Thank participants profusely for being on the team and attending training – acknowledge that school staff have “full plates” now and that their time is valuable

Stress the importance of school IAQ/IEQ as an ongoing important public health issue, especially addressing asthma triggers in schools

Success stories fact sheet: We have outcome data that shows how TfS can be successful in addressing health complaints and identifying and correcting problems
Agenda:

1. Welcome, Introductions and “Catch-up”

2. Why School IAQ Is Important

3. Indoor Air Quality Health Issues

4. Quick Review of TfS Implementation

5. Importance of Communication Plan

6. Walkthrough
   • IAQ Sources
   • Conducting the Walkthrough

7. Green Cleaning Video
“Catch-up”

- Improvements, Successes?
  – (Small Things Are Great, Too)

- ask about who are old new members to get a sense of how much, how little background you need to cover

- Thank “old” members for all their past work, thank new ones for agreeing to participate

- Have one of the old members give an overview of what they have done, progress made – any major successes

- Mention that we have 6+ years of successes in many districts
EXPLAIN the following points:

- As a result of poor IAQ, health problems can include coughing, asthma episodes, bronchitis, headaches, allergic reactions, toxic poisoning, and the spread of infectious diseases.

- Students don’t learn as well and teachers don’t teach as well when they are suffering health effects of poor IAQ.

- When schools aren’t aware of IAQ problems, and don’t act to prevent them, the eventual costs may be much higher than would have been the case otherwise. Identifying and fixing a problem early, or taking preventive measures, may save many dollars in the long run. For example, if schools must be closed for repair, if substitute teachers must be hired to replace sick ones, or if equipment must be replaced rather than maintained, large costs may be incurred.

- Negative publicity resulting from poor IAQ may have parents and community members upset, generating lack of trust for the school system.

- The school system may even be sued for damages caused by poor
IAQ.
EXPLAIN briefly why these causes are common in schools.

- Budgets are frequently tighter than for office buildings, for example, especially for costs related to building maintenance.

- Schools have less space per person (higher occupancy) in a classroom than in most work places. Occupants share a smaller volume of air.

- School buildings may be old or poorly designed, making them difficult or expensive to maintain.

- Unique sources of pollution and odors may come from art and science labs, locker rooms, and vocational teaching areas.

- Space may be used for different purposes than the original intention. For example, extra walls may be added to previously “open classrooms.”

- Additions to existing school buildings may not include adequate ventilation systems. Temporary space, such as portable classrooms, may present special problems, such as inadequate ventilation.
The Importance of good ventilation

- School IEQ not just a health issue

This slide shows the connection between ventilation rates and academic performance:

Most importantly it links actual ventilation rates with standardized test scores – which are key drivers in evaluating school performance.
Read the definition, say main focus of problem is contaminants, ventilation issues and temp/humidity

• We like to divide the problem into 3 areas:
  • Thermal Comfort – too hot, too cold, too dry, too humid. Thermal comfort is generally the most common complaint and difficult to address (people have different tolerances).

  • Ventilation: getting fresh air into the building and moving airborne contaminants out of the building.
    • What kind of ventilation system?
    • Is it working correctly?

  • Contaminants: Main contaminant is dirt and dust!
Mention the importance of the word “Potential” - exposure does not automatically mean health effects

Bioaerosols:
- these are very important asthma triggers to address
- mold: this is about moisture identification and control
- dander: animals in the classroom - discouraged

Formaldehyde - solvent widely used in building materials, some products: furniture, carpets (though most carpets now use alternatives), school laboratories

Other VOCs - cleaning solvents, wood preservatives, phenols used in equipment such as copiers
**Nitrogen Oxides**: from combustion processes, combustion appliances: typical source may be buses and trucks parked near building air intake vents, windows

**Carbon Monoxide**: comes from incomplete combustion
   Sources: gas and oil furnaces, gas water heaters, blocked flues, vehicle exhaust
   higher levels can cause asphyxiation, death

**Particulates**
   Bus exhaust contains fine particulates
   - Pollen, etc may be brought in by ventilation system, especially unit ventilators next to areas that are mowed
   - Construction debris – dust, etc from renovation during occupancy is a source of many complaints – need to follow guidelines (NIOSH – on CD)
ETS - Not so much of a factor because of Smoking Regulations

Lead: from deteriorating paint -specifically dust. could be issue in drinking water due to pipes most schools evaluated for lead through state program

Radon: naturally occurring gas produced by breakdown of radium, all or most schools evaluated for radon

Pesticides:
- state legislation mandates all pesticides be applied only by licensed professional, parents to be warned
- Stress importance of supporting IPM – Integrated Pest Management:
- Address food storage issues in classrooms

Dust/Dirt
- usually the # 1 problem – TfS mobilizes staff, building occupants to find ways to prevent dirt from entering, help custodians get the dirt out-
Asbestos

- All Schools Built Before the 1970’s Probably Contain Asbestos
- Schools Required to Have Written Asbestos Management Plan, Designated Planner
- Touch Base W/Asbestos Management Planner
- Questions: Call Local Health Department, or CT DPH Asbestos Program (860-509-7367)

Asbestos Should Not Become a Focus of TfS Team!!!
BUT – Assure Responsible People are Aware

- All Schools built before the 1970’s probably contain asbestos. However, the vast majority of schools have had friable asbestos removed.

