Petition No. 58

Haddam, Connecticut

July 23, 1981

Mr. Doocy, Mr. Wood, and Mr. Reid met Mr. Bibbi and Mr. Biondi of NUSCO for a final review of Petition No. 58.

This petition involves the construction of an Emergency Operations Center (EOC), a building used to monitor conditions within the nuclear plant during an emergency.

The Building is located approximately 1,600 feet north of the Connecticut Yankee Atomic Power Plant and is 14 feet high, 126 feet long, and 86 feet wide with a 14 foot shielded entrance, which includes pressurized door locks. It contains shower rooms for decontaminating personnel, a small kitchen, office space for 70 emergency personnel, well water supply and storage tanks, air filters, and an emergency generator. The grounds around the concrete building are attractively landscaped with a variety of trees, shrubs, and vines. A grass cover has been established on all areas disturbed by construction, and a hay bale check dam has been established between the construction site and the wetland south of the EOC.

Presently, the building is being used for plant personnel training sessions. The company hopes to find alternate uses for this two million dollar emergency facility.

All construction appears to have been completed as described in the petition. Final approval is recommended.
