This facility was approved by the Town of Newington –on June 25, 1975. The approval did not come with conditions. Please see attached correspondence from previous Town Planner, Craig Minor.

Please accept this letter as notification pursuant to Regulations of Connecticut State Agencies§ 16- SOj-73, for construction that constitutes an exempt modification pursuant to R.C.S.A. § 16-50j-72(b)(2). In accordance with R.C.SA. § 16-SOj-73, a copy of this letter is being sent to Mayor Beth DelBuono, Elected Official and Renata Bertolli, Town Planner for the Town of Newington, as well as the property owner and the tower owner.

The planned modifications to the facility fall squarely within those activities explicitly provided for in R.C.S;A. § 16-50j-72(b)(2).

1. The proposed modifications will not result in an increase in the height of the existing structure.

2. The proposed modifications will not require the extension of the site boundary.

3. The proposed modifications will not increase noise levels at the facility by six decibels or more, or to levels that exceed state and local criteria.

4. The operation of the replacement antennas will not increase radio frequency emissions at the facility to a level at or above the Federal Communications Commission safety standard.

5. The proposed modifications will not cause a change or alteration in the physical or environmental characteristics of the site.

6. The existing structure and its foundation can support the proposed loading.

For the foregoing reasons, T-Mobile respectfully submits that the proposed modifications to the above referenced telecommunications facility constitute an exempt modification under R.C.S.A. § 16-50j-72(b)(2).

Kyle:

There is no "original" approval letter in our files from the Town to T-Mobile's predecessor, Omnipoint. The only letter we have that might be relevant is the 1975 site plan approval letter from the Town Plan and Zoning Commission to the property owner to build the tower.

Please let me know if I can be of any other assistance.

2. INTRODUCTION

The subject tower is located at 99 Cedarwood Lane in Newington, CT. The structure is a 170' guyed tower structure designed by Charles Burns, P.E. (Mohawk Towers) and Rohn Industries.

The structural analysis was conducted in accordance with the following:

- TIA-222-G Standard for a wind velocity range of 90 mph to 105 mph (3-second gust) and 50 mph (3-second gust) concurrent with 1.00 ice thickness, considered to increase in thickness with height.
- 2015 International Building Code with 2018 Connecticut State Building Code Amendments for a wind speed of 97 mph (3-second gust)
- 2010 AISC Load Resistance Factor Design (LRFD)
- 2010 ASCE 7 Minimum Design loads for Buildings and Other Structures for the ice thickness referenced in the TIA-222-G Standard.

This structural analysis of the communications tower was performed by AECOM on behalf of the recent antenna upgrades of the T-Mobile service equipment. The purpose of this analysis was to investigate the existing tower structure and foundation components with existing and proposed antenna loads. This analysis was conducted to evaluate stress on the tower and the effect of forces to the foundation of the tower resulting from existing and proposed antenna arrangements.

3. ANALYSIS METHODOLOGY AND LOADING CONDITIONS

The structural analysis was done in accordance with the 2018 Connecticut State Building Code, TIA-222-G—Structural Standard for Steel Antenna Towers and Antenna Supporting Structures, and the American Institute of Steel Construction (AISC) Manual of Steel Construction—Load Resistance Factor Design (LRFD).

The analysis was conducted using TNX tower version 8.0.5.0. and used the following conditions for this tower review (following the TIA-222-G Standard):

- Structure Class 2 – (Substantial Communications)
- Topographic Category 3 – (Tower location on top of hill – rolling wind conditions considered)
  - NOTE: The use of Google Earth Pro software (version 7.3.1.4505) along with Survey Topograpic maps were used for the following determinations
    - Crest Height used for analysis (approximate elevations listed below):
      - Tower Base elevation = 340'
      - Average elevation measured from 0.5 miles, 1.0 miles, 1.5 miles and 2 miles from tower (213 ft., 170 ft., 147 ft., 129 ft.)
        - Average elevation determined from above information = 165 feet
      - "H" = Average Elevation – Base Elevation = (340-165) = **175 feet**
- Exposure Class B – (Urban / Suburban areas; closely spaced obstructions)
- Load Conditions:
  - Two load conditions were evaluated as shown which were compared to design stresses according to AISC and TIA-222-G Standard.

Basic Wind Speed:

- TIA-222-G:
  - Hartford County (Wind Speed Range): V = 90 mph – 105 mph (3-second gust) [Annex of TIA-222-G 2006]
- IBC 2015 w/ 2018 CT State Building Code Amendment
  - (2012) IBC Section 1609.1.1 – Determination of Wind Loads – Exception 5 "Designs using TIA-222" applies for determination of Design Wind Load obtained as "V.ult" are to be converted to "V.asd" when applying the TIA-222-G design Standard (Under Section 1609.3) for Basic Wind Speed.
  - (2018) CT State Building Code Amendment to the IBC Section 1609.3 wind loads are obtained from Appendix N of the State Building Code.
    - V.asd = 97 mph (3-second Gust) Wind Design Parameter for the Town of Newington, Connecticut for Risk Category two (II) for Substantial (non-essential) communications.

