## Respiratory Virus Panel

<table>
<thead>
<tr>
<th><strong>Test Description</strong></th>
<th>Qualitative assay to detect non-influenza respiratory virus nucleic acids: Respiratory syncytial virus, Parainfluenza 1, Parainfluenza 2, Parainfluenza 3, Parainfluenza 4, Human metapneumovirus, Rhinovirus, Enterovirus, Adenovirus</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Test Use</strong></td>
<td>To aid in the diagnosis of viral infection in individuals exhibiting symptoms of acute respiratory illness</td>
</tr>
</tbody>
</table>
| **Test Department**  | Virology  
Phone: (860) 920-6662,  FAX: (860) 920-6661 |
| **Methodology**      | Singleplex Reverse Transcriptase real-time Polymerase Chain reaction (rRT-PCR) |
| **Availability**     | Daily, Monday-Friday |
| **Specimen Requirements** | • Nasopharyngeal/Oropharyngeal swab submitted in viral transport media  
• Nasal aspirate, 2 mL, in a sterile screw capped container |
| **Collection Kit/Container** | M4RT viral transport tube; Sterile polyester–tipped sampling swab; Category B shipping box with cold pack.  
To obtain collection kit, refer to Collection Kit Ordering Information. |
| **Collection Instructions** | Collect sample within 3 days of symptom onset. Use only polyester or Dacron-tipped swabs with plastic or aluminum shafts. Do NOT use calcium alginate or cotton-tipped swabs, or wooden shaft swabs. Immediately place swabs into viral transport media |
| **Specimen Handling & Transport** | Store specimen at 2-8°C up to 3 days. Transport to the laboratory with a frozen ice pack coolant. If there is a delay in shipment expected, store specimens at -20°C or lower until delivered to the laboratory. |
| **Unacceptable Conditions** | Unlabeled specimen  
Specimens that have leaked or containers that have broken in transit  
Specimens not handled, stored, or transported as described above |
| **Requisition Form** | Clinical Test Requisition (select Respiratory Virus Panel) |
| **Required Information** | Name and address of submitter (and/or Horizon profile #)  
Patient name or identifier, town of residence (city, state, zip), date of birth  
Specimen type or source of collection, date collected, test requested  
Please ensure patient name on the requisition matches that on the specimen. |
| **Limitations** | • Rhinoviruses (RVs) and enteroviruses (EVs) are closely related members of the family Picornaviridae, genus Enterovirus.  
• Because of the close genetic relatedness of these viruses, the RV rRT-PCR assay may detect some REVs and the REV rRT-PCR assay may detect some RVs if the viral load is high. |
| **Additional comments** | • The REV assay should only be used for detection of enteroviruses in respiratory specimens for diagnosis of acute respiratory illness. This assay should not be used for diagnosis of other illnesses associated with enterovirus infections.  
• Identification of a respiratory pathogen by rRT-PCR is not definitive proof of its etiologic link with the disease. A previous infection with continued virus shedding or a concurrent unrelated infection could result in misidentification of the pathogen responsible for the acute illness. |
