COMMERCIAL FERTILIZERS REPORT FOR 1935

STATUTE AND REGULATIONS REGARDING COMMERCIAL FERTILIZERS

The term "commercial fertilizers" as used in the Connecticut fertilizer statute includes any and every substance imported, manufactured, prepared or sold for fertilizing or manuring or soil amendment purposes, except barnyard manure and stable manure that have not been artificially treated or manipulated, marl and lime.

The seller is responsible for the proper labelling of each package of fertilizer, for the registration of each brand sold or offered for sale, for the payment of the required analysis fee and for the payment of the tonnage tax. If, however, proper labelling, registration and payments of analysis fees and of tonnage tax have been provided for by the manufacturer or by another responsible person, all sellers of such brands are released from the above mentioned requirements. The retailer, therefore, should assure himself that the requirements of the law have been met by the manufacturer of the brands which he handles, or himself be prepared to meet all these requirements.

It frequently happens that a manufacturer or jobber sells fertilizer materials which are the products of, and which are registered by, another firm or individual. Distributors in such cases should sell such materials by the exact brand names under which they are registered in order that there may be no mistake as to the identity of the brands. Any change in the brand names, or failure to make the identity of the brand and its manufacturer clear, makes the distributor liable for the registration of the product as his own brand.

The law exempts from registration, and from other requirements referred to, only (1) fertilizers passing through the state in transit; (2) fertilizers and fertilizer materials shipped to regular fertilizer factories to be used for manufacturing purposes; and (3) fertilizers and fertilizer chemicals sold to the Connecticut Agricultural Experiment Station for experimental purposes.

NOTE: Analyses reported in this bulletin were made by Messrs. Nolan, Mathis and Walden; microscopic examinations by Miss Shepard; inspection and sampling by Mr. Churchill; and compilations by Mrs. Vosburgh.

"COMPOST" MATERIAL AND "SOIL" SOLD AS "FERTILIZER"
FOR LAWN DRESSING

There is an increasing practice in Connecticut of selling compost material from house to house as a top dressing for lawns and shrubbery. Such material is sold by itinerant vendors who retail it by the bushel or other unit of measure at approximately \$1.00 for 100 pounds. The compost as sold usually contains from 25 to 50 per cent of organic matter and the remainder is water and soil. At the price charged, the organic matter costs from 2 to 4 cents per pound. Similar material may be obtained at no higher price in a good grade of commercial peat moss or in commercial dried farm manures, such as sheep, cattle or poultry manures. These latter also have the advantage of being uniform and dependable in composition, and, in the case of dried manures, of supplying some actual plant food in addition.

Purchasers of such "top dressing" should understand that it has some value because the organic matter present increases the moisture-holding capacity of light, sandy soil and adds needed humus. However, any representation that such material serves as a regular mixed fertilizer is unwarranted because it contains practically no plant food, i.e. nitrogen, phosphoric acid and potash, for which regular "complete" fertilizers are valuable.

There is another type of material that is also being offered for potting plants and for dressing lawns. A product of this type called "Wright Soil" was submitted by a purchaser and examined. The sample was found to contain 2.01 per cent of moisture, 82.22 per cent of ash, 77.08 per cent of ash insoluble in acid, and 15.77 per cent of organic matter. The nitrogen content was 0.71 per cent, phosphoric acid 0.55 per cent and potash (water-soluble), 0.23 per cent. The product is therefore largely soil with a little humus added, and possibly also reinforced slightly with mineral forms of plant food. The material has the character of soils ordinarily classed as fertile. Microchemical tests made by the Soils Department showed approximately the same degree of available fertility as a good garden loam. While fertilizer elements in the product may be sufficient for good growth if the whole topsoil is replaced with this material, the small amounts which one can conceivably afford to use at the price demanded are not adequate to sustain vegetation without supplements from other sources. The purchaser should understand that products of this type are not "complete" fertilizers in the accepted sense of that term or in the popular understanding of it.

No regulation has been made to require these types of materials to be registered as "fertilizers". They are soil supplements or amendments; but since they generally do not contain plant food in excess of 1 per cent of nitrogen, phosphoric acid or potash, they are not recognized as fertilizers subject to registration. In nitrogen content they sometimes exceed 1 per cent, but when such nitrogen comes from peat or similar sources, and has resisted transformation over long periods of soil decomposition, its availability as plant food is limited or negligible and it may be doubted if it is within the intent of the fertilizer law to recognize it as a registerable item of composition.

