Hospital financially, making it good public policy and consistent with OHCA's statutory mission to ensure, among other things, the financial strength of the healthcare system statewide. For these reasons, Applicants' proposal should be approved.

II. Exceptions

Applicants take exception with numerous Findings of Fact contained within the Proposed Final Decision. These Findings of Fact center mostly around the Section 19a-639(a) decision criteria and are set forth below. Arguments in support of these exceptions are presented in Section III of this brief.

FF 12: *In 2010, OHCA issued a decision denying Greenwich Hospital's first proposal to establish and operate elective angioplasty program without on-site open heart surgery. The proposal was denied because the projected volume included New York patients, there was insufficient evidence to support the projected volumes, and there was an existing provider of elective PCI and full service cardiac program in the service area (Stamford Hospital).*

FF 14: *Stamford Hospital and White Plains Hospital are currently providing elective angioplasty procedures in Greenwich Hospital's claimed PSA.*

FF 36: *Although Applicants provided letters of support from the two (2) physicians from the state of New York who state they would offer elective PCI at Greenwich Hospital if that were an option, the projected new PCI volumes are speculative and appear to be a shifting of the elective PCI patients from an area provider to Greenwich Hospital.*

FF 40: *Stamford Hospital's PCI discharges have declined 15% between FY 2009-2011 and, therefore, Stamford Hospital has capacity to serve the needs of the community.*

FF 42: *In light of the historical elective PCI transfers from Greenwich Hospital to existing providers and the declining statewide PCI volumes, OHCA finds that the Applicants have not provided sufficient evidence to support its projected PCI utilizations.*

FF 43: *A letter from White Plains Hospital states that its elective PCI program presently has capacity to service the needs of the community and they are not aware of any backlog of cases in their service area that would indicate patients are not receiving timely care.*

FF 44: *White Plains Hospital is located approximately ten (10) miles west of Greenwich Hospital. If this application is approved, three (3) elective angioplasty programs will operate within sixteen (16) miles of each other.*

FF 45: *The map illustrates the location of Greenwich Hospital and the existing providers such as Stamford Hospital and White Plains Hospital, in Greenwich Hospital's proposed service area and their approximate distance to Greenwich Hospital.*

FF 53: *OHCA is currently in the process of establishing the statewide facilities and services plan ("the plan"). The plan was not a published document at the time of this*

proposal was filed; however, even if the plan is published by the time this final decision is issued, it has no bearing on the outcome of this matter, as the Applicants have not sufficient demonstrated a clear public need for this proposal.

FF 54: *There is insufficient evidence to establish that there is a clear public need for the Applicants' proposal.*

FF 55: *The Applicants have not satisfactorily demonstrated how this proposal will impact the financial strength of the health care system in this state.*

FF 56: *The Applicants have failed to satisfactorily demonstrate that their proposal would improve the accessibility of health care delivery in the region but they have satisfactorily demonstrated a potential improvement in quality and cost effectiveness.*

FF 58: *The Applicants have satisfactorily identified the population to be served by their proposal but have failed to satisfactorily demonstrate that this population has a need as proposed.*

FF 59: *The historical elective PCI discharges in the service area do not support this proposal.*

FF 60: *The Applicants have failed to satisfactorily demonstrate that their proposal would not result in any unnecessary duplication of existing elective PCI services in the area.*

Applicants also take exception with how these Findings of Fact are interpreted in the Discussion section of the Proposed Final Decision.

In addition, there are certain Findings of Fact that Applicants believe support their proposal and were not given due weight by the Hearing Officer. These Findings of Fact are discussed in the Argument section below.

III. Argument

A. Consideration of the Section 19a-639(a) Guidelines & Principles

Sections 19a-639(a)(1) through 19a-639(a)(9) of the Connecticut General Statutes set forth the guidelines and principles that must be used by OHCA in evaluating CON proposals. Section 19a-639(a) states that "[i]n any deliberations involving a certificate of need application filed pursuant to section 19a-638, the office shall take into consideration and make written

findings concerning" the guidelines and principles contained within the statute.[2] These guidelines and principles are more commonly known as the "statutory decision criteria" for CON applications. Although OHCA is required to consider and make written findings concerning each of the guidelines and principles set forth in Section 19a-639(a), the statute does not contain an express requirement that an applicant demonstrate a specific level of compliance with every stated criteria. Nor does the statute authorize OHCA to give substantial weight to one of the criteria to the exclusion of all others or to fail to make findings with respect to one of the criteria because another has not been met to the agency's satisfaction. If OHCA makes findings on the statutory decision criteria consistent with the evidence in the record, and considers all of these findings together, the CON Application should be approved.

---

[2] Conn. Gen. Stat. § 19a-639(a) provides in its entirety: In any deliberations involving a certificate of need application filed pursuant to section 19a-638, the office shall take into consideration and make written findings concerning each of the following guidelines and principles: (1) Whether the proposed project is consistent with any applicable policies and standards adopted in regulations by the office; (2) The relationship of the proposed project to the state-wide health care facilities and services plan; (3) Whether there is a clear public need for the health care facility or services proposed by the applicant; (4) Whether the applicant has satisfactorily demonstrated how the proposal will impact the financial strength of the health care system in the state; (5) Whether the applicant has satisfactorily demonstrated how the proposal will improve quality, accessibility and cost effectiveness of health care delivery in the region; (6) The applicant's past and proposed provision of health care services to relevant patient populations and payer mix; (7) Whether the applicant has satisfactorily identified the population to be served by the proposed project and satisfactorily demonstrated that the identified population has a need for the proposed services; (8) The utilization of existing health care facilities and health care services in the service area of the applicant; and (9) Whether the applicant has satisfactorily demonstrated that the proposed project shall not result in an unnecessary duplication of existing or approved health care services or facilities.

i. Applicants' Demonstrated a Clear Public Need For This Proposal

In this case, the Hearing Officer made a number of factual findings in support of her conclusion that there is no clear public need for Applicants' proposal (Conn. Gen. Stat. §19a-639(a)(3)) (Proposed Final Decision, FF 42, 53, 54 & 58). Applicants take exception with these findings as set forth below:

- Applicants' Projections Are Supported By Evidence.

  In Finding of Fact 35, the Hearing Officer acknowledges that a percentage of the projected elective angioplasty volume at Greenwich Hospital will result from the addition of New York interventional cardiologists who do not practice at Greenwich currently, but have referral relationships with the medical staff and will utilize the Hospital for elective angioplasty if a program is approved (Howes Testimony, pp. 670-671 & 675-676). Although Applicants provided letters of support from two of these New York physicians, OHCA found that their projected PCI volumes were speculative and appear to represent a shift of elective PCI patients from one area provider to Greenwich (Proposed Final Decision, FF 36).

  As a threshold matter, projections by their very nature are speculative. Applicants provided letters of support from named physicians, which included firm commitments to perform an identifiable number of elective angioplasties at Greenwich Hospital each year (Howes Testimony, pp. 675-676). OHCA has historically allowed providers to establish projected volume through letters from physicians indicating that they will refer/perform a certain number of procedures if a CON is approved. For example, this is common in CON applications for the acquisition of major imaging equipment or the addition of owners to an

ambulatory surgery center. In fact, OHCA will often accept projected volume attributable to anonymous physicians because in this competitive healthcare environment, many physicians are hesitant to publically support one provider when they work with many. Moreover, Applicants explained to the Hearing Officer that physicians typically will not make formal commitments (beyond a letter of support) unless and until a CON for a new service is approved (Public Hearing Transcript, p. 117).

In addition, while the Hearing Officer calls Applicants' letter evidence "speculative," a letter offered by Susan Fox, Executive Vice President of White Plains Hospital ("White Plains"), is taken as entirely true and accurate (Proposed Final Decision, FF 13-15, 36 & 43; Testimony of Sharon Kiely, M.D., pp. 49-50).[3] This letter caused the Hearing Officer to conclude that White Plains has the "capacity to serve the needs of the community," without any critical analysis of the unsubstantiated claims made by Ms. Fox (Proposed Final Decision, FF 43).

