New Britain, CT 06051

Re: Docket No. 187; Milford Power, LLC – Potable Water Consumption

Dear Ms. Roberts:

I write on behalf of Milford Power Company LLC (“Milford Power”) to provide you with Milford Power’s annual report on the use of potable water as a cooling source. This report is being submitted in accordance with paragraph 2 of the Connecticut Siting Council’s (“the Council”) Decision and Order, dated April 7, 2009, in the above-referenced docket, which requires Milford Power to provide an annual report on the use of water and identifying contingency events.

As you will see from the attached report, “Milford Power Company LLC, 2011 Monthly Consumption of River Water and Supplemental Potable Water for Cooling,” Milford Power used a total of 988,192,572 gallons of water, of which 129,711,677 gallons was potable water, or 13.13 percent. A second table, “Milford Power Company LLC – 2011 Potable Water Usage Summary,” lists the dates on which potable water was used, the volumes consumed and the contingency events that necessitated the use of potable water.

As you know, Paragraph 1 of the Decision and Order limits the facility’s use of potable water to 15 percent of the annual average consumption of the facility’s total water use. Advance approval from the Council is required to exceed the 15 percent limit. As you may recall, Milford Power notified the Council on June 16, 2011 that it had discovered a significant leak in the supply line from the river water pump house to the on-site treatment facilities and that it would be necessary to utilize potable water for cooling until the supply line could be repaired. On September 9, 2011, Milford Power submitted a status report on the repair of the river water supply line and indicated that

Page 2

because of the use of potable water during the repair of the supply line, that the 15 percent limit may be exceeded. The Council considered and approved that potable water use request on September 22, 2011. As you will see from the attached reports Milford Power did not exceed the potable water limit in 2011 and was able to keep the actual potable water consumption below the 15 percent limit, in part because the levels of total suspended solids in the river water were within tolerances throughout the second half of the year.

Going forward, in an effort to minimize the use of potable water, Milford Power will be completing \$480,000 of preventative maintenance and instrumentation upgrades on the river water treatment system in the first quarter of 2012. The maintenance activities include the installation of new filter media which will require that the treatment system be taken out of service for approximately 14 days during which time Milford Power will be utilizing potable water as the cooling source. The estimated potable water use while the system is out of service for maintenance is estimated at 33,500,000 gallons. Milford Power should be able to manage the facility's use of potable water to remain below 15 percent of the annual average consumption of the facility's total water use as required by the Decision and Order.

If you have any questions or require additional information, please do not hesitate to contact me.

Sincerely,

Andrew W. Lord

Enclosure

cc: Mr. Christopher J. Curtis