When such products are sold by itinerant vendors, local authority will, of course, require a vendor's license, provided local ordinances make it necessary.

DEFINITIONS OF FERTILIZER MATERIALS AND
INTERPRETATION OF TERMS USED IN
FERTILIZER CONTROL

For the purpose of bringing about a better understanding among control officials and the fertilizer industry as to the identity of fertilizer materials and the significance of terms used in interpreting results of analysis, a special committee of the Association of Official Agricultural Chemists was appointed in 1921 to consider this question, and from time to time pronouncements have been made.

The following definitions and interpretations are now official.¹

DEFINITIONS

ACIDULATED FISH TANKAGE, ACIDULATED FISH SCRAP

Acidulated fish tankage, acidulated fish scrap, is the rendered product derived from fish and treated with sulfuric acid.

ACTIVATED SEWAGE PRODUCTS

Activated sewage products are those made from sewage freed from grit and coarse solids and aerated after being inoculated with micro-organisms. The resulting flocculated organic matter is withdrawn from the tanks, filtrated with or without the aid of coagulants, dried, ground, and screened.

AMMONIATED SUPERPHOSPHATE

Ammoniated superphosphate is a product containing superphosphate and/or dissolved bone and nitrogenous compounds, but without the addition of potash.

ANALYSIS

Analysis, as applied to fertilizers, designates the percentage composition of the product expressed in terms of nitrogen, phosphoric acid, and potash in their various forms.

ASHES FROM LEACHED WOOD

Ashes from leached wood are unleached ashes resulting from the burning of wood that has been exposed to or digested in water or other liquid solvent, as in the extraction of dyes, so that a part of the plant food has been dissolved and removed.

BASIC PHOSPHATE SLAG

Basic phosphate slag is a by-product in the manufacture of steel from phosphatic iron ores. The product shall be finely ground and shall contain no admixture of materials other than what results in the original process of manufacture. It shall contain not less than twelve per cent (12%) of total phosphoric acid (P_2O_5), not less than eighty per cent (80%) of which shall be soluble in two per cent (2%) citric acid solution according to the Wagner method of analysis. Any other phosphate slag not conforming to this definition shall be designated low grade.

¹Official and Tentative Methods of Analysis, A.O.A.C., 1930, page 490.

BRAND AND BRAND NAME

A brand is a term, design, or trademark used in connection with one or several grades of fertilizers.

A brand name is a specific designation applied to an individual fertilizer.

CRUDE, INERT, OR SLOW-ACTING NITROGENOUS MATERIALS

Crude, inert, or slow-acting nitrogenous materials are unprocessed organic substances relatively high in nitrogen, but having a very low value as plant food and showing a low activity by both the alkaline and neutral permanganate methods—below fifty per cent (50%) and eighty per cent (80%) respectively.

DISSOLVED BONE

Dissolved bone is ground bone or bone meal that has been treated with sulfuric acid.

DRIED BLOOD

Dried blood is the collected blood of slaughtered animals, dried and ground, and containing not less than twelve per cent (12%) of nitrogen in organic forms.

DRIED, PULVERIZED, OR SHREDDED MANURES

Dried, pulverized, or shredded manures are what the name indicates, and not mixtures of manures and other materials.

FERTILIZER GRADE

Fertilizer grade shall represent only the minimum guarantee of its plant food expressed in terms of nitrogen (not ammonia), available phosphoric acid, and water-soluble potash.

FISH TANKAGE, FISH SCRAP, DRY GROUND FISH, FISH MEAL FERTILIZER GRADE

Fish tankage, fish scrap, dry ground fish, fish meal fertilizer grade is the dried ground product derived from rendered or unrendered fish.

GARBAGE TANKAGE

Garbage tankage is the rendered, dried, and ground product derived from waste household food materials.

GROUND RAW BONE

Ground raw bone is dried ground animal bones that have not been previously steamed under pressure.

GROUND STEAMED BONE

Ground steamed bone is ground animal bones that have been previously steamed under pressure.

