Approval is for the replacement of a 150' self-support structure. The Tower was later approved by the CSC on Oct. 24, 2007, Docket# EM-MCM-004-070824 (enclosed) There were no further post construction stipulations set. Please see attached.

Please accept this letter as notification pursuant to Regulations of Connecticut State Agencies §16-50j-73, for construction that constitutes an exempt modification pursuant to R.C.S.A. §16.50j-72(b)(2). The planned modifications to the facility fall squarely within those activities explicitly provided for in R.C.S.A. §16.50j-72(b)(2).

6. The existing structure and its foundation can support the proposed loading.

For the foregoing reasons, T-Mobile respectfully submits that the proposed modifications to the above-referenced telecommunication facility constitute an exempt modifications under R.C.S.A. § 16-50j-72(b)(2).

The original tower was approved by Town of Avon zoning agencies prior to a statewide change in the law in 2001 which subsequently brought it under the Connecticut Siting Council's jurisdiction.

Approval is for replacement of a 150 ft. guyed tower with a 150 ft. self-support structure. A routine & periodic inspection of the existing tower in January of 2007 showed the existing tower doesn't meet current structural standards. Therefore, tower needed to be replaced to meet current & future structural safety standards.

At a public meeting held on October 16, 2007, the Connecticut Siting Council (Council) acknowledged your notice to modify this existing telecommunications facility, pursuant to Section 16-50j-73 of the Regulations of Connecticut State Agencies with the condition that Message Center Management, Inc. will flag any trees slated for removal in the field and note the same on the construction drawings to be submitted as part of any building permit application.

The proposed modifications are to be implemented as specified here and in your notice dated August 23, 2007 and additional information dated September 28, 2007, including the placement of all necessary equipment and shelters within the tower compound. The modifications are in compliance with the exception criteria in Section 16-50j-72 (b) of the Regulations of Connecticut State Agencies as changes to an existing facility site that would not increase tower height, extend the boundaries of the tower site, increase noise levels at the tower site boundary by six decibels, and increase the total radio frequencies electromagnetic radiation power density measured at the tower site boundary to or above the standard adopted by the State Department of Environmental Protection pursuant to General Statutes § 22a-162. This facility has also been carefully modeled to ensure that radio frequency emissions are conservatively below State and federal standards applicable to the frequencies now used on this tower.

This decision is under the exclusive jurisdiction of the Council. Please be advised that the validity of this action shall expire one year from the date of this letter. Any additional change to this facility will require explicit notice to this agency pursuant to Regulations of Connecticut State Agencies Section 16-50j-73. Such notice shall include all relevant information regarding the proposed change with cumulative worst-case modeling of radio frequency exposure at the closest point of uncontrolled access to the tower base, consistent with Federal Communications Commission, Office of Engineering and Technology, Bulletin 65. Any deviation from this format may result in the Council implementing enforcement proceedings pursuant to General Statutes § 16-50u including, without limitation, imposition of expenses resulting from such failure and of civil penalties in an amount not less than one thousand dollars per day for each day of construction or operation in material violation.

Thank you for your attention and cooperation.

Very truly yours,

Daniel F. Caruso

## CONNECTICUT SITING COUNCIL

### **NOTICE OF EXEMPT MODIFICATION BY MESSAGE CENTER MANAGEMENT, INC. ("MCM") REGARDING A REPLACEMENT TOWER AT ITS EXISTING FACILITY IN AVON CONNECTICUT**

Pursuant to Connecticut General Statutes § 16-50g et. seq., and Section 16-50j-72(b)(3) of the Regulations of Connecticut State Agencies adopted pursuant thereto, Message Center Management, Inc. ("MCM") hereby notifies the Connecticut Siting Council of its intent to modify an existing facility located at 81 Montevideo Road, Avon, Connecticut (the "Avon Facility") by replacing the tower to the same height.

#### **The Existing Avon Tower Facility**

The Avon Facility consists of a one hundred fifty (150') foot guyed tower (the "Tower"), building and other improvements located on sizeable parcel of property in the Town of Avon. The Avon Facility is principally used by Omnipoint Communications Inc. ("T-Mobile") and Sprint Spectrum, L.P. ("Sprint") that provide "cellular" services to the public as that term is defined and used in Section 16-50i(a)(6) of the Connecticut General Statutes. The Avon Facility was originally approved by Town of Avon zoning agencies prior to a statewide change in the law in 2001 which subsequently brought it under the Siting Council's jurisdiction.