Loading cases:

Load Condition 1 = 97 mph (3-second gust) Wind Load (without ice) + Tower Dead Load
Load Condition 2 = 50 mph (3-second gust) Wind load (with ice) + Ice Load + Tower Dead Load

The ice thickness used for this analysis is **1 inch** (assumed to start at the base of the tower) and is considered to increase in thickness with height. The initial ice thickness for design is referenced in the Annex of TIA-222-G and follows the same design criteria as the ASCE 7 Standard.

Seismic event consideration factors/values for design:

- S.s = 0.182 (2018 CT State Building Code – Location Specific Value)
- S.1 = 0.064 (2018 CT State Building Code – Location Specific Value)
- Site Classification = "C" (Reference: Terracon Geotechnical Report Page 4)
- Seismic Design Category = "B" (2015 International Building Code)
- F.a = 1.2 (Obtained from TIA-222-G Table 2-12 Considering above conditions)
- F.v = 1.7 (Obtained from TIA-222-G Table 2-13 Considering above conditions)

3. ANALYSIS METHODOLOGY AND LOADING CONDITIONS (continued)

Strength Limit State Load Combinations (TIA-222-G Section 2.3.2):

The structural analysis herein has considered the following load combinations within the analysis:

1. ***1.2 Dead Load Tower structure + 1.0 Dead Load Guy Assemblies + 1.6 Wind Load without Ice***
2. 1.2 Dead Load Tower structure + 1.0 Dead Load Guy Assemblies + 1.0 Dead Weight of ice due to factored ice thickness + 1.0 concurrent wind load with factored ice thickness + 1.0 Load effects due to temperature
3. 1.2 Dead Load Tower structure + 1.0 Dead Load Guy Assemblies + 1.0 Earthquake Load

Note 1: The above **bolded** load combination is considered to create the governing design loads per the results of the analysis.

Note 2: The “Load effects due to temperature” do not apply for structures that are self-sustaining (from the TIA-222-G Standard)

4. FINDINGS AND EVALUATION

Combined axial and bending stresses on the modified tower structure were evaluated to compare with strength above in accordance with AISC (LRFD). The results of the analysis indicates the existing tower structure, foundation, guy cable anchorage and guy cable components HAVE enough capacity to support the proposed loading conditions mentioned in the Executive Summary and Inventory sections of this analysis report.

SEISMIC BASE SHEAR

Seismic (Vs) Base Shear Implementing ANSI/TIA–222-G, IBC 2015 & Connecticut State Building Code of 2018

Calculation of Seismic Base Shear Implementing ANSI/TIA-222-G, IBC 2015 & & CT State Building Code 2018.

Location: Newington, CT -Site Class "C"

$S_{DS} = \frac{2}{3} F_A S_S$, where $S_S = 0.182$ and $F_A = 1.2$ $S_{DS} = \frac{2}{3} F_A S_S = \frac{2}{3} * 1.2 * 0.182 = 0.146$

$S_{D1} = \frac{2}{3} F_V S_1$, where $S_1 = 0.064$ and $F_V = 1.7$ $S_{D1} = \frac{2}{3} F_V S_1 = \frac{2}{3} * 1.7 * 0.064 = 0.073$

TIA-222-G SECTION 2.7 EARTHQUAKE LOADS (PROCEDURES):

1. Importance Factor "I" (tables 2-3 TIA-222-G) = 1.0 (Structure Class 2)

ANSI/TIA-222-G 2.7.7.1 (TOTAL BASE SEISMIC SHEAR (Vs)

W=DL TOWER	= 10.501	Kips
W=Antennas/Mounts	= 10.626	Kips
W=Cables	= 3.760	Kips
	24.887	Kips = WT Total = "W"

$V_s = \frac{S_{DS} * W * I}{R} = \frac{0.146 * 24.887 kips * 1.0}{2.5} = 1.4534 \ kips,$ where R = 2.5 for Guyed Lattice Tower

$V_{S.min} = \frac{0.5 * S_{D1} * W * I}{R} = \frac{0.5 * 0.073 * 24.887 kips * 1.0}{2.5} = 0.3634 \ kips$

*By visual inspection, the above "Base Shear" value when considering the following Load Combination is less that the base shear of wind on structure.

$1.2 * DL + 1.0\ E < 1.2\ DL + 1.6\ W,$ (2.485 Kips), therefore seismic effect on structure Does NOT control Design.

