REPORT ON INSPECTION AND ANALYSIS OF
COMMERCIAL FERTILIZERS

1964

Part II: List of Registrants, Tonnages Sold, and Analyses
H. J. Fisher, Chief Chemist¹

INTRODUCTION

During the past year the form of these annual reports was reviewed by the Station biometrician Dr. C. I. Bliss in consultation with members of our soils department to see if some different method of presentation of the results of analysis of official fertilizer samples would not make these data more readily useful to the farmers and home gardeners of Connecticut. As a result of this study, the 1964 report is being issued in two parts. Part I, which was published as Circular 226, consisted of a table designed to show to what extent the products of each manufacturer gave full value when allowance was made for the fact that an excess over guaranty of one ingredient could offset a deficiency in another. Part II (the present bulletin) contains a complete list of registered brands, the tonnage figures, and the actual analyses of all official samples taken during the period July 1, 1963 - June 30, 1964. The analyses of all mixed fertilizer samples (whether from large or small packages) are reported in a single table. These samples are grouped together by grades under each ratio, instead of being listed alphabetically under the respective manufacturers as was the previous practice; the breakdown into the various forms of nitrogen has also been simplified.

A special table showing the percentages of water-soluble phosphoric acid in those grades of fertilizers used in potato-growing is included at the request of Dr. Arthur Hawkins of the University of Connecticut. His field tests appear to show a more or less direct relationship between potato yields and the proportions of the total phosphorus that are in water-soluble form.

Comments on this new method of reporting are solicited.

CONNECTICUT LAW AND REGULATIONS REGARDING
COMMERCIAL FERTILIZERS

The term "commercial fertilizers", as used in the Connecticut fertilizer statute, includes "any and every substance imported, manufactured, prepared or sold for fertilizing or manuring or soil amendment purposes, except barnyard manure and stable manure which have not been artificially treated or manipulated, marl and lime." An amendment of the law in 1949 permitted fertilizers to be labelled with guaranties of elements other than nitrogen, phosphorus and potassium, but did not change the requirement that mixed fertilizers must contain at least 0.82 per cent of nitrogen, and 1 per cent of either phosphoric acid or potash, for guaranties of these elements to be made. Phosphorus must be declared as available phosphoric acid (except in the case of bone, tankage and other

¹ Analyses were made by Messrs. Richard A. Botsford, Sherman Squires, Werner Mueller, Charles Hahn and Miss Helen Kocaba; inspection and sampling by Mr. R. Richard Nichols; compilations by Mrs. Gerald Fishbone.

natural organic materials, where total phosphoric acid may be guaranteed instead), and potassium as water-soluble potash; all other elements must be guaranteed in terms of percentages of the elements, not as oxides or salts. A registration fee of \$10.00, payable annually, is charged for each element guaranteed in each brand of fertilizer; there is also a six cent tonnage tax payable semi-annually.

While manufacturers usually register their own fertilizers, if a retailer sells a fertilizer manufactured by an out-of-state firm, and that firm refuses to register, under the law the retailer is responsible for registration fees and tonnage taxes. The retailer, therefore, should assure himself that the requirements of the law have been met by the manufacturers of the brands which he handles, or himself be prepared to meet all these requirements.

The law exempts from registration, and from other requirements, only: (1) fertilizers passing through the State in transit; (2) fertilizers and fertilizer materials shipped to regular fertilizer factories to be used for manufacturing purposes; and (3) fertilizers and fertilizer chemicals sold to The Connecticut Agricultural Experiment Station for experimental purposes.

Cottonseed, linseed, peanut and soybean oil meals, when sold or used for fertilizer purposes must be registered as fertilizers and the specified fees paid thereon. For such products the registration fee is \$10.00 per brand. This fee and the tonnage tax are entirely apart from the registration fee required by the feeding stuffs law for vegetable meals used as feeds (there is no tonnage tax on feeds).

Because manufacturers or jobbers do not know how much, if any, of their vegetable meal tonnage is sold or used as fertilizers, local dealers and purchasers report their sales or purchases to this Station. This information is not for publication but is used to inform manufacturers of the total sales of their meal as fertilizer in this State. It is expected that the fees provided for by statute will be paid by the manufacturer or other party responsible for the brands.