#### **Reasons for the proposed Tower Replacement**

MCM's consulting engineers completed a routine and periodic inspection of the existing Tower in January of 2007, a copy of which is enclosed. As noted therein, the existing tower does not meet current structural standards. As such a recommendation was made to replace the tower along with other interim measures which MCM has since completed. At this time, MCM is proposing to replace the tower to meet current and future structural safety standards.

#### **Replacement Tower**

As shown on the enclosed plans prepared by URS Corporation, including a survey, site plan, and tower elevation, MCM proposes replacing the existing 150' guyed tower with a self-support lattice tower maintaining the same height and antenna locations (the "Replacement Tower"). The Replacement Tower will be located immediately adjacent to the existing Tower approximately 15' to the east and will be designed to taper to a uniform tower face for a significant portion of its height above grade. No other antenna or equipment modifications are proposed by MCM.

### **MCM's Tower Replacement Constitutes An Exempt Modification**

The proposed replacement of the existing Tower constitutes an exempt modification of an existing facility as defined in Connecticut General Statutes Section 16-50i(d) and Council regulations promulgated pursuant thereto. Specifically 16-50j-72(b)(3) of the Council's regulations provides that, among other exempt modifications, included is a:

Replacement of an existing CATV tower or telecommunications tower and associated equipment with a tower that is no taller than the tower to be replaced....

Here the Replacement Tower is the same height as the existing Tower and as such the modification is exempt from the requirement for any further processing or approvals.

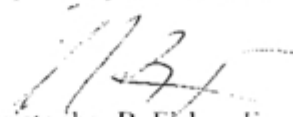

### **MCM's Discussions with Town Planning Officials**

We note that representatives of MCM have discussed this project with Town of Avon Planning Officials regarding the structural issues and different tower replacement options. As part of those discussions MCM noted for the Town that a replacement guyed tower would require substantial tree clearing at the Avon Facility site. In lieu of same, MCM has elected to replace the tower with a self support structure which will continue to accommodate users of the site and have a minimal impact on tree clearing. For reference purposes, we have also included photosimulations of the existing Tower and proposed Replacement Tower.

### **Conclusion**

MCM requests that the Connecticut Siting Council acknowledge that its proposed Replacement Tower at the Avon Facility meets the Council's exemption criteria specified in Section 16-72(b)(3) of its regulations. We note that no other land use or zoning approvals are required for the project pursuant to Section 16-50x of the Connecticut General Statutes. As such, upon receipt of the Council's acknowledgment, MCM intends to procure signed/sealed tower drawings from the manufacturer of the Replacement Tower and file for a building permit from the Town of Avon.

Respectfully Submitted,

Christopher B. Fisher, Esq.  
On behalf of MCM

**RE: W.O. 3997.07  
AVON TOWER UPGRADE  
81 MONTEVIDEO ROAD  
AVON, CT  
ANALYSIS RESULTS AND RECOMMENDATIONS**

Dear Virginia:

As requested, Tectonic Engineering & Surveying Consultants P.C. has completed an inspection and detailed structural analysis of the existing 150' guyed tower at the above referenced site. The overall configuration of the tower is shown in Figure 1, attached.

The tower was inspected by representatives of Tectonic on 11/28/06. Based on our inspection, there are several items of concern with respect to the physical condition of the tower, as follows:

- Significant external corrosion of the tower mast, especially between the 100' and 130' levels.
- Considering the age of the tower and the use of light gauge steel tubing for the tower legs, we anticipate that internal corrosion may be present. Due to the thin walls of the tubing, even moderate corrosion can significantly reduce the structural capacity of the tower legs.
- The bracing members are very small diameter steel rods. Several are bent, which reduces their effectiveness.
- Some of the leg splice bolts are significantly corroded.
- The guys are small diameter and are generally not sufficiently taut.
- The antenna mounts at the 108' level are heavily corroded.
- Numerous existing cables are inadequately secured, and they are not efficiently bundled to minimize wind loading.

