Re: **Sub-Petition No. 1133-VER-20220228 – Approved Modifications to the Flagpole Tower at 541 Broadbridge Road, Bridgeport, Connecticut**

Dear Attorney Bachman:

On April 8, 2022, the Siting Council (“Council”) approved the Cellco Partnership d/b/a Verizon Wireless (“Cellco”) Eligible Facilities Request (“EFR”) for modifications to the existing wireless base station at 541 Broadridge Road in Bridgeport. The modifications involved the replacement Cellco’s antennas and the expansion of the antenna screening shroud around the antennas at the top of the tower.

Following the Council’s approval of the EFR and the hand-off of the project to Cellco’s construction team, project construction engineers discovered that the diameter of the antenna mounting shaft and certain antenna mount designs referenced in the original November 19, 2021 Structural Analysis (“SA”) and January 12, 2022 Mounts Analysis (“MA”) were incorrect. Upon discovery of this error, Centek Engineering completed a new SA, dated November 1, 2022, and a new MA, dated October 21, 2022. The new SA and MA came to the same overall conclusion, confirming that the tower can accommodate the proposed facility modifications.

To avoid confusion during the Council’s “close out” of this project, I am enclosing copies of the November 1, 2022 corrected SA and the October 21, 2022 corrected MA for your records. Also enclosed is a set of Construction Drawings for the proposed facility modifications and facility improvements.

Melanie A. Bachman, Esq.

We respectfully request that Council staff acknowledge receipt of this modified information and, according to Condition No. 1 of the April 8, 2022 Council approval, approve this minor project change.

Please contact me with any questions.

Introduction

The purpose of this report is to summarize the results of the non-linear, P- Δ structural analysis of the antenna upgrade proposed by Verizon on the existing flagpole (tower) located in Bridgeport, Connecticut.

The host tower consists of three (3) 10-ft concealment canister sections supported on a 68.0-ft tall, two-section, eighteen sided, tapered monopole original designed by EEI jo no. 18280-D01 dated 04/25/2018. The tower geometry and structure member sizes were obtained the original design documents.

Antenna and appurtenance information were obtained from a Verizon RF data sheet.

The tower is made up of two (2) tapered vertical sections consisting of A572-65 sections. The vertical tower sections are slip joint connected. The diameter of the pole (flat-flat) is 35.5-in at the top and 45.00-in at the base.

Antenna and Appurtenance Summary

The existing, proposed and future loads considered in this analysis consist of the following:

- **VERIZON(EXISTING TO REMOVE):**
Antennas: Six (6) Commscope SBJAHH-1D65B-DL panel antennas with rad center elevation of $\pm 92\&82$ -ft above grade level.
Appurtenances: Three(3) Nokia B13 RRH 4x30 radio head units, three (3) Nokia B25 RRH 4x30 radio head units, three (3) Nokia B66A RRH 4x45 radio head units and twenty four (24) Kaelus QBC0002F1V51-1 Quadplexer.
- **VERIZON (Proposed):**
Antennas: Three (3) Commscope NNH4-65B-R6 panel antennas and three (3) JMA MX08FIT265-01 panel antennas mounted within a concealment canister with rad center elevations of $\pm 92\&82$ -ft above grade level.
Appurtenances: Three(3) Samsung RT-8808-77A radio head units, six (6) Commscope CBC61923T-DS-43 diplexers and one 6 OVP box.

Primary Assumptions Used in the Analysis

- The tower structure's theoretical capacity not including any assessment of the condition of the tower.
- The tower carries the horizontal and vertical loads due to the weight of antennas, ice load and wind.
- Tower is properly installed and maintained.
- Tower is in plumb condition.
- Tower loading for antennas and mounts as listed in this report.
- All bolts are appropriately tightened providing the necessary connection continuity.
- All welds are fabricated with ER-70S-6 electrodes.
- All members are assumed to be as specified in the original tower design documents or reinforcement drawings.
- All members are "hot dipped" galvanized in accordance with ASTM A123 and ASTM A153 Standards.
- All member protective coatings are in good condition.
- All tower members were properly designed, detailed, fabricated, installed and have been properly maintained since erection.
- Any deviation from the analyzed antenna loading will require a new analysis for verification of structural adequacy.
- All coax cables to be installed as indicated in this report.