HOOF AND HORN MEAL

Hoof and horn meal is processed, dried, and ground hoofs and horns.

KAINIT

Kainit is a potash salt containing potassium and sodium chlorides and sometimes sulfate of magnesia with not less than twelve per cent (12%) of potash (K_2O).

LEACHED WOOD ASHES

Leached wood ashes are ashes from burned unleached wood with part of their plant food removed by artificial means or by exposure to rains, snows, or other solvent.

MANURE SALTS

Manure salts are potash salts containing high percentages of chloride and from twenty per cent (20%) to thirty per cent (30%) of potash (K_2O). The term double manure salts is discontinued.

MURIATE OF POTASH (COMMERCIAL POTASSIUM CHLORIDE)

Muriate of potash is a potash salt containing not less than forty-eight per cent (48%) of potash (K_2O), chiefly as chloride.

NITRATE OF POTASH (COMMERCIAL POTASSIUM NITRATE)

Nitrate of potash is a salt containing not less than twelve per cent (12%) of nitrogen and forty-four per cent (44%) of potash (K_2O).

NITRATE OF SODA (COMMERCIAL SODIUM NITRATE)

Nitrate of soda is commercial sodium nitrate containing not less than fifteen per cent (15%) of nitrogen, chiefly as sodium nitrate.

PRODUCTS SECURED BY HEATING CALCIUM PHOSPHATE WITH ALKALI SALTS CONTAINING POTASH

Products secured by heating calcium phosphate with alkali salts containing potash are non-acid phosphates with potash. They are not potassium phosphate.

SULFATE OF POTASH (COMMERCIAL POTASSIUM SULFATE)

Sulfate of potash is a potash salt containing not less than forty-eight per cent (48%) of potash (K_2O), chiefly as sulfate, and not more than two and one-half per cent (2.5%) of chlorine.

SULPHATE OF POTASH-MAGNESIA

Sulfate of potash-magnesia is a potash salt containing not less than twenty-five per cent (25%) of potash (K_2O), nor less than twenty-five per cent (25%) of sulfate of magnesia, and not more than two and one-half (2.5%) of chlorine.

SUPERPHOSPHATE

Superphosphate is a cured mixture of rock phosphate and sulfuric acid and/or phosphoric acid. The grade shall always be used as a prefix to the name. Example: 16% Superphosphate. The use of the term Acid Phosphate is discontinued.

TANKAGE

Tankage (without qualification) is the rendered, dried, and ground by-product, largely meat and bone from animals (slaughtered or that have died otherwise).

UNIT OF PLANT FOOD

A unit of plant food is twenty (20) pounds, or one per cent (1%) of a ton.

UNLEACHED WOOD ASHES

Unleached wood ashes are ashes from burned unleached wood that have had no part of their plant food removed and that contain four per cent (4%) or more of water-soluble potash (K_2O).

INTERPRETATIONS

ACTIVITY OF WATER-INSOLUBLE NITROGEN IN FERTILIZERS

The alkaline and neutral permanganate methods distinguish between the better and the poorer sources of water-insoluble nitrogen; they do not show the percentage availability of the material. The available nitrogen of any product is measured only by carefully conducted vegetation experiments.

(a) The methods shall be used on mixed fertilizers containing water-insoluble nitrogen amounting to three-tenths of one per cent (0.3%) or more of the weight of the material. If a total nitrogen exceeds the minimum guarantee and is accompanied by a low activity of the insoluble nitrogen, the over-run shall be taken into consideration in determining the classification of the water-insoluble nitrogen.

(b) The water-insoluble nitrogen in mixed fertilizers showing an activity below fifty per cent (50%) by the alkaline method, and also below eighty per cent (80%) by the neutral method, shall be classed as inferior. This necessitates the use of both methods, also the provision as to over-run in (a), before classifying as inferior.

AMOUNT OF CHLORINE PERMISSIBLE IN FERTILIZERS IN WHICH THE POTASH IS CLAIMED AS SULPHATE

Chlorine in mixed fertilizers in which the potash is claimed as sulfate shall not exceed one-half of one per cent (0.5%) more than what is called for in the minimum potash content based on the definition for sulfate of potash formulated by the committee. Calculate as follows: 0.05 times the percentage of potash found plus 0.5.

