Re: **Request of Cellco Partnership d/b/a Verizon Wireless for an Order to Approve the Shared Use of the Existing Long Ridge Fire Company Tower at 366 Old Long Ridge Road, Stamford, Connecticut**

Dear Ms. Bachman:

Pursuant to Connecticut General Statutes ("C.G.S.") §16-50aa, as amended, Cellco Partnership d/b/a Verizon Wireless ("Cellco") hereby requests an order from the Connecticut Siting Council ("Council") to approve the shared use by Cellco of an existing telecommunications tower at 366 Old Long Ridge Road in Stamford, Connecticut (the "Property"). The existing 152-foot tower and the Property are owned by the Long Ridge Fire Company ("LRFC"). Cellco requests that the Council find that the proposed shared use of the LRFC tower satisfies the criteria of C.G.S § 16-50aa and issue an order approving the proposed shared use.

Background

The LRFC owns and operates a 152-foot self-supporting lattice tower adjacent to its station house at the Property. The existing tower is shared by numerous entities, emergency service providers and four (4) commercial wireless service providers including AT&T, T-Mobile, Sprint and Air Touch. Equipment associated with each of the tower sharing entities is located either on the ground near the base of the tower or inside the LRFC building.

Cellco is licensed by the Federal Communications Commission ("FCC") to provide wireless services throughout the State of Connecticut. Cellco and the LRFC have agreed to the proposed shared use of the existing tower pursuant to mutually acceptable terms and conditions. The LRFC has authorized Cellco to apply for all necessary permits and approvals that may be required to share the existing tower. (*See* Owner's authorization letters included in Attachment 1).

Cellco proposes to install twelve (12) antennas and six (6) remote radio heads (RRHs) at a height of 98 feet above ground level on the LRFC tower. Equipment associated with Cellco's antennas will be located inside a newly constructed 12-foot x 14-foot equipment room located in modified space in the basement of the LRFC building. Two air conditioning condensing units would be installed at grade to the north of the LRFC building. Cellco will share the existing LRFC's back-up generator. Included in Attachment 2 is a set of project plans showing the location of all proposed site improvements.

C.G.S. § 16-50aa(c)(1) provides that, upon written request for approval of a proposed shared use, "if the council finds that the proposed shared use of the facility is technically, legally, environmentally and economically feasible and meets public safety concerns, the council shall issue an order approving such shared use." Cellco respectfully submits that the shared use of the tower satisfies these criteria.

A. Technical Feasibility. The existing LRFC tower is structurally capable of supporting Cellco's proposed improvements. The proposed shared use of this tower is, therefore, technically feasible. A Detailed Structural Analysis and Evaluation Report verifying the structural integrity of the tower, and its ability to support Cellco's antennas, RRHs and related equipment is included in Attachment 3.[1]

B. Legal Feasibility. Under C.G.S. § 16-50aa, the Council has been authorized to issue orders approving the shared use of an existing tower such as the LRFC tower. This authority complements the Council's prior-existing authority under C.G.S. § 16-50p to issue orders approving the construction of new towers that are subject to the Council's jurisdiction. In

[1] Please note that the October 31, 2014 Detailed Structural Analysis and Evaluation Report includes "proposed" facility modifications by Sprint and AT&T, in addition to Cellco. This tower share filing seeks approval, only for Cellco's antennas, RRHs and related equipment. AT&T and Sprint will seek separate antenna modification approvals in the future.

addition, § 16-50x(a) directs the Council to "give such consideration to other state laws and municipal regulations as it shall deem appropriate" in ruling on requests for the shared use of existing tower facilities. Under the statutory authority vested in the Council, an order by the Council approving the requested shared use would permit the Applicant to obtain a building permit for the proposed installations.