TOWER DESIGN NOTES

1. Tower is located in Hartford County, Connecticut.
2. Tower designed for Exposure B to the TIA-222-G Standard.
3. Tower designed for a 97 mph basic wind in accordance with the TIA-222-G Standard.
4. Tower is also designed for a 50 mph basic wind with 1.00 in ice. Ice is considered to increase in thickness with height.
5. Deflections are based upon a 60 mph wind.
6. Tower Structure Class II.
7. Topographic Category 3 with Crest Height of 175.00 ft
8. ANALYSIS ASSUMPTIONS:
9. Previous Un-Modified Tower Dimensions are from Original Construction Plans developed by Charles L. Burns for Mohawk Towers (12/1997).
10. Tower diagonal and horizontal bolts are assumed to match ROHN specifications of 1/2" ASTM 325N (unless indicated otherwise).
11. Tower Bolt information obtained from Hudson Design Group Tower Mapping Report (Dated 05/11/2012).
12. Following Previous Tower Modifications are assumed to have been Constructed:
13. * Elevation Range 120' - 140' - U-bolted w/ welded ends of (1) SR to existing (vertical leg) - Designed by Bay State Design (04/07/2010
14. * Elevation Range 60' - 80' (Addition of 1/3 HSS/Pipe U-Bolted to existing Tower leg) - Designed by Hudson Design Group - Implemented by URS Corporation (dated 08/18/2014)
15. * Elevation Range 7.5' - 37' (Addition of Horizontal 1" S.R. Members) Designed by URS Corporation (08/18/2014)
16. * Elevation Range 120' - 140' (Replacement of Existing Diagonal Members from 3/16" thick to 1/4" thick members) Designed by URS Corporation (08/18/2014)

TNX TOWER DETAILED OUTPUT

Tower Input Data

The main tower is a 3x guyed tower with an overall height of 170.00 ft above the ground line.
The base of the tower is set at an elevation of 0.00 ft above the ground line.
The face width of the tower is 3.42 ft at the top and tapered at the base.
This tower is designed using the TIA-222-G standard.
The following design criteria apply:

Tower is located in Hartford County, Connecticut.
Basic wind speed of 97 mph.
Structure Class II.
Exposure Category B.
Topographic Category 3.
Crest Height 175.00 ft.
Nominal ice thickness of 1.0000 in.
Ice thickness is considered to increase with height.
Ice density of 56 pcf.
A wind speed of 50 mph is used in combination with ice.
Temperature drop of 50 °F.
Deflections calculated using a wind speed of 60 mph.
ANALYSIS ASSUMPTIONS:.
Previous Un-Modified Tower Dimensions are from Original Construction Plans developed by Charles L. Burns for Mohawk Towers (12/1997)..
Tower diagonal and horizontal bolts are assumed to match ROHN specifications of 1/2" ASTM 325N (unless indicated otherwise)..
Tower Bolt information obtained from Hudson Design Group Tower Mapping Report (Dated 05/11/2012)..
Following Previous Tower Modifications are assumed to have been Constructed:.
* Elevation Range 120' - 140' - U-bolted w/ welded ends of (1) SR to existing (vertical leg) - Designed by Bay State Design (04/07/2010.
* Elevation Range 60' - 80' (Addition of 1/3 HSS/Pipe U-Bolted to existing Tower leg) - Designed by Hudson Design Group - Implemented by URS Corporation (dated 08/18/2014).
* Elevation Range 7.5' - 37' (Addition of Horizontal 1" S.R. Members) Designed by URS Corporation (08/18/2014).
* Elevation Range 120' - 140' (Replacement of Existing Diagonal Members from 3/16" thick to 1/4" thick members) Designed by URS Corporation (08/18/2014).
* Elevation Range 120' - 155' (Addition of Horizontal L1-3/4x1/4 and SR 1 bracing members) Designed by URS Coproration (08/22/2014).
* Elevation Range 140' - 155' (Replacement of existing 1.5 Pipe x 16th Gage pipe w/ 1.5 STD Pipe) Designed by URS Corprotation (08/22/2014).
Proposed Modifications - Tower Legs:.
*1/3rd HSS 2.8750x0.203 welded on Existing ROHN 2 STD Pipe. Overall Steel Grade reduced to Reinforcement Material (ASTM A500-Gr. C) (Cons.) (Elevation 100' to 120').
*1/3rd HSS 3.5x0.250 welded on Existing ROHN 2.5 STD Pipe. Overall Steel Grade Reduced to Reinforcement Material (ASTM A500-Gr. C) (Cons.) (Elevation 20' to 60').
* RFI #1 Request (1/31/2020) - Update 20' to 60' steel from 1/3rd HSS 3.5x0.250 to 1/3rd HSS 3.5x0.300 (Status of update: ???).
*T-Plate Beam welded on Existing ROHN 2.5 EH Pipe. (Elevation 0'-5').
Pressures are calculated at each section.
Safety factor used in guy design is 1.
Stress ratio used in tower member design is 1.

Local bending stresses due to climbing loads, feed line supports, and appurtenance mounts are not considered.