A n a l y s i s

The existing tower was analyzed using a comprehensive computer program entitled tnxTower. The program analyzes the tower, considering the worst case loading condition. The tower is considered as loaded by concentric forces along the tower, and the model assumes that the tower members are subjected to bending, axial, and shear forces.

The existing tower was analyzed for the controlling basic wind speed with no ice and the applicable wind and ice combination to determine stresses in members as per guidelines of TIA-222-H entitled “Structural Standard for Antenna Support Structures, Antennas and Small Wind Turbine Support Structures”, the American Institute of Steel Construction (AISC) and the Manual of Steel Construction; Load and Resistance Factor Design (LRFD).

The controlling wind speed is determined by evaluating the local available wind speed data as provided in Appendix P of the CSBC¹ and the wind speed data available in the TIA-222-H Standard.

T o w e r L o a d i n g

Tower loading was determined by the basic wind speed as applied to projected surface areas with modification factors per TIA-222-H, gravity loads of the tower structure and its components, and the application of 1.0” radial ice on the tower structure and its components.

Load Cases:	<u>Load Case 1</u> ; 120 mph (Risk Cat II) wind speed w/ no ice plus gravity load – used in calculation of tower stresses and rotation.	<i>[Appendix P of the 2022 CT Building Code]</i>
	<u>Load Case 2</u> ; 50 mph wind speed w/ 1.00” radial ice plus gravity load – used in calculation of tower stresses.	<i>[Annex B of TIA-222-H]</i>

¹ The 2021 International Building Code as amended by the 2022 Connecticut State Building Code (CSBC).

Tower Capacity

- Calculated stresses were found to be within allowable limits.

Tower Section	Elevation (AGL)	Stress Ratio (percentage of capacity)	Result
Antenna Pole (Inside Canister – L3)	68.5' - 78.0'	93.1%	PASS
Pole Shaft (L6)	1.0' - 38.3'	35.5%	PASS

Foundation and Anchors

The existing foundation consists of a one (1) 6-ft Ø round x 18.75-ft tall pier. The existing foundation properties were obtained from the aforementioned design documents. The base of the tower is connected to the foundation by means of (6) 1.75"Ø, ASTM A615-75 anchor bolts embedded approximately 5.17-ft into the concrete foundation structure.

- The tower base reactions developed from the governing Load Case were used in the verification of the foundation and its anchors:

Location	Vector	Proposed Reactions
Base	Shear	12 kips
	Compression	14 kips
	Moment	668 kip-ft

- The foundation was found to be within allowable limits.

Foundation	Design Limit	Proposed Loading	Result
Reinforced Concrete Caisson	Moment Capacity	23.2%	PASS
	Lateral Deflection	0.27 in.	PASS

- The anchor bolts and base plate were found to be within allowable limits.

Tower Component	Design Limit	Stress Ratio (percentage of capacity)	Result
Anchor Bolts	Combined Axial and Bending	63.5%	PASS
Base Plate	Bending	60.8%	PASS

Conclusion

This analysis shows that the subject tower **is adequate** to support the proposed modified antenna configuration.

- Replacement of the top two (2) 10-ft concealment canisters with 10-ft x 48" diameter canisters (designed by others) is required to accommodate the proposed antennas.

The analysis is based, in part, on the information provided to this office by Verizon. If the existing conditions are different than the information in this report, Centek Engineering, Inc. must be contacted for resolution of any potential issues.

Please feel free to call with any questions or comments.

Program Options

Units Used in Computations - US Customary Units: Inches, Pounds

Basic Program Options:

Analysis Type 3:

- Computation of Nonlinear Bending Stiffness and Ultimate Bending Moment Capacity with Pile Response Computed Using Nonlinear EI

Computation Options:

- Only internally-generated p-y curves used in analysis
- Analysis does not use p-y multipliers (individual pile or shaft action only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix elements
- Output summary table of values for pile-head deflection, maximum bending moment, and shear force only
- Analysis assumes no soil movements acting on pile
- No additional p-y curves to be computed at user-specified depths

Solution Control Parameters:

- Number of pile increments = 100
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 1.0000E+02 in

Printing Options:

- Only summary tables of pile-head deflection, maximum bending moment, and maximum shear force are to be printed in output file.