Moreover, the evidence in the record does not support the Hearing Officer's conclusion that the projected volume from New York interventional cardiologists "appears to be a shifting of the elective PCI patients <u>from an area provider</u> to Greenwich Hospital (emphasis added)" (Proposed Final Decision, FF 36). Neither TSH nor White Plains (via TSH) introduced any evidence that the cases promised by Drs. Newman and Hjemdahi-Monsen in their letters of support for this proposal were cases that would otherwise be performed at their facilities

[3] This letter was offered through Intervenor TSH. White Plains did not petition for status and Ms. Fox did not attend the hearing and testify.

(Howes Testimony, pp. 675-676). In fact, these are cases that we know to be performed for the most part at large New York City hospitals, including New York Presbyterian (Completeness Question Responses, p. 591; Public Hearing Transcript, pp. 57-58, 64-65). Moreover, the letters from Drs. Newman and Hjemdahi-Monsen state specifically that they would bring procedures to Greenwich that they currently treat at hospitals outside of Connecticut (Howes Testimony, pp. 675-676). Accordingly, there is no proof that this proposal will result in a shift of volume from a smaller Connecticut provider such as TSH or that it would impact TSH (or White Plains) in any way.

- Excess Capacity At Existing Providers Is Unsubstantiated and Irrelevant.

We respectfully disagree with the Hearing Officer's conclusion that TSH and White Plains have capacity to serve the elective angioplasty needs of the community (Proposed Final Decision, FF 40 & 43). These conclusions were drawn based upon a recent decline in TSH's inpatient PCI volume and the above-referenced letter from Susan Fox attesting to White Plains' capacity. No further analysis has been done regarding if and how these providers could and would meet the elective angioplasty needs of the Greenwich community. It is worth nothing that this decline in TSH's inpatient PCI volume may be attributable to the migration of more PCI cases to an outpatient setting.

The reality is there is minimal overlap between the service areas of TSH and Greenwich for cardiac services. The Hearing Officer acknowledges this in Finding of Fact 11, wherein she found that 80% of Greenwich's cardiovascular patients come from Greenwich, Port Chester and Rye, while only 4.6% of TSH's

cardiovascular patients originate from these towns. Conversely, 88% of TSH's cardiovascular patients come from Stamford and Darien, while only 7% of Greenwich's cardiovascular patients originate from these towns (Proposed Final Decision, FF 11; Howes Testimony, pp. 669-670).

OHCA cannot force a change in patient preference and physician referral patterns for cardiac services (Howes Rebuttal Testimony, pp. 668-671). The TSH and White Plains programs have been operational for years and yet patients continue to present at Greenwich Hospital in need of elective angioplasty services (CON Application, pp. 19 & 32; Completeness Question Responses, p. 589; Howes Rebuttal Testimony, pp. 762-763). Thus, even if there is excess capacity at TSH and/or White Plains, which has not been established as fact, this should not be considered in evaluating the needs of patients who choose Greenwich over either of these hospitals and who, if no program is available in Greenwich, will travel as far as New York City for their cardiac care (Howes Testimony, pp. 657-676; Public Hearing Transcript, pp. 57-58 & 64-65).

- Existence of Multiple Providers In Area Does Not Mean There Is No Need.

The Hearing Officer's determination that there is no clear public need for this proposal is based, in part, on the fact that if Greenwich Hospital offered elective angioplasty there would be three elective angioplasty providers within 16 miles of each other (Proposed Final Decision, FF 44 & 45). However, there are other areas in the state where three or more elective angioplasty providers operate within a similar radius. OHCA has approved full-service cardiac programs at John Dempsey Hospital, Hartford Hospital and St. Francis Hospital and Medical

Center, which are located less than 10 miles from each other (see Exhibit A attached). In addition, OHCA has approved full-service cardiac programs at YNHH (and the former Hospital for St. Raphael – now YNHH), Bridgeport Hospital and St. Vincent's Medical Center. The distance between the farthest of these locations is just over 20 miles (see Exhibit B attached). Note also that in these areas of the state, travel within a 10 to 20 mile radius is considerably easier and faster than traveling within the 16 mile radius between Stamford and White Plains, which experiences significant traffic and delays at various times throughout the day. Thus, the fact that approval of Applicants' proposal would result in three elective angioplasty providers being located within a 16 mile radius (one of which is a New York provider whose revenues do not support the financial strength of the Connecticut healthcare system) should not be determinative of a lack of clear public need.

- Flat PCI Volumes Do Not Mean There Is No Clear Public Need For Program.

The Hearing Officer found that the flat to declining elective angioplasty volumes in the state and proposed service area do not support establishment of an additional elective angioplasty program (Proposed Final Decision, FF 59). This was an argument raised by TSH in opposition to Applicants' proposal. However, the Hearing Officer has overlooked the equally important fact that when TSH sought and received approval for its full-service cardiac program, which includes elective angioplasty, PCI volumes were also declining statewide and in the service area (Borgstrom Rebuttal Testimony, pp. 699-701). If this factor were determinative of need, then TSH's CON application should have been denied.

But it was not denied, rather that CON was approved based on factors such as improved accessibility, continuity of care and improved quality of cardiac services (Borgstrom Rebuttal Testimony, pp. 701 & 732-733). These are the same factors that were raised by Applicants in support of a program at Greenwich. They speak less of a numerical demand for services and more to a clinical demand for care. That demand exists in terms of a patient's right to receive critical cardiac healthcare services at the provider of his/her choice (Howes Rebuttal Testimony, pp. 668-671); in the physical and mental stress that results for patients and families when they are transferred out of Greenwich Hospital for elective angioplasty (Proposed Final Decision, FF 20; CON Application, pp. 19-20; Completeness Question Responses, pp. 589 & 599); and in the physical risks and excess costs associated with having duplicate cardiac procedures, all of which were documented throughout Applicants CON submissions and hearing testimony (Proposed Final Decision, FF 27 & 47; CON Application, p. 40; Public Hearing Transcript, pp. 30-31, 66-67 & 76). Applicants therefore request that in the interest of fairness and consistency in decision making, OHCA reconsider its findings in this regard.

Based on the foregoing and all of the evidence in the record, Applicants have established a clear public need for the proposed Elective Angioplasty Program at Greenwich Hospital. Applicants respectfully request that Findings of Fact 12, 14, 36, 40, 42-45, 53, 54 58 and 59, and any discussion arising from those Findings of Fact, be revised accordingly.

ii. Applicants Met The Remaining Applicable Statutory Decision Criteria

Applicants also take exception with a number of the Findings of Fact relative to the remaining Section 19a-639(a) decision criteria, as set forth below.

a. Financial Strength of the Healthcare System

The Hearing Officer found that Applicants failed to satisfactorily demonstrate how the proposal will impact the financial strength of the healthcare system in this state (Conn. Gen. Stat. §19a-639(a)(4)) (Proposed Final Decision, FF 55). However, Applicants have introduced sufficient evidence to demonstrate that the proposed elective angioplasty program will have a positive financial impact on Greenwich Hospital and, as such, on the healthcare system as a whole.

As a threshold matter, this statutory guideline is relatively new. It was introduced in 2010, when CON laws were completely overhauled by the legislature. In 2012, OHCA attempted to revise this guideline out of Section 19a-639(a). The rationale given by OHCA staff was that the agency "does not have the data to properly evaluate the financial impact of the CON proposal on the state's healthcare system" and "CON applicants struggle to produce evidence demonstrating the impact of the proposal on the state's health care system" (Public Health Committee Testimony, dated March 7, 2012, attached as Exhibit C). Historically, OHCA has allowed providers to demonstrate compliance with this guideline by introducing evidence regarding the positive financial impact of a proposal on a healthcare facility as a result of cost-savings, increased revenue and the like (see i.e. Docket Nos. 11-31736-CON & 12-31750-CON). Anything that improves a hospital or healthcare facility's financial position and/or streamlines

care appears to impact favorably on the financial strength of the institution and the healthcare system as a whole.[4]

Applicants offered evidence to support a finding that the proposed Elective Angioplasty Program will benefit both Greenwich Hospital and its patients financially and, therefore, impact favorably on the financial strength of the healthcare system. This includes evidence, referenced by OHCA in the Proposed Final Decision, that the existence of elective angioplasty at Greenwich would reduce the need for patient transfers and duplicate procedures, which in turn reduces healthcare costs (Proposed Final Decision, FF 47; CON Application, p. 40; Frank Corvino's Testimony, p. 681-682; Public Hearing Transcript, pp. 30-31, 67 & 76, 79-80). In addition, Applicants submitted evidence that the inclusion of elective angioplasty cases would reduce some of the financial burden attributable to the maintenance of staff and infrastructure for primary angioplasty cases (Proposed Final Decision, FF 50 & 51; CON Application pp. 20 & 40-41; Completeness Question Responses, pp. 598-599). Given the broad manner in which this statutory provision has been interpreted by OHCA, a finding should have been made in favor of Applicants. Applicants respectfully request that Finding of Fact 55, and any discussion arising from that Finding of Fact, be revised accordingly.

