## A STUDY OF MARINE RECREATIONAL FISHERIES IN CONNECTICUT

Federal Aid in Sport Fish Restoration F-54-R-27 Annual Performance Report March 1, 2007 - February 29, 2008

## Special Acknowledgement

Boat Captain Peter Simpson, who "retired" on May 22, 2008, is featured on this year's cover to honor his significant contributions to the project over the past 23 years. Pete played an integral role in the acquisition of the $R / V$ John Dempsey, contributing significantly to the layout, equipping, construction inspection and ultimately delivery of the vessel on August 2, 1990 from Pascagoula, MS. He navigated all the USCG inspection and documentation requirements, and ran and maintained the vessel professionally. Given the high profile nature of the vessel, we particularly appreciated the way Pete represented the Department while on the water working with local lobstermen in New York and Connecticut to conduct the LIS Trawl Survey and even the LIS Water Quality Monitoring Program. His knowledge of LIS and trawl survey work were invaluable and his cooperative spirit in working with the science crews on both surveys are what everyone will remember. Similarly, Pete was a welcoming face of the Department for the many visiting researchers and media personnel that have spent time on the Dempsey. In addition to vessel operations Pete help "shoreside" making the state purchasing process work for all Marine Fisheries staff will be sorely missed.

The cover photo includes some scenes from Pete's days on the Dempsey as well as a photo of Pete posing with an unlikely friend at a DEP outreach event not long ago.

Thanks to Kurt Gottschall for making maximal use of his insomnia over several nights to put together the photo collage for this year's cover to honor Pete's many contributions to DEP activities on LIS over the years.

## EXECUTIVE SUMMARY

Project: A Study of Marine Recreational Fisheries in Connecticut
Federal Aid Project: F54R-27 (Federal Aid in Sport Fish Restoration)
Annual Progress Report: March 1, 2007 - February 29, 2008
Total Project Expenditures (2007/08): \$734,667 (\$551,000 Federal, \$183,667 State)

## Purpose of the Project

The purpose of this project is to collect information needed for management of the marine recreational fishery. This information includes angler participation, effort, catch, and harvest; the relative abundance of finfish and specific population parameters for important selected species, water quality and habitat parameters, and assessment of fishery related issues such as hook and release mortality. The project also includes an outreach component to inform the public, and increase understanding and support for management programs and regulations.

The project is comprised of six jobs: 1) Marine Angler Survey, 2) Marine Finfish Survey, 3) Inshore Survey (Inactive), 4) Fishing Gear Studies (Inactive), 5) Cooperative Interagency Resource Monitoring, 6) Public Outreach. Job 3 has been inactive since March 1997. Job 4 has been inactive since 2000 .

Information on marine angler activity is collected from intercept interviews conducted by DEP staff and through a telephone survey conducted by a National Marine Fisheries Service contractor as part of the coastwide Marine Recreational Fisheries Statistics Survey. The relative abundance of 40 species and more detailed population information on selected finfish are obtained from an annual Long Island Sound trawl survey. The relative abundance of young-of-year winter flounder and nearshore finfish species is obtained from fall seine sampling conducted at eight sites. Fishing gear and fishing practices are evaluated by conducting studies of hook and release mortality rates and through sampling catches of commercial fishing vessels taking species of recreational interest. Marine habitat is monitored and evaluated through cooperative interagency monthly sampling of water quality parameters (temperature, salinity, dissolved oxygen) at 20 to 25 fixed sites throughout the Sound. Public outreach is performed through speaking engagements at schools, with civic organizations and fishing clubs as well as through displays in the Marine Headquarters lobby and fishing shows. Project staff also keep the Fisheries Advisory Council informed on project activities and frequent media contacts provide broad newspaper coverage of project activities and findings.

This project is designed to address critical resource issues by monitoring trends in abundance of all common marine finfish, age and growth in selected sportfish and by estimating harvest rates and size composition for a variety of important recreational species. Jobs 1, 2, 3 and 4 are designed to provide the components of stock assessments described above based on the resources and the recreational and commercial fisheries occurring in Long Island Sound. Fishery catch and size composition (Jobs 1, 4) and fishery independent measures of abundance and size composition (Jobs 2, 3) are vital to understanding how regional fishery management plans are likely to affect the local fishery. Each of these Jobs also provide the basis for developing state specific strategies for compliance with fishery management plans where such latitude is permitted.

Job 5 provides trends in area, duration and intensity of hypoxia, the most significant water quality problem facing the Sound today. Job 6 provides for public outreach to communicate to anglers, the benefits of this project in particular and of the Federal Aid in Sport Fish Restoration program in general.

## JOB 1: MARINE ANGLER SURVEY

PART 1: MARINE RECREATIONAL FISHERY STATISTICS SURVEY

## OBJECTIVES (Summary)

- To estimate the number of marine anglers, fishing trips, fish caught, and number and weight of fish harvested.

## KEY FINDINGS:

- An estimated 365,941 anglers made 1.7 million trips in 2007. Total estimated trips made in 2007 were above the 1.45 million trip average (1981-2006).
- Marine anglers caught an estimated 6.3 million fish, harvesting 1.7 million in 2007.
- Five species: bluefish, scup, striped bass, summer flounder and tautog accounted for over 90 of both total catch and harvest estimates.
- Winter flounder harvest has declined to fewer than 25,000 fish annually since 2000 and the estimated harvest for 2007 was only 4,164 fish. The long-term average winter flounder harvest was 333,093 fish with peak harvests of over 1 million fish in the early to mid-1980's.

## CONCLUSIONS:

- Coastwide fishery management plans and strong recent year class production are resulting in increases in several fish populations and good catches of many of the primary recreational species.
- The once productive winter flounder resource no longer supports a substantial fishery in Connecticut. Landings (in number) that once ranked second or third behind bluefish and scup now account for less than $1 \%$ of fish harvested.

## RECOMMENDATIONS

Continue to obtain catch and harvest information and angler participation rates through the Marine Recreational Fisheries Statistics Survey in order to monitor the status of the recreational marine fishery.

## JOB 1: MARINE ANGLER SURVEY

PART 2: VOLUNTEER ANGLER SURVEY

## OBJECTIVES (Summary)

To characterize the size and catch composition of both kept and released fish observed by volunteer anglers.

## KEY FINDINGS:

- A total of 75 anglers participated in the survey and made 1,521 fishing trips in 2006. Volunteers including additional anglers involved in a fishing party made a total of 3,172 fishing trips. With multiple species taken per trip anglers reported 1,393 trips targeting bluefish, 2,157 trips for striped bass, 738 trips for summer flounder, 73 trips for winter flounder, 132 trips for scup and 176 trips for tautog.
- Volunteer anglers measured 2,060 individual bluefish measuring $>12$ inches in length, 3,613 striped bass, 2,001 summer flounder, 94 winter flounder, 1,327 scup and 469 tautog. Collecting length measurements on released fish provides valuable data not available through MRFSS except for the party/headboat at sea sampling survey.

## CONCLUSIONS:

- Volunteer anglers provide a tremendous amount of data on the size and catch composition of popular recreational species in Connecticut, supplying several stock assessments with scarce length information on released fish.

## RECOMMENDATIONS:

- Maintain the Volunteer Angler Survey as an effective means of characterizing angler behavior and particularly in collecting length data on released fish that are not available from the MRFSS survey.

## JOB 2 PART 1: LONG ISLAND SOUND TRAWL SURVEY (LISTS) OBJECTIVES (Summary)

- Provide an annual index of numbers and biomass per standard tow for 40 common species and age specific indices of abundance for scup, tautog, winter flounder, and summer flounder, and recruitment indices for bluefish (age 0 ) and weakfish (age 0 ).
- Provide annual totals counts for all finfish species taken, total biomass for all finfish and invertebrate species taken, as well as, a species list for all species caught in LIS Trawl Survey sampling.

## KEY FINDINGS:

- A total of 203,701 finfish, lobster and squid weighing 18,710 kg were collected in 2007.
- Sixty finfish species and forty-one invertebrate species (or taxa) were collected from 200 tows conducted in 2007. The total fish species count (60) is above the 23 -year average of 58 species per year (1984-2006). The Long Island Sound Trawl Survey has collected ninety-seven finfish species since the survey began in 1984. One new finfish species, striped burrfish, was observed in 2007.
- Only one species, weakfish, was at record abundance by number (geometric mean count per tow) in 2007. This was principally due to a phenomenal year-class (record high index of 63.93 young-of-year fish per tow) - a complete reversal from near-record low abundance in 2006. Age $1+$ weakfish abundance remains average.
- Although spiny dogfish were not at record abundance by number, they were at record levels of biomass (kg / tow) in 2007. Smooth dogfish abundance in 2007 was the second highest by weight and the third highest by number for the time-series.
- Adult scup abundance remains high relative to 1984-1998 levels; the 2007 index was the fourth highest in the time series. Summer flounder abundance has declined from the high levels recorded between 2001 and 2003 to average levels as observed from 1996 to 2000.
- Adult bluefish abundance has been at average levels for the past three years after decreasing from near-record high abundance in 2004. Striped bass abundance has been above average for the past 13 years.
- The spring survey index for tautog has remained low and below the time-series average for the past 15 years except for a short-lived increase in abundance recorded in 2002. The past nine years of winter flounder springtime abundance indices have been the lowest on record, with 2006 being the lowest index for the time series and 2007 being approx one-third of the timeseries average.
- The spring index for American lobster has been declining for eight years now (since 1999) and has remained below the time-series average for the past five years. Fall lobster abundance has
also declined for eight years - to a record low for the third year in a row. Five of the past six years have been the lowest fall indices on record.
- Several species not typically exploited in recreational or commercial fisheries have undergone significant changes in abundance over the survey time series. Declining trends are evident for such species as tomcod, sea raven, longhorn sculpin, ocean pout and cunner all of which are cold temperate species. In contrast, several warm temperates have undergone significant increases in abundance that are similarly difficult to attribute to fishery management actions. These include moonfish, hickory shad, smallmouth flounder, spotted hake, northern sea robin, clearnose skate and inshore lizardfish.

## CONCLUSIONS:

- The abundance of recreationally important species in Long Island Sound remains moderate to high including scup, striped bass, summer flounder and snapper bluefish. Recent high abundance of young-of-year scup also bodes well for future catches for this species. The increased abundance of hickory shad in recent years (2005 \& 2006) has been providing additional recreational fishing opportunities, especially for nearshore anglers. However, some recreational species like winter flounder and tautog have gone through a protracted period of declining abundance and this is cause for concern. Additionally, several species not typically targeted by recreational fishermen are at record low levels and may indicate shifts in species assemblages within Long Island Sound associated with broad scale increasing temperature trends in the northwest Atlantic.

## RECOMMENDATIONS:

- Continue monitoring through LIS Trawl Survey to provide information for stock assessment purposes and to evaluate the effectiveness of management measures.

## JOB 2 PART 2: ESTUARINE SEINE SURVEY

## OBJECTIVES (summary)

- To provide an annual index of recruitment for young-of-year winter flounder and all finfish and crab species taken.

## KEY FINDINGS:

- The 2007 annual index of recruitment for young-of-year winter flounder (4.7 fish/haul) ranked $14^{\text {th }}$ out of 20 annual indices.
- Mean catch of all finfish (236 fish/haul) ranked third out of 20 annual indices and was well above the series average of 142 fish/haul (Figure 2.2).
- The forage fish index for 2007 (149 forage fish/haul) was the second highest of the time series, and well above the time series average of 102 forage fish/haul.

## CONCLUSIONS:

- A small increase in abundance of the winter flounder young of year index for 2007, followed by fairly low indices since 2000 and the absence of a strong year class since 1996 is not expected to change the disappointing short term outlook for the stock.
- The inshore forage fish abundance index primarily reflects the abundance of Atlantic silversides, followed by striped killifish and mummichog, the dominant forage species taken in the survey.

## RECOMMENDATIONS:

- Continue to monitor young-of-year winter flounder and inshore forage species abundance through the September seine survey.

## JOB 3 A STUDY OF NEARSHORE HABITAT - INACTIVE THIS SEGMENT

## JOB 4 FISHING GEAR SELECTIVITY - INACTIVE THIS SEGMENT

## JOB 5: COOPERATIVE INTERAGENCY RESOURCE MONITORING OBJECTIVES

- Provide monthly monitoring of water quality parameters important in the development of summer hypoxia in Long Island Sound including temperature, salinity, and dissolved oxygen.
- Provide indicators of hypoxia impacts on living resources.

## KEY FINDINGS:

- Hypoxia first developed late in 2007 on or about July 12 and persisted for 72 days ending about September 21, 2007.
- Severe hypoxia ( $<1.0 \mathrm{mg} / \mathrm{l}$ dissolved oxygen) was not observed in 2007. Areas exposed to severe hypoxia would be expected to be devoid of finfish, lobsters and crabs.
- Hypoxia ( $<=3.5 \mathrm{mg} / \mathrm{l}$ dissolved oxygen) extended over a maximum area of $917 \mathrm{~km}^{2}$ during late July - early August, a larger area than during the 2004-2006 seasons.
- The Biomass Area-Day Depletion Index (BADD) index for 2007 was about average at 5,198 or about $2.7 \%$ of the total area-days in the LIS sampling area. The BADD index is a gross measure of seasonal habitat loss associated with hypoxia.

## CONCLUSIONS:

- Hypoxia developed fairly late in the 2007 season but persisted well into September ( $11^{\text {th }}$ ). However, with no severe hypoxia present the BADD index recorded the lowest level of seasonal habitat loss since 2001.

## RECOMMENDATIONS:

- Continue conducting the water quality monitoring program to provide information needed to evaluate the effectiveness of measures to reduce nutrient loading to LIS and the impact of water quality improvements on marine life.

## JOB 6: PUBLIC OUTREACH OBJECTIVES

- Increase public awareness among anglers and the general public that information provided through this project contributes to state and federal efforts to enhance recreational fisheries conservation and that the majority of marine fisheries research and monitoring activities in Connecticut are funded through the Federal Aid in Sportfish Restoration Program.

## KEY FINDINGS:

- A total of 21,697 outdoor and environmental writers, marine anglers and boaters, marina operators, fishing tackle retailers, Fisheries Advisory Council (FAC) members, and members of the general public attended outreach events. The largest event was the "CMTA Boat Show" attended by 11,308 fishermen and hunters, followed by "Northeast Hunting and Fishing Expo" at the Hartford Convention Center which had an attendance of 9,527.

## CONCLUSIONS:

- Large numbers of anglers and members of the general public are provided information about Marine Fisheries programs through participation in outdoor fishing \& hunting shows, Science and Career Days, public speaking engagements and displays at the Marine Fisheries Office.

## RECOMMENDATIONS:

- Continue outreach efforts.

## EXPENDITURES

Summary of expenditures for the period March 1, 2007 to February 29, 2008.

|  | Federal | State | Total |
| :--- | ---: | ---: | ---: |

## JOB 1: MARINE ANGLER SURVEY PART 1: MARINE RECREATIONAL FISHERY STATISTICS SURVEY

## GOAL

To provide long term monitoring of marine recreational fishing activity including angler participation and catch statistics in a manner that is comparable to other Atlantic coastal states.

## OBJECTIVES

Provide estimates of:

1) Number of marine anglers in Connecticut each year.

A total of 365,941 marine anglers were estimated to have fished in Connecticut during 2007.
2) Total effort (trips) expended by anglers in Connecticut each year.

Marine anglers made 1,683,284 fishing trips in Connecticut during 2007.
3) Total catch (numbers of fish kept and released fish) and harvest (numbers and the weight of kept fish) of the most commonly sought species: bluefish, scup, winter flounder, summer flounder, tautog, and striped bass.

In 2007, marine anglers creeled 375,064 bluefish ( $2,273,529 \mathrm{lbs}.), 689,975$ scup ( $777,901 \mathrm{lbs}$.), 4,164 winter flounder ( $6,634 \mathrm{lbs}$.), 108,528 summer flounder ( $360,322 \mathrm{lbs}$ ), 211,327 tautog ( $960,087 \mathrm{lbs}$.$) , and 109,856$ striped bass ( $1,718,924 \mathrm{lbs}$.$) .$
4) Length-frequency of harvested bluefish, scup, winter flounder, summer flounder, tautog, and striped bass.

Length frequency distributions (minimum, mean, and maximum) were estimated for bluefish, scup, winter flounder, summer flounder, tautog, and striped bass (Tables 1.9-1.14).

## INTRODUCTION

The Connecticut Department of Environmental Protection (DEP), Bureau of Natural Resources, Marine Fisheries Division, has been collecting marine recreational fisheries information along the Connecticut coastline since 1979. However, in order to improve statewide marine fisheries statistics and become more consistent with other states, Connecticut joined with the MRFSS program in July, 1987. Before Connecticut's involvement in the MRFSS, data collection was conducted by NMFS's contractor just as in other states where state agencies do not participate in the program. This report includes state angler intercept survey work in 2007 and MRFSS angler effort and catch statistics from 1981-2007.

## METHODS

The MRFSS is based on two complementary surveys: A random telephone survey of households, and an intercept survey of anglers at fishing sites (NMFS 1992). MRFSS utilized a contractor to conduct the telephone survey to calculate total angler participation and trip estimates. Connecticut performed the angler intercept survey (angler interviews) in order to collect angler catch and effort data, biological data, and socioeconomic and demographic information.

The MRFSS's primary objectives are (1) to provide a collection of accurate and representative data on the marine recreational fishery and (2) to produce accurate and precise regional (e.g. ME-CT) catch estimates which can be used by fishery managers to assess the impacts of recreational fishing on finfish stocks. In order to produce estimates with adequate precision at the state level (where proportional Standard Error (PSE) $\leq 20 \%$, a modified version of Coefficient of Variation = S.E./Mean *100), the MRFSS initial intercept quota was tripled for Connecticut. Telephone and Intercept Surveys are collected in bimonthly time periods (termed Waves) and further broken down by mode in the Intercept Survey. In 2001, NMFS base allocations for the Northeast and Mid-Atlantic sub-regions were increased 1.5 times in order to increase effort and catch precision estimates for those areas. The increase was accomplished through a grant proposal submitted by the Atlantic Coastal Cooperative Statistics Program (ACCSP) Recreational Statistics Technical Committee and later approved by the ACCSP Coordinating Council. ACCSP is comprised of fifteen Atlantic coastal states and two federal agencies, which oversee and administer the collection of commercial and recreational fishery statistics. ACCSP provided funding for the additional intercept sampling as described in Table 1.1. However since state participation in 1987, Connecticut had already tripled NMFS Intercept Survey allocation and provided funding for those increases. ACCSP's involvement basically reduces Connecticut's expenditure toward processing of the additional intercepts. Wave 1 is not sampled in Connecticut or any states in the Mid Atlantic (NY-VA) and Northeast (ME-CT) subregions due to low fishing activity (NMFS 1992).

In addition, the sampling methodology of the party/charter boat mode was modified beginning in Wave 4 (July-August) 2003 in order to improve catch and trip estimates. The new changes in the survey (termed "the For-Hire Survey") called upon each state to provide and update a comprehensive list of current party/charter boat vessels and operators. This list provided a sampling frame where ten percent of for-hire vessel operators would be randomly selected to be contacted by telephone to report their fishing trip effort (angler trips) for a given two week period. Coupled with the telephone survey, pre-validation of vessels was performed where vessels were randomly selected and checked to determine if the vessel was out fishing or not. The same list would generate intercept assignments by wave. For-hire intercept assignments were split by vessel type (charter - 6 or less passengers) and party/head boats (more than 6) since sampling methods differ. Anglers fishing in the charter boat fishery were interviewed at dockside where party/charter boat anglers were interviewed on board while at sea. Dockside sampling of charter boat anglers was selected because of the six passenger limitation. At sea sampling was selected to increase the number of length and weight measurements on creeled fish in addition to length measurements on discarded fish. Intercept collection quotas for the
party/head boat mode were set by the number of trips (based on 2 samplers/trip). All other modes were allocated by the number of intercepts.

