

Cardiovascular Diseases Premature Mortality Connecticut Residents

2021 Connecticut Department of Public Health Death Registry Database

Community, Family Health and Prevention Section • June 2023

Years of potential life lost (YPLL) is a measure of premature mortality, or deaths before age 75. The cutoff is set at 75 years because this age is below the normal life expectancy.

Age-adjusted YPLLs for cardiovascular diseases, heart disease, coronary heart disease, stroke, and heart failure vary by gender and race and ethnicity. The YPLLs among Connecticut men are higher compared with women for cardiovascular diseases, heart disease, coronary heart disease and heart failure. Non-Hispanic Black residents have the highest YPLLs for cardiovascular diseases, heart disease, coronary heart disease, stroke, and heart failure.

Heart Disease

Age-adjusted YPLL per 100,000 population

Stroke

Age-adjusted YPLL per 100,000 population

Cardiovascular Diseases

Age-adjusted YPLL per 100,000 population

Coronary Heart Disease

Age-adjusted YPLL per 100,000 population

Heart Failure

Age-adjusted YPLL per 100,000 population

*Not reported because of the small number of deaths under the age of 75 years.
