RE: Notice of Exempt Modification // Site Number: CT2151
177 West Rocks Road, Norwalk, CT (Site Name: Norwalk North-West Rocks Rd)
N 41.143922 // W -73.4182611

Dear Ms. Bachman:

New Cingular Wireless, PCS, LLC ("AT&T") currently maintains nine (9) antennas at the 111 foot level of the existing 108 foot water tank at 177 West Rocks Road, Norwalk, CT 06851. The water tank is owned by The First Taxing District of the City of Norwalk. They also own the property. AT&T now intends to replace three (3) of its existing antennas with three (3) upgraded models for its LTE upgrade. These antennas would be installed at the 111 foot level of the water tank. AT&T also intends to install three (3) remote radio units and three (3) surge arrestors.

The current proposal involves an antenna swap only (three for three); no antennas will be added. AT&T was originally approved for twelve (12) total antennas on January 5, 2000.

Please accept this letter as notification pursuant to Regulations of Connecticut State Agencies § 16-50j-73, for construction that constitutes an exempt modification pursuant to R.C.S.A. § 16-50j-72(b)(2). In accordance with R.C.S.A. § 16-50j-73, a copy of this letter is being sent to Harry Rilling, City of Norwalk Mayor, as well as the water tank and ground owner, The First Taxing District of the City of Norwalk.

The planned modifications to the facility fall squarely within those activities explicitly provided for in R.C.S.A. § 16-50j-72(b)(2).

Attached to accommodate this filing are construction drawings dated April 4, 2016 by ComEx Consultants, a structural analysis dated March 31, 21016 by Destek Engineering/ComEx Consultants and an Emissions Analysis Report dated February 11, 2016 by EBI Consulting.

1. The proposed modifications will not result in an increase in the height of the existing structure.

2. The proposed modifications will not require the extension of the site boundary.

3. The proposed modifications will not increase noise levels at the facility by six decibels or more, or to levels that exceed state and local criteria.

4. The operation of the replacement antennas will not increase radio frequency emissions at the facility to a level at or above the Federal Communications Commission safety standard.

5. The proposed modifications will not cause a change or alteration in the physical or environmental characteristics of the site.

6. The existing structure and its foundation can support the proposed loading as shown in the attached structural analysis by Destek Engineering dated March 31, 2016.

For the foregoing reasons, AT&T respectfully submits that the proposed modifications to the above referenced telecommunications facility constitute an exempt modification under R.C.S.A. § 16-50j-72(b)(2).

Sincerely,

Michael Gentile, Site Acquisition

Emissions Analysis for Site: **CTU2151 – NORWALK NORTH-WEST ROCKS RD**

EBI Consulting was directed to analyze the proposed AT&T facility located at **177 West Rocks Road, Norwalk, CT**, for the purpose of determining whether the emissions from the Proposed AT&T Antenna Installation located on this property are within specified federal limits.

All information used in this report was analyzed as a percentage of current Maximum Permissible Exposure (% MPE) as listed in the FCC OET Bulletin 65 Edition 97-01and ANSI/IEEE Std C95.1. The FCC regulates Maximum Permissible Exposure in units of microwatts per square centimeter (μW/cm2). The number of $\mu W/cm^2$ calculated at each sample point is called the power density. The exposure limit for power density varies depending upon the frequencies being utilized. Wireless Carriers and Paging Services use different frequency bands each with different exposure limits, therefore it is necessary to report results and limits in terms of percent MPE rather than power density.

All results were compared to the FCC (Federal Communications Commission) radio frequency exposure rules, 47 CFR 1.1307(b)(1) – (b)(3), to determine compliance with the Maximum Permissible Exposure (MPE) limits for General Population/Uncontrolled environments as defined below.

<u>General population/uncontrolled exposure</u> limits apply to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Therefore, members of the general public would always be considered under this category when exposure is not employment related, for example, in the case of a telecommunications tower that exposes persons in a nearby residential area.

Public exposure to radio frequencies is regulated and enforced in units of microwatts per square centimeter ($\mu W/cm^2$). The general population exposure limits for the 700 and 850 MHz Bands are approximately 467 $\mu W/cm^2$ and 567 $\mu W/cm^2$ respectively. The general population exposure limit for the 1900 MHz (PCS), 2100 MHz (AWS) and 2300 MHz (WCS) bands is 1000 $\mu W/cm^2$. Because each carrier will be using different frequency bands, and each frequency band has different exposure limits, it is necessary to report percent of MPE rather than power density.

Occupational/controlled exposure limits apply to situations in which persons are exposed as a consequence of their employment and in which those persons who are exposed have been made fully aware of the potential for exposure and can exercise control over their exposure. Occupational/controlled exposure limits also apply where exposure is of a transient nature as a result of incidental passage through a location where exposure levels may be above general population/uncontrolled limits (see below), as long as the exposed person has been made fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

Additional details can be found in FCC OET 65.

