

Continuous Load Path: Wall Bracing

2009 International Residential Code

This program will look at:

- Building code requirements for wall bracing.
- Their differences from, and similarities to previous codes.
- Sections of code that pertain to building in New England.
- “Continuous load path” provisions of the code directly related to the wall bracing section.
- Common problem areas, such as framing sides of the garage door opening, walls with multiple windows, and two story walls.
- “Engineered solutions” or what to do when your plan falls outside of the *prescriptive* code.
- Software available to help determine the minimum wall bracing length requirements.

R106.1.1 Information on construction documents

- Where required by the Building Official, the following shall be identified on the construction documents:
- All pertinent information including, but not limited to:
 - Braced wall lines
 - Bracing methods
 - Location and length of brace wall panels
 - Foundation requirements

R301.2.1.1 Design criteria.

In regions where the basic wind speeds from Figure R301.2.1.1 equal or exceed 100 miles per hour, the design of building shall be in accordance with one of the following methods.

DELETE

(Add) APPENDIX R – WIND SPEEDS and SEISMIC DESIGN CATEGORIES

Municipality	Basic Wind Speed (3-second gust) (mph)	Seismic Design Category ¹	
		Site Class A-D	Site Class E
Andover	100	B	B

R602.10.1.2.1 Braced wall panel uplift load path.

1. Fastening in accordance with Table R602.3(1) where:

- 1.1. The basic wind speed does not exceed 90 mph (40 m/s), the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, or
- 1.2. The net uplift value at the top of a wall does not exceed 100 plf. The net uplift value shall be determined in accordance with Section R802.11 and shall be permitted to be reduced by 60 plf (86 N/mm) for each full wall above.

R602.10.1.2.1 Braced wall panel uplift load path.

2. Where the net uplift value at the top of a wall exceeds 100 plf (146 N/mm), installing approved uplift framing connectors to provide a continuous load path from the top of the wall to the foundation. The net uplift value shall be as determined in Item 1.2 above.

Standard for Residential Construction in High Wind Regions

307 SPECIAL PROVISIONS FOR WOOD STRUCTURAL PANEL WALL SHEATHING OR SIDING

307.1.4 Wood Structural Panel Sheathing or Siding Used to Resist Both Shear and Uplift: Wood structural panel sheathing or siding shall be permitted to be used in conjunction with the WFCM to resist shear and uplift simultaneously in accordance with this Section provided the following conditions are met in those areas:

1. Anchor bolt spacing shall be 16" or less on center.
2. 3" x 3" x 0.229 steel washers shall be used at anchor bolt locations.
3. Nails in any single row shall not be spaced closer than 3" on center.

307.1.4.1. From Tables 3.17A through 3.17E of the WFCM, select a sheathing construction using minimum 7/16" or 15/32" Wood Structural Panel sheathing that will provide required shear capacity.

307.1.4.2. From Table 2.2A of the WFCM determine the uplift load based on the wind speed and roof span.

307.1.4.3. From Table 307.5.1 determine the uplift capacity of the sheathing selected in accordance with 307.1.1, based on the alternate nail spacing in the top and bottom plates.

November 2006 130

307.1.4 Multiple rows of nails applied at panel ends and edges shall be installed in accordance with Figure 307.5.1.

307.1.4.5 Panels shall be of the minimum thickness of 7/16" and be installed as follows:

- a. Panels shall be installed with strength axis parallel to studs.
- b. All horizontal joints shall occur over framing and shall be attached per WFCM 3.2.
- c. On single story construction, panels shall be attached to bottom plates and top member of the double top plate. Lowest plate shall be attached to foundation with minimum 5/8" bolts with minimum embedment of 7" or connectors of sufficient capacity to resist the uplift and shear forces developed in the wood structural panel sheathed or sided walls.
- d. On two story construction, upper panels shall be attached to the top member of the upper double top plate and to sand joist at bottom of panel. Upper attachment of lower panel shall be made to sand joist and lower attachment made to lowest plate at first floor framing. Lowest plate of first floor framing shall be attached to foundation with minimum 5/8" bolts with a minimum embedment of 7" or connectors of sufficient capacity to resist the uplift and shear forces developed in the wood structural panel sheathed or sided walls.
- e. Where windows and doors interrupt wood structural panel sheathing or siding, framing anchors or connector shall be used to resist the appropriate uplift loads.