This analysis was performed using Revision G of the TIA-222 standard, as previously discussed. We find that the structure is significantly overloaded in its existing condition, despite the fact that the tower was assumed to be in "like-new" condition for the purpose

of the analysis. In other words, the capacities of the tower members and guys were not adjusted (i.e. reduced) to reflect their actual condition.

As a result of our analysis, we find that:

1. The existing tower is unable to withstand the required wind loading of 95 mph (3-second gust) with no ice accumulation.
2. The maximum wind speed that the tower can safely withstand is less than 60 mph.
3. The existing tower cannot support the required ice loading, even with no wind load acting on it at all.

The primary reasons for the large degree of overstress are:

- a. The small size and limited capacity of the leg and bracing members, as well as the guys.
- b. The inclusion of a topographic factor based on the site location, as required by TIA-222-G.
- c. The larger ice thickness required by TIA-222-G, compared to the previous version of the standard.

We note that previous Structural Analysis reports by Tectonic and at least two (2) other firms show that there were problems related to the capacity of the tower under Revision F of the TIA-222 standard.

Since no information on the existing tower foundation and guy anchors was available, we could not assess their actual capacities. Based on the large overstress in the tower mast and guys, we anticipate that the existing foundations may not have sufficient capacity to resist the required loads.

The tower will need to be upgraded to satisfy the current code requirements, and to provide capacity for modified antenna configurations in the future. Reinforcement is expected to involve the installation of heavy external bracing in approximately the lower half of the tower, and replacing the guys at several levels with larger size guy wires and matching hardware. It will also involve modifications to the tower base foundation and all guy anchors.

Although upgrading the tower to meet these requirements may be technically feasible, it may be as costly and disruptive as the construction of a new replacement tower.

We recommend the installation of a new, sturdier tower on a new foundation, and relocation of all existing antennas thereto, as a better alternative. We understand that

Avon, CT  
Analysis Results and Recommendations

replacement of the structure does bring up other issues, but it will probably be more economical in the long run.

Anticipating that the processes for approval, procurement, and installation of a replacement tower may take a substantial amount of time, we recommend that the following corrective actions be taken as soon as possible:

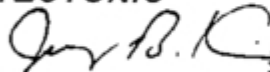

1. Retension all of the guys to be between 8% and 10% of their breaking strength.
2. Clean and repaint the deteriorated portions of the tower to minimize further corrosion.
3. Bundle and securely fasten the cables to the tower legs or faces.
4. Perform a simple visual inspection of the structure after any severe wind or ice storm, to verify that no damage has occurred.

In closing, we foresee no problem with removing the two (2) existing T-Mobile panel antennas that are mounted at the 138' level, and reinstalling one (1) panel antenna at a lower elevation, as suggested.

Please contact me if there are any questions on the above.

Sincerely,

**TECTONIC**

**Site Type:** Construction of new U14.0x150' Valmont Lattice Tower  
**Site Visit Type:** Special Inspection  
**Project Number:** 36924843.00000 / MCM-007  
**Date of Visit:** May 21, 2008  
**Attendees:** Jason Mead - URS Corporation

**Weather:** 52<sup>o</sup> Cloudy, 07:30am  
**Prepared by:** Jason Mead  
**Progress / Activities:** Foundation Sub-grade and Material Inspection

The following was noted:

1. Sub-grade: Sub-grade material corresponded with that identified within the geotechnical report prepared by Clarence Welti, P.E., P.C, dated November 6<sup>th</sup>, 2007. Material consisted of moraine soils; fine to medium sand. Base was compacted with a hand-manuevered vibratory compactor. Excavation was dry and free of deleterious materials. Contractor had installed a layer of 3/8" crushed stone at the base of the excavation, per the recommendations of the geotechnical report and was confirmed by JGI. Base of foundation excavation measured 6'-0"+/-. Finished grade shall differentiate by 1 foot vertically from East to West side of the tower base per URS design drawing C-1 and C-2 dated 01/25/08.
2. Rebar/Anchors: Rebar inventory was observed and found to be in conformance with the requirements of the Valmont design documents, i.e., size, quantity and material specification (ASTM A615, Grade 60). Rebar was supplied by Barker Steel Company, Inc. Anchor bolt assembly (x3) provided by the tower manufacturer (Valmont).