Options

	Consider Moments - Legs		Distribute Leg Loads As Uniform		Use ASCE 10 X-Brace Ly Rules

Re: Geotechnical Engineering Services
Callahan Tower
Newington, Connecticut
Terracon Proposal No. PJ2185155

Dear Mr. Egan:

Terracon Consultants, Inc. (Terracon) has completed our review of the above-referenced project, in accordance with our proposal dated September 26, 2018. Our scope of work included visiting the site to review existing site conditions and reviewing the results and recommendations provided in our August 24, 2012 Geotechnical Engineering Report. Based on our conversations, we understand the project consists of performing a structural assessment of the existing tower to evaluate the capacity to carry additional communications equipment.

Based on our review, we recommend proceeding with the analysis using the parameters provided and conditions summarized in our previous report. Seismic ground motion values should be updated to meet the Connecticut State Building Code version applicable to the design of this project.

We trust this letter meets your needs at this time. Please contact us if you have questions or require additional information.

Sincerely,
Terracon Consultants, Inc.

Terracon Consultants, Inc. (Terracon) has completed our review of the above-referenced project, in accordance with our proposal dated September 26, 2018. Our scope of work included visiting the site to review existing site conditions and reviewing the results and recommendations provided in our August 24, 2012 Geotechnical Engineering Report. Based on our conversations, we understand the project consists of performing a structural assessment of the existing tower to evaluate the capacity to carry additional communications equipment.

Based on our review, we recommend proceeding with the analysis using the parameters provided and conditions summarized in our previous report. Seismic ground motion values should be updated to meet the Connecticut State Building Code version applicable to the design of this project.

We trust this letter meets your needs at this time. Please contact us if you have questions or require additional information.

Sincerely,
Terracon Consultants, Inc.

1.0 INTRODUCTION

A geotechnical engineering report has been completed for the existing approximately 170-foot high guyed tower located within wooded land at the end of Cedarwood Lane in Newington, Connecticut. Two test borings was advanced to a maximum depth of 15 feet below the existing ground surface to the north and the south of the existing fenced compound area. Three test probes were advanced proximal to the guy anchors to depths ranging from approximately 5.5 to 10 feet below the existing ground surface. Logs of the test boring and probes, along with a Site Location Map (Exhibit A-1) and an Exploration Location Diagram (Exhibit A-2) are included in Appendix A of this report.

The purpose of these services is to provide information and geotechnical engineering recommendations relative to:

- subsurface soil conditions
- groundwater conditions
- soil/rock design parameters
- seismic considerations

2.0 PROJECT INFORMATION

2.1 Project Description

Item	Description
Site layout	Appendix A, Exhibit A-2 - Exploration Location Diagram
Tower	Approximately 170-foot high guyed communications tower
Guyed tower: **Maximum allowable settlement**	Total Settlement: 1 inch
Grading	No change to grade anticipated.

2.2 Site Location and Description

Item	Description
Location	Existing compound surrounded by wooded land at the end of Cedarwood Lane in Newington, Connecticut.
Existing improvements	Approximately 170-foot high guyed communications tower with associated electrical appurtenances within a fenced compound area.
Current ground cover	Forest mat and gravel
Existing topography	Slopes down gradually to the east.

3.0 SUBSURFACE EXPLORATIONS AND CONDITIONS

3.1 Typical Profile

Based on the results of the explorations and observations at the time of drilling, subsurface conditions on the project site can be generalized as follows:

Description	Approximate Depth to Bottom of Stratum (feet)	Material Encountered [1]	Consistency / Relative Density
Glacial Till	5.5 to 10	Silty Sand, with gravel, occasional cobbles, red-brown	Medium Dense to Very Dense
Bedrock	> 15	Gray, fresh, hard, Basalt	N/A

1. Forest Mat or gravel (about 6 inches thick) was encountered at the ground surface

Because of site limitations, including existing underground electrical lines and site topography, B-1 was advanced just south and B-2 was advanced just north of the existing compound area. Competent bedrock was encountered at a depth of approximately 9.5 feet to 6.5 feet below the existing ground surface. Bedrock was cored to a depth of 15 feet with an NX-sized core barrel in B-1. The Rock Quality Designation (RQD) value was 78 percent from a depth of 10 to 15 feet, indicating good in-situ bedrock quality. Presumed bedrock was encountered at a depth of approximately 6.5 feet in B-2. Three additional probes (P-1, P-2, and P-3) were advanced proximal to the three guy anchor locations, to further identify subsurface conditions. The probes were terminated on auger refusal on competent bedrock at depths of approximately 5.5 to 10 feet below existing ground surface.

Conditions encountered at each exploration location are indicated on the test boring and test probe logs. Stratification boundaries on the exploration logs represent the approximate location of changes in soil types; *in situ*, the transition between materials may be gradual. Further details of the explorations can be found on the logs in Appendix A of this report.

