Analysis of
Fertilizers
Sold in Connecticut
1997

BY MARY JANE INCORVIA MATTINA

*Bulletin 952
July 1998*

From January 1, 1997 to December 31, 1997 the Department of Analytical Chemistry analyzed 205 fertilizer samples to determine that the label guarantee on the product is in compliance with State of Connecticut regulations. Determinations of the macronutrients, nitrogen, phosphorus (as P_2O_5) and potassium (as K_2O), as well as a large number of micronutrients were made.

Thirty-five different manufacturers were represented in this year's survey. Of the total number of samples analyzed 87 samples (42.4%) were deficient in one or more of the macronutrients. A sample is considered to be unsatisfactory if the value for a parameter is below the guaranteed value by more than the permissible percentage established by the Association of American Plant Food Control Officials. Specifically, 21 samples (10.2%) were deficient in nitrogen, 7 samples (3.4%) were deficient in phosphorus, and 63 samples (30.7%) were deficient in potassium. The results of the analyses for macronutrients are provided in the Table. Of the 67 samples analyzed for micronutrients, 34 (50.7%) were found to be deficient in one or more micronutrients. These results are summarized in the Table as well. A deficiency in either the macronutrients or micronutrients is indicated by a minus (-) sign next to the deficient analyte.

The samples were collected by Alton VanDyke and John Schneider of the Connecticut Department of Agriculture. The analyses were performed by Craig Musante and Mamie Pyles under the supervision of Dr. David Stilwell.

The Connecticut Agricultural Experiment Station is an Equal Opportunity, Affirmative Action Employer. Persons with disabilities who require alternate means of communication of program information should contact the Station Editor at (203) 974-8446 (voice) or 974-8502 (FAX) or paul.gough@po.state.ct.us (e-mail).

Table 1. Analysis of Fertilizer Products. The micronutrients are as follows: B=boron; Ca=calcium, Co=cobalt; Cu=copper, Fe=iron, Mg=magnesium; Mo=molybdenum; Na=sodium; S=sulfur; Zn=zinc.

The Connecticut Agricultural Experiment Station,
founded in 1875, is the first experiment Station in America. It is chartered by the General Assembly to make scientific inquiries and experiments regarding plants and their pests, insects, soil and water, and to perform analyses for State agencies. The laboratories of the Station are in New Haven and Windsor; its Lockwood Farm is in Hamden. Single copies of bulletins are available free upon request to Publications; Box 1106; New Haven, CT 06504-1106