BRAND NAME TO INCLUDE ANALYSIS OR GRADE OF FERTILIZER

The analysis or grade of a fertilizer should be included with its brand name, and so used by the manufacturer on sacks and in printed literature and by the control official in his reports and publications.

FERTILIZER FORMULA

A fertilizer formula shall express the quantity and grade of the crude stock materials used in making a fertilizer mixture. For example: 800 pounds of 16 per cent superphosphate, 800 pounds of tankage (7.40 nitrogen and 9.15 total phosphoric acid), and 400 pounds of sulphate of potash-magnesia (twenty-six per cent (26%) potash).

FINELY GROUND AS APPLIED TO BASIC PHOSPHATE SLAG

Finely ground in the definition of basic phosphate slag shall refer to actual size of particles as determined by the use of standard sieves, as follows: seventy per cent (70%) or more shall pass a 100-mesh, and ninety per cent (90%) or more shall pass a 50-mesh sieve.

FORM OF NITROGEN IN CALCIUM CYANAMIDE

The nitrogen in calcium cyanamide shall be considered as being of organic nature.

THE TERM LIME AS APPLIED TO FERTILIZERS

The term lime shall not be used in the registration, labelling, or guaranteeing of fertilizers or fertilizing materials, unless the lime is in a form to neutralize soil acidity, such as the oxide, hydroxide, or carbonate, or equivalent magnesia compounds.

ORDER OF TERMS

The order of terms in mixed fertilizers shall be nitrogen first, phosphoric acid second, and potash third.

NAME OF A FERTILIZER MATERIAL USED AS THE BRAND NAME OR PART OF THE BRAND NAME OF A MIXED FERTILIZER

When the name of a fertilizer material is used as part of the brand name of a mixed fertilizer, as for example blood, bone or fish, the nitrogen or phosphoric acid shall be derived from or supplied entirely by the material named. When the name of a fertilizer material is used as a brand or as part of a brand and the nitrogen and phosphoric acid is not supplied by the material named, the word brand shall follow the name of the material. Example: Fish Brand Fertilizer.

STATEMENT OF GUARANTEE

The statement of guarantee of mixed fertilizers shall be given in whole numbers.

REGISTRATIONS

LATE REGISTRATIONS FOR 1934

To the brands registered for 1934 in our last report should be added:
Sutton & Sons, Ltd., Reading, England
Sutton's Simplex Fertilizer

REGISTRATIONS FOR 1935

For 1935, 57 firms and individuals registered 325 brands of fertilizers at this Station for sale in this State. As required by statute, the brands so registered are listed as follows:

The Acme Guano Co., Baltimore, Md.

Acme 4-8-4
Acme 4-8-10
Acme 5-8-7
Acme 7-6-6
Acme 8-16-14
Acme Fine Ground Bone
Acme Muriate of Potash
Acme Superphosphate

Double A Tobacco Fertilizer 5-3-5
Sanderson's Formula B 4-8-7

American Cyanamid Co., 30 Rockefeller Plaza, New York City

Aero Cyanamid
Ammo-Phos 11-48-0
Ammo-Phos 16-20-0
Granular 'Aero' Cyanamid

American Agricultural Chemical Co., West Haven, Conn.

AA Double Strength Fertilizer 8-16-14
AA General Crop Fertilizer 2-10-2
AA Monarch Fertilizer 4-8-4
AA Peerless Fertilizer 4-8-7
AA Potato and Vegetable Fertilizer 5-8-7
AA Prolific 10% Potash Fertilizer 2-8-10
AA Superphosphate 16%
AA Tobacco Starter 5-5-15
AA Top Dresser 7-6-6
AA XL Fertilizer 3-10-4
AAC Castor Pomace
AAC Dry Ground Menhaden Fish
AAC Fine Ground Bone
AAC Ground Tankage
AAC Muriate of Potash
AAC Pulverized Sheep and Goat Manure
AAC Sulphate of Ammonia
AAC Sulphate of Potash
Agrico for Corn 3-10-6
Agrico for Lawns, Trees and Shrubs 7-6-6
Agrico for New England 4-8-10
Agrico for Pastures and Top Dressing 7-6-6
Agrico for Potatoes and Vegetables 5-8-7
Agrico for Tobacco 6-3-6
Agrico for Truck 5-10-5

Apothecaries Hall Co., Waterbury, Conn.