NEW! SDWF Structural Wood Screw For Floor-to-Floor Connections

The Simpson Strong-Tie® Strong-Drive® SDWF structural wood screw is designed to provide the floor-to-floor wind-uplift connections with providing superior performance over the life of the structure. The unique design of the SDWF provides the critical uplift and pull-out strength from the floor opening to the roof system and provides an air-tight floor-to-raft connection within the vertical load path of the structure.

The SDWF is designed to provide a full air seal that improves performance of the SDWF when installed between the same and the sole plate of the upper floor. As the structure settles because of shrinkage and construction loads, the threaded portion under the head of the screw catches up through the sole of the T&G, which is bonded with Simpson Strong-Tie Strong-Drive® SD screws. The interlock between the sole of the sole and under the T&G sole plate seal, providing a full air seal and maintenance-free air leakage compensation up to 1/2" per day.

FEATURES:

- Easy to install than other floor-to-floor connection methods - drive the screw, install the sole up member and the connection is made. Drive in place.
- Shrinkage compensation allows a tight connection even after initial shrinkage and settlement occur.
- Made from treated lumber, eliminating rot and work in the upper stories and enhancing air tightness.
- Installed with the drive before or after sheetrock installation is applied for added flexibility.
- One screw length can be used for multiple floor depths (refer to chart to select appropriate screw sizes), reducing the need for many screw lengths.
- The SDWF kit includes all required installation hardware.

WARNING: SDWF - contact with T&G - 1/2" gap.
FINISH: SDWF - C-Coat™ T&G - Galvanized
CODES: ICC-ES ESR-2026 (2009) / ICC-ES ESR-2028 (1/10)

Note: Stud to stud connections are required to complete the load path and are the responsibility of the designer.

Braced Walls

What is a “Braced Wall Line”?

What is a “Braced Wall Panel”?

Where do “Braced Wall Panels” go?

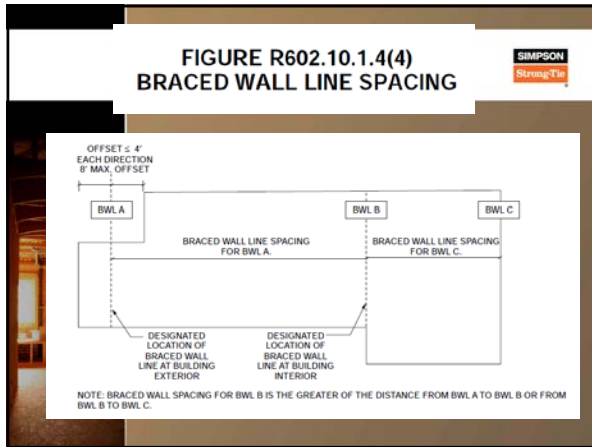

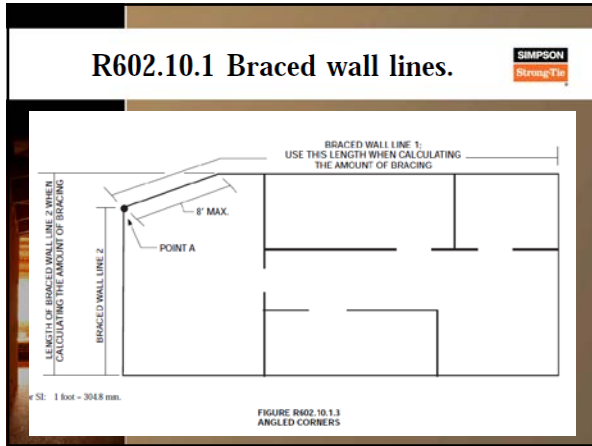

How much “Bracing” is required?

