

May 21, 2021: photos of crane tower simulation. The top of the crane is at 170' and the panels are 8' high and 10' wide with a 2' space in between.

With this information, you can accurately estimate the height of the surrounding tree canopy at 110' – 120' without any other measuring tool. If you measure the images in the photo with a ruler, you can get a more accurate estimate.