C. Environmental Feasibility. The proposed shared use of the LRFC tower would have a minimal environmental effect, for the following reasons:

1. The proposed installation of twelve (12) antennas and six (6) remote radio heads at the 98-foot level on the existing 152-foot tower would have an insignificant incremental visual impact on the area around the existing tower. (*See* Tower Elevation on Plan Sheet C-1 in Attachment 2). Cellco's equipment would be located in a newly constructed equipment room in the basement of the LRFC building. Cellco will share the existing LRFC generator on site. Cellco's shared use of this tower would therefore, not cause any significant change or alteration in the physical or environmental characteristics of the Property.

2. Noise associated with Cellco's air conditioning condensing units located adjacent to and north of the LRFC building was evaluated for compliance with State and/or local noise standards. According to the Noise Evaluation Report included in Attachment 4, noise from its air conditioning condensing units will not exceed State and/or local noise limits. As mentioned, Cellco will not install a new generator at the LRFC site, but will share the existing LRFC generator.

3. Operation of Cellco's antennas, in addition to all existing antennas on the LRFC tower would not exceed the RF emissions standards adopted by the Federal Communications Commission ("FCC"). Included in Attachment 5 of this filing is a Calculated Radio Frequency Emissions Report from C-Squared Systems, LLC confirming that, with the addition of Cellco's proposed antennas, the facility will operate well within (52.36%) the FCC's radio frequency emissions safety standards.

4. Under ordinary operating conditions, Cellco's proposed wireless facility would not require the use of any water or sanitary facilities and would not generate air emissions or discharges to water bodies or sanitary facilities. After construction is complete the proposed installations would not generate any increased traffic to the LRFC facility other than periodic (monthly) maintenance visits to the cell site.

The proposed shared use of the LRFC tower would, therefore, have a minimal environmental effect, and is environmentally feasible.

D. Economic Feasibility. As previously mentioned, Cellco has entered into agreements with the LRFC for the shared use of the existing facility subject to mutually agreeable terms. The proposed tower sharing is, therefore, economically feasible. (*See* Attachment 1).

E. Public Safety Concerns. As discussed above, the tower is structurally capable of supporting Cellco's full array of twelve (12) antennas, six (6) RRHs and associated equipment. Cellco is not aware of any public safety concerns relative to the proposed sharing of the LRFC tower. In fact, the provision of new and improved wireless service through shared use of the existing tower is expected to enhance the safety and welfare of area residents and members of the general public traveling throughout northern portions of Stamford.

Conclusion

For the reasons discussed above, the proposed shared use of the existing LRFC tower at 366 Old Long Ridge Road satisfies the criteria stated in C.G.S. § 16-50aa and advances the General Assembly's and the Council's goal of preventing the unnecessary proliferation of towers in Connecticut. The Applicant, therefore, respectfully requests that the Council issue an order approving the proposed shared use.

Thank you for your consideration of this matter.

Very truly yours,

Kenneth C. Baldwin

This structural re-analysis of the communications tower modification design was performed by URS Corporation (URS) for Verizon and Sprint. The purpose of this analysis was to investigate the structural integrity of the modified tower and reinforced foundation with its existing and proposed antenna loads. The analysis was conducted to evaluate stress on the modified tower and the effect of forces to the modified foundation of the tower resulting from existing and proposed antenna arrangements.

The analysis results presented herewith are based upon previous tower modification proposed by URS Corporations' tower modification analysis report, project 36922268, signed and sealed on June 13, 2013.

3. ANALYSIS METHODOLOGY AND LOADING CONDITIONS

The structural analysis was done in accordance with the 2005 Connecticut State Building Code, TIA/EIA-222-F - Structural Standard for Steel Antenna Towers and Antenna Supporting Structures, and the American Institute of Steel Construction (AISC) Manual of Steel Construction – Allowable Stress Design (ASD).

The analysis was conducted using TNX Tower 6.1.3.1. Two load conditions were evaluated as shown below which were compared to allowable stresses according to AISC and TIA/EIA.

