Project #33: Wetland Restoration on the Lower Housatonic River Project Annual Summary Report

Prepared for the Trustee SubCouncil for the Geographic Area of Connecticut

Reporting Period: July 1, 2013 – June 30, 2014

Submitted by Paul Capotosto
The Connecticut Department of Energy and Environmental Protection Wildlife Division, Wetland Habitat and Mosquito Management (WHAMM) program was awarded funding to restore wetlands within the lower Housatonic River that have been degraded by the non-native invasive form of the plant Phragmites (Phragmites austiralis americanus). Restoration is to be accomplished by herbiciding and mowing plants over a three-year period, thereby increasing the habitat quality of this ecosystem and the survival and fitness of fish and wildlife using these habitats.

A summary of accomplishments during the time period July 1, 2013 to June 30, 2014, is as follows:

**Outreach and Project Preparation**
The WHAMM Program has continued to talk with property owners about the three-year project. Another letter was sent out to municipal leaders, conservation commissions and property owners informing them that the project was proceeding and what the expectations were for native plant growth.

**Implementation**
Vendors were hired to implement the third phase of the Phragmites control work. There was a new Phragmites control contract with two new vendors: Innovative Mosquito Management was the vendor to do Phragmites herbiciding and they worked on the Milford side and the Stratford side. Snowy Egret Wetlands Services was the vendor to do Phragmites mowing in both Milford and Stratford. The third phase included herbiciding and mowing the Phragmites in both communities; herbiciding was done in the summer months (July-September), mowing was done in the winter months. The WHAMM program worked with the two conservation commissions from the town of Stratford and the City of Milford and the mayor’s office of Stratford and Milford to inform the public that this work was being implemented and completed. Two hundred acres were herbicide and mowed.

**Equipment**
The WHAMM Program’s Marsh Master II vehicle with sprayer, mower and trailer was use to do Phragmites control. The two vendors have an assortment of low ground pressure vehicles including Marsh Master II and ARGO with tag along mower.

**Personnel**
The WHAMM Program’s two durational positions assisted in this Phragmites control.
Monitoring
The WHAMM Program monitored bird and vegetation in several areas of the Housatonic River Phragmites control project site. Four sites were used on the river from the mouth to the northern area past the Route 15 Bridge. In 2014, the post-treatment bird surveys indicated several rails using all four sites as some native vegetation is growing in the mowed down Phragmites areas.