[4] Note also that there are a number of 2012 CON approvals that make no mention of this particular decision criteria, therefore, failure to meet it should not, in and of itself, be used as a basis for denial (i.e. Docket Nos. 12-1759-CON; 11-31734-CON; and 11-31730-CON).

b. Accessibility, Quality and Cost-Effectiveness of Healthcare

The Hearing Officer correctly found that Applicants demonstrated a potential improvement in quality and cost-effectiveness with the proposed Elective Angioplasty Program, but erred in finding no evidence that the proposal would improve the accessibility of healthcare delivery in the region (Proposed Final Decision, FF 56). Applicants take exception with this finding for several reasons.

First, any time a hospital adds a healthcare service it enhances access to care. Elective angioplasty is not available at Greenwich Hospital despite the fact that many patients attempt to access this service at the Hospital each year. These patients are denied access and as result, experience considerable stress and incur additional costs associated with the receipt elective angioplasty services elsewhere (CON Application, pp. 19-20, 32; Completeness Question Responses, pp. 589 & 599; Public Hearing Transcript, pp. 19, 66-67, 86, 119-120). Drs. Newman and Hjemdahi-Monsen indicated in their letters of support for this proposal that their patients desire local access to elective angioplasty services, access that is not currently available (Howes Testimony, pp. 675-676). If Greenwich had an elective angioplasty program, these individuals would have access to this critical healthcare service at the hospital of their choosing in their community, where care can be provided appropriately and safely – in this case, a hospital affiliated one of the nation's leading cardiac providers (Public Hearing Transcript, pp. 24, 92). This is improved accessibility of healthcare.

Moreover, while there are no current regulations that define "accessibility" for CON purposes, the former OHCA regulations define this term to include

"accessibility to medically underserved individuals who often experience the greatest difficult in obtaining equitable access to health services" (Regulations of Connecticut State Agencies, §19a-643-71). Increasing access to a hospital-based service inevitably increases access for the underserved, including uninsured individuals, as well as Medicare and Medicaid patients. As the payer mix projections in Applicants' CON submissions show, the Elective Angioplasty Program would be comprised of 45.9% Medicare/Medicaid patients and 5.4% uninsured patients (CON Application, p. 40).

c. Decline in Elective PCI Is Not Basis For Denial of CON

Section 19a-639(a)(8) of the General Statutes requires OHCA to consider and make findings regarding the "utilization of existing health care facilities and health care services" in the service area. In this regard, the Hearing Officer made findings with respect to the historic utilization of PCI services, which are set forth in Findings of Fact 38 through 42 and 55. Ultimately, the Hearing Officer found that Applicants had not provided sufficient evidence to support their projected PCI utilization and that historical elective PCI discharges in the service area do not support this proposal (Proposed Final Decision, FF 42 & 59). Applicants take exception with these findings.

Specifically, Applicants take exception with the Hearing Officer's conclusion that declining PCI volumes indicate that there is no clear public need for an Elective Angioplasty Program at Greenwich. As previously mentioned, Applicants have projected volume that is supported by evidence in the record. Applicants' volume projections are based on historical primary angioplasty

volume and elective angioplasty transfers, as well as an informal survey of referring physicians and letters from New York physicians indicating that they would perform cases at Greenwich if this CON is approved. These letters should be afforded the same weight, and considered equally as credible, as the letter from Susan Fox of White Plains, which the Hearing Officer cites throughout her decision (Proposed Final Decision, FF 13, 15 & 43).

Moreover, although PCI volume is declining, it was also declining leading up to 2006, when TSH was given permission to establish a full-service cardiac program including elective angioplasty (Borgstrom Rebuttal Testimony, pp. 699-701). Even with declining PCI volume and an elective angioplasty program at TSH, patients continue to present at Greenwich Hospital in consistent numbers each year in need of these services (CON Application, p. 19-22 & 32; Completeness Question Responses, p. 589; Public Hearing Transcript, p. 27). There is clearly a need for elective angioplasty in the Greenwich area among this patient population, which is not being met by area providers. In evaluating this proposal, OHCA should consider not only this need, but those same factors it considered in evaluating TSH's application – namely, whether the program would improve accessibility, quality and continuity of care (Borgstrom Rebuttal Testimony, pp. 701 & 732-733).

In addition, as mentioned above, the Hearing Officer's finding that TSH has the capacity to meet all community need for elective angioplasty is not supported by evidence in the record (Proposed Final Decision, FF 40). For these reasons, Applicants ask OHCA to find that utilization of elective PCI services – in

particular, the continued attempts by area residents to access these services at Greenwich Hospital – supports approval of this CON request. Finding of Fact 59, and any discussion related thereto, should be revised accordingly.

d. This Proposal Will Not Result in an Unnecessary Duplication of Services

OHCA is required by Section 19a-639(a)(9) to make findings with respect to whether a proposal results in the unnecessary duplication of existing healthcare services. Applicants take exception with the Hearing Officer's finding that they failed to show that unnecessary duplication of services will not result from the addition of elective angioplasty at Greenwich Hospital (Proposed Final Decision, FF 60). As previously mentioned, the Hearing Officer concedes in Finding of Fact 11 that there is virtually no overlap for cardiovascular services between Greenwich and TSH. The disparity in patient towns of origin is significant (Howes Testimony, pp. 668-671; Howes Rebuttal Testimony, pp. 762-763). If Greenwich and TSH are not providing cardiac services to the same patient populations, then the addition of an Elective Angioplasty Program at Greenwich will not result in the unnecessary duplication of services. Moreover, there is no evidence in the record that definitively establishes a service area for elective angioplasty at White Plains, therefore the Hearing Officer cannot conclude that a Greenwich program would duplicate services available at this New York hospital. As previously noted, the geographic proximity of programs is not sufficient evidence that services are duplicative and unnecessary at any given location. Connecticut has thriving cardiac programs at many hospitals in close proximity to each other (i.e. John Dempsey Hospital/Hartford Hospital/St. Francis Hospital &

Medical Center; Yale-New Haven Hospital/Bridgeport Hospital/St. Vincent's Medical Center).

In addition, there is evidence in the record that this proposal would in fact avoid the unnecessary duplication of services. As OHCA acknowledged in the Proposed Final Decision, payers and patients incur unnecessary costs of approximately $425,000 per year as a result of the need to be transferred from Greenwich Hospital to another provider for elective angioplasty (Proposed Final Decision, FF 47; CON Application, p. 40; Corvino Testimony, pp. 681-682; Public Hearing Transcript, pp. 30-31, 66-67 & 76). If Greenwich was authorized to provide this service, these duplicate procedures and costs would be avoided. For these reasons, OHCA should find that Applicants have adduced evidence that this proposal will not result in the unnecessary duplication of services. Finding of Fact 60, and any discussion related thereto, should be revised accordingly.

iii. OHCA's Decision Relied Too Heavily On The Clear Public Need Criteria

The Hearing Officer based her decision to deny Applicants' request for permission to establish an Elective Angioplasty Program at Greenwich almost entirely on her conclusion that there is no clear public need for the proposal. Even assuming this is the case, which Applicants dispute, the Hearing Officer should not have relied on one of the Section 19a-639(a) criteria to the exclusion of all others. As previously mentioned, Section 19a-639(a) requires OHCA to make written finding on each of the guidelines and principles set forth in the statute, but it does not require a specific level of compliance with every one of these criteria. Nor does it allow the agency to make decisions based on one of the criteria only or to fail to make findings on certain criteria. OHCA is obligated to review CON proposals based upon all of the factors that the

legislature deemed relevant and to base its decisions on the totality of evidence. Applicants have shown that there is a clear public need for an Elective Angioplasty Program at Greenwich and there is ample additional evidence in the record to support approval of this proposal. To deny Applicants' CON request would be clearly erroneous in view of the reliable, probative and substantial evidence on the whole record.