Bone Meal 2.47-22.00%
Bone Meal 3.70-21.00%
Bone and Meat Tankage 3.70-21.00%
Castor Pomace 4½%
Cotton Hull Ashes
(Sold on Unit Basis)
Dry Ground Fish 9.46%-5.00%
Liberty Corn 2-10-2
Liberty Fish, Bone and Potash 3-10-4
Liberty High Grade Corn 2-12-4
Liberty High Grade Market Gardeners 5-8-7
Liberty High Grade Tobacco Manure 6-3-7
Liberty Market Gardeners Special 4-8-4
Liberty Onion Special (Potash as Sulphate) 4-8-7
Liberty Potato and General Crops 4-8-10
Liberty Potato and Market Gardeners (Potash as Muriate) 4-8-7
Liberty Potato and Vegetable 2-8-10
Liberty Special Fertilizer for Fruit 7-8-6
Liberty Special Fertilizer for Lawns, Gardens, etc. 4-4-0
Liberty Tobacco Fertilizer 6-3-6
Liberty Tobacco Mixture 7-3-7
Liberty Tobacco Special 5-3-5

Liberty Top Dresser for Grass and Grain 8-8-8
 Muriate of Potash
 Nitrate of Potash 13-44%
 Precipitated Bone
 Sheep and Goat Manure 1.25-1-2.00%
 Sheep Manure 1.80-1.00-2.00%
 Sulphate Ammonia 20.56%
 Sulphate of Potash
 Super Phosphate 16%
 Tankage 7.40-9.00%

Armour Fertilizer Works, 120 Broadway, New York City

Armour's Big Crop Fertilizer 2-10-2
 Armour's Big Crop Fertilizer 3-12-6
 Armour's Big Crop Fertilizer 4-8-4
 Armour's Big Crop Fertilizer 4-8-7
 Armour's Big Crop Fertilizer 4-8-10
 Armour's Big Crop Fertilizer 4-16-4
 Armour's Big Crop Tobacco Special 5-3-5
 Armour's Big Crop Fertilizer 5-8-7
 Armour's Big Crop Fertilizer 7-6-6
 Armour's Big Crop Fertilizer 8-16-20
 Armour's Big Crop Superphosphate 16%
 Armour's Bone Meal Fertilizer
 Armour's Special Turf Fertilizer 10-8-6
 Armour's Vert Plant Food 5-8-6
 Muriate of Potash 50%
 Sheep and Goat Manure

Ashcraft-Wilkinson Co., Atlanta, Ga.
 Cow-Eta Brand 41% Cottonseed Meal

The Associated Chemical Co., Baltimore, Md.

Associated Sheep and Goat Manure
 Muriate of Potash
 Sulphate of Potash

Associated Seed Growers, Inc., 205 Church St., New Haven, Conn.

Acid Phosphate
 Clark's Special Mixture for General Use 4-8-4
 Clark's Standard 4-8-7
 Tip Top Brand, Clark's 5-8-7

Atkins & Durbrow, Inc., 165 John St., New York City

Andco Soil Builder 3-1-1
 Driconure

Baker Castor Oil Co. of Delaware, 120 Broadway, New York City
 Castor Pomace

Barrett Co., 40 Rector St., New York City

Arcadian the American Nitrate of Soda
 Arcadian Sulphate of Ammonia
 Sulphate of Ammonia

F. A. Bartlett Tree Expert Co., Stamford, Conn.

Bartlett Green Tree Food 6-7-4

The Berkshire Chemical Co., Bridgeport, Conn.