CALCULATIONS

Calculations were done for the proposed AT&T Wireless antenna facility located at **177 West Rocks Road, Norwalk, CT**, using the equipment information listed below. All calculations were performed per the specifications under FCC OET 65. Since AT&T is proposing highly focused directional panel antennas, which project most of the emitted energy out toward the horizon, all calculations were performed assuming a lobe representing the maximum gain of the antenna per the antenna manufactures supplied specifications, minus 10 dB, was focused at the base of the tower. For this report the sample point is the top of a 6 foot person standing at the base of the tower.

For all calculations, all equipment was calculated using the following assumptions:

1) 2 UMTS channels (850 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

2) 2 UMTS channels (PCS Band – 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

3) 2 GSM channels (850 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 30 Watts per Channel.

4) 2 LTE channels (WCS Band – 2300 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

5) 2 LTE channels (700 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

6) 2 LTE channels (PCS Band – 1900 MHz) were considered for each sector of the proposed installation. These Channels have a transmit power of 60 Watts per Channel.

7) All radios at the proposed installation were considered to be running at full power and were uncombined in their RF transmissions paths per carrier prescribed configuration. Per FCC OET Bulletin No. 65 - Edition 97-01 recommendations to achieve the maximum anticipated value at each sample point, all power levels emitting from the proposed antenna installation are increased by a factor of 2.56 to account for possible in-phase reflections from the surrounding environment. This is rarely the case, and if so, is never continuous.

8) For the following calculations the sample point was the top of a six foot person standing at the base of the tower. The maximum gain of the antenna per the antenna manufactures supplied specifications minus 10 dB was used in this direction. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.

9) The antennas used in this modeling are the **CCI HPA-65R-BUU-H6, Powerwave P65-16-XLH-RR and the Powerwave 7770.00** for transmission in the 700 MHz, 850 MHz, 1900 MHz (PCS) and 2300 MHz (WCS) frequency bands. This is based on feedback from the carrier with regards to anticipated antenna selection. Maximum gain values for all antennas are listed in the Inventory and Power Data table below. The maximum gain of the antenna per the antenna manufactures supplied specifications, minus 10 dB, was used for all calculations. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.

10) The antenna mounting height centerline of the proposed antennas is **111 feet** above ground level (AGL).

11) Emissions values for additional carriers were taken from the Connecticut Siting Council active database. Values in this database are provided by the individual carriers themselves.

All calculations were done with respect to uncontrolled / general public threshold limits.

Summary

All calculations performed for this analysis yielded results that were **within** the allowable limits for general public exposure to RF Emissions.

The anticipated maximum composite contributions from the AT&T facility as well as the site composite emissions value with regards to compliance with FCC's allowable limits for general public exposure to RF Emissions are shown here:

AT&T Sector	Power Density Value (%)
Sector 1:	5.68 %
Sector 2:	5.68 %
Sector 3 :	5.68 %
AT&T Maximum Total (per sector):	5.68 %
Site Total:	16.92 %
Site Compliance Status:	**COMPLIANT**

The anticipated composite MPE value for this site assuming all carriers present is **16.92%** of the allowable FCC established general public limit sampled at the ground level. This is based upon values listed in the Connecticut Siting Council database for existing carrier emissions.

FCC guidelines state that if a site is found to be out of compliance (over allowable thresholds), that carriers over a 5% contribution to the composite value will require measures to bring the site into compliance. For this facility, the composite values calculated were well within the allowable 100% threshold standard per the federal government.

4.0 STANDARD CONDITIONS FOR ENGINEERING SERVICES ON EXISTING STRUCTURES

The analysis is based on the information provided to Destek and is assumed to be current and correct. Unless noted otherwise, the structure and the foundation system are assumed to be in good condition, free of defects and can achieve theoretical strength.

It is assumed that the structure has been maintained and shall be maintained during its service. The superstructure and the foundation system are assumed to be designed with proper engineering practice and fabricated, constructed and erected in accordance with the design documents. Destek will accept no liability which may arise due to any existing deficiency in design, material, fabrication, erection, construction, etc. or lack of maintenance.

The analysis results presented in this report are only applicable for the previously mentioned existing and proposed additions and alterations. Any deviation of the proposed equipment and placement, etc., will require Destek to generate an additional structural analysis.

5.0 ANALYSIS AND ASSUMPTIONS

The structure is considered to have adequate strength for the proposed loading if the existing structural members that will be used to support the proposed equipment are structurally adequate per the applicable code criteria, or that the additions or alterations to the existing structure do not increase the force in any structural element by more than 5%.

This analysis was performed by utilizing Risa 3-D, a commercially available structural engineering software package by Risa Technologies, as applicable.

This analysis does not include an evaluation or qualification of the mounts supporting the existing and proposed equipment.