## MRFSS Estimation Methods

MRFSS estimation methods used to compute catch and effort statistics were based on the following criteria: (1) improved guidelines for recording proxy data in lieu of missing data, (2) imputation for missing data, (3) telephone survey sample weighting, and (4) cleanup of historical intercept data (NMFS 1994). In cases where gaps or insufficient data occurs, proxy data (information obtained in the Telephone Survey from someone in a fishing household other than the angler) were used to fill voids in the database. In addition, catch and effort statistics for 1979-80 were omitted because of inadequate information (missing files that contained nonfishing household sample size information).

Angler participation and fishing trip estimates were derived primarily from the Telephone Survey and, in special situations, the Intercept Survey (NMFS 1992). In the Telephone Survey, households with telephones located in coastal counties or within 50 miles of the coastline were randomly selected and called to determine if a household fell into either of two categories: (1) households that comprised one or more marine recreational anglers and (2) non-fishing households. Households with anglers were further surveyed in order to collect fishing trip information used in estimating total fishing trips and angler participation. In situations where anglers did not possess a telephone (or live in a household), Intercept Survey data were used in order to account for that segment of the angling population that would otherwise be missed.

## MRFSS Catch Type Categories

Catch estimates were broken down into three categories: Catch Type A, B1 and B2. Catch Type A consisted of catches that were kept by anglers and available for inspection by field interviewers. Catch Type B1 included angler catches that were used for bait, discarded dead, etc., and were not available for inspection, and Catch Type B2 was comprised of fish that were caught and released alive. In this report, total catch estimates consist of Catch Types A+B1+B2.

Creeled catch (fish removed from the population) include Catch Type A+B1 only. Catch Types A and B1 were the only catch groups estimated in both numbers and weights. Since Catch Type B1 are unobserved catches, Catch Type A mean weight estimates were used to expand Catch Type B1 estimates. Catch statistics in this document will be reported in numbers caught or as otherwise specified.

## RESULTS AND DISCUSSION

## Connecticut Intercept Survey 2007

During March-December 2007, a total of 1,983 interviews (intercepts) with marine anglers were conducted by Marine Fisheries Division staff for the MRFSS (Table 1.2). Intercept shortfalls occurred particularly in Waves 2 and 6 for NMFS + ACCSP quotas because of low fishing activity and poor weather conditions. Furthermore, most Connecticut-based party/charter businesses and marinas terminate their operations by November 1.

Table 1.2: Total Number of Angler Intercepts Collected by Mode and Party/Head Boat Trips Taken by Wave, 2007

| Wave 2 | Wave 3 | Wave 4 | Wave 5 |  |  |  |

## MRFSS 2007 Angler Participation and Fishing Trip Estimates and the MRFSS Time Series from 1981-2007

During 2007, an estimated 365,941 marine anglers made 1,683,285 trips (Tables 1.3-1.4). The annual estimated number of marine anglers averaged 339,467 participants from 1981-07. The annual total of marine recreational fishing effort averaged $1,452,230$ trips for the same period. Connecticut residents comprised about $80 \%$ of the total marine fishing population whereas nonresident anglers made up the remaining 20\% from 1981-2007.

The three principal modes of marine recreational fishing include Shore Mode (anglers fishing from beach and bank or manmade structure), Private/Rental Mode (anglers fishing from a privately owned or rental boat), and Party/Charter Boat Mode where anglers pay a captain/vessel for hire to fish. The percentage breakdown of trips in 2007 by mode was $32.3 \%$ for shore mode, $3 \%$ party/charter boat mode and $64.7 \%$ for the private/rental mode. The percent distribution of
fishing trips by mode for the time series was $35.9 \%$ for shore mode, $6 \%$ for party/charter mode and $58.1 \%$ in the private/rental mode.

## MRFSS Catch Estimates 2007

Total catch was estimated at 6,347,293 fish and creeled catch at 1,684,016 fish for 2007. Five popular species: bluefish, striped bass, scup, summer flounder, and tautog comprised over $90 \%$ of the estimated total catch and creeled catch (Tables 1.5-1.22). For that reason, these species will be the focus of discussion in this section. Precision estimates for bluefish, striped bass, summer flounder, scup and tautog were near or below a PSE of $20 \%$ for both total and creeled catch. Total creeled catch in pounds for all species combined was estimated at 6 million lbs.

Catch estimates vary annually for most species primarily due to changes in abundance and fishing regulations. For more insight to historical accounts of Connecticut's marine recreational fishery regulations please refer to Table 1.23.

## BLUEFISH

Bluefish was the third most frequently caught species in Connecticut in 2007 with an estimated $1,222,423$ million fish for total catch. The creeled catch estimate was 375,064 fish. Bluefish catch estimates in numbers comprised about $19 \%$ of the total catch and $21 \%$ of the total creeled catch for all species (Figure 1.3). Bluefish estimated creeled catch in pounds accounted for $36 \%$ of the total creeled catch. The proportion of bluefish released was $69 \%$.

The private rental boat mode comprised $73 \%$ and $44 \%$ for total catch and creeled catch estimates. The shore mode accounted for $18 \%$ and $33 \%$ for total catch and creeled catch estimates. In the time series, however, the shore mode annual mean was approximately $44 \%$ and $45 \%$ for total and creeled catch estimates.

In numbers caught, bluefish have been the most commonly caught and harvested species in the MRFSS time series ( $27 \%$ and $34 \%$, respectively). Bluefish total catch estimates range from a record low of 690,694 fish in 1988 to record high of about 6.3 million fish in 1982. The annual mean was about 1.8 million fish for total catch. Creeled catch estimates have ranged from 372,525 fish in 2000 to 3.3 million fish in 1981. The annual mean for creeled catch was 1.3 million fish. The annual mean rate anglers released fish alive was $27 \%$. The time series for released bluefish ranged from about $4 \%$ to a record high of $72 \%$ (2005 estimate).

## STRIPED BASS

Striped bass were the most frequently caught fish by marine recreational anglers in 2007 with an estimated total catch of about 1.9 million fish (comprising $30 \%$ of the total catch for all species). The private/rental boat mode accounted for $86 \%$ of the total catch. The creeled catch was estimated at 109,856 fish, an all time high for the time series. Striped bass creeled catch in numbers comprised $9 \%$ for all species. Creeled catch in weight was estimated at 1.7 million
pounds and comprised $29 \%$ of the total creeled catch for all species. Approximately $94 \%$ of the total number of striped bass caught were released alive.

Throughout the MRFSS time series, striped bass total catch estimates varied from as low as 27,783 fish in 1981 to a record high of 1.9 million fish in 2007 (Figure 1.4). Low abundance of striped bass in the 1980's due to over-fishing followed by successful stock restoration efforts in the 1990's to present have resulted in a substantial upward trend of total catch. With the exception of 1981, 1983, and 1985 the creeled catch estimate has remained consistently low with an annual mean retention rate of about $7 \%$ (range $\simeq 0.7 \%-15 \%$ ). The low retention rate can be attributed to catch restrictions implemented to curtail harvest in addition to recreational anglers increased awareness of conservation fishing practices (e.g. catch and release fishing).

## SUMMER FLOUNDER (Fluke)

The summer flounder recreational total catch estimate decreased substantially (57\%) from 2006 to 2007. The estimated total catch of 433,038 fish comprised $7 \%$ of the total catch for all species (Figure 1.5). The private/rental boat mode accounted for $97 \%$ of the total catch. Even though the total catch estimate dropped by more than half, the creeled catch estimate in numbers increased slightly (1\%) from 2006 with an estimated 108,528 fish and accounted for about $6 \%$ of the total creeled catch for all species. The creeled catch in weight was an estimated 360,322 pounds and accounted for $3 \%$ of the total creeled catch in weight for all species. Approximately $75 \%$ of summer flounder caught were released.

In numbers caught, summer flounder comprised $7 \%$ and $5 \%$ of the total and creeled catch estimates in the MRFSS time series. The lowest estimated total catches occurred back to back in 1989 and 1990 with only 44,541 and 56,352 summer flounder, respectively. Creeled catch estimates have been highly variable (range $=17,707$ in $1990-576,160$ fish in 1983).

## WINTER FLOUNDER

Winter flounder total catch decreased (43\%) from an estimated 31, 756 fish in 2006 to 18,258 in 2007. The total creeled catch estimate was 4,164 fish. Total and creeled catch estimates comprised only $0.3 \%$ for all species (Figure 1.6). The private/rental mode comprised $79 \%$ of the estimated total catch. Since 1992, winter flounder annual estimates have fallen well below the time series mean of 406,612 fish for total catch and 333,093 for creeled catch. Winter flounder creeled catch in weight was estimated at 6,634 pounds, or about $0.1 \%$ of the total creeled catch in weight for all species. The proportion of winter flounder released was $77 \%$.

## SCUP (Porgy)

Scup was the second most frequently caught species in 2007 with $1,560,603$ and 689,975 fish estimated for total and creeled catches. The private/rental boat mode accounted for $87 \%$ of the total catch. Scup estimates comprised $25 \%$ and $41 \%$ of the total and creeled catch estimates for all species (Figure 1.7). In weight, the creeled catch was estimated at 777,901 pounds. The proportion of scup released was approximately $56 \%$.

## TAUTOG (Blackfish)

Tautog, locally referred to as blackfish by Connecticut anglers, are one of the few year round resident species of Long Island Sound. Tautog total catch in 2007 was estimated at 656,690 fish (a two fold increase from 2006). The creeled catch total was estimated at 211,327 fish (Figure 1.8). The total and creeled estimates comprised $10 \%$ and $13 \%$ of the total for all species. In weight, the creeled catch was estimated at 960,087 pounds. The proportion of tautog released was $44 \%$.

## LENGTH FREQUENCY DISTRIBUTION FOR BLUEFISH, STRIPED BASS, SCUP, SUMMER FLOUNDER, WINTER FLOUNDER, AND TAUTOG

Length measurements were collected as described in the MRFSS Procedures Manual. Attempts were made to measure all marine finfish when available or in random sub-samples when large catches were encountered. Length frequency distributions for Type A (observed fish) as well as catch and trip statistics can be queried on the following NMFS web site: http://www.st.nmfs.gov/st1/recreational/queries/index.html.

Length frequency distributions varied annually for each species (as shown in Figures 1.91.14) in response to factors including year class strength and changes in recreational fishery regulations (minimum length requirements, daily creel limits, and closed fishing seasons). Since most marine species are regulated by a minimum length requirement, length frequency distributions were primarily comprised of legal size fish. One particular note, in the intercept survey fish are measured from the tip of the snout to the fork in the tail (fork length). Regulations for minimum length are measured from the tip of the snout to the end of the tail (total length) regardless if a species possess a forked tail or not.

## MODIFICATIONS

None.

## JOB 1: MARINE ANGLER SURVEY

 PART 2: VOLUNTEER ANGLER SURVEY
## OBJECTIVES

Provide estimates of:

1) Size composition data on both kept and released bluefish, striped bass other common species.

Anglers participating in the Volunteer Angler Survey measured bluefish, striped bass and other species. Length frequencies of popular species: bluefish, striped bass, summer flounder, winter flounder, scup, tautog and weakfish are listed in Tables 1.1A-1.7A.
2) Catch frequency (trips catching 0,1,2,...fish) data on both kept and discarded fish.

Catch frequency data and percent distribution on both kept and released are listed in Tables $1.1 \mathrm{~A}-1.2 \mathrm{~A}$.

## INTRODUCTION

The purpose of the Volunteer Angler Survey (VAS) is to supplement the National Marine Fisheries Service, Marine Recreational Fishery Statistics Survey by providing additional length measurement data particularly concerning fish that are released. In 1994, the VAS program was incorporated into the Marine Angler Survey (Job 1) in order to improve and expand the survey.

The survey's initial objective was to collect marine recreational fishing information concerning finfish species with special emphasis on striped bass. In 1994, the collection of bluefish length measurements was added to the survey to fully understand that fishery. In 1997, length measurement information on other marine finfish was added to the survey. This report primarily consists of data collected in 2007.

## METHODS

The VAS is designed to collect trip and catch information from marine recreational (hook and line) anglers who volunteer to record their fishing activities by logbook. The logbook format consists of recording fishing effort, target species, fishing mode (boat vs. shore), area fished (subdivisions of Long Island Sound and adjacent waters), catch information concerning finfish kept (creeled) and released, and striped bass and bluefish length measurements (Appendix 1.1A). In 1997, the logbook was modified in order to collect length measurement data on other species as well. Instructions for volunteers were provided on the inside cover of the postage paid logbook. Each participating angler was assigned a personal numeric code for confidentiality purposes. After the logbook data were computer entered, logbooks were returned to each volunteer for their own personal record. For their participation, volunteers were sent a soft insulated lunch cooler in addition to updates of survey results. Furthermore, to improve communications with recreational anglers and to encourage more public input, volunteers were
notified of upcoming public hearings including proposed and final changes in recreational fishing regulations.

## RESULTS AND DISCUSSION

Over the years the number of participants in the survey ranged from as low as 18 anglers participating in 1979 to a high of 115 anglers in 1997. Advertising the VAS program through the DEP's annually published Connecticut Angler's Guide including the State web site www.ct.gov/dep has helped increase volunteer participation. The guide is distributed to anglers purchasing freshwater licenses in addition to being circulated by bait and tackle shops and other entities.

## VAS 2007

In 2007, a total of 75 anglers participated in the survey. Those 75 anglers took 1,521 fishing trips. Volunteers including additional anglers involved in a fishing party made a total of 3,172 fishing trips (note: targeted trips in the following paragraphs are not additive to the trip total since more than one species may be sought during an angler trip). Boat trips comprised $82 \%$ of the total trips taken. The percent of successful trips, where at least one fish of any species was caught, was $93 \%$ for boat anglers and $74 \%$ for shore anglers. Besides striped bass and bluefish, VAS anglers pursued and caught a wide range of inshore and offshore pelagic species and recorded length measurements on many species. This report contains statistics on species anglers targeted the most and that are under a current fishery management plan (bluefish, striped bass, summer flounder, scup, winter flounder, tautog, black sea bass, and weakfish). Please refer to tables $1.1 \mathrm{~A}-1.2 \mathrm{~A}$ for length frequency distribution tables and catch trip frequency distributions for kept and discarded (released) fish are listed in figures 1.1A-1.7A.

## Bluefish

VAS participants made 1,393 targeted bluefish trips (boat and shore modes combined) and recorded a total of 2,260 adult bluefish caught (bluefish $>12$ inches). Of the total number of targeted trips, only $11 \%$ were unsuccessful. The overall catch including trips not targeting bluefish was 2,674 fish. Of the overall catch, anglers measured 2,060 adult bluefish ( $77 \%$ ) and released about $75 \%$. The $50^{\text {th }}$ percentile length measurement for bluefish was approximately 23.5 inches (total length). The targeted catch-per-unit-of-effort (CPUE) was 1.6 and 0.47 fish per angler trip for total and creeled catches.

## Striped bass

Volunteers made 2,157 trips targeting striped bass and caught a total of 6,845 fish (overall catch including trips not targeting striped bass was 6,901 fish). About $14 \%$ or 291 trips targeting striped bass were unsuccessful. Of the overall catch, about $96 \%$ of the catch was released. VAS anglers measured 3,613 striped bass ( $52 \%$ of the overall catch). Legal size striped bass ( $\geq 28$ inches) comprised about $21 \%$ of the measured catch. The percent of legal size striped bass released was estimated at $73 \%$. The $50^{\text {th }}$ percentile length measurement for striped
bass was about 21.5 inches. Striped bass ranged in length from as small as 6 inches to 48 inches. Targeted CPUE was 3.2 and 0.11 fish per angler trip for total and creeled catches.

## Summer flounder

A total of 738 fishing trips were directed toward catching 2,728 summer flounder. Only $5 \%$ of the trips targeting summer flounder were unsuccessful. The overall catch was 2,794 fish. Volunteers measured 2,001 fish or about $72 \%$ of the overall catch. Approximately $69 \%$ of the overall catch was released. About $60 \%$ of the measured catch was comprised of fish less than the legal length limit of 18 inches. VAS anglers released $23 \%$ of summer flounder measuring 18 inches and greater. The $50^{\text {th }}$ percentile length measurement for summer flounder was about 18 inches. Length measurements ranged from 8 to 29 inches. Summer flounder targeted CPUE was 3.7 and 1.2 fish per angler trip for total and creeled catches.

## Winter flounder

Volunteers made 73 trips that targeted winter flounder. These targeted trips produced just 86 fish. The overall catch including non-targeted trips was 94 winter flounder. Of the total trips targeting winter flounder, $32 \%$ of the trips were unsuccessful. Of the overall catch, all 94 winter flounder were measured. Anglers released about $25 \%$ of the overall catch and about $7 \%$ of the measured catch were sub-legal in size ( $<12$ inches). Anglers released $13 \%$ of legal sized fish ( $\geq 12$ inches). The $50^{\text {th }}$ percentile length measurement for winter flounder was about 13 inches. Length measurements ranged from 10 to 21 inches. Winter flounder targeted CPUE was 1.2 and 0.9 fish per angler trip for total and creeled catches.

## Scup

Volunteers made 132 targeted trips for scup producing a total of 1,199 fish. Of the total trips targeting scup, only $3 \%$ of the trips were unsuccessful. The overall total catch was 1,702 fish. Volunteers measured about $78 \%(1,327$ fish ) of the overall total catch. Of the overall total catch, $80 \%$ were released. Sub-legal fish ( $<10.5$ inches) comprised $66 \%$ of the measured catch. The proportion of legal sized fish ( $\geq 10.5$ inches) released by anglers was approximately $40 \%$. The $50^{\text {th }}$ percentile length measurement for scup was about 9.5 inches. Length measurements ranged from as little as 4 inches to 18 inches. Scup targeted CPUE was 9.1 and 1.8 fish per angler trip for total and creeled catches.

## Tautog

VAS anglers made 176 trips that targeted tautog and caught a total of 753 fish. Of the total trips targeting tautog, $6 \%$ of the trips were unsuccessful. The overall total catch was 787 fish. Volunteers measured 469 tautog or about $60 \%$ of the overall total catch. About $24 \%$ of the measured catch was less than the legal size of 14 inches. Of the legal size measured catch, approximately $42 \%$ were released. The $50^{\text {th }}$ percentile length measurement for tautog was about 16.5 inches. Length measurements ranged from 6 to 24 inches. Tautog targeted CPUE was 4.3 and 1.4 fish per angler trip for total and creeled catches.

## Weakfish

There were insufficient weakfish data for analysis. Although 30 trips targeted weakfish only two fish were recorded caught by VAS anglers.

## Black sea bass

VAS angler took 26 trips targeting black sea bass catching 24 fish. However, the overall catch was 427 black sea bass. Of the overall total catch, $85 \%$ were released. Volunteers measured 355 fish or $83 \%$ of the overall total catch. Of the measured catch, $76 \%$ of the catch was below the 12 inch legal length limit. The $50^{\text {th }}$ percentile length measurement for black sea bass was about 8 inches and the percent of legal size fish released was $30 \%$. Black sea bass targeted CPUE was 0.9 and 0.12 fish per angler trip for total and creeled catches. The nontargeted catch rates suggests that the black sea bass fishery in Long Island Sound is an incidental fishery for most anglers.