Berkshire 3-10-6 Fertilizer
 Berkshire Castor Pomace
 Berkshire Complete Fertilizer 2-12-2
 Berkshire Complete Tobacco Fertilizer 5-3-5
 Berkshire Cotton Hull Ashes
 Berkshire Double Strength Fertilizer 8-16-14
 Berkshire Dry Ground Menhaden Fish
 Berkshire Economical Grass Fertilizer 8-8-8
 Berkshire Fine Ground Bone
 Berkshire Golf Green Fertilizer 8-5-2
 Berkshire Grass Special Fertilizer 6-6-6
 Berkshire Ground Tankage
 Berkshire High Grade Tobacco Fertilizer 6-3-6
 Berkshire Japanese Sardine Fish Meal
 Berkshire Long Island Special Fertilizer 4-8-7

INSPECTION OF 1935

The Station Agent has visited 78 towns and villages in the State and has drawn 370 official samples of fertilizer, including all the registered brands that could be found. The classification of these and of other samples is given in the summary.

CLASSIFICATION OF FERTILIZER MATERIALS, 1935

	Number of samples	Page
<i>I. Containing Chiefly Nitrogen</i>		
Nitrate of Soda	6	17
Calcium nitrate	2	18
Urea	3	18
Cyanamid	3	17
Ammonium sulfate	10	18
Castor pomace	12	17
Cottonseed meal	90	17
Cottonseed meal—Castor pomace mixture	3	17
Linseed meal	8	19
<i>II. Containing Chiefly Phosphoric Acid</i>		
Superphosphate	16	20
Precipitated bone	5	20
Basic slag	1	20
<i>III. Containing Chiefly Potash</i>		
Muriate of potash	9	23
Sulfate of potash	10	23
Cottonhull ashes	46	23
Wood ashes	2	23
<i>IV. Containing Nitrogen and Potash</i>		
Nitrate of potash	12	25
Nitrate of potash and soda	4	25
<i>V. Containing Nitrogen and Phosphoric Acid</i>		
Dry ground fish	29	27
Tankage	10	27
Ground bone	29	27
<i>VI. Mixed Fertilizers</i>		
Commercial mixtures	226	32
Special and home mixtures	17	33
<i>VII. Miscellaneous</i>		
Sheep manure	21	53
Lime	10	53
Other miscellaneous	39	53
Check meals and fertilizers	42	53
Total	665	

I. RAW MATERIALS CHIEFLY VALUABLE FOR NITROGEN

NITRATE OF SODA AND OTHER NITROGENOUS MATERIALS

Analyses of official samples of these materials are given in Table 1.

Guaranties were met or exceeded in all cases except No. 9077, nitrate of soda, and No. 8732, cyanamid, in which our results showed deficiencies of about 0.5 per cent in each instance.

VEGETABLE PRODUCTS USED AS SOURCES OF NITROGEN

Cottonseed meal and castor pomace are used to a considerable extent in fertilizer mixtures as sources of organic nitrogen. To a lesser extent linseed meal is used for the same purpose, and this year cottonseed meal mixed with castor pomace has been on the market.

Cottonseed meal is commonly used for feeding animals, but castor pomace is not suitable for that purpose because it is poisonous to stock. The fertilizer mixtures of these two materials do not contain enough pomace to give them a general appearance different from straight cottonseed meal. The Station has therefore advised packers and distributors that such mixtures must be plainly tagged with the names of both ingredients, and labeled "not suitable for feeding purposes".

Analyses of official samples of cottonseed meal and other vegetable sources of organic nitrogen are given in Table 2. No deficiencies were found.

Samples submitted by purchasers have been examined, but these are not included in the tabulations.

II. RAW MATERIALS CHIEFLY VALUABLE FOR PHOSPHORIC ACID

SUPERPHOSPHATE

This raw material is one of basic importance in the fertilizer industry. It is made in this country by treating phosphate rock with sulphuric acid. The finished product contains 16 per cent of available phosphoric acid and a considerable amount of calcium sulphate (gypsum). If the gypsum is largely or entirely removed, the percentage of available phosphoric acid is correspondingly higher. Thus there are so-called "double" and "triple" superphosphates on the market which are products of the process just described. They contain from 40 to 50 per cent of available phosphoric acid.

The official (A.O.A.C.) definition of superphosphate is "the cured product obtained by mixing rock phosphate with sulphuric or phosphoric acid or with both". The grade should always be designated, as, for example, "16 per cent superphosphate", "32 per cent superphosphate", etc.

Sixteen official samples of superphosphates have been examined and all satisfied their guaranties. One of these was of the "double" superphosphate grade and was guaranteed to contain 32 per cent available phosphoric acid.