**Weather:** 82<sup>o</sup> Sunny, 12:00noon  
**Prepared by:** Jason Mead  
**Progress / Activities:** Rebar Inspection and Concrete Placement

The following was noted:

- 1. Rebar/Anchors:** Rebar installation was observed and found to be in conformance with the requirements of the Valmont design documents, i.e., size, quantity, spacing and material specification (ASTM A615, Grade 60). Rebar was supplied by Barker Steel. Precast masonry blocks were utilized to attain 3" min bottom cover. Type 26, #5 standees were utilized in accordance with the Valmont design documents to support the top temperature steel from the bottom flexural reinforcement (main bars). Twelve (12) #12 vertical L bars were installed at each pier location and secured at top with one (1) #4 tie. Remaining ties shall be installed once main footing concrete has initially cured. URS noticed that the design documents prepared by Valmont did not include a provision for a minimum of two (2) #4 ties within the top 5in of the pier/column s, per ACI 318 Section 7.10.5.6. URS contacted Valmont to discuss discrepancy. Valmont concurred with URS that an additional tie shall be required. URS notified G.C and building official of this change. Anchor bolt assemblies (x3) were in place and leveled by laser.
- 2. Concrete Placement:** Concrete specification utilized was 4000psi. Min design requirement was 3000psi. URS observed six deliveries out of a total of seven and received batch slips. First concrete delivery arrived at 1:25pm and concrete was placed approximately every 30 minutes thereafter.

**Concrete Placement continued:**

Date: 05/29/08

Concrete was vibrated and evenly distributed. Slump tests and cylinder samples were performed by JGI Eastern, results of which shall be provided under separate cover. A seventh concrete delivery was required to finish the mat pour. Concrete top surface was leveled. Finished concrete was reportedly covered with a tarpaulin to prevent anticipated rain infiltration. URS departed from site at approximately 3:30pm.

**Progress / Activities:** Concrete Placement (Three piers)

The following was noted:

**Concrete Placement:** Sonotube forms were installed and adjusted to maintain 3" min side cover from pier vertical rebar. Anchor bolts were checked for alignment and clearance. Two #4 binder ties installed within top 5" per ACI 318 Section 7.10.5.6 and 6" o.c thereafter, for a total of seven (7). Unitex Pro Poxy 204 medium viscosity, multi purpose two component epoxy bonding adhesive was applied to the hardened mat concrete prior to placing of pier concrete. Concrete specification utilized was 4000psi. Min design requirement was 3000psi. Concrete placement consisted of one delivery of approximately 6 cu yds. Batch slip checked for conformance and retained by G.C and JGI Eastern/Terracon. Concrete delivery arrived at 12:10pm. Concrete was placed and evenly distributed. Slump tests, cylinder samples and an air entrainment test were conducted by JGI Eastern, results of which shall be provided under separate cover. Concrete surface was floated and crowned to drain. All three pier concrete placement completed by 1:10pm. URS departed from site at 1:20pm.

## Introduction

The purpose of this report is to summarize the analysis results on the 150 ft PIROD Self Supporting Tower to support the proposed antennas and transmission lines in addition to those currently installed. Any modification listed under Sources of Information was assumed completed and was included in this analysis.

## Analysis Criteria

The rigorous analysis was performed in accordance with the requirements and stipulations of the TIA-222-G-2. In accordance with this standard, the structure was analyzed using **TESTowers**, a proprietary analysis software. The program considers the structure as an elastic 3-D model with second-order effects and temperature effects incorporated in the analysis. The analysis was performed using multiple wind directions.