## CONCLUSIONS

VAS anglers provide valuable recreational fisheries data at a relatively low cost. In addition, collecting length data on released fish is often difficult or unattainable through conventional intercept surveys. The VAS program provides this information which is essential in assessing the recreational fishery. VAS data is also used in monitoring and assessing the recreational striped bass fishery in Connecticut as required through the Atlantic States Marine Fisheries Commission. Furthermore, VAS data is now being used in bluefish, summer flounder, winter flounder and weakfish stock assessments and will most likely be involved in other species as well. Any anglers interested in participating in the program can contact Rod MacLeod at 860-434-6043, or e-mail address: rod.macleod@ct.gov or writing to State of Connecticut, DEP, Marine Fisheries Office, P.O. Box 719, Old Lyme CT 06371.

## MODIFICATIONS

None.

## ACKNOWLEDGMENTS

I am very grateful to all anglers who have participated in the survey. Without their cooperation and assistance, the VAS program would not be possible.

## APPENDIX 1.1A: Connecticut Volunteer Angler Logbook

Volunteer Angler Survey Logbook Instructions: Listed below are instructions for filling out the logbook. Upon logbook completion, tape the prepaid postage logbook shut and drop it off in the mail. All information is kept confidential. Once the information is entered in our computer system and error checked, the logbooks will be returned for your own records. If you any questions or comments regarding the survey, please contact Rod MacLeod at (860) 434-6043 or at E-Mail address rod.macleod@po.state.ct.us.
(1) Please enter the month and day fishing trip took place.
(2) Fishing start time in military time (Example: $11 \mathrm{am}=1100,1 \mathrm{pm}=1300 \mathrm{hrs}, 2 \mathrm{pm}=1400$, etc.).
(3) Actual fishing time or lines wet to the nearest $1 / 2$ hour. Do not include travel time.
(4) Number of anglers in fishing party.
(5) Areas fished most in descending order as described on the chart located on the inside cover of logbook. Also, if most of the fishing took place in a river please place a check mark in the box provided.
(6) Check mark your mode of fishing (boat or shore).
(7) Enter species code for 1st (primary) targeted species and 2nd (secondary) targeted species provided in the species code list below.
(8) Number of anglers that caught fish.
(9) Place a check mark if no fish were caught for the entire fishing party.

Catch Information: Catch information should include the total number of fish caught by the entire party. Enter the number of fish kept and released in the designated boxes. If you caught fish other than those in the pre-coded boxes, please refer to the species code list below and enter the code in the designated blank boxes. If you caught a fish not listed in the species code list, please write down the common name(s) in the blank box(es) provided.

Length Measurement Information: Please try to provide length measurement data on popular species caught including kept and released fish (exclude skates, cunners, etc). Fish must be measured to the nearest $1 / 2$ inch from the tip of the snout to the end of the tail (total length). In case of large catches, try to measure your catch on a random basis. Measuring just large fish will not accurately reflect the actual size or age distribution of the population. When handling and measuring sublegal sized fish, anglers should use their best judgement and experience to insure that those fish are returned to the water unharmed.

## Species Code List:

## JOB 2 PART 1: LONG ISLAND SOUND TRAWL SURVEY (LISTS)

## CRUISE RESULTS FROM THE 2007 <br> SPRING \& FALL SURVEYS

## STUDY PERIOD AND AREA

The Connecticut DEP Marine Fisheries Division completed the twenty-forth year of the Long Island Sound Trawl Survey in 2007. The Long Island Sound Trawl Survey encompasses an area from New London to Greenwich, Connecticut and includes waters from 5 to 46 meters in depth in both Connecticut and New York state waters. Long Island Sound is surveyed in the spring during April through June and during the fall from September through October. This report includes results from the 2007 spring and fall sampling periods as well as providing time series information since the commencement of the survey in 1984.

## GOAL

To collect, manage, synthesize and interpret fishery independent data on the living resources of Long Island Sound for fishery management and information needs of Connecticut biologists, fishery managers, lawmakers and the public.

## OBJECTIVES

1) Provide an annual index of counts and biomass per standard tow for 40 common species.
2) Provide age specific indices of abundance for scup, summer flounder, tautog and winter flounder.
3) Provide a recruitment index for bluefish (age 0) and weakfish (age 0).
4) Provide length frequency distributions of bluefish, scup, striped bass, summer flounder, tautog, weakfish, winter flounder, and other ecologically important species suitable for conversion to age using modal analysis, age-length keys or other techniques.
5) Provide annual total counts and biomass for all finfish species taken.
6) Provide annual total biomass for all invertebrate species taken.
7) Provide a species list for Long Island Sound based on LIS Trawl Survey sampling, noting the presence of additional species from other sampling conducted by the Marine Fisheries Division.

## INTRODUCTION

The Long Island Sound Trawl Survey (LISTS) was initiated in 1984 to provide fishery independent monitoring of important recreational species in Long Island Sound. A stratified-random design based on bottom type and depth interval was chosen and forty sites were sampled monthly from April through November to establish seasonal patterns of abundance and distribution. Seven species were initially of primary interest: bluefish, scup, striped bass, summer flounder, tautog, weakfish, and winter flounder. Length data for these species were collected from every tow; scup, tautog, and winter flounder were sampled for ageing. All fish species were identified and counted.

Since 1984, several changes have been incorporated into the Survey. In 1991, the sampling schedule was changed to a spring/fall format, although sampling is still conducted on a monthly basis (April - June, September, and October). Beginning in 1992, species were weighed in aggregate with an onboard scale to provide indices of biomass. Furthermore, more species have been sampled for lengths, such as windowpane and fourspot flounders, and important forage species such as butterfish, long-finned squid, and several herring species. By 2003, a total of 20 finfish species and two invertebrate species (lobster and long-finned squid) had been added to the original list of seven species measured. In addition, rarely occurring species (totaling less than 30 fish/year each) are now measured and age structures are collected for a sub-sample of weakfish and all summer flounder ( $>59 \mathrm{~cm}$ ). All of these changes served to improve the quality and quantity of information made available to fishery managers for local and regional assessment of stock condition, and to provide a more complete annual inventory of LIS (Long Island Sound) fishery resources.

In the fall of 1999, an unusual die-off of lobsters occurred, particularly in the western portion of the Sound known as 'The Narrows' (Johnson and Shake 2000). This event lead to speculation that this area, which is adjacent to highly urbanized portions of Connecticut and New York, was experiencing a broad decline in living resources including finfish. Since the standard 40 sites per month did not cover this area, new sites were needed to evaluate finfish and invertebrate species composition and abundance west of a north-south line from Norwalk, CT to Eatons Neck, NY. Therefore, starting in 2000, additional sites in the western portion of the Sound were sampled during each month in addition to the LISTS sites. Sampling and data analysis for the Narrows, although not funded by this project or covered by the objectives, has in the past been discussed in LISTS annual reports (Gottschall and Pacileo 2007). Since a final report of Narrows sampling is required in 2008 under Fisheries Disaster Relief funding (Grant number: NA16FW1238), this report will not include that analysis.

## METHODS

## Sampling Design

LISTS is conducted from longitude $72^{\circ} 03^{\prime}$ (New London, Connecticut) to longitude $73^{\circ} 39^{\prime}$ (Greenwich, Connecticut). The sampling area includes Connecticut and New York waters from 5 to 46 m in depth and is conducted over mud, sand and transitional (mud/sand) sediment types. Sampling is divided into spring (April-June) and
fall (Sept-Oct) periods, with 40 sites sampled monthly for a total of 200 sites annually. The sampling gear employed is a 14 m otter trawl with a 51 mm codend (Table 2.1). To reduce the bias associated with day-night changes in catchability of some species, sampling is conducted during daylight hours (Sissenwine and Bowman 1978).

LISTS employs a stratified-random sampling design. The sampling area is divided into $1.85 \times 3.7 \mathrm{~km}$ ( $1 \times 2$ nautical miles) sites (Figure 2.1), with each site assigned to one of 12 strata defined by depth interval ( $0-9.0 \mathrm{~m}, 9.1-18.2 \mathrm{~m}, 18.3-27.3$ m or, $27.4+\mathrm{m}$ ) and bottom type (mud, sand, or transitional as defined by Reid et al. 1979). For each monthly sampling cruise, sites are selected randomly from within each stratum. The number of sites sampled in each stratum was determined by dividing the total stratum area by $68 \mathrm{~km}^{2}$ ( 20 square nautical miles), with a minimum of two sites sampled per stratum (Table 2.2). Discrete stratum areas smaller than a sample site are not sampled.

## Sampling Procedures

Prior to towing at each site, temperature $\left({ }^{\circ} \mathrm{C}\right)$ and salinity ( ppt ) are measured at 1 m below the surface and 0.5 m above the bottom using a YSI model $30 \mathrm{~S}-\mathrm{C}-\mathrm{T}$ meter. Water is collected at depth with a five-liter niskin bottle, and temperature and salinity are measured within the bottle immediately upon collection.

The otter trawl is towed from the 15.2 m aluminum R/V John Dempsey for 30 minutes at approximately 3.5 knots, depending on the tide. At completion of the tow the catch is released onto a sorting table and sorted by species. Finfish, lobsters and squid are counted and weighed in aggregate (to the nearest 0.1 kg ) by species with a precision marine-grade scale ( $30 \mathrm{~kg},+/-10 \mathrm{gm}$ capacity). Catches weighing less than 0.1 kg are recorded as 0.1 kg . For the initial two years ( $1984 \& 1985$ ), lobsters were the only invertebrates recorded. Squid abundance has been recorded since 1986. Since 1992, additional invertebrate species have been weighed in aggregate, and some have been counted. The complete time series of species counted and weighed in the survey is documented in Appendix 2.4.

For selected finfish species, lengths are recorded to the centimeter as either total length or fork length (e.g. measurements from 100 mm to 109 mm are recorded as 10 cm ) and entered in the database as 105 mm (Table 2.3). Lobsters are measured to 0.1 mm carapace length. Squid are measured to the centimeter mantle length and horseshoe crab measurements are taken using the prosomal width (cm).

The number of individuals measured from each tow varies by species, and also depends on the size of the catch and range of lengths (Table 2.3). If a species is subsampled, the length frequency of the catch is determined by multiplying the proportion of individuals in each centimeter interval by the total number of individuals caught. Some species are sorted and subsampled by length group so that all large individuals are measured and a subsample of small (often young-of-year) specimens are measured. All individuals not measured in a length group are counted. The length frequency of each group is estimated as described above, i.e. the proportion of individuals in each centimeter interval of the subsample is expanded to determine the total number of
individuals caught in the length group. The estimated length frequencies of each size group are then appended to complete the length frequency for that species. This procedure is often used with catches of bluefish, scup, and weakfish, which are usually dominated by young-of-year or discrete age/length classes.

Scup, summer flounder, tautog, weakfish and winter flounder are sampled for age determination (Table 2.3). Subsamples of scup, stratified by length group, are measured to the nearest mm (fork length) and scales from each individual are taken for ageing. Scup scales are removed posterior to the pectoral fin and ventral to the lateral line. The scales are pressed onto plastic laminate with an Ann Arbor roller press to obtain an impression of the scale, which is then viewed with a microfiche reader at 21x. Scales are also taken from all summer flounder greater than 59 cm . At least 15 scales are removed from the caudal peduncal area. These scales are pressed and aged to supplement the National Marine Fisheries Service age key used to age summer flounder collected by LISTS (see below). Most tautog taken in LISTS are aged due to the low numbers caught in recent years (under 250 fish). Tautog are iced and taken to the lab, where their total length ( mm ), sex, and total weight ( gm ) are recorded and their age is determined from opercular bones (Cooper 1967). Subsamples of winter flounder, stratified by length group and area (Table 2.3), are iced and taken to the lab where they are measured to the millimeter (total length), weighed (gm), sexed, their maturity stage determined (NMFS 1989), and they are aged with whole and sectioned otoliths (Simpson et al. 1988). Weakfish scales are obtained and processed as described above for scup, and otoliths are sectioned and read using procedures described in Simpson et al. 1988.

In reports prior to 2001, three species were not included in annual and seasonal totals: American sand lance, bay anchovy, and striped anchovy. These species, with the possible exception of striped anchovy, can be very abundant in Long Island Sound, but are not retained well in the otter trawl. Additionally, many of these fish are young-ofyear and often drop out of the net as it is retrieved and wound on the net reel. For this reason they were not included in the list of species to be counted when LISTS was started in 1984. However, to document the occurrence of these species in LISTS catches, American sand lance was added in 1994, striped anchovy was added in 1996, and bay anchovy was added in 1998. Since 2001, adults of these three species are added to the annual and seasonal totals and the young-of-year are listed if present in the year's catch but are not quantified (Table 2.16, Appendix 2.4). Young-of-year for these three species are included in the database but are cataloged with a separate species identifier and quantities are considered estimates (Appendix 2.2).

## Data Analysis

## Indices of Abundance: Annual Mean Count and Weight per Tow

To evaluate the relative abundance of common species, an annual spring (April June) and fall (September-October) geometric mean number per tow and weight per tow (biomass, kg ) is calculated for the common finfish and invertebrate species. To calculate the geometric mean, the numbers and weight per tow are logged $\left(\log _{e}\right)$ to normalize the highly skewed catch frequencies typical of trawl surveys:

Means are computed on the $\log$ scale and then retransformed to the geometric mean:
geometric mean $=\exp ($ mean $)-1$.
The geometric mean count per tow was calculated from 1984-2007 for 38 finfish species, lobster, and long-finned squid (1986-2007). The geometric mean weight per tow was calculated using weight data collected since 1992 for the same species, plus an additional 13 invertebrates.

For the seven finfish species that were measured on every tow--bluefish, scup, striped bass, summer flounder, tautog, weakfish, and winter flounder--biomass indices were calculated for the years 1984-1991 by using length/weight equations to convert length frequencies to weight per tow. Bluefish, scup, weakfish and winter flounder lengths were converted using equations from Wilk et al. 1978; striped bass conversions were accomplished using an equation from Young et al. 1994; and summer flounder and tautog conversions were accomplished using equations developed from LISTS data from 1984-1987 and 1984-1996 respectively.

## Indices of Abundance: Indices-at-Age and Age Group

Annual age specific indices (indices-at-age matrices) were calculated for scup, striped bass, summer flounder, winter flounder and tautog. The age data used to calculate the indices came from three sources: striped bass ages were derived using the von Bertalanffy (1938) equation; summer flounder age-length keys were obtained from the National Marine Fisheries Service (NMFS) Northeast Fisheries Science Center spring and fall trawl surveys combined with LISTS ages ( $>59 \mathrm{~cm}$ ); and scup, winter flounder and tautog age-length keys (in 1 cm intervals) were obtained directly from LISTS. Since fish growth can fluctuate annually as a function of population size or other environmental factors, a year and season specific age-length key was used wherever possible. Once lengths have been converted to age, the proportion at age is multiplied by the abundance index of the appropriate season to produce an index of abundance at age.

Recruitment (young-of-year) and age $1+$ (all fish age one and older) indices were calculated for bluefish and weakfish. Observed modes in the length frequencies were used to separate the two groups.

The specific methods used to calculate indices-at-age for each species were as follows:

- Bluefish. Since bluefish are not aged, modes observed in the fall length frequencies were used to separate bluefish into age 0 and age $1+$ groups, and a geometric mean catch per tow was calculated for each group. Comparison of the mean length-at-ages reported for young-of-year and age 1 bluefish in the New York Bight (Chiarella and Conover 1990) and Long Island Sound (Richards 1976) with LISTS length frequencies suggests that bluefish can easily be identified as either age 0 (snapper bluefish) or adults (age 1+). Richards (1976) and Chiarella and Conover (1990) determined that most bluefish less than 30 cm are age 0 . A discontinuity in the LISTS fall length frequencies occurs most years between 26 cm and 39 cm
(Gottschall and Pacileo 2007, Table 2.35). Therefore 30 cm was determined to be a suitable length for partitioning age 0 and age one fish.

Although North Carolina state biologists have aged bluefish, their age keys were not used to age Long Island Sound bluefish because North Carolina mean lengths-at-age are not consistent with modes observed in Long Island Sound bluefish length frequencies. This difference suggests that growth may vary by region, or that early and late spawned bluefish may be differentially distributed along the coast (Kendall and Walford 1979).

- Scup. An index-at-age matrix was developed for 1984-2007 using spring (May-June only) and fall (September-October) LISTS data. April data was omitted since very few scup are taken at this time. A total of 8,819 scup aged between 1984 and 2007 were used to make year and season specific age-length keys ( 1 cm intervals). In the relatively few instances when the season/year specific key failed at a given 1 cm length interval, a three-year pooled key was used to determine the age. Three-year pooled keys were calculated using the years preceding and following the "run" year. For the terminal year, only two years were used for the pooled key. The final index-at-age was computed for both spring and fall indices-at-age. Since very few scup older than age 9 are taken, an age $10+$ group is calculated by summing indices for ages 10 and up. To represent the full adult portion of the population an age $2+$ index is calculated by summing the indices for ages 2 through $10+$.
- Striped bass. To approximate the ages of striped bass taken in the survey, the average of the Chesapeake Bay and Hudson River striped bass von Bertalanffy parameters ( $\mathrm{L}_{\text {max }}=49.9 \mathrm{in}, \mathrm{K}=0.13, \mathrm{t}_{\mathrm{o}}=0.16$, Vic Crecco, pers. comm.) were used in the rearranged von Bertalanffy equation:

$$
\mathrm{t}=(1 / \mathrm{K}) *\left(-\log _{\mathrm{e}}\left(\left(\mathrm{~L}_{\max }-\mathrm{L}_{\mathrm{t}}\right) / \mathrm{L}_{\max }\right)\right)+\mathrm{t}_{\mathrm{o}}
$$

Since this equation estimates age $t$ as a fraction of a year, the estimates were rounded to the nearest year (e.g. age $3=$ ages 2.5 to 3.4 ). A spring catch-at-age matrix was developed for 1984 through 2007 by apportioning the spring index by the percentage of fish at each age.

- Summer flounder. The year and season specific age-length keys ( 1 cm intervals) used to age LISTS catches were provided by NMFS from their spring and fall trawl surveys. These keys were supplemented with fish caught and aged by LISTS ( 60 cm and over). Since 2001, whenever the season/year specific key failed at a given 1 cm length interval a pooled year key using only adjacent years was used (Gottschall and Pacileo 2002). Since it is thought that growth rates for summer flounder have changed over time, a pooled key using only adjacent years would more accurately represent fish that could not be aged by the season/year specific key. Using this methodology, the catch-at-age matrix will remain unchanged for all but the terminal year, which will be updated as the following years' data becomes available.
- Tautog. An index-at-age matrix was developed for 1984-2006 using all survey months (Gottschall and Pacileo 2007). Ageing for 2006-2007 has not yet been completed thus results and a current index-at-age will not be presented in this report. Two-hundred forty three tautog were collected during the spring of 2007, and low catches in the fall resulted in only 25 fish being processed for that period. These collections will be aged during the summer of 2008 .
- Weakfish. Age 0 and age $1+$ indices were calculated for both spring and fall surveys, 1984-2007. Since few weakfish are taken in April, the spring geometric mean was calculated using only May and June. All weakfish taken in spring are assumed to be age $1+$. Similar to bluefish, the fall age 0 and $1+$ index was calculated by using length frequencies to separate the catch. Since a break in the fall length frequencies generally occurs between 24 and 32 cm each year (Gottschall and Pacileo 2007, Table 2.48), weakfish less than 30 cm are considered to be age 0 while those greater than or equal to 30 cm are ages $1+$.
- Winter flounder. An index-at-age matrix was developed for 1984-2007 using April and May LISTS data. June data was not used since length frequency data suggest that many adult winter flounder have left the Sound by this time (an exception was made for 1984, the first year of LISTS, because very few samples were taken in the spring months). A total of 17,906 winter flounder aged between 1984 and 2007 were used to make year and region (east of Stratford Shoal, west of Stratford Shoal) specific age-length keys in 1 cm intervals. Similar to scup and summer flounder, three year pooled keys using only the adjacent years (two years for the terminal year runs) were used to assign ages if year specific keys were not available.

