OPM Criminal Justice Update
The 2017 Prison Population Forecast
Sex Offender Recidivism – 2011 Release Cohort

Presented to:
CJPAC
February 23, 2017
The 2017 Prison Population Forecast

- Each February, OPM is required to publish a prison population forecast that projects the size of the inmate population in the coming year.

- This year’s projection is available on-line at OPM’s Criminal Justice Policy & Planning Division website.
OPM considers this year’s forecast to be moderately conservative. By the start of next year, we could see a prison population at or below 14,100.
The chart above shows the historical ratio of offenders supervised by the DOC in facilities versus those in community programs. The lines diverge with the creation of the CRU. Had the ratio remained constant, there would have been approximately 600 more offenders in facilities at the beginning of 2017. This internal change accounts for nearly all of the error in the 2016 forecast.
• This chart places the OPM’s 2017 forecast within the context of prison population trends since their historic peak in 2008.
The 2017 Recidivism Report

• Each year, OPM is required to produce a report on recidivism among prisoners who have been released from CT prisons.

• In 2012, OPM published a study that evaluated 5-year recidivism rates among sex offenders who were released or discharged from prison during 2005.

• This year, OPM will be releasing the findings of a follow-up to the 2012 study that tracked a cohort of offenders who were released or discharged from prison in 2011.

• Today we will report on the general findings with respect to recidivism as well as discuss our plans to publish the full findings.
One of the fundamental questions we faced at the outset of the 2012 study was, who - within the general population of prisoners released each year - is a sex offender.

- People who had ever been sentenced to prison for a sexual-offense? (746)
- People completing a prison sentence for a sexual offense? (423)
- People who had a DOC Sex Treatment Score >1? (1,229)
- People who had ever been convicted for a sexual offense? (896)
- People who had ever been arrested and charged with a sexual offense? (1,471)

In the 2012 study we tracked several subgroups of the offender population in addition to breakouts by DOC Sex treatment score.

In the 2012 study we investigated 2 types of recidivism

- general recidivism, and
- specific recidivism i.e., new sex-related offenses.
The 2017 Recidivism Report

• In this iteration we have relied on the same methodology to evaluate recidivism – general and specific although we have modified the scheme we used for identifying sex offenders, and
• In the full report, we will present a more thorough analysis since we have access to complete offender data, including:
  • Juvenile referral and commitment data for 2,999 offenders,
  • Data related to probation supervision, and
  • Offender-treatment and polygraph data on approximately 700 offenders who were treated by The Connection Inc.

</tbody>
</table>
Unlike previous OPM recidivism studies – the criteria used to identify recidivism events was modified.

- New arrest, new conviction and new prison sentences reported here are restricted to offenses committed after the offender’s 2011 release.
- One consequence of this change is that recidivism rates may appear lower compared to other OPM reports which included arrests, convictions and new prison sentences related to any offense.
- We have also modified the scheme we used for identifying sex offenders. An offender’s inclusion in a sex offender subgroup is based on triggering at least one of four condition flags.

1) An arrest for a sex offense 2) A conviction for a sex offense
3) Sentenced to prison for an SO 4) DOC SxTS >1
The 2017 Recidivism Report

The study used four criteria to identify possible subgroups within the general offender population.

Specific Recidivism – new arrests

This table shows the number of offenders from the 2011 cohort and certain subgroups who were arrested in the 60 months following their 2011, release by crime type.

Re-arrests rates for new sexual offenses ran from 2.8% to 14.5%. The highest rates were associated with public indecency incidents.
### Specific Recidivism - new convictions

This table shows the number of offenders from the 2011 cohort and certain subgroups who were convicted in the 60 months following their 2011, release by crime type.

New conviction rates ranged between 1.9% to 11.4%. Again, public indecency incidents dominated the highest group.

This table shows the number of offenders from the 2011 cohort and certain subgroups who were convicted in the 60 months following their 2011 release by crime type.

Rates of returning to serve a new prison sentence of a sex offense ranged between 1.8% to 10.1%. Again the number was influenced by public indecency charges.