<b>Wind Speed Used in the Analysis:</b>	Ultimate Design Wind Speed $V_{ult} = 120.0$ mph (3-Sec. Gust)/ Nominal Design Wind Speed $V_{asd} = 93.0$ mph (3-Sec. Gust)
<b>Wind Speed with Ice:</b>	50 mph (3-Sec. Gust) with 1" radial ice concurrent
<b>Operational Wind Speed:</b>	60 mph + 0" Radial ice
<b>Standard/Codes:</b>	TIA-222-G-2 / 2015 IBC / 2018 Connecticut State Building Code
<b>Exposure Category:</b>	B
<b>Structure Class:</b>	II
<b>Topographic Category:</b>	4
<b>Crest Height:</b>	520 ft
<b>Seismic Parameters:</b>	$S_5 = 0.181$ , $S_1 = 0.064$

This structural analysis is based upon the tower being classified as a Structure Class II; however, if a different classification is required subsequent to the date hereof, the tower classification will be changed to meet such requirement and a new structural analysis will be run.

## **Analysis Results**

The results of the structural analysis, performed for the wind and ice loading and antenna equipment as defined above, are summarized as the following:

Tower Component	Legs	Diagonals	Horizontals
Max. Usage:	<b>90.0%</b>	<b>87.9%</b>	<b>41.8%</b>
Pass/Fail	<b>Pass</b>	<b>Pass</b>	<b>Pass</b>

## **Foundations**

	Compression (Kips)	Uplift (Kips)	Shear (Kips)
Analysis Reactions	278.9	255.2	27.4

The foundation has been investigated using the supplied documents and soils report and was found adequate. Therefore, no modification to the foundation will be required.

## **Operational Condition (Rigidity):**

The maximum twist and sway of the microwave dishes under the operational wind speed as specified in the Analysis Criteria are listed in the table below:

Elevation (ft)	Antenna / Dish	Carrier	Twist (deg)	Sway (deg)
76.8	4.5' Parabolic Dish	Unknown	0.447	0.261
73.0	4.5' Parabolic Dish	Unknown	0.414	0.216

It is recommended that the carriers review the twist and sway values of the microwave dishes.

## **Conclusions**

Based on the analysis results, the existing structure and its foundation were found to be adequate to safely support the existing and proposed equipment and meet the minimum requirements per the ANSI/TIA/EIA 222-G Standard under the design basic wind speed as specified in the Analysis Criteria.

## Standard Conditions

Emissions Analysis for Site: CT11284A - Avon\_1

EBI Consulting was directed to analyze the proposed T-Mobile facility located at **81 Montevideo Road** in **Avon, Connecticut** for the purpose of determining whether the emissions from the Proposed T-Mobile Antenna Installation located on this property are within specified federal limits.

All information used in this report was analyzed as a percentage of current Maximum Permissible Exposure (% MPE) as listed in the FCC OET Bulletin 65 Edition 97-01 and ANSI/IEEE Std C95.1. The FCC regulates Maximum Permissible Exposure in units of microwatts per square centimeter ( $\mu\text{W}/\text{cm}^2$ ). The number of  $\mu\text{W}/\text{cm}^2$  calculated at each sample point is called the power density. The exposure limit for power density varies depending upon the frequencies being utilized. Wireless Carriers and Paging Services use different frequency bands each with different exposure limits; therefore, it is necessary to report results and limits in terms of percent MPE rather than power density.

All results were compared to the FCC (Federal Communications Commission) radio frequency exposure rules, 47 CFR 1.1307(b)(1) – (b)(3), to determine compliance with the Maximum Permissible Exposure (MPE) limits for General Population/Uncontrolled environments as defined below.

General population/uncontrolled exposure limits apply to situations in which the general population may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Therefore, members of the general population would always be considered under this category when exposure is not employment related, for example, in the case of a telecommunications tower that exposes persons in a nearby residential area.

Public exposure to radio frequencies is regulated and enforced in units of microwatts per square centimeter ( $\mu\text{W}/\text{cm}^2$ ). The general population exposure limits for the 600 MHz and 700 MHz frequency bands are approximately  $400 \mu\text{W}/\text{cm}^2$  and  $467 \mu\text{W}/\text{cm}^2$ , respectively. The general population exposure limit for the 1900 MHz (PCS), 2100 MHz (AWS) and 11 GHz frequency bands is  $1000 \mu\text{W}/\text{cm}^2$ . Because each carrier will be using different frequency bands, and each frequency band has different exposure limits, it is necessary to report percent of MPE rather than power density.