 Pile Structural Properties and Geometry

- Pile Length = 225.00 in
- Depth of ground surface below top of pile = 9.00 in
- Slope angle of ground surface = 0.00 deg.

Structural properties of pile defined using 2 points

Point No.	Point Depth in	Pile Diameter in	Moment of Inertia in**4	Pile Area Sq.in	Modulus of Elasticity lbs/Sq.in
1	0.0000	72.00000000	1319167.	4071.5000	3604996.
2	225.0000	72.00000000	1319167.	4071.5000	3604996.

Please note that because this analysis makes computations of ultimate moment capacity and pile response using nonlinear bending stiffness that the above values of moment of inertia and modulus of are not used for any computations other than total stress due to combined axial loading and bending.

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer = 9.000 in
Distance from top of pile to bottom of layer = 210.000 in
p-y subgrade modulus k for top of soil layer = 0.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 0.000 lbs/in**3

NOTE: Internal default values for p-y subgrade modulus will be computed for the above soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer = 210.000 in
Distance from top of pile to bottom of layer = 240.000 in
p-y subgrade modulus k for top of soil layer = 0.000 lbs/in**3
p-y subgrade modulus k for bottom of layer = 0.000 lbs/in**3

NOTE: Internal default values for p-y subgrade modulus will be computed for the above soil layer.

(Depth of lowest layer extends 15.00 in below pile tip)

3	210.000	0.00000	40.00	-----	-----
4	240.000	0.00000	40.00	-----	-----

Notes:

- (1) Cohesion = uniaxial compressive strength for rock materials.
- (2) Values of E50 are reported for clay strata.
- (3) Default values will be generated for E50 when input values are 0.
- (4) RQD and k_rm are reported only for weak rock strata.

Loading Type

Static loading criteria was used for computation of p-y curves.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load Case Number 1

Pile-head boundary conditions are Shear and Moment (BC Type 1)

Shear force at pile head = 12000.000 lbs
Bending moment at pile head = 8016000.000 in-lbs
Axial load at pile head = 14000.000 lbs

Non-zero moment at pile head for this load case indicates the pile-head may rotate under the applied pile-head loading, but is not a free-head (zero moment) condition.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

Number of sections = 1

The sectional shape is a circular drilled shaft (bored pile).

Centek Project No. 21007.69

Dear Mr. Leone,

Centek Engineering, Inc. has reviewed the Verizon antenna installation at the above-referenced site. The purpose of the review is to determine the structural adequacy of the proposed three (3) antenna masts, Pipe 2.0 STD X 8- FT and three (3) antenna masts, Pipe 2.0 STD X 3- FT as detailed on the Centek Engineering construction drawings entitled “Verizon, Bridgeport NE CT, 541 Broadbridge Road Bridgeport, CT” issued 10/21/2022 (Rev. 1). The antennas are being proposed inside concealment canisters in an existing flagpole. The review considered the effects of dead load and ice load in accordance with the 2021 International Building Code as modified by the 2022 Connecticut State Building Code (CSBC), including ASCE 7-16 and ANSI/TIA-222-H *Structural Standards for Steel Antenna Towers and Supporting Structures*.

The loads considered in this analysis consist of the following:

- **Verizon:**
Antenna Masts: Three (3) Commscope NNH4-65B-R6 panel antennas, three (3) JMA MX08FIT265-01 panel antenna, three(3) Samsung RT-8808-77A RRU’s and six (6) Commscope CBC61923T-DS-43 diplexers the proposed antenna mounts inside concealments canisters with RAD center elevations of 92 ft +/- & 82 ft +/- AGL.

The antenna mount was analyzed per the requirements of the 2021 International Building Code as modified by the 2022 Connecticut State Building Code, considering a design ice thickness of 1.0 inch for Bridgeport as required in Annex B of the ANSI/TIA-222-H *Structural Standards for Steel Antenna Towers and Supporting Structures*.

Based on our review of the installation, it is our opinion that **the proposed antenna masts have sufficient capacity** to support the aforementioned antenna configuration. If there are any questions regarding this matter, please feel free to call.