## RESULTS AND DISCUSSION

## Overview of LISTS 2007 Spring and Fall Surveys

The spring survey commenced on April $10^{\text {th }} 2007$ in eastern Long Island Sound aboard the R/V John Dempsey. The first site was conducted in deep water off the mouth of the Connecticut River. Sampling continued until the 40th tow was completed on May $2^{\text {nd }}$. Two Narrows tows were also conducted for this cruise on the $1^{\text {st }}$ of May. A total of 10 sampling days were needed to complete the 42 April samples. May sampling again started in the east on May $11^{\text {th }}$ and was completed on the $30^{\text {th }}$ of the month after nine days of sampling. The June cruise commenced on the $11^{\text {th }}$ of June and continued for the next nine days. Sampling was completed on the following Monday the $25^{\text {th }}$ to finish up the 40 June tows and three Narrows samples. A total of 120 LISTS tows and 8 Narrows tows were completed during the spring survey (Table 2.4). Fall sampling (September and October) included all 80 of the scheduled LISTS tows, as well as two tows each month in the Narrows. Thirteen days were required each month to complete the sampling, an average of 3.23 tows per day.

Maps showing the sites selected versus the sites sampled during each month of sampling are provided in Figure 2.2 (April), Figure 2.3 (May), Figure 2.4 (June), Figure 2.5 (September) and Figure 2.6 (October). These figures provide a short description if a
site had to be relocated and the explanation why. During the spring cruise, five samples were relocated in April, five in May and two during the June survey. During the fall cruise, two sites were moved in each month. Additional site information is provided in Table 2.5 (April), Table 2.6 (May), Table 2.7 (June), Table 2.8 (September) and Table 2.9 (October) including date of sample, time, tow duration, latitude/longitude, and surface and bottom temperature and salinity. Information for the Narrows tows is provided at the bottom of each of the respective figures and tables.

Sometimes, a full 30-minute tow cannot be completed. Typical reasons for short tows include lack of room because of observed pot gear set in the immediate area, a drop in speed due to entanglement with some object on the bottom (frequently pot gear), or a complete stop in forward motion (submerged wreck or rock pile). Survey crew will often attempt to finish an interrupted tow by resetting beyond the obstruction or observed gear. If this is not possible, a site may have to be moved to another site nearby with the same stratum (bottom type and depth). Typically, a minimum of 15-20 minutes is required for the LIS Trawl Survey, while a minimum of 10 minutes is accepted for the Narrows sampling (with some exceptions) due to the difficulties associated with towing in this area of Long Island Sound (Gottschall and Pacileo 2007). Short tow information is summarized in Tables 2.10 (spring) and 2.11 (fall).

## Cooperative Sample and Data Collection

Throughout the time series LISTS survey staff have been participating in cooperative efforts for sample collections, data requests, and special projects using survey personnel, equipment, and other resources. Most of these cooperative efforts are with state researchers or agencies, the National Marine Fisheries Service, Atlantic States Marine Fisheries Commission, New England and Mid-Atlantic Councils, and researchers or grad students associated with state or local universities. Table 2.12 illustrates many of the organizations that requested data in 2007 while Table 2.13 shows sample request received and fulfilled (each by month). In recent years many requests for samples have come from high schools, aquariums, or other educational organizations needing finfish and invertebrates for teaching purposes. Additionally, our own staff often have sample or data requests for media or other public outreach events (see job six of this report).

## Number of Species Identified

Sixty finfish species were observed in 2007 including one new species, the striped burrfish (Chilomycterus schoephi) (Table 2.14). From 1984 to 2007, ninety-seven species were identified (Appendix 2.1), averaging 58 species per year with a range of 49 to 70 species (Fig 2.7). In addition, a total of forty-one types of invertebrates were collected in 2007 (Table 2.15). Most invertebrates are identified to species. However, in some difficult cases, invertebrates were identified to genus or higher taxon.

## Total Catch

Appendix 2.4 presents a time series (1984-2007) of the finfish species collected each year and their respective rank by numbers. Annual total biomass of invertebrates are also included in this appendix, and are ranked by weight (kg).

A total of 177,841 finfish weighing 17,540.3 kg were sampled in 2007 (Table 2.16). In seventeen out of the last twenty-four years butterfish has been the highestranking finfish (numbers) in LISTS, however, in 2007 scup were more abundant and accounted for $42.6 \%$ of the catch by number (vs. butterfish $27.6 \%$ ). Scup also ranked first by weight in 2007 with $30.4 \%$ of the total annual biomass from 75,681 fish taken in 200 tows. Butterfish were the second most abundant species caught in LISTS but ranked fourth in biomass behind smooth dogfish ( 580 fish or $12 \%$ of the annual total) and bluefish ( $10.3 \%$ of the annual total). Weakfish (17,386 fish), bluefish (9,378 fish) and winter flounder ( 4,550 fish) were the third, fourth and fifth most abundant species by number. These five species accounted for $87.8 \%$ of the total annual catch and $57.7 \%$ of the total biomass in 2007. These five species have also been the dominant species over the last ten years with the exception of little skate replacing bluefish for fifth most common in 2001 and 2002, and weakfish falling out of the top five in 2006, replaced by bay anchovy.

Scup once again topped the spring catches with 11,763 fish accounting for $32.2 \%$ of the total and more than a quarter $(26.6 \%)$ of the spring biomass (Table 2.17). Scup catches this spring ( 11,763 fish) were the fifth highest in the time series and the second largest since, the record catch of 50,651 scup in 2002. Three prominent length groups for scup were seen this past spring with modes peaking at $10-12 \mathrm{~cm}, 16-18 \mathrm{~cm}$, and $30-32$ cm . Butterfish were the second most abundant fish taken with 4,492 fish ( 252.3 kg ) being observed in the May and June samples, however this is less than half the butterfish caught in 2006. Winter flounder again ranked third with 4,336 fish ( 914.2 kg ), taken this past spring. Winter flounder ranked first in number of fish taken during spring sampling for sixteen straight years until scup became more abundant in the catches in 2000. Flounder then fell to second rank each year until 2005 when it surpassed scup once again then dropped to the current third rank.

Catches in the fall survey have consistently been dominated by four species: scup, butterfish, weakfish, and bluefish. In 2007 these four species comprised $95.7 \%$ of the total catch of finfish and $68.5 \%$ of the total fall biomass. Scup surpassed butterfish for the first time since 2000 with a catch of 63,918 fish weighing $3,309.1 \mathrm{~kg}$ this year. Butterfish catches were less than the time series average $(58,995)$ with 44,645 fish recorded this past fall. In twenty-one out of the last twenty-four years butterfish have ranked first. Weakfish and bluefish comprised $12.3 \%$ and $6.6 \%$ of the fall catch with 17,355 fish and 9,339 fish respectively. Smooth dogfish again ranked high in biomass (3rd) with $1,548.4 \mathrm{~kg}$ from 373 individuals. Bay anchovy, moonfish, and windowpane flounder were the fifth, sixth, and seventh most abundant species during the fall period.

A total of $2,512.7 \mathrm{~kg}$ of invertebrates were taken in 2007 (Table 2.16). Longfinned squid ( 773.6 kg ), horseshoe crab ( 596.4 kg ) and American lobster ( 396.5 kg ) were the top three species in biomass. These three species accounted for $70.3 \%$ of the biomass. One thousand six hundred and forty-eight $(1,648)$ lobsters were recorded in the 200 survey tows in 2007 along with 24,212 long-finned squid and 333 horseshoe crabs. Spider crab ( 165.5 kg ) and Lion's mane jellyfish ( 129.8 kg ) were the fourth and fifth most dominant invertebrate species by weight.

The total biomass of invertebrate catch taken in the spring of 2007 was $1,123.9 \mathrm{~kg}$ (Table 2.18). American lobster had the highest biomass of 331.2 kg comprising $29.4 \%$ of the total spring weight followed by horseshoe crab with 273 kg ( $24.3 \%$ ) and spider crab with $120.1 \mathrm{~kg}(10.7 \%)$. Spring lobster abundance increased from a record low abundance of 1.94 lobsters/tow in 2006 to 3.22 lobsters/tow in 2007. Springtime catches of longfinned squid made record catches in 2006 with 11.55 squid/tow, however, squid were far less abundant this spring and seemed to enter the Sound later in the year. Only 888 squid ( 2.14 squid/tow, Table 2.19 ) were cataloged in the spring of 2007 weighing 64.6 kg . Fall squid catches however, were more reminiscent of the early and mid-nineties with 179.39 squid/tow recorded in 2007. Squid $(23,325)$ totaled 709.0 kg in the forty fall tows (Table 2.18). Long-finned squid accounted for $51 \%$ of the fall biomass followed by $23.3 \%$ for horseshoe crab ( 167 individuals or 323.4 kg ) and $9.3 \%$ for lion's mane jellyfish ( 649 individuals or 129.3 kg ). American lobster abundance dropped to a time-series low during the fall of 2007 . Only 220 lobsters $(65.3 \mathrm{~kg})$ were documented in the fall survey and another $18 \%$ drop in abundance to 1.21 lobsters/tow was recorded this year.

## Seasonal Indices of Abundance

The geometric mean count per tow was calculated from 1984-2007 for 38 finfish species plus lobster and long-finned squid (squid since 1986). All spring (April-June) and fall (September-October) data are used to compute the abundance indices presented in Tables 2.19 (spring) and 2.20 (fall), with the preferred seasonal index (for counts) denoted by an asterisk. Geometric mean biomass-per-tow indices have been calculated for 38 finfish and 15 invertebrate species (or species groups) since 1992, for both spring and fall (Table 2.21 and 2.22, respectively). Age specific indices of abundance were calculated for specific important recreational species, including scup, striped bass, summer flounder, and winter flounder (see below). For two other species, bluefish and weakfish recruitment indices were calculated using modal analysis of the length frequencies. For each of the thirty-eight finfish species, plots including catch per tow in numbers and biomass in kilograms are illustrated in Figures 2.8 through 2.13. These figures also include plots of each of the age specific indices and recruitment indices mentioned above. Figure 2.14 provides plots of abundance (biomass) indices for crabs (1992-2007), American lobster (1984-2007), and long-finned squid (1986-2007).

The only species with record high abundance in Long Island Sound during 2007 was weakfish (fall) with abundance at 63.96 fish per tow; comprised mostly of young-ofyear weakfish. Five other species with notably higher abundance in 2007 are: black sea bass (spring index 0.26 fish/tow) which ranks third highest in the time series (also $3{ }^{\text {rd }}$ for fall); scup (fall index 475.29 fish/tow), like weakfish this index is comprised mostly of young of year and also ranks third in the time series; striped bass (spring 1.02 fish/tow) is currently fourth highest, however abundance has varied at high levels since 1999; and smooth dogfish (fall index of 2.27 fish/tow) and moonfish ( 1.66 fish/tow) both recorded the fourth highest abundance since 1984. Spiny dogfish has once again appeared in Long Island Sound Trawl Survey catches. Its abundance has been increasing since 2000 and is currently at the highest level seen in the last seventeen years. A few additional species have higher abundance during the non-preferred season (see Tables 2.19-2.20 for designation). Four of these species are: summer flounder in the spring survey (2.51
fish/tow); smooth dogfish, also in the spring survey ( 0.64 fish/tow); fall alewife abundance ( 0.95 fish/tow) and fall northern sea robin abundance ( 1.05 fish/tow). These four species were all in the top ten percent rank for their respective time series

Several species were at record low abundance or were in the lower tenth percentile for their respective time series in both the spring and fall surveys. This includes four spring species (i.e. where the spring survey provides better estimates of overall abundance): cunner ( 0.05 fish/tow) and long-finned squid abundance (2.14 squid/tow) were at record lows in 2007, silver hake ( 0.98 fish/tow) and little skate ( 2.82 fish/tow) were in the lower $10^{\text {th }}$ percentile. Winter flounder (20.58 fish/tow) and fourbeard rockling ( 0.35 fish/tow) were also low in the spring of 2007 but recorded just above the tenth percentile. American lobster spring abundance (spring and fall are both good estimates) increased $66 \%$ in 2007 (to 3.22 lobsters/tow) from the minimum 1.94 lobsters per tow recorded in 2006. However, LISTS fall sampling produced the worst American lobster abundance index in the twenty-four year time series ( 1.21 geometric mean count per tow).

Using the preferred spring index, a total of sixteen "spring species" had increasing abundance in 2007 while five species had decreasing abundance from the prior year (Table 2.19-2.20). During the fall, fourteen "fall species" had increasing abundance and six had decreasing abundance from the prior year. One species remained the same for this period.

## Indices of Abundance: Important Recreational Species

Spring and fall abundance indices are presented in Tables 2.19-2.20. Indices of abundance at age were also calculated for seven important recreational species: bluefish (Table 2.23), scup (Table 2.24), striped bass (Table 2.25 age frequency, Table 2.26 index at age), summer flounder (Table 2.27), weakfish (Table 2.28) and winter flounder (Table 2.29). Bluefish and striped bass indices-at-age are based on the fall and spring surveys, respectively, whereas winter flounder indices-at-age are based on only the April and May cruises of the spring survey. In 2007, LISTS collected and aged 946 winter flounder for use in the development of age keys and the final catch-at-age matrix. Both scup and weakfish indices-at-age are calculated and presented separately for each season. Six hundred and eighty-three (683) scup were collected and aged in 2007 for use in the keys and calculations of the age matrix. Weakfish and bluefish use modal distributions for calculating their respective recruitment index although a small number of weakfish are taken each year for ageing purposes (see methods).

## Bluefish

A generally increasing trend in overall bluefish abundance in Long Island Sound was documented in LISTS from 1986 through 1999. Abundance peaked in 1999, however, since 1991 abundance indices have been more variable with changes from $15 \%$ to $55 \%$ seen from one year to the next (Table 2.19, Figure 2.8). Since the peak in 1999, abundance dropped and varied around the mean of 24.4 fish/tow for the next five years. In 1995 and 1996 abundance was below average at 18.89 fish/tow and 15.66 fish/tow respectively. A substantial increase to 30.66 fish/tow was documented in 2007 with most
of that coming from an increase in snapper abundance (93\%). Only a $14 \%$ increase in adults was recorded in 2007. Like weakfish, the overall bluefish index is dominated by young-of -year individuals that make up about $70 \%$ of the bluefish catch. The 2007 young-of-year index of 23.98 fish per tow is $42 \%$ above the mean. Higher abundance of age 0 fish were observed in 1997-1999, however, for the following seven years abundance was at or slightly below average. A sixty-eight percent (68\%) drop in age 0 abundance occurred from the time series high in 1999 (39.19/tow) to 2006 (Table 2.23, Figure 2.8). Catches of age $1+$ fish for the last three seasons have remained about the same averaging 2.4 fish/tow; sharply lower than the 21 -year record high abundance (in numbers) and the second highest biomass index for age 1+ fish recorded in 2004 (10.38 fish/tow, $13.96 \mathrm{~kg} /$ tow). The age $1+$ bluefish abundance ( $>29 \mathrm{~cm}$ ) increased by a factor of twelve from 1999, when a time series low was recorded ( $0.86 /$ tow), to the anomalous high in 2004. At the inception of the survey, adult abundance was low ( 1.6 fish/tow in 1984) then increased to just above average levels in 1985 ( 3.56 fish/tow). Abundance of adults then decreased steadily to 1.92 fish/tow in 1989. For the next three years, a large increase nearing record abundance levels was observed (8.44/tow in 1992). The following seven years (1993-1999) marked a declining trend in adult abundance to well below the series average and the lowest abundance recorded for the survey in 1999.

## Scup

Scup abundance indices have increased by nearly an order of magnitude since about 1998 (Table 2.20, Figure 2.11). However, since 1999 abundance has been highly variable and changing between roughly 143 to 475 fish/tow from one year to the next. Excluding the exceptional but short-lived 1991 year class which produced an overall index of 311.6 fish/tow, fall abundance indices early in the survey time series (1984 through 1997) ranged between 10.7 (1984) and 92.5 fish/tow, averaging 52 fish/tow. Since 1998 the fall index has ranged from 103.3 (1998) to 537.7 (1999), averaging 315 fish/tow, and six times the pre-1998 average. High numbers of fish per tow result primarily from strong young-of-year indices (1999-2002, 2004-2005, 2007), as high as 498 fish/tow in 1999 (Table 2.24). However, unlike the strong 1991 year class signal (291 fish/tow at age 0) which produced only one subsequent double-digit index (26.5 at age 1 in Fall 1992), several recent strong year classes have persisted at double digit strength through age 3 (2000, 2001 year classes) or age 4 (1999 year class) and have produced record abundance indices at age through at least age 8 .

Another very strong young-of-year index was recorded in 2005 and again this past fall. These two cohorts are the second and third highest respectively in the time series. The 2005 year class followed through in 2006 and 2007 with the second highest age 1 ( 51.02 fish/tow) and second highest age-2 index ( 29.3 fish/tow) in the time series. In 2007, most indices at age (with the exception of age 5) are well above the 1984-2006 mean. The time series strongest cohort (1999) once again produced a record age 8 index of 0.31 fish/tow this year. Only two year classes, 2003 and 2006, stand out as weak to moderate recruitment in the last several years. The 2006 young-of-year index is at 52.16 fish/tow and far below the 123.86 series mean. The 2003 year class also produced the lowest age 1 index in the last twelve years and the lowest age 2 index in the last six years. This past seasons high young-of-year index (319.9 fish/tow) is the third highest in the series and is expected to produce high indices at age as the year class gets older.

The new scale of elevated scup abundance has also been apparent in the spring survey. Spring indices of adult (age $2+$ ) fish jumped from 2 to 21.7 fish/tow between 1999 and 2000, and have remained elevated since. During the spring 2002 survey, unusually high availability of scup resulted in an age $2+$ index of 208.8 fish/tow, almost 14 times the series average. Age 3 fish from the 1999 year-class were particularly abundant at 123.2 fish/tow. Spring age 2+ indices during 2006 and 2007 are currently at the second and fourth highest abundance observed at 40.57 and 25.29 fish/tow respectively (Table 2.24, Figure 2.11).

