

Connecticut Department of Energy and Environmental Protection

June 21, 2016 OTR Ozone Exceedances

By Michael Geigert

Connecticut Department of Energy and Environmental Protection

Summary

- Mostly Good to Moderate throughout the OTR, with USG around LIS;
- 4 sites in OTR reached USG.
 - 1. 4 sites above 70 ppb ozone NAAQS, 1 sites in CT
 - 2. 0 sites above (2008) 75 ppb ozone NAAQS, 0 sites in CT
 - 3. 0 sites above (1997) 84 ppb ozone NAAQS, 0 sites in CT

Tables of OTR and CT Monitoring Sites

Mostly Good to Moderate across the OTR with 4 USG exceedances

June 21, 2016 Peak East Coast Ozone

USG for Madison CT and three Long Island Monitors

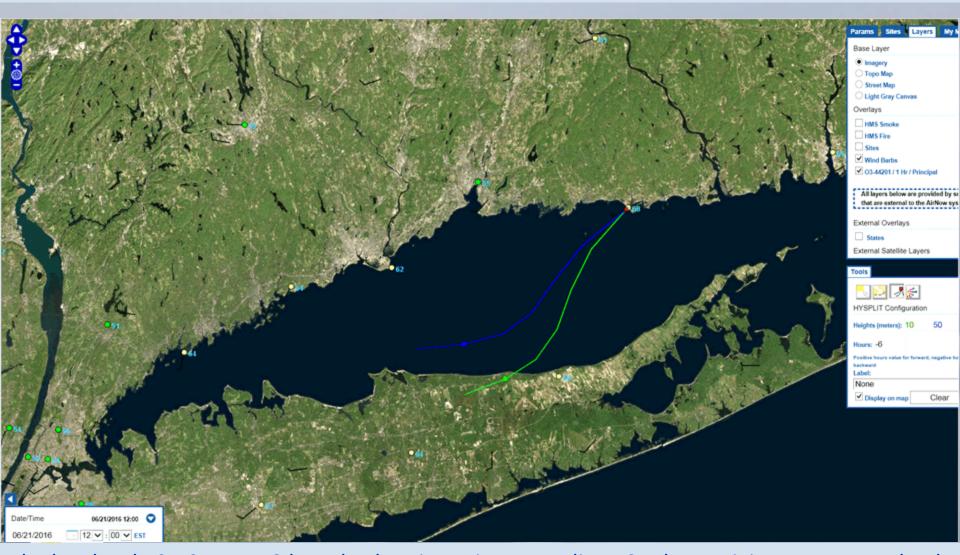

24-hr Back Trajectories 2:00 pm EST

The 100/500/1500 meters trajectories to Madison CT and Babylon NY originated over the Great Lakes. By early afternoon, the low level flow had shifted to the southwest, transporting ozone precursors from the NYC metro area into LIS.

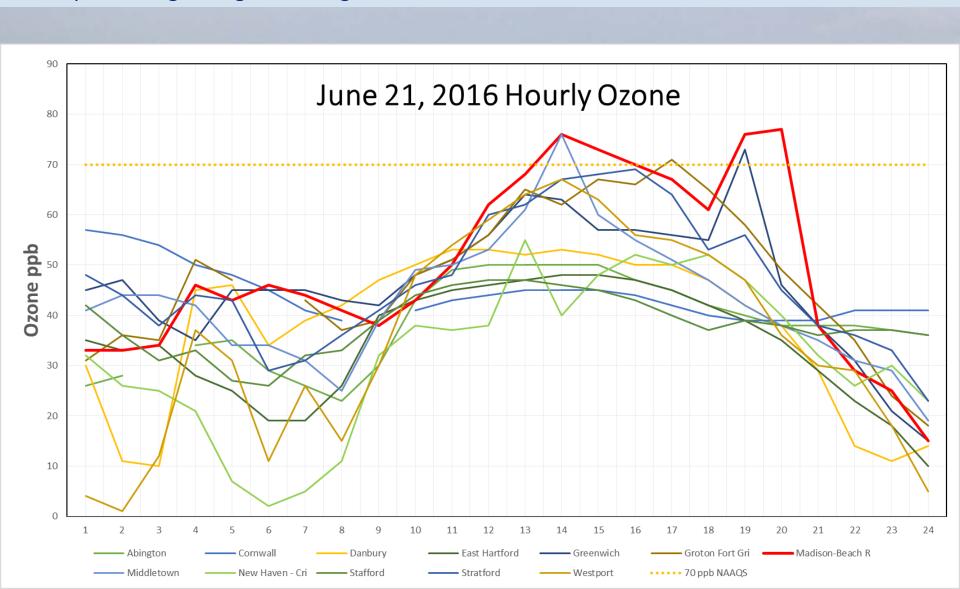

6-hr Back Trajectory Animation: 12:00-8:00 pm EST

The low level 10-50 meter 6-hour back trajectories to Madison CT show origins over Long Island and Long Island Sound. Frontal passage at 8:00 pm EST turns wind to northwest as ozone levels drop.

