

Note: This page intentionally left blank

INTRODUCTION

This exhibit provides aerial photography-based maps, at a scale of 1"=100', that illustrate the 10.4-mile Proposed Route that Eversource has identified for the new 115-kV transmission line and related facilities comprising the Frost Bridge to Campville 115-kV Project (Project)¹. The maps identify both environmental features along the Proposed Route and Project design information as follows:

Project Design Information

- Right-of-Way boundaries
- Property lines, including Eversource-owned lands
- Existing tree line and proposed limits of vegetation removal²
- Existing transmission line centerline and structure locations (by number)
- Proposed 115-kV transmission line centerline and structure locations (by number)³
- Work pad locations⁴
- Existing and new (proposed) access roads
- Existing culverts and proposed watercourse crossings
- 10-foot topographic contours

Environmental Features

- Land use and vegetation type (as illustrated by the aerial photographs)
- Town boundaries
- Wetlands, state and federal jurisdictional areas (by alpha-numeric identifier)
- Watercourses (by alpha-numeric identifier)
- Vernal pools (by alpha-numeric identifier)
- FEMA 100-year floodplains
- Public recreations areas (including state parks, trails, forests, and federal lands)
- Zoning designations
- Public roads

Eversource's Proposed Route, along which the new 115-kV transmission line would be constructed and operated in predominantly overhead configurations, would extend between Eversource's existing Frost Bridge Substation in the Town of Watertown and Campville Substation in the Town of Harwinton. The entire Proposed Route would be accommodated within an existing Eversource right-of-way. In conjunction with the development of the new 115-kV transmission line, Eversource would modify the existing Frost Bridge Substation and Campville Substation. (Refer to Volume 1 for details regarding the Proposed Route and transmission line facilities)

The Index provides a key to the maps by town and proposed transmission line structure locations.

¹ Aerial photographs were derived from 2012 aerial imagery; environmental and land use features are mapped based on 2015 Geographical Information System data obtained from federal and state agencies (such as the Connecticut Department of Energy and Environmental Protection (CT DEEP) and the Federal Emergency Management Agency (FEMA)), as well as the results of environmental and engineering field surveys and ROW / transmission lines and information from Eversource. Consistent with the Connecticut Siting Council's Application Guide, the maps in this exhibit pertain only to the Proposed Route.

² The proposed limits of vegetation removal depicted on the maps illustrate the general areas along the new 115-kV transmission line where vegetation must be cleared for construction of the Project, and managed in low-growing species compatible with overhead transmission line operation thereafter. Such vegetation management is required, pursuant to mandatory North American Electric Reliability Corporation standards, to maintain appropriate clearance between tall-growing vegetation and the new 115-kV transmission line conductors. During construction, additional vegetation clearing, outside of the vegetation removal limits depicted on the maps, will be required. For example, vegetation will have to be cleared along construction access roads that extend outside the limits of vegetation removal depicted. Danger trees located outside the managed ROW limits also will have to be removed.

³ Eversource has sited proposed new 115-kV structures, as identified on the maps, based on current design information. During final Project design, the structure locations shown may shift slightly.

⁴ Work pads, as depicted on the maps for each proposed new structure, pulling site or guard structure, illustrate the approximate work pad locations that would be necessary to facilitate construction.