4 Easy Steps

1. Locate the Braced Wall Lines
 1. Maximum 60' O/C
 2. All Braced Wall Panels within 4' of the BWL
2. Determine minimum bracing length required for each line
 1. Determine the Bracing Method.
 2. Determine the BWL spacing
 3. Tables and adjustment factors
3. Locate the Braced Wall Panels within the line.
 1. Start within 12'-6" (total) of end of each Braced Wall Line
 2. Maximum 25' O/C
 3. Minimum Braced Wall Panel Length.
 1. Adjacent to window or door opening
 2. CS-PF, PF-HD, PF-G

4 Easy Steps

- If you do not have enough bracing available:
- **Start all over again!**
 - Add a Braced Wall Line
 - Use a different Bracing Method
 - Use an engineered Solution
 - Move, or remove windows and doors

R602.10.1.2 Length of bracing.

R602.10.1.2 Length of bracing. The length of bracing along each *braced wall line* shall be the greater of that required by the design wind speed and *braced wall line* spacing in accordance with Table R602.10.1.2(1) as adjusted by the factors in the footnotes or the Seismic Design Category and *braced wall line* length in accordance with Table R602.10.1.2(2) as adjusted by the factors in Table R602.10.1.2(3) or *braced wall panel* location requirements of Section R602.10.1.4. Only

Section R602.10.1.3. In no case shall the minimum total length of bracing in a *braced wall line*, after all adjustments have been taken, be less than 48 inches (1219 mm)

TABLE R602.10.1.2(1)^{A,B,C,D,E}—continued

		60	43.5	43.5	25.0	21.0

TABLE R602.10.1.2(1)^{A,B,C,D,E}—continued
BRACING REQUIREMENTS BASED ON WIND SPEED
(As a function of braced wall line spacing)

For 101 - 104 ft mean roof height, 1 wall per bay = 0.447 mph, 2 ground floor = 0.448 ft

a. Standard bracing lengths are based on Wind Exposure Category C, 20 ft mean roof height, 10 ft eave to ridge height, 10 ft wall height, and two braced wall lines extending from a given plan direction to a given story level. Methods of bracing shall be as described by Sections R602.10.1.2, R602.10.4 and R602.10.5. See exceptions shall be permitted.

b. For other mean roof heights and exposure categories, the required bracing length shall be multiplied by the appropriate factor from the following table:

NUMBER OF STOREYS	EXPOSURE HEIGHT FACTORS		
	Exposure B	Exposure C	Exposure D
1	1.0	1.2	1.5
2	1.0	1.2	1.6
3	1.0	1.4	1.7

c. For other roof to eave ridge heights, the required bracing length shall be multiplied by the appropriate factor from the following table: interpolation shall be permitted.

SUPPORT CONDITION	ROOF EAVE TO RIDGE HEIGHT		
	5 ft or less	10 ft	20 ft
Roof only	0.7	1.0	1.5
Roof + floor	0.45	1.0	1.1
Roof + 2 floors	0.9	1.0	1.1

d. For a maximum 5-foot wall height, multiplying the table values by 0.85 shall be permitted. For a maximum 8-foot wall height, multiplying the table values by 0.90 shall be permitted. For a maximum 12-foot wall height, the table values shall be multiplied by 1.1.

e. For three or more bays of wall lines in a given plan direction, the required bracing length on each braced wall line shall be multiplied by the appropriate factor from the following table:

NUMBER OF BRACED WALL LINES	ADJUSTMENT FACTOR
3	1.30
4	1.45
5	1.60

f. Bracing lengths are based on the application of ground-braced loads as required applied to the braced face of a braced wall panel. When ground-braced loads are applied to the inside face of braced wall panels, the adjusted lengths shall be multiplied by the appropriate factor from the following table:

BRACING METHOD	ADJUSTMENT FACTOR
Method LUB	1.8
Methods DWB, WSP, SFB, PBS, PCP, HPS	1.1

g. Bracing lengths for Method CB are based on the application of ground-braced loads on both faces of a braced wall panel. When Method CB is permitted on only one side of the wall, the required bracing amounts shall be doubled. When Method CB is used on wall panels attached to the structure with Section R602.10.2 pan braced at 8 inches on center at eave, ridge, on both top and bottom planes, and on braced wall panels attached to the structure by the required bracing percentage for wind load by 0.7 shall be permitted.

h. Method LUB bracing shall be ground braced attached to at least one side according to the Section R602.10.2 Method CB requirements.

i. Required bracing length for Methods DWB, WSP, SFB, PBS, PCP and HPS in braced wall lines is used to one story buildings and for the top story of two or three story buildings shall be permitted to be multiplied by 0.85 when an approved third story story with a maximum height (from base of 100 ft) is permitted.

R602.10.3 Minimum length of braced panels.

R602.10.3 Minimum length of braced panels. For Methods DWB, WSP, SFB, PBS, PCP and HPS, each braced wall panel shall be at least 48 inches (1219 mm) in length, covering

Exceptions:

- Lengths of braced wall panels for continuous sheathing methods shall be in accordance with Table R602.10.4.2.
- Lengths of Method ABW panels shall be in accordance with Sections R602.10.3.2.
- Length of Methods PFH and PFG panels shall be in accordance with Section R602.10.3.3 and R602.10.3.4 respectively.

R602.10.4 Continuous sheathing.

R602.10.4.1 Continuous sheathing braced wall panels. Continuous sheathing methods require structural panel sheathing to be used on all sheathable surfaces on one side of a braced wall line including areas above and below openings and gable end walls. Braced wall panels shall be constructed in accordance with one of the methods listed in Table R602.10.4.1. Different bracing methods, other than those listed in Table R602.10.4.1, shall not be permitted along a braced wall line with continuous sheathing.

R602.10.4.1.1 Continuous portal frame.

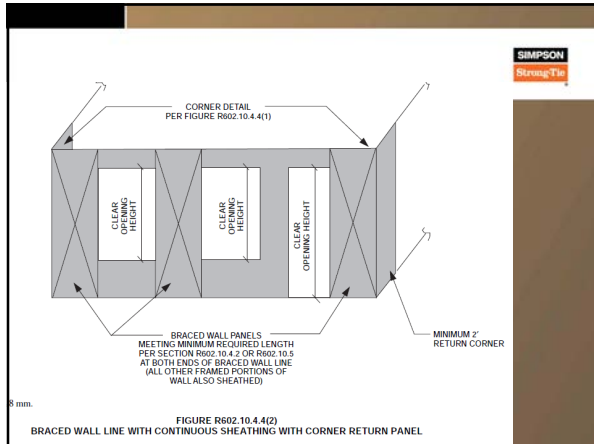

R602.10.4.1.1 Continuous portal frame. Continuous portal frame braced wall panels shall be constructed in accordance with Figure R602.10.4.1.1. The number of continuous portal frame panels in a single braced wall line shall not exceed four. For purposes of resisting wind pressures acting perpendicular to the wall, the requirements of Figure R602.10.4.1.1 and Table R602.10.4.1 shall be met. There shall be a maximum of two braced wall segments per header and header length shall not exceed 22 feet (6706 mm). Tension straps shall be installed in accordance with the manufacturer's recommendations.

Prescriptive Wall Bracing Methods – Narrow Alternatives Portal Frame with Hold-Downs – PFH

Figure R602.10.6.2 similar (minor differences)/2308.9.3.2 – (2006-2009),
Table R602.10.2 Intermittent Bracing Methods (Method – PFH, R602.10.3.3) (2009);

Min 1000 lb. strap (opposite sheathing)
Fasten sheathing to header with 8d common or galv. box nails in a 3" grid pattern and 3" o.c. into all framing
Min. 3/8" wood structural panel
Min. 4200 lb. embedded-strap type hold-down – can only be used in concrete, stem-wall or slab foundation.
Minimum Width: 16" for 1-story and 24" for 1st of 2-story
May replace 4' of required braced wall panel.
Specific requirements for splices

© Simpson Strong-Tie Company Inc.