Basic Wind Speed:

- Fairfield County; v = **85**mph (fastest mile) [Section 16 of TIA/EIA-222-F-1996]
- Stamford; v = 105mph (3 second gust) equivalent to 85mph (fastest mile) [Appendix K, 2005 Connecticut State Building Code Supplement]

Loading Cases:

Load Condition 1 = 85 mph (fastest mile) Wind Load (without ice) + Tower Dead Load
Load Condition 2 = 74 mph (fastest mile) Wind Load (with ice) + Ice Load + Tower Dead Load

Please note that wind pressure is a function of velocity squared. Under Load Condition 2, a 25 percent reduction in wind pressure is allowed by code to account for the unlikelihood of the full wind pressure and ice load occurring at the same time. The same results may be achieved by utilizing a lower wind pressure without taking the 25 percent reduction, as shown above.

The TIA/EIA standard permits a one-third increase in allowable stresses for towers and monopoles less than 700 feet tall. For the purposes of this analysis, in computing the load capacity the allowable stresses of the tower members were increased by one-third.

4. FINDINGS AND EVALUATION

Stresses on the modified tower structure were evaluated to compare with the allowable stress in accordance with AISC. The results of the analysis indicate that the calculated stresses under the proposed loading are **BELOW** the allowable stresses (see tables below). The modified tower foundation has sufficient capacity to resist the proposed uplift forces. The tower anchor bolts were found to be within the allowable limits.

5. CONCLUSIONS AND RECOMMENDATIONS

The results of the analysis indicate that the proposed modified tower structure and the proposed modified foundation components are in compliance with the proposed loadings. The proposed modified tower structure and proposed modified foundation components are considered structurally adequate with the wind classification specified above and all the existing and proposed antenna loading.

The analysis results presented herewith are based upon the previous tower modification proposed by URS Corporations' tower modification analysis report, project 36922268, signed and sealed on June 13, 2013. No installation of proposed antennas, mounts, cables of accessories shall occur prior to the completion of the tower and foundation modifications specified in the June 13, 2013 report. A copy of the reinforced drawings are included with this report.

Tower Input Data

The main tower is a 3x free standing tower with an overall height of 152.00 ft above the ground line.
The base of the tower is set at an elevation of 0.00 ft above the ground line.
The face width of the tower is 6.52 ft at the top and 20.78 ft at the base.
This tower is designed using the TIA/EIA-222-F standard.
The following design criteria apply:

Tower is located in Fairfield County, Connecticut.
Basic wind speed of 85 mph.
Nominal ice thickness of 0.500 in.
Ice density of 56 pcf.
A wind speed of 74 mph is used in combination with ice.
Temperature drop of 50 °F.
Deflections calculated using a wind speed of 50 mph.
A non-linear (P-delta) analysis was used.
Pressures are calculated at each section.
Stress ratio used in tower member design is 1.333.
Local bending stresses due to climbing loads, feed line supports, and appurtenance mounts are not considered.

Options

Consider Moments - Legs	Distribute Leg Loads As Uniform	Treat Feedline Bundles As Cylinder
Consider Moments - Horizontals	Assume Legs Pinned	Use ASCE 10 X-Brace Ly Rules
Consider Moments - Diagonals	√ Assume Rigid Index Plate	√ Calculate Redundant Bracing Forces
Use Moment Magnification	√ Use Clear Spans For Wind Area	Ignore Redundant Members in FEA
√ Use Code Stress Ratios	√ Use Clear Spans For KL/r	SR Leg Bolts Resist Compression
Use Code Safety Factors - Guys	Retension Guys To Initial Tension	√ All Leg Panels Have Same Allowable
Escalate Ice	Bypass Mast Stability Checks	Offset Girt At Foundation
Always Use Max Kz	Use Azimuth Dish Coefficients	√ Consider Feedline Torque
Use Special Wind Profile	√ Project Wind Area of Appurt.	Include Angle Block Shear Check
√ Include Bolts In Member Capacity	Autocalc Torque Arm Areas	Poles
√ Leg Bolts Are At Top Of Section	SR Members Have Cut Ends	Include Shear-Torsion Interaction
√ Secondary Horizontal Braces Leg	√ Sort Capacity Reports By Component	Always Use Sub-Critical Flow
Use Diamond Inner Bracing (4 Sided)	Triangulate Diamond Inner Bracing	Use Top Mounted Sockets
Add IBC .6D+W Combination	Use TIA-222-G Tension Splice Capacity Exemption

- Consider factored uplift for applications not involving allowable stress design:

202 K.IP x 1.4 = 283 K.IP

- Determine Anchor rod:
  - Page 18 (Williams Form Engineering Corp.)

