Outpatient Influenza-like Illness (ILINet) was 0.95%, lower than the 1.17% observed last week.

### 2020-2021 Overview for Week 53 (December 27, 2020 – January 2, 2021)

| | A total of 11 influenza-associated hospitalizations have been reported since the beginning of the 2020-2021 season. |
| Outpatient Influenza-like illness (ILI) activity was lower than the previous week. Influenza geographic activity is **SPORADIC**. | |
| Hospital Emergency Department (ED) Syndromic Surveillance data reveal a much lower percentage of total ED visits for ILI than the percentage ED ILI visits observed in previous influenza seasons. | No new influenza associated deaths were reported in week 53. A total of 1 death has been reported since the beginning of the 2020-2021 season. |
| Of the 32 positive influenza tests reported to DPH this season, 0 (0 %) were Influenza A 2009 (H1N1), 0 (0 %) was Influenza A (H3N2), 8 (25 %) Influenza Type B, and 24 (75 %) were Influenza A (type unspecified). | No new influenza-associated pediatric deaths were reported in week 53. No influenza-associated pediatric deaths have been reported since the beginning of the 2020-2021 season. Annual vaccination is the best way to protect children from influenza. |

**Connecticut COVID data**

**CDC Flu View**

**ALL DATA ARE PRELIMINARY AND SUBJECT TO CHANGE.**

Annual vaccination is the best way to protect against severe illness due to influenza.
**ILINet Surveillance**

Each week a network of volunteer outpatient providers, including clinics, health centers, urgent care centers, and emergency departments, known as ILINet, report the percentage of patient visits with influenza-like illness (ILI), which consists of cough and/or sore throat and a fever >100°F in the absence of a known cause. Because of expansion of ILINet to additional providers and the effect of COVID-19, the current year should not be compared to previous years. As of January 2, 2021, outpatient ILI is at 0.95%.

**Hospital Syndromic Surveillance**

DPH EpiCenter receives near real-time information about emergency department (ED) visits from hospital EDs and hospital-affiliated urgent care centers throughout Connecticut. Gaps in the 2018-2019 and 2019-2020 data lines occur since these years do not include a 53rd week. Data from 2019-2020 flu season were influenced by the onset of COVID-19 Pandemic. As of January 2, 2021, approximately 5.92% of 2020-2021 season ED patients had ILI.
Laboratory Surveillance

Laboratories report positive influenza tests to DPH. Test results may include the virus subtype (as H3N2), which helps determine the specific virus strains circulating in CT. Other results only provide a general type (Type A Unspecified, Type B). As of January 2, 2021, 32 positive influenza tests have been reported.

Percent of each influenza virus type reported to DPH during the current season.

Total number of positive influenza tests and the number of each influenza virus type reported to DPH per MMWR week during the current season.

Rate of positive influenza tests per 100,000 persons reported from each county in Connecticut during the current season.
Hospital Surveillance

Hospitals report patients hospitalized with influenza to DPH. The Connecticut Hospital Association (CHA) also tracks basic hospitalization data. As of January 2, 2021, 11 patients have been hospitalized with influenza during the current season. Two hospitalized influenza patients were also infected with COVID-19.

Total number of patients hospitalized with laboratory-confirmed influenza by virus type per MMWR week.

[Graph showing the number of patients hospitalized by virus type per MMWR week]

Total number of reported patients hospitalized with influenza by age and influenza virus type during the current season. NOTE: Type A Unspecified test results are not displayed in the second figure below so other results may be clearly seen.

[Graphs showing the number of patients hospitalized by age group and influenza virus type]
Influenza-associated deaths are reported to DPH. The graph shows the number of deaths associated with influenza by age group. Comparisons to previous years are provided when new data are available. **Due to the need to confirm reports and reporting delays, consider the current week data preliminary.** As of January 2, 2021, 1 influenza-associated death has been reported to DPH.