The Hearing Officer acknowledges that this proposal will potentially improve the quality and cost-effectiveness of cardiac care in the Greenwich area (Proposed Final Decision, FF 56). Enhanced quality of care is probably the most significant benefit of this CON proposal. The Greenwich Hospital cardiac program is part of the YNHHVC – an integrated model whereby the interventional cardiologists who perform angioplasty at Greenwich also perform cases at YNHH, the highest volume angioplasty provider with the most advanced cardiac program in the state (Proposed Final Decision, FF 3, 5 & 28; Borgstrom Testimony, p.. 672). The Hearing Officer does not give adequate weight to these key facts in recommending that the CON for an Elective Angioplasty Program at Greenwich be denied. Yet the practical effect of denial is to deprive Greenwich area residents in need of elective angioplasty of local access to the resources and professional expertise of the YNHHVC.

Moreover, both the quality and cost-effectiveness of care are enhanced by having an Elective Angioplasty Program at Greenwich, which avoids the need for patient transfers and duplicate procedures (Proposed Final Decision, FF 56). As Dr. Henry Cabin, Clinical Chief of Cardiology at the Yale University School of Medicine and Medical Director of the YNHHVC, testified at the public hearing on this matter, elective angioplasty would be performed at Greenwich Hospital by the exact same physicians who perform the procedure at YNHH, and it can be done as safely at Greenwich as at YNHH (Public Hearing Transcript, p. 60). It therefore

makes little sense, either from a cost or patient safety perspective, to deny patients local access to these services (Public Hearing Transcript, p. 60).[5]

As discussed above, the evidence demonstrates that the Elective Angioplasty Program will also improve the accessibility of cardiac care in the region. Increased patient access is inextricably linked with issues of quality and cost-effectiveness of care. Providing patients with local access to care is not just a convenience issue. It will truly enhance the quality of care for those patients who will continue to present at Greenwich in need of elective angioplasty, and who will insist that these services be provided by the highly qualified and experienced physicians and staff of the YNHHVC. As noted above, it makes little sense to allow the Greenwich-based YNHHVC physicians to perform elective angioplasty on Greenwich patients in New Haven, but not in their own community.

Increased access will also have a positive impact on the costs associated with obtaining and providing angioplasty services. OHCA cannot ignore the fact that when patients need to be transferred from Greenwich to another facility for elective angioplasty, which could safely and competently be performed at Greenwich, this costs patients, payers and the system as a whole more money. In addition, the Primary Angioplasty Program at Greenwich is a necessary but extremely costly program to operate on a continuous basis. The addition of an Elective Angioplasty Program at Greenwich, with more procedure volume over which to spread these fixed costs, will make the provision of angioplasty services more cost-effective for the Hospital. All of this will in turn have a positive financial impact on Greenwich Hospital and the state's healthcare system.

---

[5] The Hearing Officer does not appear to be concerned, from a quality perspective, with the lack of onsite surgical backup at Greenwich. In fact, she suggests that White Plains, which has an elective angioplasty program without onsite surgery, is an appropriate alternative provider to meet the demand for these services in the Greenwich area.

Moreover, the Elective Angioplasty Program at Greenwich will not result in the unnecessary duplication of services because, as the evidence in the record clearly shows, there is minimal overlap in the cardiovascular patient populations at Greenwich and TSH. While it is true that PCI volume is in moderate decline, the present situation is no different that the situation that existed in 2006, when OHCA approved TSH's request for a CON to establish a full-service cardiac program. OHCA approved that application based upon factors including improved accessibility, quality and continuity of care – these are the same factors that support approval of Applicants' request. Applicants ask OHCA to reconsider and acknowledge the substantial benefits to patients, payers and the healthcare system that will result from a Final Decision approving this proposal.

B. Approval of This CON Is Sound Public Policy & Consistent With OHCA's Mission

Approving Applicants' request to establish an Elective Angioplasty Program at Greenwich Hospital is consistent with OHCA's statutory mission to promote the availability of cost-effective care and to ensure the financial strength of the healthcare delivery system in this state (Conn. Gen. Stat, Section 19a-637). The Hearing Officer's suggestion that White Plain has capacity to handle patients (presumably including Connecticut residents) in need of elective angioplasty is contrary to OHCA's mission in that it encourages the outmigration to New York of healthcare services and revenues. This is particularly troubling at a time when Connecticut hospitals are experiencing rising costs and declining revenue, all while trying to maintain their ability to provide core hospital services to their communities.

In addition, denial of this CON Application limits patient choice for critical health care services. Greenwich area residents have spoken and their preference is to obtain cardiac services through Greenwich Hospital and the YNHHVC. Given the nature of the services involved,

patients should not be forced to obtain care at an alternate provider. Moreover, patients should not be placed in a situation where they are expected to travel unreasonably long distances to obtain elective angioplasty services at the provider of their choosing.

IV. Requested Relief

In light of the foregoing, Applicants respectfully request the following relief:

- That OHCA revise the various Findings of Fact listed in the Exceptions section above, and any language within the Discussion section of the Proposed Final Decision based on the erroneous factual findings.

- That OHCA determine, specifically, that there is a clear public need for this proposal, that it will enhance the accessibility, quality and cost-effectiveness of healthcare and improve the financial strength of the healthcare delivery system, and that it will not result in the unnecessary duplication of services.

- That OHCA issue a Final Decision approving Applicants' request for a CON to establish an Elective Angioplasty Program at Greenwich Hospital.

In the alternative, Applicants ask that OHCA consider granting provisional approval of the proposed Elective Angioplasty Program under whatever terms the agency and Applicants agree are necessary to measure the need for this program and its impact on the healthcare delivery system. Any provisional approval might be similar to the approval given for the Primary Angioplasty Program at Greenwich (see Docket No. 03/08-30148), via Agreed Settlement, which included initial approval for a period of three years in order to validate that Applicants' projections (and minimum ACC/AHA/SCAI Guidelines volumes) had been

achieved. Applicants would agree to submit volume data to OHCA so that a similar analysis can be undertaken regarding the Elective Angioplasty Program. OHCA could also collect and analyze outcome and other relevant data to determine whether the proposal has met the programmatic requirements of the ACC/AHA/SCAI Guidelines. The submission of data would allow the agency to evaluate the proposed Elective Angioplasty Program at Greenwich Hospital and determine whether it should be given permanent status. Applicants are confident that all projections will be met and all measure will be achieved, proving that the proposal is necessary and fulfills the guidelines and principles set forth in Section 19a-639(a).

V. Conclusion

For all of the foregoing reasons, Applicants urges the Deputy Commissioner to revise the Findings of Fact and issue a Final Decision approving the proposed Elective Angioplasty Program at Greenwich Hospital. In the alternative, Applicants welcome a conversation with OHCA staff regarding the possibility of a provisional approval that will allow the agency to validate the need for the proposal and its impact on the accessibility, quality and cost-effectiveness of healthcare – cardiovascular services in particular – in the Greenwich Area. This program is critical to Greenwich Hospital patients and the time has come for it to be approved.

Respectfully Submitted,

GREENWICH HOSPITAL

STATE OF CONNECTICUT

DEPARTMENT OF PUBLIC HEALTH

TESTIMONY PRESENTED BEFORE THE COMMITTEE ON PUBLIC HEALTH
March 7, 2012

Kimberly Martone, Director of Operations, Office of Health Care Access, 860-418-7029

House Bill – Bill 5321 - An Act Concerning the Office of Health Care Access and the Certificate of Need Process

---

The Department of Public Health would like to provide the following information in favor of House Bill 5321. We thank the Committee for choosing to take up the Department's proposal. Below is information on the provisions contained in the bill.