Precipitated bone phosphate, generally called "precipitated bone", is a by-product obtained in the manufacture of glue from bones. It contains about 40 per cent of "available" phosphoric acid. Three official samples were examined. They were guaranteed 38 per cent available phosphoric acid, and all substantially met or exceeded that claim.

Basic slag is a by-product obtained in the manufacture of steel from phosphatic iron ores. The one sample of this type of material examined exceeded the minimum standard set by the A.O.A.C., but was 0.21 per cent short of its registered guaranty of 14.4 per cent.

Analyses of official samples of this group of materials are given in Table 3.

III. RAW MATERIALS CHIEFLY VALUABLE FOR POTASH

POTASH SALTS

Seven official samples of muriate of potash and six of sulphate of potash were examined. One sample of muriate was found to be 0.76 per cent under the guaranty, and one sample of sulphate showed the slight deficiency of 0.24 per cent.

COTTONHULL ASHES

The ashes of cottonhulls are largely used for fertilizer purposes as sources of potash. Their composition is so variable that it is difficult to fix guaranties, and hence sales are made on the unit basis depending on the analysis. For this reason the Station has made a considerable number of analyses for purchasers.

WOOD ASHES

No official samples of wood ashes have been taken but two samples submitted by purchasers have been examined. We were informed that these ashes had been exposed to the weather for some time, and the analyses showed that a large proportion (nearly all in one case) of the potash had been leached out. Potash found was 2.38 per cent in one sample and 0.11 per cent in the other.

Analyses of official samples of materials in this group are given in Table 4.

IV. RAW MATERIALS SUPPLYING NITROGEN AND POTASH

Four official samples of nitrate of potash and two of nitrate of potash-soda were examined and the results are given in Table 5.

Sample 9070 showed a deficiency in both nitrogen and potash. The local distributor, Berkshire Chemical Co., and the importer, F. W. Berk and Co., New York City, were at a loss to understand the shortage.

Four samples submitted to us by purchasers, and representing the same stock, were found to meet the guaranty of 13 per cent nitrogen and 44 per cent potash. A portion of our sample, 9070, was sent to the importer to be checked by the exporter in Germany who reported 13.2 per cent nitrogen and 43.66 per cent potash. The methods used by the German chemists differed from the official methods used by this Station and this furnished at least a partial explanation of the discrepancy.

Difference in moisture content was not a factor because the sample contained only 0.26 per cent of moisture. It may be noted that the water-insoluble material in this particular sample was 3.54 per cent, while the water-insoluble in the four samples submitted by purchasers ranged from 0.8 per cent to 2.3 per cent. If sample 9070 had contained no more insoluble than the maximum found in the previous samples, it would still have met the guaranty. In passing, it should be noted that the exporter's figure for potash (43.66 per cent), in the sample that we submitted, does not equal the guaranteed 44 per cent.

This explanation is given in fairness to the local distributor and to the importers who have spared no pains to investigate the deficiency.

V. RAW MATERIALS SUPPLYING NITROGEN AND PHOSPHORIC ACID

FISH, TANKAGE AND BONE

Eight official samples of dry ground fish were examined and all met guaranties except 8660, which showed a slight deficiency in nitrogen. No evidence of adulteration with mineral forms of nitrogen was found.

Analyses are given in Table 6.

The official samples of tankage, seven in number, showed no deficiencies. Two were bone and meat tankage and were so designated.

Analyses are given in Table 7.

Twenty official samples of ground bone were examined and guaranties were met with two exceptions, 7686 and 8669, in which deficiencies in phosphoric acid were found. Microscopic examination revealed no evidence of adulteration.

Analyses are given in Table 8.

VI. MIXED FERTILIZERS

In this group are 215 official samples. One of them supplies only nitrogen; three supply only nitrogen and phosphoric acid; and one supplies only phosphoric acid and potash.

Analyses are given in Table 9. A summary of this table is as follows:

Total number of samples	215
Samples deficient in:	
one item	36
two items	8
three items	3
percentage of samples meeting guaranties in all respects....	78
Total guaranties made	639
Guaranties not met:	
nitrogen	32
phosphoric acid	12
potash	17
Percentage of guaranties met	61
Samples showing commercial deficiencies exceeding \$1.00 per ton	90
Percentage of commercial deficiencies	4
	1.9

The performance of manufacturers in producing fertilizer mixtures that substantially meet the guaranties of plant food under which they are sold has improved greatly in recent years. This feature is clearly shown by the following tabulation based upon records of official inspections in past years.