OFFICIAL DEFINITIONS OF FERTILIZER TERMS AND MATERIALS

It is expected that fertilizers sold in this state will comply with the regulations and standards of the Association of American Fertilizer Control Officials. A copy of the "Official Publication" of that Association giving these definitions and regulations may be obtained from the secretary-treasurer, B. D. Cloaninger, Drawer 392, Clemson, South Carolina, for \$4.00.

FIRMS AND REGISTRATIONS

For 1964, 108 firms registered 676 brands of fertilizer for sale in this State. The following list gives the names and addresses of these manufacturers and the brands registered by them. Included also are the companies and brands whose products were not registered because they were sold only in packages of 10 pounds or less net weight; these are distinguished by being starred. Listed also are a few companies whose products were not in small packages but failed to be registered. Brands not in small packages that were unregistered for any reason are marked with a /.

GRADES OF FERTILIZER USED IN CONNECTICUT

The Connecticut fertilizer law does not provide for compulsory limitation of the grades that may be sold in this State. Nevertheless (until recently, at least) there has been general agreement that a small number of grades can take care of all of the needs of agriculture, and that standardization on a few grades will promote economy of manufacture, with the consequent possibility of lower prices. In contrast to this, the last few years have seen the rise in some States of so-called bulk blending plants which mix fertilizer ingredients to the order of individual farmers according to proportions determined by soil analyses. Whether this type of custom mixing will spread in Connecticut with its smaller farms remains to be seen.

To promote grade standardization the New England agronomists have from time to time compiled lists of recommended fertilizer ratios and minimum grades. The last such list, which was drawn up at a meeting in Burlington, Vermont on June 19, 1961, was as follows:

Ratio	Most Common Grade
0-1-1	0-20-20
0-1-2	0-15-30
0-1-3	0-10-30
0-1-4	0-10-40
0-3-1	0-30-10
1-1-1	10-10-10
1-2-2	5-10-10
1-4-2	3-12-6
2-1-1	10-5-5
2-1-2	6-3-6
2-3-3	8-12-12
3-2-2	15-10-10
3-4-4	6-8-8
4-2-3	16-8-12
4-3-1	8-6-2

Sixty-seven per cent of the mixed fertilizers sold in this State during the 1963-1964 season were of the recommended ratios in grades whose plant food content equalled or exceeded the specified "most common grades". Four other grades, each of which sold at least a thousand tons (5-10-5, 8-10-10, 10-6-4 and 20-10-5), accounted for another 22 per cent. (These same grades plus one other—the 8-6-4—were purchased in similar quantities the previous year.) The numerous additional grades accounted for only 11 per cent of the total tonnage. This tonnage exceeded that for the 1962-1963 season by 9,116 tons.

During the past season the Station agent collected samples of all registered brands that could be found on the market. The total number of official samples was 548.

The following tabulation lists the number of samples analyzed (both official and unofficial) of each class of fertilizer, as well as the tonnage sold during the period between July 1, 1962 and June 30, 1963:

TONNAGES OF FERTILIZER MATERIALS AND MIXED FERTILIZERS PURCHASED DURING THE PERIOD OF JULY 1, 1963 - JUNE 30, 1964

	No. of Samples	Tonnage	
I. Containing chiefly nitrogen:			
Nitrate of ammonia	4	289	
Nitrate of soda	2	345	
Sulphate of ammonia	1	21	
Cyanamid	-	207	
Urea	10	430	
Nitrogen solutions	-	546

COMPLIANCE WITH GUARANTIES

The table in Circular 226 was designed to indicate at a quick glance the relative performances of the various manufacturers by two bases of measurement: (1) The total numbers of deficiencies found in their samples; and (2), the extent (expressed as percentage) to which their products offered more or less fertilizer value than was claimed, when allowance was made for the fact that an excess of one major element could offset a deficiency in another. This table gave no actual analytical figures, and did not indicate the specific fertilizers in which the summarized deficiencies occurred. Such a table probably offers a means of comparison that is both simpler and fairer than the summaries and table-underlinings of previous years. It is however wholly derivative, and its conclusions cannot be checked. Partly to furnish the missing data, and partly just to supply information on the composition of specific brands, analyses of the actual official samples with their indicated deficiencies are given in Tables 1 to 6. Comments thereon follow:

I. Materials Chiefly Valuable for Nitrogen

Analyses of 48 official samples of nitrogenous materials are given in Table 1. Forty-two of these met their guaranties and six were deficient. The substandard samples included three of cottonseed meal and one each of ammonium nitrate, calcium nitrate and urea.