3.2 Groundwater

Groundwater was not encountered in the explorations. However, fluctuations in groundwater level may occur because of seasonal variations in the amount of rainfall, runoff, and other factors. Additionally, groundwater may become perched in portions of the Glacial Till with elevated fines content or on bedrock. The possibility of groundwater level fluctuations should be considered.

4.0 RECOMMENDED SOIL/ROCK DESIGN PARAMETERS

Although our scope of work did not include an investigation of existing tower foundation configuration, we anticipate that the approximately 170-foot lattice telecommunications tower is supported on a mat foundation bearing on glacial till and the guy anchors are likely bearing in the glacial till or on bedrock. Based on our observations, we have tabulated our estimates of the soil/bedrock parameters below:

4.1 Soil/Rock Design Parameters

Description	Value
Net allowable bearing pressure (on glacial till) [1]	4 kips per square foot (ksf)
Net allowable bearing pressure (on bedrock) [1]	10 kips per square foot (ksf)
Total Unit Weight (Glacial Till) (γ)	130 pounds per cubic foot (pcf)
Total Unit Weight (Bedrock) (γ)	165 pcf
Angle of Internal Friction [2]**, φ (degrees)**	30 to 32
Coefficient of sliding friction [3]	0.5 (ultimate)

1. The recommended net allowable bearing pressure is the pressure in excess of the minimum surrounding overburden pressure at the footing base elevation.
2. Angle of internal friction of the glacial till may be higher where there are more frequent gravel-sized particles.
3. A factor of safety of at least 1.5 should be applied to the sliding resistance.

4.2 Seismic Considerations

Description	Value
Code Used	Connecticut State Building Code (CBC) [1]
Site Class	C[2]
Maximum considered earthquake ground motions (5 percent damping)	0.064g (1.0 second spectral response acceleration, S_1)
	0.240g (0.2 second spectral response acceleration, S_s)
Liquefaction potential in event of an earthquake	Not susceptible

1. The CBC incorporates the Seismic Design Category approach from the 2003 International Building Code.
2. The CBC requires a site soil profile determination extending a depth of 100 feet for seismic site classification. The current scope requested does not include the required 100-foot soil profile determination; the borings performed for this report extended to a maximum depth of 15 feet. However, we expect soil at least as dense as encountered above a depth of 10 feet or bedrock will extend to a depth of 100 feet.

5.0 GENERAL COMMENTS

The analysis and recommendations presented in this report are based upon the data obtained from the explorations performed at the indicated locations and from other information discussed in this report. This report does not reflect variations that may occur between explorations, across the site, or due to the modifying effects of weather. The nature and extent of such variations would not become evident without excavation to the bedrock surface.

The scope of services for this project does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

This report has been prepared for the exclusive use of our client for specific application to the project discussed and prepared in accordance with generally accepted geotechnical engineering practices. No warranties, either express or implied, are intended or made. Site safety, excavation support, and dewatering requirements are the responsibility of others. In the event that changes in the nature, design, or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless Terracon reviews the changes and either verifies or modifies the conclusions of this report in writing.

Field Exploration Description

The site has an existing tower within a fenced compound area. Terracon monitored the advancement of two test borings (B-1 and B-2) in the vicinity of the existing tower compound area and three test probes (P-1, P-2, and P-3) proximal to the guy anchors on August 13, 2012. The explorations were advanced using a Mobile B-53 all-terrain vehicle-mounted rotary drill rig, owned and operated by New England Boring Contractors Inc. of Glastonbury, Connecticut. B-1 and B-2 was advanced using 3 1/4-inch inside diameter hollow-stem augers (HSA) to a maximum depth of about 10 feet below existing grade and terminated at refusal on competent bedrock. Bedrock was then cored to a depth of 15 feet with an NX-sized core barrel.

The soil samples were placed in labeled glass jars and taken, along with the rock core in a wooden core box, to our Rocky Hill (Hartford), Connecticut office for further review by a Terracon geotechnical engineer. Information provided on the boring log attached to this report includes soil and rock descriptions, relative density and/or consistency evaluations, boring depths, sampling intervals, and groundwater conditions. The boring was backfilled with auger cuttings prior to the drill crew leaving the site.

P-1, P-2, and P-3 were advanced with 4-inch diameter solid stem augers (SSA) to further evaluate the subsurface conditions in the vicinity of the existing tower compound area. P-1 and P-2 were terminated on auger refusal at depths ranging from approximately 5.5 to 6.5 feet. P-3 was terminated at a depth of approximately 10 feet. The probes were backfilled with auger cuttings prior to the drill crew leaving the site.

Field logs of the boring and probes were prepared by a Terracon field engineer. These logs included visual classifications of the materials encountered during drilling as well as interpretation by our field engineer of the subsurface conditions between samples. Final exploration logs included with this report represent further interpretation by the geotechnical engineer of the field logs and incorporate, where appropriate, modifications based on laboratory classification of the samples.