Use 2 1/4"
(Yield) $P_n = F_y \times A_g = 128\ ksi \times 4.08\ in^2 \times 0.9 = 470\ K.IP$ (OK)
(Rupture) $P_n = F_u \times A_e = 150\ ksi \times (4.08\ in^2 - (0.2 \times 4.08\ in^2)) \times 0.75 = 367.2\ K.IP$ (OK)

Check 1 3/4"
(Yield) $P_n = F_y A_g = 128 \times 2.60\ in^2 \times 0.9 = 299.52\ K.IP$ (OK)
(Rupture) $P_n = F_u A_e = 150\ ksi \times (2.60\ in^2 - (0.2 \times 2.60\ in^2)) \times 0.75 = 234\ K.IP$ (NG)

- Determine Anchor Length:
  - Page 10 & 11 (Williams Form Engineering Corp.) "Free Stress Length"

U = 613 K.IP → 613 K.IP x 0.5 = 306.5 K.IP > 283 K.IP (OK)
F.S. = 0.5

Introduction

Cellco Partnership (d/b/a Verizon Wireless) has proposed a wireless communications facility utilizing 2 condensing units at grade. These units will be located at 366 Old Long Ridge Road, Stamford, CT. The noise evaluation report and the City of Stamford Noise Control Ordinance use a dBA scale. This scale is used because it closely approximates the response characteristic of the human ear to loudness, and is the scale most commonly used in the measurement of community noise.

Noise Regulations

The City of Stamford has enacted regulations which limit the amount of noise which may be transferred from one property to another. In pertinent part, the Regulations provide as follows:

Daytime hours are between 8a.m. and 8 p.m., Monday through Saturday, and the hours of 10 a.m. through 8 p.m. Sundays and federal and state holidays.

Nighttime hours are between 8 p.m. and 8 a.m., Sunday evening through Saturday morning except Saturday night shall mean the hours between 8 p.m. Saturday and 10 a.m. and federal and state holidays.

(Sec. 164-3 Definitions).

Noise Level Standards

The noise Emitters and the noise Receptors are in a residential noise zone. It shall be unlawful for any person to emit or cause to be emitted any noise beyond the property lines of his / her premises in excess of the following noise levels.

Zone in Which Noise Emitter is located	Allowable Levels Daytime Hours (dBA)	Allowable Levels Nighttime Hours (dBA)
Residential (Sec. 164-5 Noise Levels).	55	45

Noise Evaluation Results

	Projected Noise Levels (dBA)
Property Line	2 Condensing Units
North	38
South	40
East	45
West	33

The noise levels take into account the effect of acoustical shielding provided by other structures on the property.

Based on the projected noise levels from the 2 condensing units to each property line, I found that the noise levels meet the conditions for compliance as set forth in the noise regulations.

Note: With one condenser running, the condenser noise level will be reduced by 3 dBA.

Calculated Radio Frequency Emissions Report

1. Introduction

The purpose of this report is to investigate compliance with applicable FCC regulations for the proposed installation of Verizon Wireless antennas on the lattice tower located at 366 Old Long Ridge Road in Stamford, CT. The coordinates of the tower are 41° 09' 11.29" N, 73° 35' 33.69" W.

Verizon Wireless is proposing the following:

1) Install three 751MHz LTE antennas (one per sector);
2) Install three 875MHz CDMA/EVDO antennas (one per sector);
3) Install three 1900MHz LTE antennas (one per sector);
4) Install three 2100MHz LTE antennas (one per sector).