Section 1

The Department's Office of Health Care Access (OHCA) is proposing to replace the phrase "how the proposal will impact the financial strength of the health care system in the state" within §19a-639(a)(4) of the General Statutes with "that the proposal is financially feasible for the applicant." In evaluating Certificate of Need (CON) applications, OHCA can verify and measure the effect a CON proposal has on the applicant by reviewing the financial status of the applicant; however, OHCA does not have the data to properly evaluate the financial impact of the CON proposal on the state's health care system. Moreover, CON applicants struggle to produce evidence demonstrating the impact of the proposal on the state's health care system. It is also worth noting that the majority of the CON proposals received and reviewed by OHCA over the past year involve the acquisition of imaging equipment, the establishment of substance abuse/mental health services, and transfer of ownership of a health care facility. Such proposals do not lend themselves to an easy demonstration of their impact on the financial strength of the health care system statewide.

Prior to the changes implemented under Public Act 10-179, OHCA evaluated the financial feasibility of the proposal rather than looking at the impact on the entire state. This financial feasibility evaluation is a more realistic guideline and most applicants are able to produce financial documents and analysis demonstrating that a particular proposal is financially feasible.

Section 2

OHCA proposes to amend the proposed language in this section by deleting "after the date the office closes the public hearing" in line 49 and substituting "following the close of the hearing record." This is to clarify the closing of the hearing record as opposed to the actual public hearing. At the public hearing, OHCA often orders additional evidence be provided after the public hearing has ended. Once the information is received by OHCA, it then *closes* the hearing record through a letter. Therefore, the proposed language clarifies when the hearing record is legally closed as well as the day on which the 60 day review period for OHCA to render a decision begins.

IN THE MATTER OF:

An Application for a Certificate of Need filed Pursuant to Section 19a-638, C.G.S. by:	Notice of Agreed Settlement Office of Health Care Access Docket Number: 12-31768-CON

Lawrence & Memorial Hospital

To:

Ms. Shraddha Patel
Director of Business Development & Planning
Lawrence & Memorial Hospital
365 Montauk Avenue
New London, CT 06320

Dear Ms. Patel:

This letter will serve as notice of the approved Certificate of Need Application in the above-referenced matter. On February 4, 2013, the Agreed Settlement, attached hereto, was adopted and issued as an Order by the Department of Health, Office of Health Care Access.

Kimberly R. Martone
Director of Operations

Enclosure

Office of Health Care Access

Certificate of Need Application

Agreed Settlement

Applicant:	**Lawrence & Memorial Hospital** **365 Montauk Avenue, New London, CT 06320**
Docket Number:	**12-31768-CON**
Project Title:	**Establish and Operate an Elective Angioplasty Program at Lawrence & Memorial Hospital**

Project Description: Lawrence & Memorial Hospital proposes to establish and operate an elective angioplasty program without onsite surgical backup at Lawrence & Memorial Hospital, with no associated capital expenditure.

Nature of Proceedings: On August 31, 2012, the Office of Health Care Access ("OHCA") received a completed Certificate of Need ("CON") application from Lawrence & Memorial Hospital to establish an elective angioplasty program without onsite backup at Lawrence & Memorial Hospital, with no associated capital expenditure. Lawrence & Memorial Hospital published notice of its intent to file the CON Application in *The Day,* on April 30, May 1 and 2, 2012. A public hearing regarding the CON application was held on December 13, 2012. On December 4, 2012, the Applicants were notified of the date, time and place of the hearing. On November 26, 2012, a notice to the public announcing the hearing was published in *The Day*.

Attorney Kevin Hansted was the designated hearing officer in this matter. The hearing was conducted as a contested case in accordance with the provisions of the Uniform Administrative Procedure Act (Chapter 54 of the General Statutes) and Conn. Gen. Stat. § 19a-639a. OHCA's authority to review and approve, modify or deny this proposal is established by Conn. Gen. Stat. § 19a-638. These provisions, as well as the principles and guidelines set forth in Conn. Gen. Stat. § 19a-639, were fully considered by OHCA in its review.

Findings of Fact

1. Lawrence & Memorial Hospital is a not-for-profit 280-bed acute care hospital located at 365 Montauk Avenue in New London, Connecticut and a health care facility or institution as defined by Conn. Gen. Stat. §19a-630. Ex. A. 9

2. Lawrence & Memorial Hospital proposes establishing and operating an elective angioplasty[1] program without onsite backup.

3. The proposed elective PCI program will be supported by a collaborative relationship with Yale-New Haven Hospital and Yale School of Medicine. Ex. A, p. 9.

4. Yale-New Haven Hospital is a not-for-profit, 944-bed acute care hospital located in New Haven, Connecticut. Yale-New Haven Hospital is a full service (i.e., cardiac catheterization[2], angioplasty and open-heart surgery) cardiac provider.

5. The proposed elective PCI program would build upon Lawrence & Memorial's primary[3] PCI program (approved by OHCA in Docket Number: 04-30297-CON) and would employ the same cardiac interventionalists, equipment, staff and facilities. Ex. A, p. 9.

---

[1]Elective (Scheduled) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure performed in a catheterization laboratory whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.
Source: DPH/OHCA Statewide Facility and Services Plan Chapter 3.

[2] Cardiac catheterization is defined as a medical procedure requiring the passage of a catheter into one or more cardiac chambers of the left and right heart, with or without coronary arteriograms, for the purpose of diagnosing congenital or acquired cardiovascular disease, or for determining measurement of blood pressure flow.
Source: DPH/OHCA Statewide Facility and Services Plan Chapter 3

[3] Primary (emergent) Percutaneous Coronary Intervention (PCI) or Coronary Angioplasty (PCA) is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a previously diagnosed blockage in the heart. An expandable balloon is passed to this spot and inflated several times, thereby flattening the blockage-causing plaque, potentially widening the artery, and thus improving blood flow.
Source: DPH/OHCA Statewide Facility and Services Plan Charter 3.

6. Lawrence & Memorial Hospital has submitted the following agreements, policies and protocols:
   - Patient selection guidelines policies (*Attachment F*)
   - Policies and Procedures for PCI Procedure (*Attachment F*)
   - Joint quality assurance reviews process and training between Lawrence & Memorial Hospital and Yale-New Haven Hospital (*Attachment I*)
   - Transfer Protocol and Agreement between Lawrence & Memorial Hospital and Yale-New Haven Hospital (*Attachment I*)
   - Yale-New Haven Hospital Department of Surgery surgical backup policy for the Lawrence & Memorial Hospital elective PCI program (*Attachment I*)

   Ex. A. p. 37-38

7. Lawrence & Memorial Hospital has a primary tertiary cardiac referral relationship with Yale-New Haven Hospital whereby Yale-New Haven Hospital provides surgical backup to Lawrence & Memorial Hospital. Since the establishment of the primary PCI program in 2009, 98% or 545 out of 555 transfers from Lawrence & Memorial Hospital to other acute care hospitals for advanced cardiac services were to Yale-New Haven Hospital. Ex. A. p. 23

8. The proposed elective PCI program will be developed and managed by Lawrence & Memorial Hospital in collaboration with Lawrence & Memorial Hospital Physician Association, Inc. in order to achieve clinical quality and outcomes that meet or exceed national standards. Ex. A. (*Attachment I*) p. 425

9. The proposed elective PCI service will be performed in Lawrence & Memorial Hospital's two existing and fully functioning diagnostic cardiac catheterization laboratories by interventional cardiologists on staff at Lawrence & Memorial Hospital and Yale-New Haven Hospital/Yale School of Medicine. Ex. A. pp. 26, 531

10. The proposed elective PCI program will augment existing primary PCI services as well as inpatient and outpatient cardiac services at Lawrence & Memorial Hospital which include:
    - Coronary Care and Telemetry Unit (25 beds)
    - Coronary Intensive Care Unit (10 beds)
    - Diagnostic cardiac catheterization (2,400 procedures completed between 2009 and 2011)
    - Interventional Radiology Laboratory
    - Pacemaker Insertions and Evaluation
    - Implantable Cardiac Defibrillator (ICD) Insertions and Evaluation
    - Vascular and Thoracic Surgery
    - Cardiac Rehabilitation
    - Cardiac Imaging Services including CT (64-slice scanner) and MRI (3.0 Tesla) scanner
    - Direct audio/video link between Lawrence & Memorial Hospital and Yale-New Haven Hospital
    - Stress testing (Exercise and Echocardiogram)
    - Nuclear stress testing (Stress, Rest, Pharmacological)
    - Echocardiography