The approximate exploration locations, which are shown on Exhibit A-2, were measured by taping from existing features in the field and by estimating right angles. The locations of the explorations should be considered accurate only to the degree implied by the method used to define them. Ground elevations at the exploration locations were not available.

GENERAL NOTES

DRILLING & SAMPLING SYMBOLS:

SS:	Split Spoon – 1-$^3/_8$" I.D., 2" O.D., unless otherwise noted	HS:	Hollow Stem Auger
ST:	Thin-Walled Tube - 2" O.D., unless otherwise noted	PA:	Power Auger

The number of blows required to advance a standard 2-inch O.D. split-spoon sampler (SS) typically the middle 12 inches of the total 24-inch penetration with a 140-pound hammer falling 30 inches is considered the "Standard Penetration" or "N-value".

WATER LEVEL MEASUREMENT SYMBOLS:

WCI:	Wet Cave in	WD:	While Drilling		
DCI:	Dry Cave in	BCR:	Before Casing Removal

Water levels indicated on the boring logs are the levels measured in the borings at the times indicated. Groundwater levels at other times and other locations across the site could vary. In pervious soils, the indicated levels may reflect the location of groundwater. In low permeability soils, the accurate determination of groundwater levels may not be possible with only short-term observations.

DESCRIPTIVE SOIL CLASSIFICATION: Soil classification is based on the Unified Classification System. Coarse Grained Soils have more than 50% of their dry weight retained on a #200 sieve; their principal descriptors are: boulders, cobbles, gravel or sand. Fine Grained Soils have less than 50% of their dry weight retained on a #200 sieve; they are principally described as clays if they are plastic, and silts if they are slightly plastic or non-plastic. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size. In addition to gradation, coarse-grained soils are defined on the basis of their in-place relative density and fine-grained soils on the basis of their consistency.

Slight	Rock generally fresh, joints stained, and discoloration extends into rock up to 1 in. Joints may contain clay. In granitoid rocks some occasional feldspar crystals are dull and discolored. Crystalline rocks ring under hammer.
Moderate	Significant portions of rock show discoloration and weathering effects. In granitoid rocks, most feldspars are dull and discolored; some show clayey. Rock has dull sound under hammer and shows significant loss of strength as compared with fresh rock.
Moderately severe	All rock except quartz discolored or stained. In granitoid rocks, all feldspars dull and discolored and majority show kaolinization. Rock shows severe loss of strength and can be excavated with geologist's pick.
Severe	All rock except quartz discolored or stained. Rock "fabric" clear and evident, but reduced in strength to strong soil. In granitoid rocks, all feldspars kaolinized to some extent. Some fragments of strong rock usually left.
Very severe	All rock except quartz discolored or stained. Rock "fabric" discernible, but mass effectively reduced to "soil" with only fragments of strong rock remaining.
Complete	Rock reduced to "soil". Rock "fabric" not discernible or discernible only in small, scattered locations. Quartz may be present as dikes or stringers.

HARDNESS (for engineering description of rock – not to be confused with Moh's scale for minerals)

Very hard	Cannot be scratched with knife or sharp pick. Breaking of hand specimens requires several hard blows of geologist's pick.
Hard	Can be scratched with knife or pick only with difficulty. Hard blow of hammer required to detach hand specimen.
Moderately hard	Can be scratched with knife or pick. Gouges or grooves to ¼ in. deep can be excavated by hard blow of point of a geologist's pick. Hand specimens can be detached by moderate blow.
Medium	Can be grooved or gouged 1/16 in. deep by firm pressure on knife or pick point. Can be excavated in small chips to pieces about 1-in. maximum size by hard blows of the point of a geologist's pick.
Soft	Can be gouged or grooved readily with knife or pick point. Can be excavated in chips to pieces several inches in size by moderate blows of a pick point. Small thin pieces can be broken by finger pressure.
Very soft	Can be carved with knife. Can be excavated readily with point of pick. Pieces 1-in. or more in thickness can be broken with finger pressure. Can be scratched readily by fingernail.

Reference: **Analysis of Antenna Mount:**
T-Mobile Site ID: CT11174A
99 Cedarwood Lane, Newington, Connecticut
AECOM Project Number: NSS-048

Dear Mr. Freincle,

AECOM has been authorized by T-Mobile to conduct a structural evaluation of the proposed antenna modification to the existing antenna mount frame attached to an existing transmission tower structure located at 99 Cedarwood Lane, Newington, Connecticut. The results of our independent structural analysis has determined that the proposed antenna upgrades to the existing antenna frame mounts are in compliance with the Codes and Standards stated herein.