## Striped bass

Similar to scup, striped bass abundance in recent years has been highly variable. Four of the highest abundances were recorded during the spring of 1999, 2002, 2005, and 2007 (Table 2.19, Figure 2.13). Abundance during the first six years of the survey was relatively low, averaging only 0.03 fish/tow. Indications of a stock recovery first appeared in 1990 and during the next five years a moderate upward trend in abundance was observed, however in 1995 a $97 \%$ increase started the trend toward high abundance. Each year thereafter abundance increased in the Sound until 2000 and 2001 when LISTS started to observe decreases in abundance and erratic indices from one year to the next. Still, for the last 12 years abundance hasn't dipped below the series mean of 0.49 fish/tow. After the second spike in 2002, abundance again was followed by two years of decline. Recently, catch in numbers per tow dropped from the second highest in LISTS during 2005 ( 1.17 fish/tow) to ninth in 2006 ( 0.61 fish/tow), and fourth this past spring to 1.02 fish/tow. Overall abundance is still considered high and on average, over the last ten years, LISTS is capturing twelve times the number of stripers as it did in the first ten years of the survey. Since 1999, larger fish from 53 cm to 73 cm length have also been common during the spring and comprised $19 \%$ to $49 \%$ of the annual catch. Prior to the mid 1990's only 125 striped bass exceeding 52 cm in length were taken during the spring surveys. During 2007, the age structure was comprised predominately of two through age five fish (Table 2.25). Indices-at-age for ages two through age eight were at or above the respective averages for the time series. Additionally, LISTS fall sampling has also seen higher catches. Two of the highest fall annual indices were produced in 2004 (0.77 fish/tow) and 2006 ( 0.47 fish/tow). The current 0.38 fish/tow observed in the fall of 2007 is the fourth highest since the survey began. Average fall abundance is 0.18 fish/tow for the time series and 0.33 fish/tow over the last ten years.

## Summer flounder

Summer flounder rebounded from record low abundances in the early and midnineties and have shown above average fall survey abundance ( 1.86 fish/tow) for ten out of the last thirteen years. Fewer summer flounder were seen in 2006 ( 1.35 fish/tow) as the index dropped below the long-term average for the first time in eight years, however a few more fish were observed in 2007 which bumped up the index to 1.89 fish/tow (Table 2.20, Figure 2.9). LISTS first observed a jump in abundance during the fall of 1996 to over 2 fish per tow. Abundance then hovered around this level for the next four years, increasing to 4.42 fish/tow in 2001. Summer flounder fall abundance peaked at 6.12 fish/tow in 2002 and dropped $45 \%$ in 2003 to 3.39 fish/tow and another $42 \%$ in 2004 to 1.95 fish/tow. Although the preferred fall index has declined sharply since 2002, abundance still remains about $32 \%$ above the average of the first twelve years of the
survey (1984-1995). Summer flounder have become more common in the spring survey since the mid-nineties when this increasing abundance trend began. Excellent springtime catches in 2003 resulted in record abundance ( 3.42 fish/tow) and an index that surpassed the fall numbers. Spring abundance generally follows the same trend as the fall, with decreasing abundance from 2002 through 2006. Summer flounder abundance in the spring of 2007 again surpassed the fall abundance with 2.51 fish/tow.

Spring 2007 indices-at-age for age one and ages three through nine were all higher than the previous year and well above their respective time series average (Table 2.27). Ages three and four as well as ages six through eight are all at the highest abundance recorded in LISTS. Ages one, five, and nine are documented as second highest in the series for the spring. The exception, age two fish ( 0.21 fish/tow), was $44 \%$ lower than average for that age group. The lack of age 2 fish in the population is consistent with low age one abundance in 2006 ( 0.04 fish/tow). Furthermore, fall age 1 abundance in 2006 also recorded low numbers ( 0.22 fish/tow) and is the second lowest in that series. Even though during the fall of 2007 abundance was considered average, some of the older ages had high abundance. Ages four, six and age eight were all at a series high while age three and five were at the second highest. Age one summer flounder made up $30 \%$ of the catch in 2007 while age $2(21 \%)$, age $3(25 \%)$, and age $4(11 \%)$ made up much of the rest. Young-of-year catches were about average this past fall with about $7 \%$ of the index ( 0.13 fish/tow), however, the young-of-year summer flounder index has been variable throughout the fall time series and may be unreliable. Some of the benefits of higher abundance seen since the mid to late-nineties is the presence of older and larger fish in the population. Eight and nine year old fish are now represented in the age matrix; prior to 1997 , the oldest fish were age 7 (Table 2.27). The length frequency distributions in the spring and fall also illustrate this, with an increase in larger ( $>50 \mathrm{~cm}$ ) fish captured in the past ten years during the spring (average 52 fish compared to 5 fish pre-1996) and fall surveys (average 29 fish compared to 9 fish pre-1996), (Gottschall and Pacileo 2007, Table 2.44-2.45).

## Weakfish

After a time-series low of 1.50 fish/tow in 2006, weakfish rebounded to a timeseries high of 63.96 fish/tow in 2007 (Table 2.20, Figure 2.13). Age 0 weakfish usually dominate the overall index and have been very abundant in the fall over the last nine years, except in 2006 (Table 2.28). A strong year class in 2000 drove the overall index to double, reaching the second highest index of the time series (63.42/tow, Table 2.28). Similarly, the record-high overall index in 2007 was driven by a record-high index of age-0 fish (63.93/tow). The Age 0 catches between 1999 and 2004 ranged from 30.93 fish/tow (1999) to 63.31 fish /tow (2000) and were unprecedented in the time series. The average catch/tow of age 0 fish prior to 1999 was 7.12 fish/tow. Weakfish age $1+$ abundance during the fall has generally fallen since the three years of peak abundance observed between 1995 and 1997. From 2002 through 2005, age $1+$ abundance in the fall remained about $50 \%$ lower than average, however, in 2006 this index rose to about average levels ( 0.29 fish/tow) but then dropped to $20 \%$ of the time series mean in 2007 ( 0.06 fish/tow). Similarly, springtime abundance of age $1+$ weakfish had remained at roughly three times higher than the average from 1997 to 1999 before declining to 0.04
fish/tow in 2003 (the lowest since 1994). This past spring, LISTS again recorded about average abundance at 0.11 fish/tow (Table 2.28, Figure 2.13).

## Winter Flounder

Winter flounder generally has had a decreasing trend in abundance since 1996. LISTS has seen lower than average catches in fourteen of the last sixteen years. The overall winter flounder spring (April-June) index for 2007 ( 20.58 fish/tow) is the highest since 2003, however, abundance is still low and is approximately one third ( $32 \%$ ) of the long term mean of 64.10 fish/tow (Table 2.19). Average catches for the first ten years of the survey were 94 winter flounder per standard tow. The customized winter flounder index (Table 2.29) that uses aged fish from April and May samples (used to develop indices of abundance at age) shows the same pattern as the overall index; the 2007 index ( 28.68 fish/tow) increased a little over the previous three years but is still well below the time series mean ( 76.85 fish/tow). This season's index is the ninth year of low abundance (Table 2.29, Figure 2.9) and illustrates why fisheries managers are concerned about the status of this species. During the beginning of the time series a slight drop in abundance was observed in 1985 and 1986 to just below average levels in 1986 (63.65/tow). For the next four years (1987-1990), abundance increased to 223.09 fish per tow: the height of winter flounder abundance for the survey. This period of high abundance was short lived as the index dropped $72 \%$ during the next two years to 61.39 fish per tow in 1992. From 1992 through 1995, abundance varied at or below average levels, however, 1996 showed a more than two-fold increase to 110.62 fish per tow. Since 2001 abundance generally has decline to the current low level.

The age-0 index, obtained from the Estuarine Seine Survey (Job 2, Part 2), shows a notable increase in abundance between 2003 and 2005 (Table 2.29). The 2006 index, however, was the lowest in the 20 -year time-series ( 0.74 fish per haul). The age- 0 index for 2007 ( 4.73 fish per seine haul) has increased considerably from the previous year, but it is still approximately $40 \%$ below the time-series average of 7.70 fish per seine haul. From its second lowest value in 2001, the age-0 index rose to average in 2003 ( 8.07 fish per haul), then increased $35 \%$ in 2004 to 10.96 fish per haul: the highest this index attained since 1996. For the past six years, the LISTS age 4+ winter flounder index has remained at less than 10 fish per tow (below the time-series average) and is currently at 4.16 fish per tow (Table 2.29). The $4+$ index was at its height at the start of the survey in 1984 (27.91/tow) then declined through 1988 to stable and average abundance (around 13.10/tow) for the next three years. Dropping abundance followed, and during 1995 the lowest observed catch/tow (2.31) at the time was recorded. An unusual increase in abundance occurred in 1996 (15.92/tow) and for the next five years it fluctuated around average levels. The high age $4+$ indices from 1996-2001 are probably a result of the strong 1992 and 1994-1996 year classes.

TABLES 2.1-2.29 LISTS

Table 2.1. Specifications for the Wilcox 14 m high-rise trawl net and associated gear.

| Component | Description |
| :--- | :--- |
| Headrope | 9.1 m long, 13 mm combination wire rope |
| Footrope | 14.0 m long, 13 mm combination wire rope |
| Sweep | Combination type, 9.5 mm chain in belly, 7.9 mm chain in wing |
| Floats | 7 floats, plastic, 203 mm diameter |
| Wings | 102 mm mesh, \#21 twisted nylon |
| Belly | 102 mm mesh, \#21 twisted nylon |
| Tail Piece | 76 mm mesh, \#21 twisted nylon |
| Codend | 51 mm mesh, \#54 braided nylon |
| Ground Wires | 18.2 m long, $6 \times 7$ wire, 9.5 mm diameter |
| Bridle Wires: | top legs 27.4 m long, $6 \times 7$ wire, 6.4 mm diameter |
| Bottom Legs | 27.4 m long, $6 \times 7$ wire, 11.1 mm, rubber disc type, 40 mm diameter |
| Doors | Steel "V" type, 1.2 m long x 0.8 m high, 91 kg |
| Tow Warp | $6 \times 7$ wire, 9.5 mm diameter |

Table 2.2. The number of sites scheduled for sampling each month within the 12 depth-bottom type strata.

|  | Depth Interval (m) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Bottom type | $\mathbf{0 - 9 . 0}$ | $\mathbf{9 . 1 - 1 8 . 2}$ | $\mathbf{1 8 . 3 - 2 7 . 3}$ | $\mathbf{2 7 . 4 +}$ | Totals |

| Totals | $\mathbf{7}$ | $\mathbf{1 0}$ | $\mathbf{1 2}$ | $\mathbf{1 1}$ | $\mathbf{4 0}$ |

Table 2.3. Length and age data collected in 2007.
In addition to the species listed below, other rarely occurring species (totaling less than 30 fish/year each) were measured. During 2007,twenty-nine other species were measured during LISTS sampling as either rarely occurring species or for other research related projects

| Species measured | Measurement | \# tows/day | \# fish measured |
| :---: | :---: | :---: | :---: |
| Alewife | FL (cm) | All | min of 15 / tow |
| American lobster | CL (0.1 mm) | All | min of 50 / tow |
| American shad | FL (cm) | All | min of 15 / tow |
| Atlantic herring | FL (cm) | All | min of 15 YOY and min of 30 adults / tow |
| Atlantic menhaden | FL (cm) | All | min of 15 / tow |
| Atlantic sturgeon | FL (cm) | All | All |
| blueback herring | FL (cm) | All | min of 15 / tow |
| bluefish | FL (cm) | All | min of $30 \mathrm{YOY} /$ tow, all adults |
| black sea bass | TL (cm) | All | All |
| butterfish | FL cm) | $1^{\text {st }}-3^{\text {rd }}$ | min of 15 YOY and 15 adults / tow |
| cunner | TL (cm) | All | All |
| dogfish, smooth | FL (cm) | $1^{\text {st }}-3{ }^{\text {rd }}$ | All |
| dogfish, spiny | FL (cm) | All | All |
| fourspot flounder | TL (cm) | $3^{\text {rd }}$ on | min of $30 /$ tow |
| hickory shad | FL (cm) | All | All |
| horseshoe crab | PW (cm) | All | All |
| northern searobin | FL (cm) | $3^{\text {rd }}$ on | min of $30 /$ tow |
| moonfish | FL (cm) | Occasional | min of $10 /$ tow |
| smallmouth flounder | TL (cm) | Occasional | min of $10 /$ tow |
| striped bass | FL (cm) | All | All |
| striped searobin | FL (cm) | $3^{\text {rd }}$ on | min of $30 /$ tow |
| scup | FL (cm) | All | min of 15 YOY and $30 /$ mode for age 1+ |
| long-finned squid | ML (cm) | $1^{\text {st }}-3{ }^{\text {rd }}$ | min of $30 /$ tow |
| summer flounder | FL (cm) | All | All |
| tautog | TL (cm) | All | All |
| weakfish | FL (cm) | All | min of $15 \mathrm{YOY} /$ tow, all adults |
| windowpane flounder | TL (cm) | $1^{\text {st }}-3{ }^{\text {rd }}$ | min of $50 /$ tow |
| winter flounder | TL (cm) | All | min of $100 /$ tow |
| winter skate | TL (cm) | All | All |

| Species aged | Structure | Subsample |
| :--- | :--- | :--- |
| scup | scales | Collected every month. For each month scales are taken from the following: 3 fish/cm <br> $<20 \mathrm{~cm} ; 5 / \mathrm{cm}$ from $20-29 \mathrm{~cm} ;$ and all fish $>30 \mathrm{~cm}$. <br> all fish $>=60 \mathrm{~cm}$ |
| summer flounder | scales | opercular bones |
| tautog | scales / otoliths | Collected from a minimum of 200 fish/year. <br> Collected each season. For each season, 1 scale and one otolith sample $/ \mathrm{cm}$ up to 19 cm <br> and all scales and otoliths $>=20 \mathrm{~cm}$. |
| weakfish | otoliths | Collected during April and May from two areas in the Sound: eastern-central and <br> western. For each month and area, subsamples are taken as follows: in the eastern- <br> central area 7 fish $/ \mathrm{cm}<30 \mathrm{~cm}, 14 / \mathrm{cm}$ from $30-36 \mathrm{~cm}$, all fish $>36 \mathrm{~cm}$. In the western <br> area 5 fish $/ \mathrm{cm}<30 \mathrm{~cm}, 10 / \mathrm{cm}$ from $30-36 \mathrm{~cm}$, all fish $>$ than 36 cm. |

Notes: min = minimum; YOY = young-of-year; $F L=$ fork length; $T L=$ total length; $C L=$ carapace length; $M L=$ mantle length; $P W=$ prosomal width.

Table 2.4. Number of Long Island Sound Trawl Survey (LISTS) samples taken by year and cruise
In 1984, thirty-five sites per monthly cruise from April through November were scheduled for sampling. Starting in 1985, forty sites per cruise were scheduled. In 1991, the Trawl Survey was modified to a spring (April - June) and fall (September - October) format--July, August and November sampling was suspended. In 1993 and 1994, an additional cruise of 40 sites was added to the fall period. The additional fall cruise was suspended in 1995. One hundred twenty tows were conducted in 2006 due to delays in rebuilding the main engine on the R/V John Dempsey (spring) and mechanical failure/overhaul of the hydraulic power take-off (fall).

Table 2.10. Samples with non-standard tow durations and reason for incomplete tow, spring 2007.
Standard LISTS tows begin with SP(spring) or FA (fall). Tows in the Narrows begin with LT.

| Sample | Date | Site | $\begin{gathered} \text { Btm } \\ \text { Type } \\ \hline \end{gathered}$ | $\begin{gathered} \text { Depth } \\ \text { Int } \\ \hline \end{gathered}$ | Time | Duration | Reason | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SP2007006 | 4/19/2007 | 0830 | S | 4 | 15:50:09 | 19 | hang | Hung up briefly; snagged pot gear; hole in starboard wing to be mended |
| SP2007022 | 4/24/2007 | 0223 | M | 4 | 12:46:52 | 23 | pots | Speed dropped 0.5 knots; ghost string on stbd door - none in net. Also ran out of room; pot buoys ahead. |
| SP2007023 | 4/24/2007 | 0422 | M | 4 | 13:45:57 | 13 | pots | Did tow in two parts: first part had to haul back b/c pots ahead; second part speed dropped. Caught a string on stbd door. Net caught on rudder; ripped belly \& tail piece. Gear set blind. |
| SP2007024 | 4/25/2007 | 0218 | M | 4 | 9:35:10 | 15 | pots | We received phone call from commercial fisherman asking us to change our tow coordinates to avoid his gear; got pots anyway. |
| SP2007027 | 4/25/2007 | 0720 | M | 3 | 13:30:40 | 21 | pots | Ran out of room; pots ahead. |
| SP2007035 | 4/27/2007 | 0110 | T | 3 | 11:35:31 | 28 | hang | Speed dropped but came off when hauled back. |
| SP2007053 | 5/17/2007 | 0623 | M | 4 | 10:36:04 | 15 | hang | Pots visible; tried to avoid. Speed dropped 0.5 kts but no gear on doors or net when hauled back |
| SP2007056 | 5/17/2007 | 0824 | T | 4 | 14:13:38 | 17 | pots | Speed dropped; snagged string of pots. One broke off \& ended up in net. |
| SP2007061 | 5/21/2007 | 0922 | M | 3 | 14:37:05 | 17 | pots | Speed dropped; string of pots on stbd door. |
| SP2007063 | 5/22/2007 | 0512 | M | 2 | 11:32:59 | 22 | pots | Three tries. Kept snagging gear (ghost gear?). |
| SP2007066 | 5/23/2007 | 0719 | M | 3 | 8:16:47 | 14 | pots | Two tries; speed dropped - snagged lines of pots on doors. |
| SP2007077 | 5/30/2007 | 0614 | M | 2 | 8:43:48 | 15 | pots | Two tries; speed dropped - snagged pot gear (some live \& some ghost gear). |
| SP2007078 | 5/30/2007 | 0412 | M | 2 | 10:11:41 | 15 | hang | Speed dropped. |
| LT2007005 | 5/29/2007 | 0007 | M | 3 | 14:45:47 | 17 | pots | Pots all around; ran out of room. |
|  |  |  |  |  |  |  |  |  |
| SP2007096 | 6/13/2007 | 1126 | T | 3 | 14:04:01 | 21 | hang | Hung up on mud/rock. Tore hole in extension. |
| SP2007104 | 6/15/2007 | 0615 | M | 2 | 11:18:52 | 23 | pots. | Speed dropped; pots on both doors \& in net. Blind set. |
| SP2007106 | 6/18/2007 | 0222 | M | 4 | 9:20:42 | 21 | pots | Speed dropped; ghost pots in net. |
| SP2007110 | 6/19/2007 | 0018 | M | 3 | 9:04:33 | 28 | pots | Speed dropped - pot warp on door. |
| SP2007111 | 6/19/2007 | 0015 | T | 4 | 10:20:38 | 25 | pots | Speed dropped; two old pots in net (singles) and old lines on both doors. |
| SP2007113 | 6/19/2007 | 5612 | T | 2 | 13:42:20 | 15 | hang |  |
| SP2007116 | 6/21/2007 | 0110 | T | 3 | 11:25:28 | 20 | hang |  |
| LT2007008 | 6/20/2007 | 0007 | M | 3 | 15:41:25 | 11 | pots | Pots all around; ran out of room. Also had ghost gear in port wing. |

Job 2 Page 96

Table 2.11. Samples with non-standard tow durations and reason for incomplete tow, fall 2007.
Standard LISTS tows begin with SP(spring) or FA (fall). Tows in the Narrows begin with LT.