- Schools are required to have a written asbestos management plan.

- These schools must have a designated asbestos management planner.

- If TfS teams have questions about the location and/or condition of asbestos in their building, find out who the designated asbestos management planner is and talk to that person. Read a copy of the asbestos management plan for that building. If further questions arise, call your local health department, or the State of CT Department of Public Health’s Asbestos program (860-509-7367).

- Start by asking the principal, facilities director, or superintendent for a copy of the asbestos management plan for that building, and the name of the designated asbestos management planner.

Asbestos should not become a focus for the TfS Team!!! The Team can act as an interested party to ensure that the school or school district is aware of its responsibilities. Leave it at that!
These symptoms usually are the most prevalent health complaints relating to IAQ problems -

These symptoms are common complaints - difference is symptoms seem to go away when people leave the building

Main Source: Ventilation Problems: poor ventilation (uneven and/or insufficient airflow)
exacerbated by contaminants

temperature and/or humidity may be a factor
Allergic Reactions - stuffy itchy nose, sneezing (rhinitis)

- **Rhinitis** is an inflammation of the mucous membrane that lines the nose, often due to an allergy to pollen, dust or other airborne substances

**Sinusitis**
Inflammation of the sinuses or a sinus, especially in the nasal region.

Asthma- pervasive health problem (see next slide) often exacerbated by biological agents

Hypersensitivity Pneumonitis - serious lung disease - recurrent pneumonia caused by fungi

**Infections**: viral and bacteriological infections such as flu, staph infections can be more frequent with poor IAQ –
Asthma

➢ Burden of Asthma
  • 89,300 Children in CT Diagnosed (DPH 2010)
  • 1 Of Every 7 (13.9%) CT Public School Students
  • Leading Childhood Chronic Disease
  • Leading Health-Related Cause of School Absences

➢ Attacks Triggered By:
  • Dust
  • Biological Agents
  • ETS
  • Some VOCs

Stress importance of reducing asthma triggers as major goal of TfS
• There are no appropriate standards for use in indoor environments such as schools and residences. There are some industrial standards for permissible exposure limits for certain chemicals used in manufacturing and other work place settings, but these standards should not be used for children, sensitive populations such as pregnant women, the elderly, or people with certain illnesses. There are no standards for indoor levels of molds so mold testing is not recommended:

• Find and fix the moisture source, kill and remove mold spores

• Testing as a first response does not usually lead to an answer or solution. Very often air testing is conducted as a knee-jerk reaction to a reported IAQ problem. Such testing done in the absence of a hypothesis, or as part of a well-planned investigation, usually produces data that raises more questions that it answers. It can raise expectations that a solution will follow, and subsequently raises suspicions if no answer is found.

• Refer participants to fact sheet:
  Indoor Air Quality Testing Should Not Be The First Move
  • in coordinators folder
  • on DPH CD
• Suggest that fact sheet be posted on district web site
Just mention that the CD we provide has lots of resources
- Mention each step, say I will go into each step in more depth.

- Stress need for annual kickoff meetings, preferably in the early fall

- Tell new members to be sure and watch all 3 video segments:
  - Taking Action
  - Ventilation Basics
  - Walkthrough Investigation
- Discuss our **REVISED** checklist that is on the CD – use this one

- allow a short period (5 minutes or so) for people to go through the checklist
Table illustrates the idea of summarizing the teachers’ checklist –
- mention later recommendation that district/schools use web-based survey to collect teachers checklist information

- Be ready to explain what a drain trap is, addressing sewer odor problem

Data

Collect, summarize and analyze

- Paper plus manual summary
- Paper plus spreadsheet
- Web-based
  - Existing School system
  - Commercial Survey tool [i.e., Survey Monkey]
  - Contact Kenny Foscue (kenny.foscue@ct.gov)

[Make Sure You Have a Field For School!]

Strongly suggest district/schools use web based survey tool
- Survey Monkey
- Google Docs
- Uploaded on district intranet
- If district wide survey, make sure there is a clickdown field for school name

- Reports generated by IT person
Map the checklist results on a blueprint of the school
- School nurses may map health complaints

Useful when doing walkthrough investigation – team can focus on areas with most number of identified problems
- More efficient use of walkthrough investigation time
Stress that the building team can conduct effective walkthroughs—“this is generally not rocket science” (the rocket science items are referred to HVAC, IAQ Consultants)

-be sure to remind them to contact LHD – they should help the team

-In a few minutes, we will learn the basics, and then do a walkthrough exercise
This is a key step in TfS process!