- 24- Hour Holter monitoring and 30-Day Event Monitoring
- Tilt table studies
- Echocardiograms
- Outpatient cardiovascular care
- Community education programs

Ex. A. pp. 26-27, 532

11. Lawrence & Memorial Hospital defined the population to be served through this proposal as being represented by the towns that are part of the primary ("PSA") and secondary ("SSA") service area, which comprise 75% of Lawrence & Memorial Hospital's inpatient volume ("Proposed Service Area"):

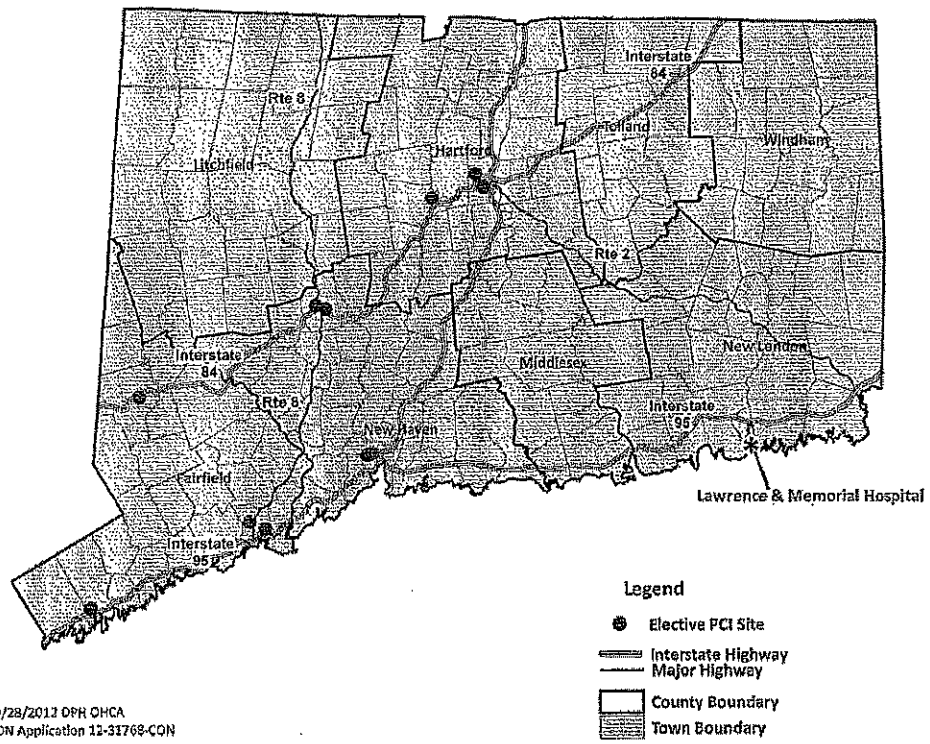
Table 1: Primary and secondary service area

PSA	SSA
East Lyme	Bozrah
Groton	Colchester
Ledyard	Franklin
Lyme	Griswold
Montville	Lisbon
New London	Old Saybrook
Old Lyme	Preston
Stonington	Norwich
North Stonington	Salem
Waterford	Voluntown
	Westerly (RI)

Ex. A. p. 27

12. The map below shows New London County's geographical isolation from facilities that perform elective PCI procedures for patients residing in southeastern Connecticut.

Sites that Offer Elective Percutaneous Coronary Intervention (PCI) in Connecticut



13. Travel distances from Lawrence & Memorial Hospital to the nearest existing full-service cardiac providers are as follows:

Table 2: Mileage from Town of New London to closest facilities

Hospital	City, State	Miles from Town of New London
YNHH	New Haven, CT	49
St. Francis Hospital	Hartford, CT	48
Hartford Hospital	Hartford, CT	49
Miriam Hospital	Providence, RI	61

Ex. A. p. 20

14. A study by the Robert Wood Johnson Foundation in 2012 evaluating the health of Connecticut communities indicated that New London County had higher than state and national rates of adult smoking and obesity and also exceeded state and national benchmarks with respect to the ratio of the population to primary care physicians and preventable hospitalizations. Below are the key statistics from the study that relate to cardiac health.

Table 3: Key statistics

	New London County	Connecticut	United States Benchmark
Health Behaviors			
Adult Smoking	19%	16%	14%
Adult Obesity	24%	23%	21%
Clinical Care			
Primary Care Physicians	1,098:1	729:01:00	631:01:00
Preventable Hospital Stays	70	63	49

Source: Robert Wood Johnson Foundation, County Health Rankings & Roadmaps (http://www.countyhealthrankings.org/#app/).
Ex. A. pp. 538-539

15. Lawrence & Memorial Hospital presented heart disease death rate and hospitalization data provided by the Centers for Disease Control and Prevention. According to these data, New London County has high heart disease death and hospitalization rates. Coupled with the lack of elective PCI services in Lawrence & Memorial's service area and New London County, these data further demonstrate the area's need for elective PCI. Ex. A. pp. 30-31, 539

16. Age is another key risk factor for coronary heart disease. Lawrence & Memorial Hospital states that cardiovascular disease is the leading cause of death in the state for residents aged 85+ and the second leading cause of death for residents ages 65-84. Data presented by Lawrence & Memorial Hospital shows that the overall population within Lawrence & Memorial Hospital's proposed service area is expected to increase by 1.6% in 2015. However, the rate of growth in the age groups (65-74) and (85+) is expected to increase by 18.4% and 14.3%, respectively, in 2015. The table below represents the demographic characteristics within Lawrence & Memorial Hospital's Proposed Service Area.

Table 4: Total Service Area Population Statistics

Age Cohort	2010	2015	% Change
0-44	170,507	165,257	-3.10%
45-54	45,925	45,447	-1%
55-64	33,181	39,230	18.20%
65-74	20,345	24,084	18.40%
75-84	14,473	14,225	-1.70%
85+	6,637	7,587	14.30%
Total	**293,078**	**297,845**	**1.60%**

Ex. A. p. 31-32

17. The physicians who will participate in the proposed elective PCI program currently perform PCI procedures at both Lawrence & Memorial Hospital and Yale-New Haven Hospital and provide on-call coverage for Lawrence & Memorial Hospital's existing primary PCI program. Ex. A. p. 524

18. Lawrence & Memorial Hospital does not anticipate an expansion in the physician referral base either geographically or in terms of quantity of physicians in the service area. Lawrence & Memorial Hospital's volume projections in the initial CON filing were not based on assumptions regarding new physicians in the market or an expansion of Lawrence & Memorial Hospital's geographic reach beyond the existing service area. Rather, Lawrence & Memorial Hospital's volume projections were based on actual data of transfers from Lawrence & Memorial Hospital's catheterization lab to Yale-New Haven Hospital for elective PCI and, in the future, the retention of select patients (i.e., non-high risk patients) that could remain at Lawrence & Memorial Hospital for their elective PCI procedure. Ex. A. p. 524

19. Lawrence & Memorial Hospital's historical volume of diagnostic cardiac catheterizations and volume transferred same day for elective PCI since 2009 is as follows:

Table 5: Lawrence & Memorial Hospital Diagnostic Catheterization Volume and Volume Transferred Same Day for Elective PCI

Fiscal Year	Total Diagnostic Caths	Total Patients Transferred for Elective PCI	Location of Transfer		
			YNHH	St. Francis	Hartford Hospital
2009	810	168	161	7	0
2010	858	200	198	2	0
2011	724	138	137	1	0
2012*	266	49	49	0	0

*Note: Represents actual volumes for FY 2012 (10/1/11 through 03/01/12) Ex. A. p.23

20. Lawrence & Memorial Hospital's historical volume for primary or emergent PCI is shown in the following table:

Table 6: Total Primary PCI Cases at Lawrence & Memorial Hospital

Program	FY 2009	FY 2010	FY 2011	Actual FY 2012*	Annualized FY 2012
Primary PCI	78	81	74	44	88