II. Materials Chiefly Valuable for Phosphoric Acid

Analyses of 12 official samples of 20 per cent superphosphate and five of the 46 per cent grade, and two each of dicalcium phosphate and phosphate rock, are given in Table 2. Of the total of 21 samples, 16 met their guaranties; two 20 per cent superphosphates, and three of the "triple" grade, were deficient.

III. Materials Chiefly Valuable for Potash

Four samples of muriate of potash, three of cotton hull ashes, and one of sulphate of potash-magnesia, were analyzed with results as given in Table 3. All samples except two of muriate of potash were passed.

IV. Materials Supplying Nitrogen and Phosphoric Acid

This group consists chiefly of dry ground fish and bone meal. For natural products such as these, guaranties of total instead of "available" phosphoric acid are permissible. Nineteen official samples of bone meal, four of dry ground fish, and one each of diammonium phosphate and "Milorganite" (a treated sewage sludge) were analyzed in 1964, with results as shown in Table 4. All samples were passed except seven bone meals and the diammonium phosphate sample. Three of the bone meals were low in nitrogen and four low in phosphoric acid, while the diammonium phosphate was deficient in both components.

V. Materials Supplying Nitrogen and Potash

One sample of straight nitrate of potash and one of mixed potassium and sodium nitrates were analyzed; both met their guaranties. Analyses are given in Table 3.

VI. Mixed Fertilizers

Commercial Mixtures

Analyses of 431 official samples of mixed fertilizers are given in Table 5. This table differs from those in previous reports in that it includes not only the samples taken from larger bags and bulk but the small-package samples that were formerly reported in a separate table.

As noted previously, the grouping of the samples in the table has been changed to place together all samples of each brand and grade.

Results of these analyses are summarized as follows:

Total number of samples		431
Samples deficient in:		
one item	138	
two items	29	
three items	1	168
Percentage of samples meeting all guaranties		61
Total guaranties made ¹		1,281
Guaranties not met:		
nitrogen	86	
phosphoric acid	81	
potash	32	199
Percentage of guaranties met		84

Twenty-four samples guaranteed between 0.12 and 4.0 per cent of magnesium (mostly 1.2 per cent) in addition to the major components; only one was low in this element. Eight samples declared between 0.075 and 0.15 per cent of iron, with no deficiencies; but one other sample listing both 0.44 per cent of iron and 0.15 per cent of manganese was low in iron. One sample carrying guaranties of the five elements, iron, boron, copper, zinc and molybdenum showed no deficiency in any of them.

Sheep and Cattle Manures

Manures must bear guaranties of nitrogen, either total or "available" phosphoric acid, and potash. Of the 21 official samples analyzed during the 1963-1964 season, 19 met all guaranties and two were low in nitrogen.

MISCELLANEOUS

Analyses of several unofficial samples of miscellaneous materials of possible or suspected plant food value are given in Table 8.

¹ Four hundred and nineteen samples with three guaranties and 12 with two guaranties (minor element guaranties not included).

Recent field experiments conducted by the University of Connecticut have indicated that the proportion of the available phosphoric acid in potato fertilizers that is present in water-soluble form is a significant factor in determining the yield of potatoes grown on land to which such fertilizers have been applied. At the request of Dr. Arthur Hawkins of the University, all of this year's official samples of the 5-10-10, 6-8-8, 8-12-12, 10-10-10 and 10-15-15 grades were analyzed for water-soluble phosphoric acid in addition to running the usual total and citrate-insoluble phosphoric acid determinations. The results so obtained have been reproduced in Table 7 for the perusal of interested potato-growers. (It should be noted that all samples in this table are also listed in Table 5.)

The usual collaboration with check analyses programs was continued. Samples analyzed included: Fourteen vegetable meal samples received from the American Oil Chemists' Society; 12 check fertilizers supplied by the National Plant Food Institute; and 16 miscellaneous samples submitted in connection with methods studies of the Association of Official Agricultural Chemists.