Using checklist results, school maps, and walkthrough investigation results, prioritize recommendations

Prioritizing Criteria:
- the severity of associated health effects and/or the number of people affected
- ease of implementation and/or cost:
  - Category A: no or low cost
  - Category B: medium cost
  - Category C: high cost

Focus should be on looking for High need (complaints, # people affected) and no or low cost (low hanging fruit)
Stress value of documenting your team’s work

Produce short report - this is a needs assessment to be used by the district to make improvements

Compilation of these items
This is a great idea that we learned from the Woodbridge School District.

The letters “close the loop” after all the steps by communicating with the individual teachers regarding their room –

• Thanks the teachers for participating in TfS
• Provides information on:
  • Specific problems found
  • Action required
  • Responsible party (teacher, custodian, etc)
Re-stress value of having a good communication plan
Green Cleaning & Infection Control
Law is a very important public health intervention:

Important points:

- Bans asthmagens as well as carcinogens, other toxins

- Law requires cleaners to be third-party certified to verify that they have minimal impacts on human health and the environment – Green Seal or Eco Logo (Not just any chemical that says “green’ on the label)

- Most important point: “No parent, guardian, teacher or staff member may bring into the school facility any consumer product which is intended to clean, deodorize, sanitize or disinfect.”

This is a major problem identified by DPH, facilities directors, custodians!

Mention green cleaning myths video to be shown at end of workshop
Third-party certified products come as concentrates that are used in dilution stations. (photo on right)

These stations control portions automatically, so that one product can be diluted at different rates for different tasks.

One product is used as a glass, bathroom, all-purpose, carpet, and neutral floor cleaner. This eliminates packaging, transportation costs from shipping gallons of water, and storage space. The closet on the right shows how much better cleaning can be!
- Suggest having TfS teams encourage staff to save energy
- more money for schools, not utility companies!

- However, do not reduce fresh air intakes to save energy!
- Consider setting thermostats at 68-70 degrees during the heating season, and 78 degrees in the warmer months if the building has air conditioning, as suggested by the Alliance to Save Energy. For every temperature degree, energy costs go up or down 2-3%.

-
Preparing For
The Walkthrough
Now we are going to focus on how to identify IAQ sources by these categories-

The Occupants Themselves:
(personal products, dirt, CO₂, other)

School Activities:
(chalk boards, markers, paper, lab chemicals, etc)

Non-Educational Activities in the Building:
(cooking, cleaning, pest management, etc)

The Building Itself & its Systems:
(entry points, ventilation system, roof, etc)

Outside the Building:
(idling fumes, pollen, grass clippings, nearby industry, etc)

Here are some things to make sure to do when you do a walkthrough of the classrooms:

If possible, talk with the teacher from each classroom -
Now we will go on a “virtual” walkthrough –
I will show a photo and you tell me the problem or problems
Clutter!
Ask custodians: What would you do if you opened the door and saw this?

- This is an extreme case but clutter is a common problem

- Hard or impossible to clean, dust accumulates

- Response: educate staff, offer assistance with storage
  - Do not embarrass teacher
  - Suggest having an “anti-clutter” day on National Healthy Schools Day
Example of good air flow out of room.

What is this? Ventilation system return
Is it working?
Point out “high tech” useful tool

Example of good air flow out of room.
This is an example of a very dirty filter –

- Ineffective because the air flow will bypass the clogged filter
- Filters should be replaced on a regular schedule
School shut due to overwhelming smell of Axe body spray

“Emergency crews rushed to a prep school in Brooklyn Wednesday following reports of a "hazardous smell" in a classroom. The dangerous and disgusting chemical responsible: Axe body spray. A student at Medgar Evers College Preparatory School released the spray in a classroom full of sixth graders, and prompting a shutdown of the school. Emergency workers transported eight students to hospitals, and parents took two others to see doctors. There were no serious injuries, but school officials say disciplinary action is pending for the student who sprayed the classroom. As if smelling like Axe all day wasn’t punishment enough.” — By Nick Mangione [Source]
What is this?
Unit ventilator – provides heat and ventilation, connected to outside for fresh air, still used in older schools, inefficient.

What is the problem?
Books, etc blocking ventilation, heat dispersal

Question?
Does removing the books, etc; reminding staff, make much of a difference?

Next slide
Illinois school facility director wanted to test this out – how much of an effect.