*Note: Represents actual volumes for FY 2012 (10/1/11 through 03/01/12)
Ex. A. p. 40

21. Projected volume for elective PCI at Lawrence & Memorial Hospital is shown in the table below:

Table 7: Total projected PCI cases at Lawrence & Memorial Hospital

Program	FY 2013	FY 2014	FY 2015
Primary PCI	89	89	89
Elective PCI	73	130	135
Total	162	219	224

Ex. A. p. 40

22. The 2011 ACCF/AHA/SCAI[4] Guidelines for PCI recommend criteria and standards for the performance of angioplasty at hospitals without on-site cardiac surgery. All of these criteria and standards will be utilized by Lawrence & Memorial Hospital. Ex. A. pp. 12-13

23. The CPORT-E[5] (Cardiovascular Patient Outcomes Research Team Elective) study indicates that programs with case totals over 200 have sufficient volume to sustain a quality and safe emergent and elective PCI program. Lawrence & Memorial Hospital is projected to exceed 200 total cases in Year 2 of operation. Ex. A. pp. 40, 44

24. The following data from OHCA's Acute Care Hospital Inpatient Discharge Database ("HIDD") represents OHCA's market share analysis of the Lawrence & Memorial service area for fiscal year 2011.

[4] The American College of Cardiology Foundation (ACCCF) / The American Heart Association Task Force on Practice Guidelines (AHA) / The Society for Cardiovascular Angiography and Intervention (SCAI)

[5] CPORT-E is a randomized trial, concluded on March 31, 2011, comparing medical, economic and quality of life outcomes of non-primary PCI at hospitals with and without on- site cardiac surgery. Source: http://my.americanheart.org/idc/groups/ahamah-public/@wcm/@sop/@scon/documents/downloadable/ucm_433712.pdf

Table 8: Service Area Discharge Data & Market Share

	FY 11			
Town	Total Town Discharges	Total Lawrence & Memorial Discharges	% of Hospital Discharges	Share of Town
Primary Service Area				
New London	4,040	3,390	22%	84%
Groton	5,341	4,266	28%	80%
Waterford	2,665	2,047	13%	77%
East Lyme	1,845	1,332	9%	72%
Stonington	722	475	3%	66%
Ledyard	1,470	835	5%	57%
Montville	2,345	863	6%	37%
Old Lyme and Lyme	912	251	2%	28%
Secondary Service Area				
Norwich	5,667	464	3%	8%

Source: OHCA's Acute Care Hospital Inpatient Discharge Database ("HIDD")

25. Per 2011 ACCF/AHA/SCAI guidelines and recommendations, Lawrence & Memorial Hospital participates in the ACC-NCDR PCI registry for quality assurance and benchmarking for its emergent PCI program. Lawrence & Memorial Hospital will continue to submit data to the ACC registry in order to ensure quality outcomes for its proposed elective PCI program. Ex. A. p. 49

26. Yale-New Haven Hospital, a full cardiac service provider, will be the receiving facility for patients from Lawrence & Memorial Hospital that require surgical intervention. Ex. A. p. 522

27. Lawrence & Memorial Hospital states that since the inception of Lawrence & Memorial Hospital's primary PCI program in 2005 there have been 13 total mortalities including patients who expired due to non-cardiac deaths (e.g., pre-existing conditions such as infections, neurological conditions, etc.). The 13 total deaths translate into a 4.1% mortality rate. This outcome is favorable compared to data from the 2011 ACCF/AHA/SCAI guidelines indicating a national in-hospital mortality rate of 4.81% in ST-segment elevation myocardial infarction (STEMI) patients that required primary PCI intervention. Ex. A. p. 47.

28. Lawrence & Memorial Hospital's proposed elective PCI program would utilize the same Yale-New Haven Hospital/Yale School of Medicine interventionalists and same clinical staff (catheterization laboratory technicians, nurses, etc.) that currently support the emergent PCI program. Lawrence & Memorial Hospital's Medical Director of its Primary Angioplasty Program and of the proposed elective program is five years post-fellowship training and has performed over 500 PCI procedures. Ex. A. p. 527

29. Lawrence & Memorial Hospital has asserted that elective PCI at Lawrence & Memorial Hospital would increase quality of care as patients who are currently transferred from Lawrence & Memorial Hospital to another facility for elective PCI are at enhanced risk of infections, bleeding complications, and other adverse events associated with multiple procedures at two facilities. Ex. A. p. 527

30. Eliminating transfers for elective PCI would reduce costs to the health care system from duplicate testing and redundant costs for dyes, catheters, surgical trays, and other supplies. Ex. A. p. 527

31. The November 2011 ACCF/AHA/SCAI Practice Guidelines note a location for elective PCI without on-site surgery is the one that "will clearly fill a void in the healthcare needs of the community" and "the cardiology community [should] foster "the [elective PCI without on-site surgery] programs…when such programs improve access to a higher level of cardiovascular care than would otherwise be available." Ex. A. Attachment B/ *2011 ACCF/AHA/SCAI Clinical Practice Guidelines*

32. Lawrence & Memorial Hospital has stated that it will adhere to strict patient selection criteria recommended by ACCF/AHA/SCAI in determining which patients are eligible to receive elective PCI at Lawrence & Memorial Hospital. According to SCAI, non-high risk patients are the best candidates for elective PCI without on-site cardiac surgery and, therefore, Lawrence & Memorial Hospital will only perform procedures on these patient types. Ex. A. pp. 36, 526

33. Lawrence & Memorial Hospital currently finances its primary PCI program through an annual fee of $1.45 million paid to Yale-New Haven Hospital. Adding elective PCI would reduce the cost per case while utilizing the same Yale-New Haven Hospital physicians to perform both elective and primary cases. Ex. A. pp. 53, 524

34. This proposal will not incur any additional capital or overhead costs thereby improving the cost effectiveness of the PCI service. Ex. A. p. 52

35. Lawrence & Memorial Hospital's current and three year projected payer mix is below.

Table 9: Patient Population Mix

	Current** FY 2012	Year 1 FY 2013	Year 2 FY 2014	Year 3 FY 2015
Medicare*	46.90%	46.90%	46.90%	46.90%
Medicaid*	10.00%	10.00%	10.00%	10.00%
CHAMPUS & TriCare	0.00%	0.00%	0.00%	0.00%
Total Government	**56.90%**	**56.90%**	**56.90%**	**56.90%**
Commercial Insurers*	41.90%	41.90%	41.90%	41.90%
Uninsured	1.30%	1.30%	1.30%	1.30%
Workers Compensation	0.00%	0.00%	0.00%	0.00%
Total Non-Government	**43.10%**	**43.10%**	**43.10%**	**43.10%**
Total Payer Mix	**100.00%**	**100.00%**	**100.00%**	**100.00%**

Ex. A. p. 51

36. OHCA is currently in the process of establishing its policies and procedures as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations adopted by OHCA. (Conn. Gen. Stat. § 19a-639(a)(1))

37. This CON application was deemed complete by OHCA prior to the state-wide health care facilities and services plan being published. Therefore, OHCA has not made any findings as to the relationship between this CON application and the state-wide health care facilities and services plan. (Conn. Gen. Stat.§ 19a-639(a)(2))

38. Lawrence & Memorial Hospital has satisfactorily demonstrated that there is a clear public need for its proposal. (Conn. Gen. Stat. § 19a-639(a)(3))

39. Lawrence & Memorial Hospital has satisfactorily demonstrated that its proposal is financially feasible. (Conn. Gen. Stat. § 19a-639(a)(4))

40. Lawrence & Memorial Hospital has satisfactory demonstrated that its proposal would improve quality, accessibility and cost effectiveness of health care delivery in the region. (Conn. Gen. Stat. § 19a-639(a)(5))

41. Lawrence & Memorial Hospital has shown that there would be improvements to the provision of health care services to the relevant populations and payer mix. (Conn. Gen. Stat. § 19a-639(a)(6))

42. Lawrence & Memorial Hospital has satisfactorily identified the population to be served by their proposal and satisfactorily demonstrated that said population has a need as proposed. (Conn. Gen. Stat. § 19a-639(a)(7))

43. There are no existing elective PCI programs in Lawrence & Memorial Hospital's service area. Therefore, OHCA has not made any findings as to the utilization of existing elective PCI programs in the service area. (Conn. Gen. Stat. § 19a-639(a)(8))

44. Lawrence & Memorial Hospital has satisfactorily demonstrated that the proposal would not result in an unnecessary duplication of existing or approved elective PCI services. (Conn. Gen. Stat. § 19a-639(a)(9))

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in Conn. Gen. Stat. § 19a-639(a). The Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Goldstar Medical Services, Inc., et al. v. Department of Social Services,* 288 Conn. 790 (2008).

