Overweight and Obesity

Connecticut State Nutrition, Physical Activity, and Obesity Profile

Obesity has important consequences on our nation's health and economy. It is linked to a number of chronic diseases including coronary heart disease, stroke, diabetes, and some cancers. Among adults, the medical costs associated with obesity are estimated at $147 billion. Many American communities are lacking healthy options when it comes to diet and physical activity. Public health approaches can make healthy options available, accessible, and affordable for all Americans.
The Centers for Disease Control and Prevention’s Division of Nutrition, Physical Activity and Obesity supports the nation’s capacity to establish successful and sustainable interventions to support healthy eating and active living. CDC provides support to states, communities, and national partners to implement policy, system, and environmental strategies. This is done through implementation and evaluation guidance, technical assistance, training, surveillance and applied research, and partnership development. The goal is to improve dietary quality, increase physical activity, and reduce obesity across multiple settings; such as, child care facilities, workplaces, hospitals, medical care facilities, schools, and communities.

Select information on obesity, physical activity, and dietary behaviors as well as specific environmental indicators for Connecticut is provided below.

**Population Statistics**

**State Population of Connecticut**

- Estimated total population 2013 = 3,596,080.
- Adults aged 18 years and older = 78.2% of the total population in 2013.
- People younger than 18 years of age = 21.8% of the total population in 2013.