| Sample | Date | Site | Btm Type | Depth Int | Time | Duration | Reason | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FA2007004 | 9/11/2007 | 1433 | S | 2 | 7:54:57 | 27 | hang | Snagged near end of tow. Large tear in net; had to switch nets. |
| FA2007022 | 9/18/2007 | 0720 | M | 3 | 14:01:48 | 18 | pots | Speed dropped; pot gear on port door (active gear). Very long up/down line? |
| FA2007023 | 9/18/2007 | 0819 | T | 2 | 15:09:04 | 18 | pots | Speed dropped; line on both doors. |
| FA2007025 | 9/19/2007 | 0223 | M | 4 | 12:05:06 | 17 |  |  |
| FA2007029 | 9/24/2007 | 5612 | T | 2 | 11:10:09 | 23 | hang |  |
| FA2007032 | 9/25/2007 | 0617 | T | 2 | 8:39:15 | 26 | pots | Speed dropped; 3 ghost pots in net (2 singles \& old line to one pot). |
| FA2007033 | 9/25/2007 | 0312 | M | 3 | 11:34:29 | 26 |  |  |
| FA2007039 | 9/28/2007 | 1320 | M | 1 | 8:26:48 | 22 |  | Speed dropped |
| FA2007046 | 10/11/2007 | 1432 | S | 2 | 7:31:38 | 26 | hang | Speed dropped 0.4 kts; hauled back to find mid-size hole in stbd wing. |
| FA2007066 | 10/18/2007 | 0014 | M | 4 | 15:42:45 | 22 | pots | Speed dropped 0.5 kts . Fouled pot line on port door, prob sunken below surface for awhile. |
| FA2007073 | 10/29/2007 | 0511 | M | 2 | 10:46:16 | 15 | pots | Speed dropped; couple strings of old gear. |
| FA2007076 | 10/30/2007 | 0521 | M | 4 | 9:38:00 | 21 | pots | Speed dropped; old gear in net \& trailing. Buoy was submerged \& had lots of mussels growing on it. |
| LT2007011 | 10/22/2007 | 5505 | T | 2 | 10:50:32 | 29 | pots | Snagged a conch pot at end. |

Table 2.12. Data requests by month, 2007.

| MONTH | REQUEST | ORGANIZATION OR PURPOSE |
| :---: | :---: | :---: |
| January | tautog catch-at-age | ASMFC Technical Committee |
|  | winter flounder indices-at-age | Dominion Annual Report |
|  | windowpane indices, counts and weights | Massachusetts DEM |
|  | maps of fishery resources in vicinity of proposed FSRU | DEIS review |
|  |  |  |
| February | invertebrate data | University of Connecticut |
|  | horseshoe crab length frequency | ASMFC Technical Committee |
|  | smooth dogfish length frequency | Massachusetts DEM |
|  | request for GIS layers with WFL distribution and abundance in Bridgeport Harbor area - we don't have this info | Environmental Consultant |
|  | count and weight indices | Council on Environmental Quality |
|  |  |  |
| March | count and weight indices | Environmental Consultant |
|  | summer flounder age matrix using NMFS \& LISTS data - also provided SFL indices, indices at age and VAS length frequency | NMFS |
|  |  |  |
| April | weakfish indices | ASMFC Technical Committee |
|  | bluefish indices | ASMFC Compliance Report |
|  | menhaden indices | ASMFC Compliance Report |
|  | maps of towpaths in vicinity of oyster cages proposed in Branford | review of proposal |
|  | maps of horseshoe crab closed areas | Notice sent to all license holders |
|  |  |  |
| May | count and weight of lobsters from each tow in LISTS and Narrows | University of Maryland |
|  | bluefish age-o indices | ASMFC Technical Committee |
|  | tautog indices | ASMFC Compliance Report |
|  | maps of horseshoe crab closed areas | DEP Wildlife signs |
|  |  |  |
| June | butterfish length frequency | NMFS Woods Hole |
|  | squid count \& weight indices | NMFS Woods Hole - Loligo DNA study |
|  | occurrence of Japanese shore crab | UCONN |
|  |  |  |
| July | squid egg catches, indices and tow info | NMFS |
|  | spiny dogfish indices | ASMFC Technical Committee |
|  | striped bass arithmetic and geometric indices | ASMFC Technical Committee |
|  | summary of sites and data in western LIS | NPS - National Coastland and Barrier Network |
|  |  |  |
| August | trends in abundance (warm vs cold) | NRDC |
|  |  |  |
| September | document anything unusual at sites near Penfield Reef - nothing | responding to phone call from public |
|  | winter flounder indices at age | NMFS |
|  | LIS monthly bottom temps from Job 5 (water quality monitoring) | Washington Post |
|  |  |  |
| October | winter flounder indices | ASMFC Compliance Report |
|  |  |  |
| November | Sites database | University of Maryland |
|  | lobster lengths 1987-2006 | University of Maryland |
|  |  |  |
| December | whelk count and biomass indices | for part of a public presentation |

Table 2.13. Sample requests by month, 2007.

| MONTH | REQUEST | ORGANIZATION OR PURPOSE |
| :---: | :---: | :---: |
| May | Loligo paeleii (longfin squid) for dissection class | Illing Middle School |
|  | lobsters for v-notch training | high schools assisting with v-notch program |
|  | squid \& various finfish specimens for dissection class | Putnam High School |
|  | lobster for shell disease research | University of Connecticut |
|  | critters for school demonstration | East Lyme |
|  | striped bass, bluefish, weakfish, lobster and American eel | EPA-residual chemical tissue analysis (e.g. PCBs) |
|  |  |  |
| June | smooth dogfish and striped bass | Norwalk Aquarium |
|  | lobsters for v-notch training | high schools assisting with v-notch program |
|  | lobster for shell disease research | University of Connecticut |
|  | striped bass, bluefish, weakfish and lobster | EPA-residual chemical tissue analysis (e.g. PCBs) |
|  |  |  |
| September | striped bass, bluefish, lobster and American eel | EPA-residual chemical tissue analysis (e.g. PCBs) |
|  | small specimens of various spp (vert \& invert) for fish bio class | Old Saybrook High School |
|  | horshoe crabs and starfish for touch tank | Marine Education Network |
|  | requested lobster for shell disease research (none sent - didn't catch sufficient sample numbers) | University of Connecticut |
|  |  |  |
| October | small specimens of various spp (vert \& invert) for fish bio class | Old Saybrook High School |
|  | striped bass, bluefish, weakfish and American eel | EPA-residual chemical tissue analysis (e.g. PCBs) |
|  | Loligo paeleii (longfin squid) for dissection class | Southern Connecticut State University |
|  | squalus specimens requested: none provided $\mathrm{b} / \mathrm{c}$ done sampling for yr | Ecology and Evolutionary Biology, UCONN |

Table 2.14. List of finfish species observed in 2007.
Sixty species were observed in 2007. (Bold type indicates new species). Since 1984, ninety-seven species of finfish have been identified in LISTS (see Appendix I for the full list of species).

| Common Name | Scientific Name | Common Name | Scientific Name |
| :--- | :--- | :--- | :--- |
| anchovy, bay | Anchoa mitchilli | mackerel, Atlantic | Scomber scombrus |
| anchovy, striped | Anchoa hepsetus | menhaden, Atlantic | Brevoortia tyrannus |
| black sea bass | Centropristes striata | moonfish | ocean pout |
| bluefish | Pomatomus saltatrix | pipefish, northern | Macrozoarces americanus |
| burrfish, striped | Chilomycterus schoephi | pollock | Syngnathus fuscus |
| butterfish | Peprilus triacanthus | puffer, northern | Pollachius virens |
| cunner | Tautogolabrus adspersus | rockling, fourbeard | Sphoeroides maculatus |
| dogfish, smooth | Mustelus canis | sand lance, American | Enchelyopus cimbrius |
| dogfish, spiny | Squalus acanthius | scad, mackerel | Ammodytes americanus |
| eel, American | Anguilla rostrata | scad, rough | Decapterus macarellus |
| flounder, fourspot | Paralichthys oblongus | scad, round | Trachurus lathami |
| flounder, smallmouth | Etropus microstomus | sculpin, longhorn | Decapterus punctatus |
| flounder, summer | Paralichthys dentatus | scup | Myoxocephalus octodecemspin |
| flounder, windowpane | Scophthalmus aquosus | sea raven | Stenotomus chrysops |
| flounder, winter | Pseudopleuronectes american | searobin, northern | Hemitripterus americanus |
| flounder, yellowtail | Pleuronectes ferrugineus | searobin, striped | Prionotus carolinus |
| glasseye snapper | Priacanthus cruentatus | sennet, northern | Prionotus evolans |
| grubby | Myoxocephalus aeneus | shad, American | Sphyraena borealis |
| gunnel, rock | Pholis gunnellus | shad, gizzard | Alosa sapidissima |
| hake, red | Srophycis chuss | shad, hickory | Dorosoma cepedianum |
| hake, silver | Merluccius bilinearis | skate, clearnose | skate, little |

Names taken from: Common and Scientific Names of Fishes from the United States, Canada and Mexico, American Fisheries Society, Sixth ed., 2004.

Table 2.15. List of invertebrate species observed in 2007.
In 2007, fourty-one invertebrate species were identified. In most cases, invertebrates are identified to species; however, species that are very similar are identified to genus, and in difficult cases, to a higher taxon.

| Common Name | Scientific Name | Common Name | Scientific Name |
| :--- | :--- | :--- | :--- |
| anemones | anemomes spp. | mussel, blue | Mytilus edulis |
| arks | Noetia-Anadara spp. | northern moon snail | Lunatia heros |
| blood star | Henricia spp. | oyster, common | Crassostrea virginica |
| bryozoan, bushy | Phylum Bryozoa | sea grape | Molgula spp. |
| bryozoan, rubbery | Alcyonidium verrilli | sea urchin, green | strongylocentrotus droebach |
| clam, hard clams | Artica-Mercinaria-Pitar sp. | sea urchin, purple | Arbacia punctulata |
| clam, surf | Spisula solidissima | shrimp, coastal mud | Upogebia affinis |
| coral, star | Astrangia poculata | shrimp, mantis | Squilla empusa |
| crab, mud | Family Xanthidae | shrimp, northern red | Pandalus montagui |
| crab, Japanese shore | Hemigrapsus sanguineus | shrimp, sand | Crangon septemspinosa |
| crab, blue | Callinectes sapidus | slipper shell, common | Crepidula fornicata |
| crab, flat claw hermit | Pagurus pollicaris | sponge spp. | sponge spp. |
| crab, horseshoe | Limulus polyphemus | sponge, boring | Cliona celate |
| crab, jonah | cancer borealis | sponge, deadman's fingers | Haliclona spp. |
| crab, lady | Ovalipes ocellatus | sponge, red bearded | Microciona prolifera |
| crab, rock | Cancer irroratus | squid, long-finned | Loligo pealeii |
| crab, spider | Libinia emarginata | starfish spp. | Asteriid spp. |
| hydroid spp. | Tubularia spp. | tunicates, misc | misc. class ascidiacea |
| jelly, water | Rhacostoma atlanticum | whelk, channeled | Busycotypus canaliculatus |
| jellyfish, lion's mane | Cyanea capillata | whelk, knobbed | Busycon carica |
| lobster, American | Homarus americanus |  |  |

Names taken from: A Field Guide to the Atlantic Seashore, Peterson Field Guide Series, 1978 (Gosner, 1978).

Table 2.16. Total number and weight (kg) of finfish and invertebrates caught in 2007.
Finfish species are in order of descending count. Invertebrate species are in order of descending weight (nc $=$ not counted). Young-of-year bay and striped anchovy are neither separated by species or quantified; young-of-year Atlantic herring are not quantified. Number of tows (sample size)=200.

| species | count | \% | weight | \% | species | count | \% | weight | \% |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| scup | 75,681 | 42.6 | 5,333.5 | 30.4 | pollock | 1 | 0 | 0.1 | 0 |
| butterfish | 49,137 | 27.6 | 1,446.2 | 8.2 | rock gunnel | 1 | 0 | 0.1 | 0 |
| weakfish | 17,386 | 9.8 | 584.8 | 3.3 | striped burrfish | 1 | 0 | 0.5 | 0 |
| bluefish | 9,378 | 5.3 | 1,801.3 | 10.3 | sea lamprey | 1 | 0 | 0.1 | 0 |
| winter flounder | 4,550 | 2.6 | 951.3 | 5.4 | yellowtail flounder | 1 | 0 | 1.0 | 0 |
| windowpane flounder | 4,051 | 2.3 | 510.8 | 2.9 | Total | 177,841 |  | 17,540.3 |  |
| red hake | 2,788 | 1.6 | 200.4 | 1.1 |  |  |  |  |  |

Table 2.19. Spring indices of abundance for selected species, 1984-2007.
The geometric mean count per tow was calculated for 38 finfish and 2 invertebrates using April-June data. An asterisk next to the species name and time series mean, indicates that the spring index is a better estimate than the fall index (Simpson et al. 1991). Two asterisks indicate that both the spring and the fall indices provide good estimates.

Table 2.20. Fall indices of abundance for selected species, 1984-2007.
The geometric mean count per tow was calculated for 38 finfish and 2 invertebrates using September-October data. An asterisk next to the species name and a time series mean, indicates that the fall index provides a better estimate than the spring index (Simpson et al. 1991). Two asterisks indicate that both the spring and the fall indices provide good estimates.

Table 2.21. Finfish and invertebrate biomass indices for the spring sampling period, 1992-2007.
The geometric mean weight (kg) per tow was calculated for 38 finfish and 15 invertebrate species for the spring (AprilJune) sampling period.

Table 2.22. Finfish and invertebrate biomass indices for the fall sampling period, 1992-2007.
The geometric mean weight (kg) per tow was calculated for 38 finfish and 15 invertebrate species for the fall (SeptOct) sampling period.

Table 2.23. Bluefish indices of abundance, 1984-2007.
Using September and October length data, the geometric mean catch per tow was calculated for two age groups of bluefish: age-0 and all fish age 1 and older. Age-0 was defined as bluefish less than 30 cm fork length.

| Year | Fall |  |  |  |

Table 2.24. Scup indices-at-age, 1984-2007.
Spring (May and June) and fall (September and October) catch and age data were used to determine the geometric mean indices-at-age ${ }^{1}$. The spring and fall age keys were used to expand length frequencies to age frequencies and then the spring and fall overall indices were proportioned by the percentage of fish in each age. The $0-10+$ index represents the overall index (sum of ages 0-10+), and the adult $2+$ index is provided as the sum of ages 2-10+ index. All fish older than age 9 were included in the age $10+$ index ${ }^{2}$.

| Year | Spring (May-June) |  |  |  |  |  |  |  |  |  |  |  |  |

(1) In 1984, 1985, 2003, 2004, and 2006 less than the number of scheduled tows were conducted in some months: in 1984, thirteen tows were conducted in May and nineteen in June; in 1985, five tows were conducted in June; in 2003, the 40 scheduled October tows were conducted in
November and thus dropped; in 2004, thirty-nine tows were conducted in June; and in 2006, twenty tows were conducted in September and twenty tows were conducted in early October (see Table 2.4).

Table 2.25. Age frequency of striped bass taken in spring, 1984-2007.
Ages were derived from trawl survey length data using the average of Hudson River and Chesapeake Bay von Bertalanffy parameters (Vic Crecco, pers. comm.).

Note: number of fish taken but not measured = one in 1984, one in 1988, two in 1990.

Table 2.26. Striped bass indices-at-age, 1984-2007.
Spring length data was converted to ages using the average of Hudson River and Chesapeake Bay von Bertalanffy parameters (Vic Crecco, pers comm). Indices-at-age were then determined by apportioning the spring indices (from Table 2.10) by the percentage of fish in each age.

| Year | Index | Age 1 | Age 2 | Age 3 | Age 4 | Age 5 | Spring <br> Age 6 | Age 7 | Age 8 | Age 9 | Age 10 | Age 11 |

Table 2.27. Summer flounder indices-at-age, 1984-2007.
Year and season specific age keys obtained from the NMFS spring and fall surveys were used to convert LISTS length frequencies to ages. Starting in 2000 LISTS ageing data ( 60 cm and over) were added to the age key to supplement the older age groups. Indices-at-age were determined for each season by apportioning the spring and fall overall indices (from Table 2.10 and Table 2.11) by the percentage of fish in each age. The age 0-7+ index is the sum of indices ages 0-9.

| Year | Spring |  |  |  |  |  |  |  |  |  |  |

Table 2.28. Weakfish age 0 and age $1+$ indices of abundance, 1984-2007.
Using spring (May, June) and fall (September, October) length data, the geometric mean catch per tow was calculated for three groups of weakfish: fall age-0, spring - all fish age 1 and older ( $1+$ ), and fall - all fish age 1 and older ( $1+$ ). Weakfish less than 30 cm fork length in the fall were defined as age-0.

Table 2.29. Winter flounder indices-at-age, 1984-2007.
The Long Island Sound Trawl Survey April and May catch and age data was used to calculate the geometric mean indices-at-age. An April-May age key was used to convert lengths to ages, and an overall April-May index (the ages 1-13 index in the table) was apportioned by the percentage of fish at age. The 4+ index is the sum of indices ages 4-13 and represents the abundance of winter flounder that are recruited to the fishery. The age-0 indices were obtained from the Estuarine Seine Survey (Job 2 Part 2).

Note: 1984:April = 0 tows, May = 13 tows, and 19 tows in June used to increase sample size; 1985: April = 0 tows, May = 41 tows; 1986-1991: April = 40 tows, May $=40$ tows; 1992: April $=0$ tows, $M a y=40 ; 1993-1995:$ April $=40$ tows, $M a y=40$ tows; 1996: April $=17$ tows, May $=63$ tows; $1997-$ 2004: April $=40$ tows and May = 40 tows; 2005: April = 35 tows, May $=45$ tows; 2006: April $=0$, and May $=40$ tows; 2007: April $=35$, and May $=45$ tows..

FIGURES 2.1-2.14

Job 2 Page 115

Figure 2.1. Trawl Survey site grid. Each sampling site is $1 \times 2 \mathrm{nmi}$ (nautical miles). A four-digit number identifies the site: the first two digits are the row numbers (corresponding to minutes of latitude) and the last two digits are the column numbers (corresponding to two nautical miles in length on the longitudinal axis). Examples: site 1428 near Guilford and 0028 near Mattituck. (Note: The sites in column 16 are approximately $2 x 1$ nmi. The grid was drawn on the Eastern and Western Long Island Sound 80,000:1 nautical charts, which overlap by the area in column 16.)

Figure 2.2. April; 2007 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Narrows sites sampled in western LIS are denoted as green dots. Samples that were collected from a different site than originally selected are noted in table below map.

April 2007 samples that were collected from a different sites than originally selected:

| Sample | Site <br> sampled | sampled <br> strata | site selected selected strata | \# Attempts <br> before moving | reason moved |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| SP2007006 | 0830 | S4 | 1133 | S4 | 2 | Tried couple times; dug into sand dunes \& snapped ground cable on first try then dug in again on second try. |
| SP2007019 | 0328 | T 3 | 5808 | T 3 | 0 | Unlikely to sampled selected site b/c pot gear interaction. |
| SP2007025 | 0521 | M 4 | 0320 | M 4 | 1 | On first try, speed dropped. String of pots through port wing \& on stbd door. Have to move to 0521 (TZ). |
| SP2007026 | 0522 | M 4 | 0419 | M 4 | 1 | Set in but had to haul back immediately because saw a lot of gear ahead. Have to move to 0522 (TZ). |
| SP2007028 | 0720 | M 3 | 0619 | M 3 | 2 | Speed dropped; had gear on both doors. Cut free \& re-set. Speed dropped again. Gear set blind. |

* Did not attempt site 00-07 because there was too much pot gear, there was also too much pot gear in alternate site (00-08).