Lawrence & Memorial Hospital is a not-for-profit 280-bed acute care hospital located in New London, Connecticut and a health care facility or institution as defined by Conn. Gen. Stat. § 19a-630. Lawrence & Memorial Hospital proposes to establish and operate an elective PCI program without onsite cardiac surgical backup. *FF.1-2.*

November 2011 ACC/AHA/SCAI PCI practice guidelines state that "it is only appropriate to consider initiation of a PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community." *FF 32.* The guidelines note that competition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interests of the community." Lawrence & Memorial Hospital, located in New London County, is geographically isolated in terms of elective PCI accessibility, as there are no facilities that perform elective PCI procedures in Lawrence & Memorial Hospital's service area or within southeastern Connecticut. *FF. 12.* Specifically, the closest facility offering full cardiac services in Connecticut is 48 miles away from New London. *FF.13.* Thus, the proposed elective PCI program will not duplicate or overlap any of the existing programs in the state.

In addition to geographic isolation, there are several New London County and/or Lawrence & Memorial Hospital service area population characteristics which indicate that such a program would be beneficial to residents. First, New London County residents have high heart disease death and hospitalization rates. *FF 15.* Second, age is a key risk factor for heart disease, and the 2015 rate of growth expected for Lawrence & Memorial Hospital service area's aging population is significantly higher than for the area as a whole. *FF16.* Third, New London County residents' smoking, obesity, and preventable hospitalization rates exceed both state and national health rates, according to a 2012 Robert Wood Johnson Foundation study. *FF14.* Furthermore, the ratio of the population to primary care physicians in New London County is high. A high ratio implies reduced ability to meet demand for primary care services, which may negatively affect the health of a community, as treatment for needed services may be delayed or not sought at all. Residents with cardiovascular disease or coronary heart disease may remain undiagnosed without an adequate base of primary care to order diagnostics or refer patients to cardiologists. *FF.14.*

The proposed program would build upon Lawrence & Memorial Hospital's primary PCI program and would utilize the same experienced cardiac interventionalists, equipment, clinical staff and facilities. *FF.5.* The elective PCI program will be supported by a collaborative relationship with Yale-New Haven Hospital, which is the Lawrence & Memorial Hospital's primary tertiary cardiac referral site. *FF.3.* Since the establishment of its primary PCI program in 2009, 98% of transfers from Lawrence & Memorial Hospital to other acute care hospitals for advanced cardiac services were to YNHH. *FF7.* Lawrence & Memorial Hospital's projected

volume is reasonable to sustain a quality and safe elective PCI program which is needed for patients residing in southeastern Connecticut. The above facts, coupled with the observation that Lawrence & Memorial Hospital's mortality rate compares favorably to the mortality rate published in the 2011 ACCF/AHA/SCAI guidelines, further support the establishment of an elective PCI program by Lawrence & Memorial Hospital. *FF28.*

This proposal is cost effective, as it will not incur any capital or overhead costs because it will build upon Lawrence & Memorial Hospital's existing primary PCI program as it will utilize the same cardiac interventionalists, equipment, staff and facilities. *FF.34-35.*

Based on foregoing, OHCA has determined that approval of the proposed elective PCI program will improve the accessibility and quality of care for patients residing in southeastern Connecticut. Lawrence & Memorial Hospital's proposal will bring appropriate access to needed elective PCI services within a reasonable travel time and improve the quality of cardiac services in a region that fares worse than the state as a whole in terms of health outcomes, health factors and limited access to primary care.

There is a substantial question as to L&M's emergency transfer protocol's compliance with the Memorandum of Decision for Declaratory Ruling Proceeding Concerning the Provision of Emergency Medical Services (February 14, 2003). Therefore, OHCA is not making any determination as to L&M's emergency transfer protocol in terms of compliance with existing state and federal laws. OHCA is referring the protocol to the Office of Emergency Medical Services for its review and consideration.

ORDER

NOW, THEREFORE, the Department of Public Health, Office of Health Care Access, and Lawrence & Memorial Hospital hereby stipulate and agree to the terms of settlement with respect to establishment an elective angioplasty program without onsite surgical backup at Lawrence & Memorial Hospital, as follows:

Lawrence & Memorial Hospital is required to fulfill the following conditions for the first seven (7) years from commencement of the Elective Angioplasty program. At the end of the 7 year period, the Office of Health Care Access reserves the right to continue requiring any of the listed conditions if Lawrence & Memorial Hospital is not performing total PCI procedures above the minimum recommended volumes prescribed by the America College of Cardiology/American Heart Association at that time.

1. Lawrence & Memorial Hospital shall submit on a quarterly basis to OHCA the following reports which must be submitted within thirty (30) calendar days of the end of each quarter:
   a. Elective and Emergency PCI performed each quarter by town of patient origin, in a format to be specified.
   b. Elective and Emergency PCI performed each quarter, broken out by inpatient and outpatient, in a format to be specified.
   c. The number of patients transferred to another hospital for cardiac treatment as a direct result of Emergency and/or Elective PCI at Lawrence & Memorial Hospital. Details to include:
      i. The cause/reason for transfer;
      ii. The name of the facility to which the patient was transferred; and
      iii. The actual time-line beginning with the reason for transfer, including the transportation time and the actual procedure administered at the facility to which the patient was transferred.

2. Reports a through c above shall not include patient identifiable data.

3. Based on OHCA's review of this quarterly data, the Office may request a meeting with Lawrence & Memorial Hospital to discuss the data submitted.

4. If Lawrence & Memorial Hospital does not perform the minimum number of elective PCIs within twelve months of the initiation of the elective PCI program, as recommended by America College of Cardiology/American Heart Association, Lawrence &Memorial Hospital shall submit monthly reports of the number of elective PCIs arrayed by physician to OHCA until such time as these volumes are met by Lawrence & Memorial Hospital or until it meets with OHCA to discuss a plan that will adhere to the quality standards recommended by the American College of Cardiology/American Heart Association.

5. Lawrence & Memorial Hospital shall participate in the ACC National Cardiovascular Database Registry (ACC-NCDR) and report all data including the optional follow-up section. Lawrence and Memorial Hospital shall provide OHCA quarterly data reports from ACC-NCDR. Data must be reported to OHCA thirty (30) calendar days subsequent to Lawrence & Memorial Hospital receiving the reports from ACC. Lawrence & Memorial Hospital is required to comply with the ACC/AHA criteria and standards. If Lawrence and Memorial Hospital determines not to participate in the ACC-NCDR, Lawrence & Memorial Hospital shall notify OHCA immediately, and continue to comply with the ACC/AHA criteria and standards. This condition supersedes Condition 3 of Docket Number 04-30297-CON, as modified by Docket Numbers 06-30297-MDF and 08-30297-MDF

6. The Office of Health Care Access and Lawrence & Memorial Hospital agree that this Agreed Settlement represents a final agreement between the Office of Health Care Access and Lawrence & Memorial Hospital with respect to Docket No. 12-31768-CON. The execution of this Agreed Settlement resolves all objections, claims and disputes, which may have been raised by Lawrence & Memorial Hospital with regard to Docket Number 12-31768-CON.

7. This Agreed Settlement is an order of the Office of Health Care Access with all the rights and obligations attendant thereto, and the Office of Health Care Access may enforce this Agreed Settlement under the provisions of Conn. Gen. Stat. §§ 19a-642 and 19a-653 with all fees and costs of such enforcement being the responsibility of Lawrence & Memorial Hospital.