SIMPSON Strong-Tie Overturning-Holdowns – Cast-in Place (STHD)

- Built in tab
 - Allows proper distance from form board
 - Keeps the hook from slipping, reduces spalling
- Countersunk nail holes
 - Less reveal
- Holes in the embedded area
 - Allows for more concrete cover
- Wider strap and staggered nail hole pattern
 - Allows proper nailing to double 2x's
- The curl on the sides of the hook makes the hook more rigid
 - Strap yields for the bend at the proper place
 - Reduces spalling at the top of the concrete
- The STHD14 meets the code requirement of a 4,200 lbs. embedded strap tie-down device.

R602.10.8 Panel joints.

R602.10.8 Panel joints. All vertical joints of panel sheathing shall occur over, and be fastened to common studs. Horizontal joints in braced wall panels shall occur over, and be fastened to common blocking of a minimum 1 1/2 inch (38 mm) thick.

Exceptions:

1. Blocking at horizontal joints shall not be required in wall segments that are not counted as braced wall panels.
2. Where the bracing length provided is at least twice the minimum length required by Tables R602.10.1.2(1) and R602.10.1.2(2) blocking at horizontal joints shall not be required in braced wall panels constructed using Methods WSP, SFB, GB, PBS or HPS.

1. Allowable loads have been increased for wind or earthquake load durations with no further increase allowed.
 2. Design and specify anchor bolt type, length, and embedment. Refer to our *Steel Construction Connection Catalog* for Simpson Strong-Tie IS, IS18, and P18 anchor bolt options.
 3. Fasteners connected to multiple members provided they are connected independently of the holdown fasteners.

TECHNICAL BULLETIN

Connector Solutions to Meet the Wall-Bracing Requirements of the 2009 International Residential Code*

Table 2: Embedded Strap-Style Holdowns

Holdown	Min. Wood Member Thickness ¹ (in.)	Tension (lbs.) (DF/SP/SP/RF) ^{2,3,4}	
		Midspan/Center	Endwall
LSTH24LSTH24RU	3.5	2720	2230
STH16LSTH16RU	3.5	4120	3140
STH16LSTH16RU	3.5	5340	4210

1. Allowable loads have been increased for wind or earthquake with no further increase allowed.
 2. Hold-downs must be installed in concrete or masonry. Refer to our *Steel Construction Connection Catalog* for Simpson Strong-Tie IS, IS18, and P18 anchor bolt options.
 3. Tension values apply to unbraced concrete in wind and low-seismic regions (see structure in seismic design categories A and B and detailed use and installation details in seismic design category C). For allowable load information for other applications, refer to current *Steel Construction Connection Catalog*.
 4. Tension values apply to minimum concrete strength of 2500 psi and minimum nominal width of 8" for values with minimum nominal width of 8" refer to current *Steel Construction Connection Catalog*.

1. Select strap from Table 3 based on capacity required.
 2. DR = Design required.

TECHNICAL BULLETIN
Connector Solutions to Meet the Wall-Bracing Requirements of the 2009 International Residential Code*

Narrow Bracing Alternatives
 In areas where window or door openings do not provide enough space to fit the code wall bracing options, consider using a code-listed shear wall product that meets the intent of the code while providing a narrow-wall solution, such as a Simpson Strong-Tie® Strong-Wall® shearwall (wood or steel).

Refer to the *Strong-Wall® Shearwalls Prescriptive Design Guide* for complete wall bracing replacement solutions, including anchorage.

Additional Bracing Considerations
 Other elements can influence wall-bracing requirements, such as construction in higher seismic design categories, installations with stone and masonry veneer, and braced wall panels located at exterior walls supporting roof rafters or trusses.

This technical bulletin is effective until December 31, 2013, and reflects information available as of January 1, 2012. This information is updated periodically and should not be relied upon after December 31, 2013; contact Simpson Strong-Tie for current information and limited warranty or see www.strongtie.com.