Job 2 Page 117

Figure 2.3. May 2007 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Narrows sites sampled in western LIS are denoted as green dots. Samples that were collected from a different site than originally selected are noted in table below map.

May 2007 samples that were collected from a different sites than originally selected:

| Sample | Site <br> sampled | sampled <br> strata | site <br> selected | selected <br> strata | \# Attempts <br> before moving | reason moved |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SP2007046 | 0931 | S 4 | 1133 | S 4 | 1 | Net not fishing properly in sand dunes. |
| SP2007053 | 0623 | M 4 | 0319 | M 4 | 0 | Phone call from commercial fisherman that several folks have pot gear in area. |
| SP2007054 | 0522 | M 4 | 0217 | M 4 | 0 | Phone call from commercial fisherman that several folks have pot gear in area. |
| SP2007067 | 0521 | M 4 | 0118 | M 4 | 0 | Phone call from commercial fisherman that several folks have pot gear in area. |
| SP2007073 | 5714 | T3 | 0417 | T3 | 0 | pots |

Job 2 Page 118

Figure 2.4. June 2007 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Narrows sites sampled in western LIS are denoted as green dots. Samples that were collected from a different site than originally selected are noted in table below map.

June 2007 samples that were collected from a different sites than originally selected:

| Sample | Site <br> sampled | sampled <br> strata | site <br> selected | selected <br> strata | \# Attempts <br> before moving | reason moved |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SP2007116 | 0110 | T3 | 5808 | T3 | 0 | pots |  |
| SP2007120 | 0521 | M4 | 0012 | M4 | 0 | pots |  |

Figure 2.5. September 2007 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Narrows sites sampled in western LIS are denoted as green dots. Samples that were collected from a different site than originally selected are noted in table below map.

September 2007 samples that were collected from a different sites than originally selected:

| Sample | Site <br> sampled | sampled <br> strata | site <br> selected | selected <br> strata | \# Attempts <br> before moving | reason moved |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FA2007024 | 0522 | M4 | 0319 | M4 | 1 | pots |  |
| FA2007040 | 1021 | M2 | 0515 | M2 |  |  |  |

## APPENDICES

LISTS

Appendix 2.1. List of finfish species identified by A Study of Marine Recreational Fisheries in Connecticut (F54R) programs. LISTS has collected ninety-seven species from 1984-2007.
This appendix contains a list of 120 species identified (Bold type indicates new species) from all sampling programs conducted since 1984. Species are listed alphabetically by common name (AFS 1991). Sampling program abbreviations are as follows: ESS = Estuarine Seine Survey; IS = Inshore Survey of Juvenile Winter Flounder; LISTS $=$ Long Island Sound Trawl Survey; SNFH = A Study of Nearshore Finfish Habitat. Gear codes are as follows: BT = beam trawl; OT = otter trawl; PN = plankton net; $S=$ seine.

| Common Name | Scientific Name | Sampling Program | Gear |
| :---: | :---: | :---: | :---: |
| anchovy, bay | Anchoa mitchilli | ESS; IS; LISTS | BT; OT; S |
| anchovy, striped | Anchoa hepsetus | LISTS | OT |
| banded rudderfish | Seriola zonata | LISTS | OT |
| bass, calico | Pomoxis sp. | SNFH | PN |
| bass, striped | Morone saxatilis | LISTS; ESS | OT |
| bigeye | Priacanthus arenatus | LISTS | OT |
| bigeye, short | Pristigenys alta | LISTS | OT |
| black sea bass | Centropristes striata | ESS; IS; LISTS | BT; OT; S |
| bluefish | Pomatomus saltatrix | ESS; LISTS | OT; S |
| bonito, Atlantic | Sarda sarda | LISTS | OT |
| burrfish, striped | Chilomycterus schoepfi | LISTS; ESS | OT; S |
| burrfish, web | Chilomycterus antillarum | ESS | S |
| butterfish | Peprilus triacanthus | ESS; IS; LISTS | BT; OT; S |
| cod, Atlantic | Gadus morhua | LISTS | OT |
| cornetfish, bluespotted | Fistularia tabacaria | ESS; IS | BT |
| cornetfish, red | Fistularia petimba | IS; LISTS | BT; OT |
| croaker, Atlantic | Micropogonias undulatus | LISTS | OT |
| cunner | Tautogolabrus adspersus | ESS; IS; LISTS | BT; OT; S |
| cusk-eel, fawn | Lepophidium profundorum | LISTS | OT |
| cusk-eel, striped | Ophidion marginatum | LISTS | OT |
| dogfish, smooth | Mustelus canis | ESS; LISTS | OT; S |
| dogfish, spiny | Squalus acanthius | LISTS | OT |
| eel, American | Anguilla rostrata | ESS; IS; LISTS; SNFH | BT; OT; PN; S |
| eel, conger | Conger oceanicus | LISTS | OT |
| filefish, orange | Aluterus schoepfi | LISTS | OT |
| filefish, planehead | Monacanthus hispidus | LISTS | OT |
| flounder, American plaice | Hippoglossoides platessoides | LISTS | OT |
| flounder, fourspot | Paralichthys oblongus | IS; LISTS | BT; OT |
| flounder, smallmouth | Etropus microstomus | ESS; IS; LISTS | BT; OT; S |
| flounder, summer | Paralichthys dentatus | ESS; IS; LISTS | BT; OT; S |
| flounder, windowpane | Scophthalmus aquosus | ESS; IS; LISTS | BT; OT; S |
| flounder, winter | Pleuronectes americanus | ESS; IS; LISTS; SNFH | BT; OT; PN; S |
| flounder, yellowtail | Pleuronectes ferrugineus | IS; LISTS | BT; OT |
| glasseye snapper | Priacanthus cruentatus | LISTS | OT |
| goatfish, dwarf | Upeneus parvus | LISTS | OT |
| goatfish, red | Mullus auratus | LISTS | OT |
| goby, code | Gobiosoma robustrum | ESS | S |
| goby, naked | Gobiosoma bosci | ESS; IS,LISTS | BT; OT, S |
| goosefish | Lophius americanus | IS; LISTS | BT; OT |
| grubby | Myoxocephalus aeneus | ESS; IS; LISTS; SNFH | BT; OT; PN; S |
| gunnel, banded | Pholis fasciata | ESS; IS | BT; S |
| gunnel, rock | Pholis gunnellus | ESS; IS; LISTS; SNFH | BT; OT; PN; S |
| gurnard, flying | Dactylopterus volitans | ESS | S |

Appendix 2.1 cont.

| Common Name | Scientific Name | Sampling Program | Gear |

Appendix 2.2. Annual total count of finfish, lobster and squid taken in the LISTS, 1984-2007.
Counts include all tows- number of tows conducted is shown in second row. Refer to Table 2.4 for details on number of tows conducted per month. Note: nc $=$ not counted. Anchovy spp., (yoy) and sand lance, (yoy) are estimated.

| Common name (number of tows) | $\begin{array}{r} 1984 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1985 \\ 246 \\ \hline \end{array}$ | $\begin{array}{r} 1986 \\ 316 \\ \hline \end{array}$ | $\begin{array}{r} 1987 \\ 320 \\ \hline \end{array}$ | $\begin{array}{r} 1988 \\ 320 \\ \hline \end{array}$ | $\begin{array}{r} 1989 \\ 320 \\ \hline \end{array}$ | $\begin{array}{r} 1990 \\ 297 \\ \hline \end{array}$ | $\begin{array}{r} 1991 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1992 \\ 160 \\ \hline \end{array}$ | $\begin{array}{r} 1993 \\ 240 \\ \hline \end{array}$ | $\begin{array}{r} 1994 \\ 240 \\ \hline \end{array}$ | $\begin{array}{r} 1995 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1996 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1997 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1998 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 1999 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2000 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2001 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2002 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2003 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2004 \\ 199 \\ \hline \end{array}$ | $\begin{array}{r} 2005 \\ 200 \\ \hline \end{array}$ | $\begin{array}{r} 2006 \\ 120 \\ \hline \end{array}$ | $\begin{array}{r} 2007 \\ 200 \\ \hline \end{array}$ | Total 5,378 |

## JOB 2 PART 2: ESTUARINE SEINE SURVEY

## OBJECTIVES

1) Provide an annual index of recruitment for winter flounder (Age0, 1+), all finfsh species taken, and all crab species.

The 2007 annual index of recruitment for young-of-year winter flounder (4.7 fish/haul) ranked $14^{\text {th }}$ out of 20 annual indices.
2) Provide an annual total count for all finfish taken.

Mean catch of all finfish ( 236 fish/haul) ranked third out of 20 annual indices and was well above the series average of 142 fish/haul (Figure 2.2). Geometric means were calculated for 22 species commonly captured since the survey began in 1988 (Table 2.1).
3) Provide an index for shallow subtidal forage species abundance.

An index of forage abundance was generated using the catch of four of the most common forage species caught: Atlantic silversides, striped killifish, mummichog, and sheepshead minnow. The index for 2007 ( 149 forage fish/haul) was the second highest of the time series, and well above the time series average of 102 forage fish/haul.

## METHODS

Eight sites (Figure 2.1) are sampled with an eight-meter ( 25 ft .) bag seine with 6.4 mm ( 0.25 in.) bar mesh during September 2006. Area swept was standardized to 4.6 m ( 15 ft .), width by means of a taut spreader rope and a 30 m ( 98 ft .), measured distance, parallel to, or at a $45^{\circ}$ angle to the shoreline, against the current or tide if present. At each site, six seine hauls were taken within two hours before and after low slack tide during daylight hours. Sites in Groton, Waterford, Old Lyme, Clinton, New Haven, Bridgeport and Greenwich have been sampled since 1988. The Milford site was added in 1990.

Finfish and crabs taken in each sample are identified to species or lowest practical taxon (full listing given in Appendix 2.1,2.2) and counted. One exception is inland silversides, which are not separated from Atlantic silversides because they are rare and difficult to identify. Qualitative counts were used for menhaden when abundant ( $\mathrm{A}=1000$ ) to minimize discard mortality. Winter flounder are measured to total length (mm), and classified as young-ofyear (YOY) if less than 12 cm and age $1+$ if 12 cm or larger. The age of flounder near this size was verified in 1990-1992 by examination of the sagittal otolith. Physical data recorded at each seine location included water temperature and salinity at one-meter depth. The geometric, or retransformed natural log mean catch per standard haul is calculated for catches at each site and collectively for the 22 most abundant species, with separate indices for young-of-year and winter flounder age 1 and older. Confidence intervals ( $95 \%$ ) for each geometric mean are retransformations of the corresponding log intervals. Frequency of occurrence is given as a percentage of all samples taken each year.

## RESULTS

A total of 48 seine hauls were taken in 2007 at eight sites, yielding a total catch of 11,336 fish of 25 species and 5,360 invertebrates of 11 species. Mean catch of all finfish (236 fish/tow) was the third highest in the time series (Figure 2.2). This catch is well above the long-term mean of 142 fish/tow is attributed to above average catches of Atlantic silversides, striped killifish, mummichog, sheepshead minnow, northern puffer, scup and tautog. Geometric means were calculated for 22 species commonly captured since the survey began in 1988 (Table 2.1). The most frequently caught species was Atlantic silversides, which occurred in 100 percent of all samples, followed by YOY winter flounder $(92 \%)$, striped killifish ( $88 \%$ ), mummichog ( $65 \%$ ), tautog ( $54 \%$ ), northern puffer ( $44 \%$ ), pipefish ( $42 \%$ ), sheepshead minnow (40\%), scup (29\%), cunner (25\%) and black sea bass (23\%). This rank order has changed from the previous years, with a notable increase in winter flounder and tautog occurrence rate along with an increase in striped killifish, northern puffer, pipefish and sheepshead minnow occurrence. Fourteen of the 22 species monitored increased in abundance in 2007, while seven fish species decreased and two were unchanged. Tautog abundance and occurrence rate increased significantly in 1998-99, returned to the series average in 2005, and was well above the series average (record year) in 2007. Previous to 2005, tautog relative abundance had significantly increased to all-time abundance levels in 2002-04 (Figure 2.4). Three forage fish species were the highest in the 20-year time-series. Tautog, scup and northern puffer occurrence and abundance were also the highest in 2007. Cunner abundance and occurrence was the third highest in the 20 year time-series in 2007. No snapper bluefish, four-spine stickleback, smallmouth founder, striped bass and weakfish young-of-year were observed in the survey in 2007. Grubby, summer flounder, age 1 winter flounder and windowpane flounder decrease in abundance in 2007 from the previous year. Grubby, northern kingfish, northern pipefish, windowpane flounder and winter flounder (age $1+$ and older) abundance and occurrence was average for the 20 -year time-series in 2007. All other species occurred in less than $10 \%$ of all samples, with occurrence rates similar to previous years. One new species of finfish, flying gurnard (Dactylopterus volitans ) was captured in 2007, at the Waterford site. Other notable catches, were 2 northern seahorses captured at the Waterford site and seven white mullet at Old Lyme.

## Relative Abundance of Juvenile Winter Flounder and Tautog

The 2007 index of YOY winter flounder (4.7fish/haul) ranked fourteenth out of 20 annual indices (Table 2.2, Figure 2.3 and 2.7). Overall, the time series indicates that relatively strong year classes were produced in 1988, 1992, 1994, and 1996 (Figure 2.3).

The 2007 index of YOY tautog ( 2.4 fish/haul) was the highest ranking out of 20 annual indices (Table 2.1, Figure 2.3 and 2.7), well above the series average of 0.74 tautog / haul. Overall, the time series indicates a significant increasing trend in abundance of young-ofyear tautog from 1988 to 2007, with good year classes produced in 1998-99, 2002-04 and 2007, even though the 2006 mean was below the long-term average. ( $\mathrm{P} \leq 0.01, \mathrm{t}=2.8, \mathrm{df}=19$ ),
(Table 2.1, Figure 2.4).

## Presence of Other Important Recreational Finfish

YOY scup is another recent addition to the seine survey, first occurring in 1999, with the highest relative abundance in the last seven years of the time series, a reflection of strong recruitment and survival in recent years (Table 2.4, Figure 2.8). Juvenile striped bass first occurred in the survey in 1999 with one individual captured. In 2003 six more YOY stripers were taken (Table 2.4, Figure 2.8). However, no striped bass were captured in 2007. YOY summer flounder have occurred in six years of the 20-year time series (1993, 1994, 1996, 1998, 2006 and 2007). The 2007 summer flounder abundance was the third highest of the time series. YOY black sea bass first appeared in 1991 and every year since 1997, reaching their highest abundance in 2001, (Figure 2.7). Snapper bluefish have occurred in 14 out of 20 years of the time series, reaching peak abundance in 1999. Juvenile tautog has occurred every year in the seine survey except 1989.

## Relative Abundance of Forage Species

Seine survey catches are dominated by forage species, defined here as short-lived, highly fecund species that spend the majority of their life cycle inshore where they are common food for piscivorous fish. An index of forage abundance was generated using the catch of four of the most common forage species caught: Atlantic silversides, striped killifish, mummichog, and sheepshead minnow (Figure 2.5, Figure 2.6). The index for 2007 was the second highest in the 20 year time series. Three of the four forage fish species (Striped killifish, sheepshead minnow and mummichog) occurred in record abundance in 2007. Atlantic silversides were the most abundant, and the only species present at all sites in all samples (Table 2.1). There was a substantial increase in silverside abundance in 2007. An increase in this species' abundance in 2002 through 2005 reversed a two-year decrease from 2000-2001 and a decrease in 2006. Striped killifish, sheepshead minnow and mummichog occurred in record abundance in 2007. Mummichog abundance (7.3) was well above the long-term average of 2.3 in 2007. Sheepshead minnow had a record abundance (3.35) in 2007, ranking highest in the 20 year time series in both total catch and percent occurrence. Striped killifish abundance and occurrence increase to record levels in 2007 (21.2 fish/tow, $88 \%$ occurrence). Collectively, killifish abundance has not been this high since 2002-2005.

Forage fish abundance has generally been increasing since 1997 (Figure 2.5) after a period of lower abundance (decreasing trend) since 1991. In 2007, forage fish abundance significantly rose above the series mean of 101.8 fish/haul, with a mean catch of 149.5 fish per haul. Forage fish abundance is driven numerically by the occurrence of adult Atlantic silverside (Figure 2.6) and more recently striped killifish, mummichog and sheepshead minnow, the second and third most abundant forage species. Striped killifish are more suited to marine habitats, than other 'Fundulus' species captured in the estuarine seine survey. Both Atlantic silverside and striped killifish were captured in slightly below average numbers in 2006, suggesting relatively poor year class production $2-3$ years ago, since the survey captures
adults more effectively. Mummichog, the third most abundant forage fish (Table 2.3) in the survey, peaked in abundance in 2007. The lowest time series abundance occurred in 1997, mummichog appear to be increasing with an above average catches since 1999. Sheepshead minnow the least abundant of the four forage fish species monitored has recently shown elevated abundance in 2002-2007, with a record year in 2007 ( 3.35 fish/tow).

## Relative Abundance of Invertebrate Species

A total of 5,360 invertebrates of 11 species were captured in 2007 (Table 2.3), (Appendix 2.2). Seven crab species were present in the seine hauls, along with two shrimp species, one gastropod and one cephalopod (shortfin squid). Mud snail, shore shrimp, sand shrimp, lady crab, hermit crab, green crab and blue crab were the most abundant, and only mud snails, shore shrimp, sand shrimp, lady and green crab had greater than $50 \%$ occurrence in 2007 (Table 2.3).

## MODIFICATIONS

None.

Job 2 Page 175

Figure 2.1: Sampling locations of the seine survey along the coast of Connecticut.

Figure 2.2: Mean catch (numbers) of all finfish taken in seine samples, 1988-2007.
Mean catch per haul includes samples at all sites. Note that sampling at the Milford site began in 1990.

Figure 2.3: Mean catch of young-of-year winter flounder, 1988-2007. The 95\% confidence interval for each index is show as a vertical bar, along with a trendline. Note that all sites are included with sampling at the Milford site beginning in 1990.

Figure 2.4: Mean catch of tautog young-of-year taken in seine samples, 1988-2007. Geometric mean catch per haul (numbers) and occurrence (percent) includes samples at all sites. The time series mean of 0.65 tautog / haul is shown by the black line. Note that sampling at the Milford site began in 1990.

Figure 2.5: Mean catch of forage fish at eight sites sampled by seine, 1988-2007.
Forage species include Atlantic silversides, mummichog, sheepshead minnow, and striped killifish. The 95\% confidence interval (CI) for each mean is also listed. See Appendix 2.1 for complete species names.