Year	Total number of samples	Substantially meeting guaranties in N, P ₂ O ₅ , and K ₂ O	Showing commercial deficiencies of \$1.00 or more per ton
		%	%
1923	261	55	17
1924	282	60	7
1925	255	67	13
1926	247	66	11
1927	243	68	7
1928	250	71	13
1929	239	72	9
1930	236	80	3
1931	235	74	3
1932	222	76	3
1933	199	76	3
1934	176	79	2.3
1935	215	78	1.9

In the early part of the period covered in the tabulation, it appears that the proportion of samples found to satisfy guaranties was between 50 and 70 per cent; and that commercial deficiencies exceeding \$1.00 per ton ranged from 10 to nearly 20 per cent of the total examined. In the latter part, the corresponding figures for guaranties met are between 70 and 80 per cent; and the commercial deficiencies are less than 5 per cent.

During the past season samples showing commercial deficiencies in excess of \$1.00 per ton were as follows:

Acme Guano Co. 8-16-14, two samples, Nos. 9133 and 9452
 Eastern States Farmers' Exchange 12-16-12, No. 9120 (Duplicate sample of same brand, No. 8996, not deficient).
 Standard Wholesale Phosphate and Acid Works 7-12-12, No. 9198

A summary of chemical deficiencies is given in Table 10. In view of a proposed change in the official method for potash, samples found deficient in this item have been given the benefit of a check determination by the proposed method if that figure was higher than the one found by the old official method. The proposed revised method is not official as final action upon it has not yet been taken by the Association of Official Agricultural Chemists. By the regular method, 26 deficiencies in potash were found exceeding 0.2 per cent, but by the modified procedure the number was reduced to 17.

QUALITY OF THE INSOLUBLE ORGANIC NITROGEN

When the insoluble organic nitrogen in mixed goods is found to have an "activity" value of less than 50 per cent by the alkaline permanganate method, and less than 80 per cent by the neutral permanganate method, the quality of the organic nitrogen is regarded as inferior. Values less than these have been found in 12 samples this year, but in all cases the actual water-soluble nitrogen found, plus the active insoluble, has substantially equalled or exceeded the guaranty and the samples have been passed.

SPECIAL AND HOME MIXTURES

Analyses of 17 samples of special and home mixtures have been made and the results will be found in Table 11.

VII. MISCELLANEOUS FERTILIZERS AND OTHER MATERIALS

SHEEP MANURE, ETC.

Analyses of 21 samples of sheep manure and other dried and pulverized farm manures are given in Table 12.

LIMING MATERIALS

Liming materials are not subject to inspection under the fertilizer law but samples are taken and analyses published for the information of purchasers.

Analyses of samples examined this year are given in Table 13.

OTHER MISCELLANEOUS MATERIALS

Thirty-nine samples of miscellaneous fertilizer materials have been examined including samples of humus or peat.

Analyses of two of them are recorded for reference.

8971. **Hops** (from a brewery plant). Analysis of the sample as submitted is as follows: Water, 70.79%; ash, 8.06%; organic and volatile matter, 21.15%. Nitrogen, 1.15%; phosphoric acid, total, 0.42%; potash, 0.05%.

9700. **Charcoal ("Charket") ashes**. Tobacco growers burn large quantities of charcoal in the sheds where tobacco is curing. A sample of the ashes was analyzed as follows: phosphoric acid, 0.93%; potash soluble in water, 4.26%; chlorine, trace; calcium oxide, 32.15%; magnesium oxide, 2.30%.

9663. **Charcoal Ashes**. This is the same sort of material as the above, 9700. It contained 1.60% of phosphoric acid, 8.67% of water-soluble potash, 40.75% of calcium oxide and 3.84% of magnesium rock.

CHECK MEALS AND FERTILIZERS

Forty-two samples of check meals and fertilizers have been analyzed in the collaboration programs of the American Oil Chemists Society and of the F. S. Royster Guano Co.