Occupational/controlled exposure limits apply to situations in which persons are exposed as a consequence of their employment and in which those persons who are exposed have been made fully aware of the potential for exposure and can exercise control over their exposure. Occupational/controlled exposure limits also apply where exposure is of a transient nature as a result of incidental passage through a location where exposure levels may be above general population/uncontrolled limits (see below), as long as the exposed person has been made fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

Additional details can be found in FCC OET 65.

## **CALCULATIONS**

Calculations were done for the proposed T-Mobile Wireless antenna facility located at 81 Montevideo Road in Avon, Connecticut using the equipment information listed below. All calculations were performed per the specifications under FCC OET 65. Since T-Mobile is proposing highly focused directional panel antennas, which project most of the emitted energy out toward the horizon, all calculations were performed assuming a lobe representing the maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was focused at the base of the tower. For this report, the sample point is the top of a 6-foot person standing at the base of the tower.

For all calculations, all equipment was calculated using the following assumptions:

- 1) 2 LTE channels (600 MHz Band) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.
- 2) 1 NR channel (600 MHz Band) was considered for each sector of the proposed installation. This Channel has a transmit power of 80 Watts.
- 3) 2 LTE channels (700 MHz Band) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.
- 4) 4 GSM channels (PCS Band - 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.
- 5) 4 LTE channels (PCS Band - 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

- 6) 2 UMTS channels (AWS Band - 2100 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.
- 7) 2 LTE channels (AWS Band – 2100 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.
- 8) 2 LTE channels (BRS Band - 2500 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 40 Watts per Channel.
- 9) 2 NR channels (BRS Band - 2500 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 40 Watts per Channel.
- 10) All radios at the proposed installation were considered to be running at full power and were uncombined in their RF transmissions paths per carrier prescribed configuration. Per FCC OET Bulletin No. 65 - Edition 97-01 recommendations to achieve the maximum anticipated value at each sample point, all power levels emitting from the proposed antenna installation are increased by a factor of 2.56 to account for possible in-phase reflections from the surrounding environment. This is rarely the case, and if so, is never continuous.
- 11) For the following calculations, the sample point was the top of a 6-foot person standing at the base of the tower. The maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was used in this direction. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.
- 12) The antennas used in this modeling are the for the RFS APXVAARR24\_43-U-NA20 for the 600 MHz / 600 MHz / 700 MHz / 1900 MHz channel(s), the Ericsson AIR 6449 for the 2500 MHz / 2500 MHz channel(s), the Ericsson AIR 32 for the 1900 MHz / 2100 MHz channel(s), the Ericsson AIR 21 for the 1900 MHz / 2100 MHz channel(s) in Sector C. This is based on feedback from the carrier with regard to anticipated antenna selection. All Antenna gain values and associated transmit power levels are shown in the Site Inventory and Power Data table below. The maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was used for all calculations. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.
- 13) The antenna mounting height centerline of the proposed antennas is feet above ground level (AGL).

- 14) Emissions values for additional carriers were taken from the Connecticut Siting Council active database. Values in this database are provided by the individual carriers themselves.
- 15) All calculations were done with respect to uncontrolled / general population threshold limits.

## Summary

All calculations performed for this analysis yielded results that were **within** the allowable limits for general population exposure to RF Emissions.

The anticipated maximum composite contributions from the T-Mobile facility as well as the site composite emissions value with regards to compliance with FCC's allowable limits for general population exposure to RF Emissions are shown here:

T-Mobile Sector	Power Density Value (%)
Sector C:	11.02%
T-Mobile Maximum MPE % (Sector C):	11.02%
Site Total:	13.69%
Site Compliance Status:	<b>COMPLIANT</b>

The anticipated composite MPE value for this site assuming all carriers present is **13.69%** of the allowable FCC established general population limit sampled at the ground level. This is based upon values listed in the Connecticut Siting Council database for existing carrier emissions.

FCC guidelines state that if a site is found to be out of compliance (over allowable thresholds), that carriers over a 5% contribution to the composite value will require measures to bring the site into compliance. For this facility, the composite values calculated were well within the allowable 100% threshold standard per the federal government.