- Red Line: temperature  -stable

- Blue line: Carbon Dioxide levels –
  - High level – above 1700 ppm – likely headache, fatigue symptoms
  - Recommended level: below 1000 ppm, generally between 700-900 ppm.
Removed books - radical drop in CO2 levels

Message: a no cost intervention (removing books) make a significant improvement in IAQ
Similar results with Unit Ventilator with Dirty Filter…….
Since unit ventilators are in individual classrooms, it is important for staff (and students) to help keep the filters clean:

- Keep plants off to prevent dirt, water from contaminating filters
- Keep young students from putting things down the vents
Walk-off mats are a relatively low-cost way of keeping dirt, mud, snow out.
Example of chronic water problems – moldy ceiling tile, flaking paint
Mold growth after room shut up all summer.
Carpet- slab on grade
What might be hiding in that couch?

Scenario: teacher needed a place to read to children, parent offered old couch from home –

Likely full of:
• Dirt/dust
• Animal dander
• Mold?
• And….. DUST MITES!
• (and maybe bedbugs?)
This is a dust mite
Holes where insects (bees) and rodents (mice) can get into room.
See pathways for rodents, insects to enter building
Improper storage of food –
Will attract pests

Explain that food stored in classrooms should be in metal tins or thick Tupperware containers.
Against the Law!

only licensed applicators can apply pesticides within any building or on the grounds of a public school (except in emergencies)
TfS Teams should be involved in supporting Integrated Pest Management (IPM) program.
TfS Teams & IPM (Cont.)

Work with Staff & Administration to:

- Remove Trash, Clean Up Spills ASAP
- Clean Refrigerators, Microwaves & Vending Machines Regularly
- Get Students Involved – Put IPM in Curriculum
- Note chlorine bleach container next to window cleaner with ammonia
What is this?
Utility tunnel under a school (Cheshire High School).

Scenario: After multiple odor complaints and subsequent investigations, someone remembered that there was a utility tunnel under area with strongest odor. Tunnel full of water, mold, dirt, etc the area was cleaned and a fan was installed to outside to ensure negative air pressure in tunnel.

Moral of story: If the source is not immediately apparent, keep searching!
In addition to looking for standing water, note holes or other areas near building where the grade may not be away from the building.

Examine rain pipes – are they draining away from the building?

Note the outside condition of unit ventilators:
- are they functional (not bent closed or covered),
- are there bushes growing too close, does it look like mowed grass may be entering?
Air intake unit damaged. Will decrease the amount of fresh air being brought into the room.
Roof top air handling unit as well as exhaust for other systems

Note sewer vent close to air intake - sewer smell entering building

Remedy: raise height of the sewer pipe above AHU
Drainage pipe (left) allowing water to drain into building.
Land is sloped toward the building. Water was flowing into building also, plantings too close to foundation (left).

Remedies:
- Put in French drain system
- Regrade landscape away from the building.
What are weep holes? Are they a good or bad thing?

Weep holes are necessary so that water cannot accumulate behind walls. They permit air circulation making the walls unreceptive to molds that can cause damage to the building’s structure.

- Check to make sure weep holes are not blocked by insect nests, bubble gum, dirt, etc.
- This should be an abbreviated version of the 2\textsuperscript{nd} session walkthrough exercise –

- walk through at least 1 classroom, preferably 2, and outside briefly, using the refresher walkthrough checklist

- use one of the participants to lead the walkthrough by reading through the questions
As you can see, IAQ/IEQ is not just one or two issues, but multifactorial –

**What are some examples of these interventions?**

**Reduce, Substitute or Eliminate Sources**
(substitute green cleaners; reduce/eliminate idling; store food properly; reduce classroom clutter, use walk-off mats)

**Improve Ventilation**
(make sure AHU working, change filters regularly, prevent blocking of unit ventilators,

**Interrupt/Alter Pathways**
(block pest entryways; fix roof, pipe leaks;
Making TfS Successful!

1. Coordinators – Keep Everyone Informed
It is important to keep all team members in the loop as things proceed, keep staff and parents updated on progress – use newsletters, web site, etc.

2. Develop Written Report
important to put down findings, recommendations in written report after walkthrough, prioritization steps – see examples in Coordinator’s Packet

3. Board of Education Presentation
At least once a year, make presentation to Bd of Ed: basics of school IAQ, present report, focus on longer term needs

4. Fall Kick-off Meetings
Each fall, have district-wide “kick-off mtg to review summer improvements, plan year’s work

5. District TfS Coordinating Structure
Good idea for district coordinating committee for TfS program. Could use Health & Safety Committee. Should include facilities director, business manager
How many watch Mythbusters on TV?

CT DEEP came up with great idea of Wastebusters series:

• Anti-idling – **good to put link on district web site**
• Wood Stoves

• This video was developed in conjunction with DPH and other partners to educate staff, parents, students about CT School Green Cleaning Products law-

• Specifically to address problem of staff, parents bringing in their own cleaners – which is against the law!

• Please make sure the link to this video is on your district’s web site and staff, parents encouraged to view it!
Evaluations!
Thank You!

Also, any last questions?