2. FCC Guidelines for Evaluating RF Radiation Exposure Limits

In 1985, the FCC established rules to regulate radio frequency (RF) exposure from FCC licensed antenna facilities. In 1996, the FCC updated these rules, which were further amended in August 1997 by OET Bulletin 65 Edition 97-01. These new rules include Maximum Permissible Exposure (MPE) limits for transmitters operating between 300 kHz and 100 GHz. The FCC MPE limits are based upon those recommended by the National Council on Radiation Protection and Measurements (NCRP), developed by the Institute of Electrical and Electronics Engineers, Inc., (IEEE) and adopted by the American National Standards Institute (ANSI).

The FCC general population/uncontrolled limits set the maximum exposure to which most people may be subjected. General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure.

Public exposure to radio frequencies is regulated and enforced in units of milliwatts per square centimeter (mW/cm^2). The general population exposure limits for the various frequency ranges are defined in the attached "FCC Limits for Maximum Permissible Exposure (MPE)" in Attachment B of this report.

Higher exposure limits are permitted under the occupational/controlled exposure category, but only for persons who are exposed as a consequence of their employment and who have been made fully aware of the potential for exposure, and they must be able to exercise control over their exposure. General population/uncontrolled limits are five times more stringent than the levels that are acceptable for occupational, or radio frequency trained individuals. Attachment B contains excerpts from OET Bulletin 65 and defines the Maximum Exposure Limit.

Finally, it should be noted that the MPE limits adopted by the FCC for both general population/uncontrolled exposure and for occupational/controlled exposure incorporate a substantial margin of safety and have been established to be well below levels generally accepted as having the potential to cause adverse health effects.

3. RF Exposure Prediction Methods

The emission field calculation results displayed in the following figures were generated using the following formula as outlined in FCC bulletin OET 65:

$$\text{Power Density} = \left(\frac{1.6^2 \times EIRP}{4\pi \times R^2} \right) \times OffBeamLoss$$

Where:

EIRP = Effective Isotropic Radiated Power

R = Radial Distance = $\sqrt{(H^2 + V^2)}$

H = Horizontal Distance from antenna in meters

V = Vertical Distance from radiation center of antenna in meters

Ground reflection factor of 1.6

Off Beam Loss is determined by the selected antenna patterns

These calculations assume that the antennas are operating at 100 percent capacity, that all antenna channels are transmitting simultaneously, and that the radio transmitters are operating at full power. As a result, the predicted signal levels reported below are much higher than the actual signal levels will be from the final site configuration.

4. Calculation Results

Table 1 below outlines the power density information for the site. Due to the directional nature of Verizon Wireless' proposed panel antennas, the majority of the RF power will be focused out towards the horizon. As a result, there will be less RF power directed below the antennas relative to the horizon, and consequently lower power density levels around the base of the tower. Please refer to Attachment C for the vertical patterns of Verizon Wireless' proposed panel antennas. The calculated results shown in Table 1 include a nominal 10 dB off-beam pattern loss to account for the lower relative gain below the antenna.

[1] Antennas heights for Verizon are based on the Verizon Wireless Antenna Recommendation, dated 12/15/2014.

[2] Please note that %MPE values listed are rounded to two decimal points. The total %MPE listed is a summation of each unrounded contribution. Therefore, summing each rounded value may not reflect the total value listed in the table.

5. Conclusion

The above analysis verifies that emissions from the final site configuration will be below the maximum power density levels as outlined by the FCC in the OET Bulletin 65 Ed. 97-01. The highest expected percent of Maximum Permissible Exposure at the base of the tower is **52.36% of the FCC Uncontrolled/General Population limit.**

6. Statement of Certification

I certify to the best of my knowledge that the statements in this report are true and accurate. The calculations follow guidelines set forth in ANSI/IEEE Std. C95.3, ANSI/IEE Std. C95.1 and FCC OET Bulletin 65 Edition 97-01.

[3] Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

[4] General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure.