6.0 RESULTS AND CONCLUSION

Water Tank: The existing water tank is considered to have **adequate** structural capacity for the proposed additions by AT&T. Utilizing a conservative approach, seismic shear and moment are calculated to be 2.13 & 2.98 times higher than the wind shear and moment respectively, thus tank structural design is governed by seismic loads. The additional gravity load on the tank due to the existing equipment by others and AT&T additions are approximately 1.10% of the design gravity loads, less than 5%. Therefore, further analysis of the tank is not required and the structure is considered to have adequate capacity.

Therefore, the alterations proposed by AT&T **can** be implemented as intended and with the conditions and recommendations outlined in this report.

Should you need any clarifications or have any questions about this report, please contact Ahmet Colakoglu at (770) 693-0835 or acolakoglu@destekengineering.com.

Seismic Load per ASCE 7-02

The following variables will remain constant throughout the analysis of the water tank and the antennas/appurtenances:

			ASCE 7-02 Reference
Occupancy category:	IV		Table 1-1, pg. 3
Importance factor:	$I := 1.5$		Table 11.5-1, pg. 116
Spectral Parameters:	$S_s := 0.301$		Figure 22-1
	$S_1 := 0.066$		Figure 22-2
	$F_a := 1.546$	Site Class D assumed per code	Table 11.4-1, pg. 115
	$F_v := 2.4$		Table 11.4-2, pg. 115
	$S_{MS} := F_a \cdot S_s$	$S_{MS} = 0.465$	Eq. 11.4-1, pg. 115
	$S_{M1} := F_v \cdot S_1$	$S_{M1} = 0.158$	Eq. 11.4.2, pg. 115
	$S_{DS} := \frac{2}{3} \cdot S_{MS}$	$S_{DS} = 0.31$	Eq. 11.4-3, pg. 115
	$S_{D1} := \frac{2}{3} \cdot S_{M1}$	$S_{D1} = 0.106$	Eq. 11.4-4, pg. 115

Response Modification Factor: $R := 3$ — Table 15.4-1, pg. 162

Seismic Reponse Coeficient:

$$C_{s1} := \frac{S_{DS}}{\frac{R}{I}} \qquad C_{s1} = 0.1551$$

Computed from Equation 12.8-2, pg. 129.
Must be compared to max. and min. values.

Maximum Value of Cs:

Maximum value of Cs need not be greater than the value given by Equation 12.8-3:
$C_s = S_{D1}/T(R/I)$

Period Determination, T:
per Section 12.8.2, pg. 90

Structure Height:	$h_n := 108$	ft	
Coefficients:	$C_t := 0.02$		Table 12.8-2, pg. 129
	$x := 0.75$		Table 12.8-2, pg. 129
Approx. Fundamental Period:	$T_a := C_t \cdot h_n^{\ x} = 0.67$	sec	Eq. 12.8-7, pg. 129

The fundamental period should not exceed:

$C_u := 1.686$ — Table 12.8-1, pg. 129

$T_{max} := C_u \cdot T_a = 1.13$ sec — Section 12.8.2, pg. 129

Therefore,

$T := T_a \quad T = 0.67$ sec

Maximum Seismic Response Coeficient:

$$C_{s\_max} := \frac{S_{D1}}{T \cdot \left(\frac{R}{I}\right)} = 0.0788$$

Eq. 12.8-3, pg. 129

Minimum value for Cs:

Minimum value of Cs should not be taken less than:

Therefore, use:

$C_{s\_min} := 0.01$ — Eq. 12.8-5, pg. 129

$C_s := \min(C_{s1}, C_{s\_max}) = 0.0788$

$C_s := \max(C_s, C_{s\_min}) = 0.0788$

Seismic Base Shear: $F_{seismic\_tank} := LF_{Seismic} \cdot C_S \cdot Weight_{Tank} = 62 \cdot kip$ Eq. 12.8-1, pg. 89

Seismic Shear: $W_{add} := W_{ATT} + W_{OC1} = 12399\,lbf$

$F_{add} := LF_{Seismic} \cdot W_{add} \cdot C_s = 683.944\,lbf$

Shear Comparison: $\frac{F_{add}}{F_{seismic\_tank}} = 1.107 \cdot \%$ < 5% **==> OK**

Seismic Moment Comparison:

Seismic Moment: $$M_{add} := \left[\left(W_{ATT} - W_{addATTc}\right) \cdot 100ft + W_{addATTc} \cdot \frac{90ft}{2} \ldots + \left(W_{OC1} - W_{addOCc1}\right) \cdot 100ft + W_{addOCc1} \cdot \frac{90ft}{2} \right] \cdot C_s \cdot LF_{Seismic} = 49.554 \cdot kip \cdot ft$$

Moment Comparison: $\frac{M_{add}}{M_{seismic\_tank}} = 0.863 \cdot \%$ < 5% **==> OK**

The total mass with the existing and proposed antennas is increased by less than 5%, thus lateral seismic load and gravity load increase is less than 5%. No further analysis is required.