The proposed antenna modification will consist of the removal of three (3) RFS-APX16DWV-16DWV-S-E-A20 Panel Antennas, three (3) DB Andrew LNX-6515DS-A1M Panel Antennas and three (3) Generic Twin Style 1A - PCS TMAs, with the installation of three (3) Ericsson AIR6449 B41 Panel Antennas, three (3) RFS APXVAARR24_43-U-NA20 Panel Antennas, three (3) Radio 4415 B25 RRH Units, three (3) CommScope SDX1926Q-43(E14F05P86) TMAs, and three (3) Ericsson 6x12 HCS Hybrid Cables on three (3) existing antenna mounts with one (1) support/tie-back arm connected to tower structure at 163 feet above the tower base. The existing mount applied for analysis was considered as three (3) Rohn 15-ft. Gate Boom Frame assemblies, with three (3) antenna mount pipes (measurements from mount mapping).

An independent structural analysis was conducted considering the antenna pipe mounted frame mounted to the existing tower structure for its strength design. This analysis did not consider the loading of the proposed antenna mounting frame attached to the tower structure.

Two load conditions were evaluated as shown below which were compared to ultimate stresses according to AISC and TIA-222-G.

Load Condition 1 = 97 mph (3-second gust) Wind Load (without ice) + (Antenna + Mount) Dead Load
Load Condition 2 = 50 mph (3-second gust) Wind Load (with ice) + 1.0” Ice Load + (Antenna + Mount) Dead Load

NOTE: The 1.0” Ice load thickness obtained from the TIA-222-G and the ASCE 7-10 Standard are considered to increase in thickness with the height of the Antenna and Mount assembly.

The independent structural analysis also considered the following site conditions (following the TIA-222-G Standard):

- Structure Class 2 – (Substantial Communications)
- Topographic Category 3 – (Tower location on top of hill – rolling wind conditions considered)
    - NOTE: The use of Google Earth Pro software (version 7.3.1.4505) along with Survey Topographic maps were used for the following determinations
        - Crest Height used for analysis (approximate elevations listed below):
            - Tower Base Elevation = 340'
            - Average elevation measured from 0.5 miles, 1.0 miles, 1.5 miles, and 2 miles from tower (213 ft., 170 ft., 147 ft., 129 ft.)
                - Average elevation determined from above information = 165 feet.
            - "H" = Average Elevation – Base Elevation = (340-165) = **175 feet**
- Exposure Class B – (Urban/Suburban areas; closely spaced obstructions)

The independent structural analysis was conducted using the STAAD.Pro V8i software design program to assess the strength design of the antenna mount frame. The analysis was conducted in compliance with the Codes and Standards of the TIA-222-Revision G with Addendum 2, the ASCE 7-2010 Minimum Design Loads Standard, the 2015 International Building Code, and the 2018 State of Connecticut Building code. The results of our independent structural analysis has determined that the proposed antenna upgrades to the existing antenna pipe mounts are in compliance with the Codes and Standards previously mentioned.

Per the included mount analysis, the controlling stress for the design mount is noted ***at 63.7%*** structural capacity rating.

Should there be any questions, please contact Michael Egan at (860) 263-5817.

Sincerely,

AECOM

Emissions Analysis for Site: CT11174A - Callahan Tower_1

EBI Consulting was directed to analyze the proposed T-Mobile facility located at **99 Cedarwood Lane** in **Newington, Connecticut** for the purpose of determining whether the emissions from the Proposed T-Mobile Antenna Installation located on this property are within specified federal limits.

All information used in this report was analyzed as a percentage of current Maximum Permissible Exposure (% MPE) as listed in the FCC OET Bulletin 65 Edition 97-01and ANSI/IEEE Std C95.1. The FCC regulates Maximum Permissible Exposure in units of microwatts per square centimeter ($\mu W/cm^2$). The number of $\mu W/cm^2$ calculated at each sample point is called the power density. The exposure limit for power density varies depending upon the frequencies being utilized. Wireless Carriers and Paging Services use different frequency bands each with different exposure limits; therefore, it is necessary to report results and limits in terms of percent MPE rather than power density.

All results were compared to the FCC (Federal Communications Commission) radio frequency exposure rules, 47 CFR 1.1307(b)(1) – (b)(3), to determine compliance with the Maximum Permissible Exposure (MPE) limits for General Population/Uncontrolled environments as defined below.

General population/uncontrolled exposure limits apply to situations in which the general population may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Therefore, members of the general population would always be considered under this category when exposure is not employment related, for example, in the case of a telecommunications tower that exposes persons in a nearby residential area.

Public exposure to radio frequencies is regulated and enforced in units of microwatts per square centimeter ($\mu W/cm^2$). The general population exposure limits for the 600 MHz and 700 MHz frequency bands are approximately 400 $\mu W/cm^2$ and 467 $\mu W/cm^2$, respectively. The general population exposure limit for the 1900 MHz (PCS), 2100 MHz (AWS) and 11 GHz frequency bands is 1000 $\mu W/cm^2$. Because each carrier will be using different frequency bands, and each frequency band has different exposure limits, it is necessary to report percent of MPE rather than power density.