STEEL STRONG-WALL® STANDARD MODELS

Shear Walls – Overturning Strong-Frame™ Ordinary Moment Frame

Use when Strong-Wall panels do not work because SW panels are too wide, don't provide enough capacity or result in anchor tension loads that are too high.

- Pre-designed moment frame solutions
 - Sizes up to 16' wide and 19' tall
- 100% bolted connections
- Pre-installed wood nailers
- Frames fit in a standard 2x6 wall
- Pre-drilled holes for utilities
- Greater quality control
- Convenient to store, ship and handle
- Strong-Frame Selector software

STEEL STRONG-WALL® – SSWAB ANCHOR BOLTS

SSWAB anchor bolts in 1/2" and 1" diameters offer flexibility to meet specific project demands. Inspection is easy; the head is stamped with a "No Equal" symbol for identification, bolt length, bolt diameter, and optional "HS" for High Strength if specified.

MATERIAL: ASTM F1554 Grade 36; High Strength (HS) ASTM A149

FINISH: None. May be ordered hot-dip galvanized; contact Simpson Strong-Tie.

An additional nut for template installation is provided with each SSWAB. It may also be used for SSW installation.

Strong-Wall®: Cast-in-Place Anchorage

		60	43.5	43.5	25.0	21.0

TABLE R602.10.1.2(1)^{a, b, c, d, e}—continued
BRACING REQUIREMENTS BASED ON WIND SPEED
(as a function of braced wall line spacing)

SIMPSON
Strong-Tie

For S1: 1 foot = 304.8 mm, 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s, 1 pound force = 4.448 N.
^a Tabulated bracing lengths are based on Wind Exposure Category B, a 30-ft mean roof height, a 10-ft rafter to ridge height, a 10-ft wall height, and two braced wall lines sharing load in a given plan direction on a given story level. Methods of bracing shall be as described in Sections R602.10.2, R602.10.4 and R602.10.5. Interpolation shall be permitted.

NUMBER OF STORES	EXPOSURE/HEIGHT FACTORS		
	Exposure B	Exposure C	Exposure D
1	1.0	1.2	1.5

^f For other roof to eave ridge heights, the required bracing length shall be multiplied by the appropriate factor from the following table. Interpolation shall be permitted.

SUPPORT CONDITION	ROOF EAVE-TO-RIDGE HEIGHT			
	5 ft or less	10 ft	15 ft	20 ft
Roof only	0.7	1.0	1.3	1.6
Roof + floor	0.85	1.0	1.15	1.3
Roof + 2 floors	0.9	1.0	1.1	NP ^g

^g For a maximum 6-foot wall height, multiplying the table values by 0.95 shall be permitted. For a maximum 8-foot wall height, multiplying the table values by 0.95 shall be permitted. For a maximum 12-foot wall height, the table values shall be multiplied by 1.1.

^h For three or more braced wall lines in a given plan direction, the required bracing length on each braced wall line shall be multiplied by the following table:

NUMBER OF BRACED WALL LINES	ADJUSTMENT FACTOR
3	1.30
4	1.45
> 5	1.60

TABLE R602.10.4.2

*BWL "A" does not meet the minimum requirements to satisfy any of the code prescribed methods, including the "Portal Frame" methods. This wall must use an engineered solution. This can be a system analyzed and designed by an engineer for this specific building on this specific address, or a pre-manufactured shear wall system that meets or exceeds the requirements.

————— = Braced Wall Line #
 //////////////// = Braced Wall Panel Location
 * = 800# or 1,800# Hold Down Device

- Did we cover all these points?
- Building code requirements for wall bracing.
 - Their differences from, and similarities to previous codes.
 - Sections of code that pertain to building in New England.
 - "Continuous load path" provisions of the code directly related to the wall bracing section.
 - Common problem areas, such as framing sides of the garage door opening, walls with multiple windows, and two story walls.
 - "Engineered solutions" or what to do when your plan falls outside of the *prescriptive* code.
 - Software available to help determine the minimum wall bracing length requirements.