## Appendix 2.1: Finfish species taken in the Estuarine Seine Survey, 1988-2007. COMMON NAME SPECIES CODE SCIENTIFIC NAME

Alewife
American eel
American shad
American sand lance
Atlantic silversides
Atlantic tomcod
Banded gunnel
Bay anchovy
Black-spot stickleback
Black sea bass BSB
Blueback herring BBH
Bluefish BLF
Blue spotted coronetfish BSC
Crevalle jack CRJ
Cunner
Flying Gurnard
Four-spine stickleback FSS
Gray snapper GRA
Grubby GRB
Hogchoker HOG
Inshore lizardfish LIZ
Little skate LSK
Menhaden MEN
Mummichog MUM
Naked goby NKG
Nine-spine stickleback NSS
Northern kingfish NKF
Northern pipefish PIP
Northern puffer PUF
Northern searobin NSR
$\begin{array}{ll}\text { Northern stargazer } & \text { STR } \\ \text { Pumpkinseed } & \text { PUM }\end{array}$
$\begin{array}{ll}\text { Pumpkinseed } & \text { RSM }\end{array}$
$\begin{array}{ll}\text { Rainwater killifish } & \\ \text { Rock gunnel } & \text { RGN } \\ \text { Northern seahorse } & \text { SEH }\end{array}$
Northern sennet NOS
Scup
Sheepshead minnow SHM
Smallmouth flounder SMF
Smooth dogfish SMD
Spotted hake SPH
Striped bass STB

## JOB 5: COOPERATIVE INTERAGENCY RESOURCE MONITORING

## GOAL

To provide long-term monitoring of physical, chemical and biological indicators of environmental conditions in order to evaluate the effects of non-fishing activities on the health and abundance of valued recreational species.

## OBJECTIVES

1) Provide monthly monitoring of water quality parameters important in the development of summer hypoxia in Long Island Sound including temperature, salinity, and dissolved oxygen, at eighteen fixed axial and lateral stations throughout Long Island Sound.
2) Provide estimates of the area and duration of summer hypoxia (low oxygen) in Long Island Sound based on sampling at an additional 30 fixed sites semi-monthly between June and September.

## INTRODUCTION

## Long Island Sound, Living Resources and Hypoxia

Long Island Sound (the Sound) is a semi-enclosed estuary that encompasses $3,370 \mathrm{~km}^{2}$ ( $337,000 \mathrm{ha}$ ) including embayments (Wolfe et al., 1991) and receives runoff from a $41,400 \mathrm{~km}^{2}$ drainage basin that includes Long Island, New York and much of New England to the Canadian border. More than 7 million people live within the state of Connecticut and New York counties bordering the Sound (LISS 1990). The Sound has typically acted as the receiving body of domestic, agricultural and industrial waste generated within the region.

Excessive nutrient inputs (most notably nitrogen) from atmospheric deposition, runoff and sewage discharges as well as natural sources results in a high rate of primary (phytoplankton) production within the Sound. Summer warming of surface water results in a temperature and density stratification within the water column, known as the pycnocline. As phytoplankton blooms die off and decompose, oxygen in bottom waters is used up, often resulting in hypoxia (low dissolved oxygen, DO $<=3.5 \mathrm{mg} / \mathrm{l}$ ) and in some cases, anoxia ( $\mathrm{DO}<0.2 \mathrm{mg} / \mathrm{l}$ ). These periodic hypoxic events generally develop by early July and may persist until late September.

Simpson et al, (1995) identified low oxygen tolerance thresholds for 16 individual species of finfish and lobster, and six aggregate species indices. For the most sensitive species (scup, striped sea robin) dissolved oxygen becomes limiting at over $4.0 \mathrm{mg} / \mathrm{l}$, whereas more highly tolerant species (Atlantic herring and butterfish) did not decline in abundance until oxygen levels were below $2.0 \mathrm{mg} / \mathrm{l}$. Both demersal species biomass and demersal species richness begin to decline when dissolved oxygen levels fall below about $3.5 \mathrm{mg} / \mathrm{l}$. No finfish or macroinvertebrates were observed when dissolved oxygen fell below $1.0 \mathrm{mg} / \mathrm{l}$.

An index of habitat impairment (Biomass Area-Day Depletion, BADD) was developed based on the percent reduction in demersal finfish biomass associated with each $1 \mathrm{mg} / 1$ interval below 3.5
$\mathrm{mg} / \mathrm{l}$. In addition to BADD, inter-annual trends in the severity of hypoxia are monitored using duration (weeks where $\mathrm{DO}<3.5 \mathrm{mg} / \mathrm{l}$ ) and maximum areal extent of waters with severe hypoxia ( $\mathrm{DO}<1.0 \mathrm{mg} / \mathrm{l}$ ). Together, these three indices are used to relate dissolved oxygen trends to conditions for living resources in the Sound.

## Water Quality Monitoring Program

In January 1991, Connecticut DEP initiated a water quality and hydrographic survey to provide continuity to a time series begun in 1988 under the National Estuaries Program's, Long Island Sound Study. This survey continues in an expanded form with EPA (and Federal Aid to Sportfish Restoration) support as the Department's "Long Island Sound Ambient Water Quality Monitoring Program."

In the first three years of this study (1991-1993), sampling was conducted cooperatively between Marine Fisheries and Water Management staff to evaluate dissolved oxygen (DO) conditions and coincident fish abundance. With the completion of fishery resource sampling in 1993, emphasis shifted to intensive water quality monitoring under the Bureau of Water Management. In 1994, fortyeight permanent stations were established to monitor summer hypoxia; eighteen of these stations are sampled on a monthly basis year-round. Marine Fisheries staff continue to provide research vessel support and rely on this program to evaluate the effects of hypoxia on living resources through the three indices identified above. In addition, monthly patterns in temperature and salinity have proven useful in understanding both seasonal and inter-annual trends and in making inferences concerning fishery resources.

## METHODS

## Sampling Design

In 1994, 48 fixed stations were established to monitor hypoxia. Beginning in December 1994, eighteen of these stations were also sampled as part of the monthly water quality monitoring program, an expansion from the previous seven axial station coverage. In 1998 a $49^{\text {th }}$ station (J4) was added in the eastern Sound. Monthly stations were distributed to provide axial coverage over the length of the Sound, including a reference station outside the Sound, southeast of Fishers Island. Transverse stations were located off New Haven, Bridgeport and Norwalk. Summer hypoxia monitoring stations are concentrated in the hypoxia prone western half of the Sound, although Connecticut shoreline coverage extends east of the Connecticut River. The eighteen monthly stations are sampled year round, generally during the first week of the month. Beginning in the end of June, hypoxia monitoring commences and twice monthly hypoxia sampling continues through September. During the summer of 2002 Connecticut DEP modified the summer hypoxia sampling by decreasing the number of stations sampled from 49 down to between 20 and 25 . These changes were made to make better use of the resources available and to better reflect the understanding from eleven years of monitoring. The mid month Hypoxia surveys will be limited to the narrows, western and central basins with a focus on stations that historically have been affected by hypoxic conditions. The number of stations sampled on these surveys will be adjusted according to the severity of the hypoxic event. During years of unusually severe hypoxia additional stations will be monitored to ensure an accurate assessment of the area affected by low dissolved oxygen.

## Sampling Procedures

Water sampling is conducted from the 50 ft Research Vessel John Dempsey. Conductivity-temperature-depth (CTD) water column profiles are taken with a Sea-Bird model SBE-19 SeaCat Profiler, equipped with dissolved oxygen (YSI model 5739), photosynthetically-active radiation (PAR) (Licor spherical underwater model 193SA) and Fluorometer (WET labs WETstar Miniature Fluorometer) sensors. Data are recorded at a rate of twice per second and the instrument is lowered through the water column at a rate of 0.2 m per second. Dissolved oxygen is also measured by Winkler titration as a quality assurance procedure. Nutrients, and chlorophyll a are also measured. See Kaputa and Olsen (2000) for a complete description of the Long Island Sound Water Quality Monitoring Program. Beginning in 2002 CTDEP expanded its monthly monitoring by adding phytopigment analysis (HPLC method) in April of 2002 and Zooplankton analysis in August of 2002. MesoZooplankton samples are collected using a 200-micron mesh, 0.5 meter double ring plankton net and MicroZooplankton samples are collected from a multiple depth composite of whole water samples. These changes will be continued through the fall of 2008.

## Area and Duration Estimates

In the initial years of this project (1991-1993) the area affected by hypoxia was estimated using a stratified-random sampling approach where stations were selected at random within five east-west zones, further subdivided by depth at the 18 m contours (Gottschall and Simpson, 1999). In 1994 a fixed station sampling program was adopted. To calculate the area of hypoxia from this fixed station design the monitoring staff developed a GIS based method using ArcView, this approach is more appropriate for the programs design.

To calculate the area affected by hypoxia, the minimum dissolved oxygen and the location of each station sampled during each survey is entered into a Geographic Information System (currently ArcMap 9.1) database and plotted. The Spatial Analyst extension is used to interpolate DO values between stations using the inverse distance weighted (IDW) method, producing a cell grid of minimum DO values for the Sound. The area within each interval (0-0.99, 1.0-1.99, 2.0-2.99, 3.0-3.5, $3.51-4.8$ ) is estimated by multiplying the number of cells within each DO interval by the area within each cell (approximately 0.1 square km ). Area estimates include LIS waters shoreward to the 4.0 m contour, except at the eastern (The Race, Fishers Island, Thames River) and western (Throgs Neck Bridge) boundaries, encompassing a total of 2,723 square km .

The duration of each annual hypoxia event in LIS was estimated using the time series of bottom water dissolved oxygen concentrations at each station. Start and end dates were approximated for each station graphically by determining the intersection of the time series line with the $3.5 \mathrm{mg} / \mathrm{l}$ grid line. The earliest start date and latest end date - regardless of station - provided the preliminary start and end date estimates for the year. Data available from the Long Island Sound Trawl Survey (Job 2), other programs and agencies, as well as daily wind and precipitation records were then considered. Such supplementary data improved the date estimates by filling in gaps between sampling events and accounting for substantial wind or storm events that would likely have provided the energy necessary to mix the water column.

## Indices of Habitat Impairment Associated with Hypoxia

An index of habitat impairment (Biomass Area-Day Depletion, BADD) was developed based on the percent reduction in demersal finfish biomass associated with each $1 \mathrm{mg} / 1$ interval below 3.5 $\mathrm{mg} / \mathrm{l}$. Based on Simpson et al (1996), demersal finfish biomass is reduced $100 \%$ (total avoidance) in waters with $\mathrm{DO}<1.0 \mathrm{mg} / \mathrm{l}$. From $1.0-1.9 \mathrm{mg} / \mathrm{l}$ biomass is reduced $82 \%$, while a $41 \%$ reduction occurs at $2.0-2.9 \mathrm{mg} / \mathrm{l}$, and a $04 \%$ reduction occurs at $3.0-3.5 \mathrm{mg} / \mathrm{l}$ dissolved oxygen. These rates are applied to the area-days within each DO interval calculated during each survey and summed over the hypoxia season defined here as July 1 - September $10(72 \mathrm{~d})$. The index is then expressed as a percentage of the available area-days (sample area $2,723 \mathrm{~km}^{2} \times 72 \mathrm{~d}$, or 196,056 area-days). In addition to BADD, inter-annual trends in the severity of hypoxia are monitored using duration (weeks where $\mathrm{DO}<3.5$ $\mathrm{mg} / \mathrm{l}$ ) and maximum areal extent of waters with severe hypoxia ( $\mathrm{DO}<1.0 \mathrm{mg} / \mathrm{l}$ ).

## RESULTS AND DISCUSSION

## Hypoxic Area and Duration

The hypoxic area and duration during the summer of 2007 in Long Island Sound was merely average, due in large part to a late onset of hypoxia. Hypoxia was estimated to begin on or about July 12, 2007 and ended on or about September 21, 2007 for a total of 72 days (Figures 5.1, 5.2). There were no areas affected by dissolved oxygen levels below $1 \mathrm{mg} / \mathrm{L}$ (Figure 5.2). Overall the hypoxic event was average for both area and duration. Our July 30-August 1 (WQAUG07) survey had the maximum area ( 917 sq . kilometers) affected by hypoxia (Table 5.1, Figure 5.2).

## Habitat Impairment Associated with Hypoxia

Area-days by DO interval were calculated for each survey (Table 5.2) to produce the biomass-area-day-depletion (BADD) index used to quantify habitat impairment (Table 5.3). The greatest impairment was associated with the $2-2.99 \mathrm{mg} / \mathrm{l}$ DO interval due to the wider area of exposure estimated for this interval throughout the summer.

The BADD index was calculated for the 72-day period between July 12 and September 21. The BADD index for 2007 was 5,198 or $2.7 \%$ of the total area-days in the LIS sampling area covered by the Ambient Water Quality Monitoring Program (Figure 5.2).

## Monthly Salinity and Temperature Trends

Monthly mean surface and bottom water temperature and salinity were calculated from six axial water quality stations (B3, D3, F3, H6, I2 and M3) for the period between 1991 and 2007. Plots of each year against the time series mean illustrate the inter-annual variability in both salinity (Figure 5.3) and temperature (Figure 5.4). In some cases, deviations from the 1991-2004 mean can be associated with fish population events. For example, strong winter flounder recruitment indices observed in 1994 and 1996 (Job 2) are consistent with colder than average late winter water temperatures that are believed to enhance survival of flounder larvae.

Missing stations can affect monthly means. Therefore the plotted values should be regarded as a qualitative summary of salinity and temperature trends.

## JOB 6: PUBLIC OUTREACH

## GOAL

To increase awareness among anglers and the general public of the information products provided by this project and how this information contributes to state and federal efforts to enhance, restore and protect marine habitat and recreational fish populations.

## OBJECTIVES

1) Increase public awareness that research \& monitoring are essential to good fisheries management and the majority of marine fisheries research \& monitoring activities in Connecticut are funded through excise tax on fishing tackle and motorboat fuels

## SUMMARY

1. A total of 21,697 outdoor and environmental writers, marine anglers and boaters, marina operators, fishing tackle retailers, Fisheries Advisory Council (FAC) members, and members of the general public attended outreach events. The importance of research and monitoring to good fisheries management was incorporated into the programs (Table 6.2).
2. These same audiences also learned that good water quality and proper pollution prevention (non-fishing impacts) are essential to good fisheries habitat management.
3. Total attendance at 16 speaking engagements with sportsmen clubs and other recreational environmental clubs was 862 (Table 6.2). The audience was encouraged to become actively involved in the fishery management process by attending public hearings and FAC meetings. Notices of public hearings were sent to hundreds of tackle shops and various media outlets including the DEP website (www.ct.gov/dep/fishing).
4. The message that the majority of marine finfish research and monitoring are funded through excise taxes on fishing and motorboat fuels was emphasized at major department outreach events (Table 6.2).

## INTRODUCTION

Public outreach was formally incorporated into this project in 1997 (segment 17). An outreach plan was developed by project staff working closely with US Fish and Wildlife Service personnel. Six target audiences were identified in priority order (Table 6.1) in the outreach plan. This report summarizes F54R outreach activities conducted from March 2007 to February 2008 (segment 26).

## Table 6.1:

Priority Audiences for Outreach Activities

1. Outdoor/environmental writers
2. Marine anglers
3. Marine boaters and marina operators
4. Fishing tackle retailers
5. Fisheries Advisory Council (to CT DEP)
6. General public

## RESULTS AND DISCUSSION

## Outdoor and Environmental Writers

DEP press releases, project summaries and full annual reports were mailed out to several outdoor writers, members of the CT Outdoor Recreation Coalition (CORC) and Fisheries Advisory Council (FAC). Project staff were also interviewed concerning F54R activities in person, at public and regulatory hearings, and over the telephone by writers and reporters for the news media.

## Marine Anglers and Marine Boaters

Project personnel organized and assisted in DEP, Marine and Inland Fisheries Division displays at two statewide fishing/hunting and boating shows. The shows were sponsored by CMTA, Dodge Trucks, Channel 3, Channel 30 and Connecticut Outdoor Recreation Coalition and were held in January and February 2008 at the Connecticut Convention Center. These shows attracted 20,835 anglers, non-anglers, boaters, tackle retailers, legislators and general outdoor recreation enthusiasts. The theme for this show was "No Child Left Inside", Trophy Fish Close to Home" and "Marine Fisheries Angler Surveys". F54R activities were highlighted at these shows in displays entitled "Trophy Fish Award Program" and "Marine Angler Surveys, (a marine fisheries cooperative management program)". Audiences learned the importance of research and monitoring which are funded through excise taxes on fishing tackle and motorboat fuels. Colorful posters and pictures, brief project specific text and taxidermy reproductions helped draw attention to marine species monitored under F54R programs and solicit questions and discussion of those programs.

Several outreach displays were developed by project staff and mounted in the lobby and hallways at the Marine Fisheries Headquarters in Ferry Point State Park. These displays highlighted unique characteristics of Long Island Sound, public access, species identification, the trophy fish award program, marine angler surveys and gave a brief description of current F54R programs designed to protect the Sound's resources. These fisheries displays can easily be viewed by anglers, boaters and their families at this popular fishing and picnic area.

## Fishing Tackle Retailers

Fishing tackle retailers provide an important avenue for communication between the department and anglers. A complete list of fishing tackle retailers is maintained and updated yearly. Timely DEP press releases, species fact sheets, Connecticut angler guides and Marine Fisheries Brochure are mailed to tackle retailers to keep them informed. Correspondence between the marine fisheries office staff and retailers are ongoing.

## Fisheries Advisory Council

The Fisheries Advisory Council, which represents a cross section of Connecticut residents with interests in fisheries issues, met quarterly to discuss statewide fisheries issues. After each meeting most Council members report Council discussions back to the fishing and environmental groups they represent. Council members also discussed monitoring and funding issues at meetings with state legislators. Many Council members visited Marine Fisheries displays at the Northeast Fishing and Hunting Expo, CMTA Boating and Fishing Show and other activities the Fisheries Division held during 2007. 'A Study of Marine Recreational Fisheries in Connecticut' was mailed to Fishery Advisory Council members to keep them informed.

## General Public

Marine Headquarters is open daily Mon-Fri. attracting thousands to the public outreach displays at the office. Display topics included all F54R projects. Activities funded under other Federal Aid in Sport Fish Restoration projects were also highlighted; including Connecticut Pumpout Stations and Waste Reception Facilities (V-4), Motorboat Access Renovation and Development (F60D), Motorboat Access Area Operation and Maintenance (F70D), and Habitat Conservation and Enhancement (F61T).

Sport Fish Restoration projects were also highlighted at public schools and universities through out the year. Presentations titled "Marine Fisheries Management / Sportfish Restoration and Marine Resource Management" were provided to students. These outreach events highlighted the importance of coastal resources and all facets of marine resource protection. Approximately 684 students attended Marine Fisheries Division presentations.

Finally, project staff lead numerous workshops and speaking engagements throughout the state, as well as informational tours and talks at the Marine Fisheries Office (Table 6.2). These talks and tours reached all target audiences, especially the business community, teachers and students. Audiences learned how to become active participants in the management process, through public hearings and FAC Meetings.

## MODIFICATIONS

None.

Table 6.2: Summary of talks, tours, career days and workshops given by project staff highlighting F54R activities, March 2007 - February 2008 (segment 27).

| DATE: | PRESENTATION TYPE: | ORGANIZATION | TITLE / TOPIC: | Target Audience | TOTAL |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3/10/2007 | Fishing Club Talk | Westport Outfitters | Marine Fisheries Mgmt./ Angler Surveys | anglers | 43 |
| 4/25/2007 | Career Day / <br> Mentoring | Fermi High School | Marine Fisheries Biologist | students | 5 |
| 5/15/2007 | Talk | East Lyme Middle School | Diversity in Estuaries | students | 29 |
| 5/15/2007 | Talk | Avalonia Land Trust | Horseshoe Crab Spawning Survey | adults | 50 |
| 6/27/2007 | Marine Presentation | CCSU Marine Biology | Marine Fisheries Biology | students | 35 |
| 7/27/2007 | Office Tour / Mentoring | New Haven/BPT Sound School Groton Maratime Academy | Marine Fisheries Management/Career | students | 90 |