Occupational/controlled exposure limits apply to situations in which persons are exposed as a consequence of their employment and in which those persons who are exposed have been made fully aware of the potential for exposure and can exercise control over their exposure. Occupational/controlled exposure limits also apply where exposure is of a transient nature as a result of incidental passage through a location where exposure levels may be above general population/uncontrolled limits (see below), as long as the exposed person has been made fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

Additional details can be found in FCC OET 65.

CALCULATIONS

Calculations were done for the proposed T-Mobile Wireless antenna facility located at 99 Cedarwood Lane in Newington, Connecticut using the equipment information listed below. All calculations were performed per the specifications under FCC OET 65. Since T-Mobile is proposing highly focused directional panel antennas, which project most of the emitted energy out toward the horizon, all calculations were performed assuming a lobe representing the maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was focused at the base of the tower. For this report, the sample point is the top of a 6-foot person standing at the base of the tower.

For all calculations, all equipment was calculated using the following assumptions:

1) 2 LTE channels (600 MHz Band) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

2) 1 NR channel (600 MHz Band) was considered for each sector of the proposed installation. This Channel has a transmit power of 80 Watts.

3) 2 LTE channels (700 MHz Band) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

4) 4 GSM channels (PCS Band - 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

5) 4 LTE channels (PCS Band - 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

6) 2 UMTS channels (AWS Band - 2100 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

7) 2 LTE channels (AWS Band – 2100 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

8) 2 LTE channels (BRS Band - 2500 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 40 Watts per Channel.

9) 2 NR channels (BRS Band - 2500 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 40 Watts per Channel.

10) All radios at the proposed installation were considered to be running at full power and were uncombined in their RF transmissions paths per carrier prescribed configuration. Per FCC OET Bulletin No. 65 - Edition 97-01 recommendations to achieve the maximum anticipated value at each sample point, all power levels emitting from the proposed antenna installation are increased by a factor of 2.56 to account for possible in-phase reflections from the surrounding environment. This is rarely the case, and if so, is never continuous.

11) For the following calculations, the sample point was the top of a 6-foot person standing at the base of the tower. The maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was used in this direction. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.

12) The antennas used in this modeling are the Ericsson AIR 6449 for the 2500 MHz / 2500 MHz channel(s), the Ericsson AIR 32 for the 1900 MHz / 1900 MHz / 2100 MHz channel(s), the RFS APXVAARR24_43-U-NA20 for the 600 MHz / 600 MHz / 700 MHz / 1900 MHz / 2100 MHz channel(s) in Sector A, the Ericsson AIR 6449 for the 2500 MHz / 2500 MHz channel(s), the Ericsson AIR 32 for the 1900 MHz / 1900 MHz / 2100 MHz channel(s), the RFS APXVAARR24_43-U-NA20 for the 600 MHz / 600 MHz / 700 MHz / 1900 MHz / 2100 MHz channel(s) in Sector B, the Ericsson AIR 6449 for the 2500 MHz / 2500 MHz channel(s), the Ericsson AIR 32 for the 1900 MHz / 1900 MHz / 2100 MHz channel(s), the RFS APXVAARR24_43-U-NA20 for the 600 MHz / 600 MHz / 700 MHz / 1900 MHz / 2100 MHz channel(s) in Sector C. This is based on feedback from the carrier with regard to anticipated antenna selection. All Antenna gain values and associated transmit power levels are shown in the Site Inventory and Power Data table below. The maximum gain of the antenna per the antenna manufacturer's supplied specifications, minus 10 dB for directional panel antennas and 20 dB for highly focused parabolic microwave dishes, was used for all calculations. This value

is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.

13) The antenna mounting height centerline of the proposed antennas is 163 feet above ground level (AGL).

14) Emissions values for additional carriers were taken from the Connecticut Siting Council active database. Values in this database are provided by the individual carriers themselves.

15) All calculations were done with respect to uncontrolled / general population threshold limits.

Summary

All calculations performed for this analysis yielded results that were **within** the allowable limits for general population exposure to RF Emissions.

The anticipated maximum composite contributions from the T-Mobile facility as well as the site composite emissions value with regards to compliance with FCC's allowable limits for general population exposure to RF Emissions are shown here:

T-Mobile Sector	Power Density Value (%)
Sector A:	7.19%
Sector B:	7.19%
Sector C:	7.19%
T-Mobile Maximum MPE % (Sector A):	7.19%
Site Total:	24.42%
Site Compliance Status:	**COMPLIANT**

The anticipated composite MPE value for this site assuming all carriers present is **24.42%** of the allowable FCC established general population limit sampled at the ground level. This is based upon values listed in the Connecticut Siting Council database for existing carrier emissions.

FCC guidelines state that if a site is found to be out of compliance (over allowable thresholds), that carriers over a 5% contribution to the composite value will require measures to bring the site into compliance. For this facility, the composite values calculated were well within the allowable 100% threshold standard per the federal government.