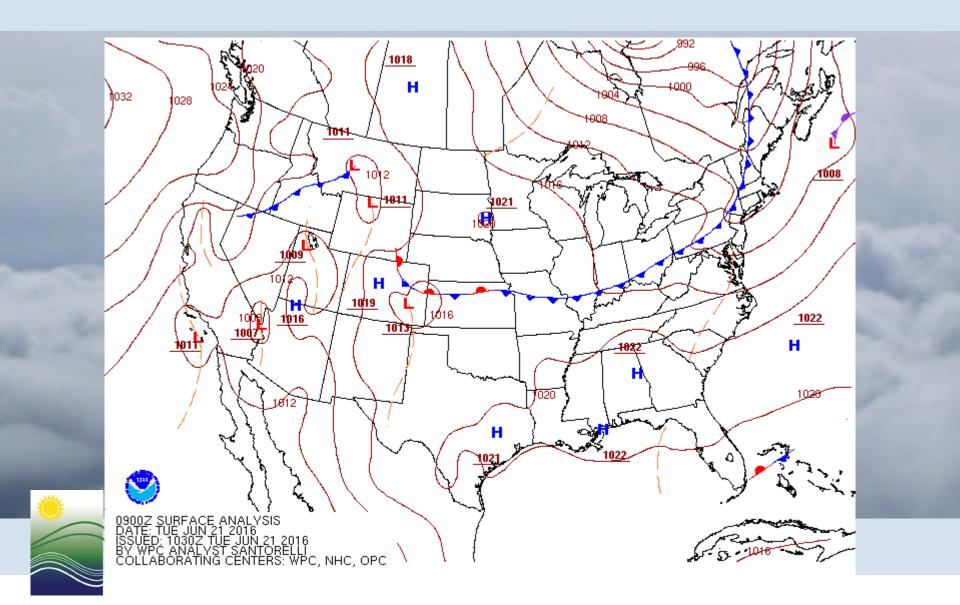

June 21, 2016 CT Ozone Monitors

Most CT sites had moderate ozone levels for several hours, however, Madison had a second ozone plume originating from Long Island Sound that caused it to exceed the NAAQS.

June 21, 2016 Surface Analysis (5:00am -11:00pm)

Cold front stalled along the coast, allowing ozone to build up over Long Island Sound

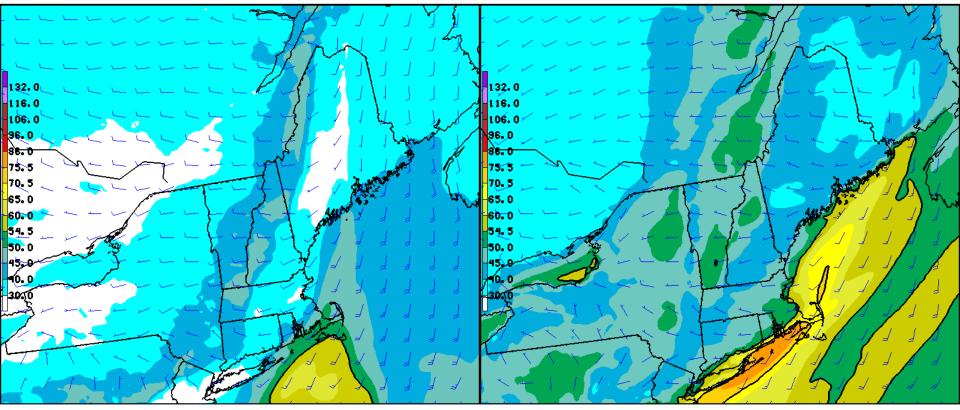

NOAA Ozone Model Animation

Model showed the ozone plume moving along the CT coast, but the 8-hour maximum predicted for Madison (2:00am update) was 61 ppb (moderate). The 8:00 am model update on June 21st predicted the Madison monitor to reach 70 ppb. This shows that the models have difficulty with this fast moving weather pattern.

Barons MAQSIP Ozone Model

The Barons models even showed more of an under prediction, making this a difficult exceedance to predict.

Connecticut Department of Energy and Environmental Protection

Conclusion

- Although models showed moderate levels along the CT coast, the stalled cold front allowed ozone to reach low USG at several sites along the Sound in NY and CT;
- The 8:00am NOAA run (available at 1:00pm), showed a near exceedance at Madison, but it was too late to forecast.
- This June weather pattern, which is more indicative of May, has
 featured an east coast trough with a fast moving jet stream in
 the vicinity. This makes exact forecasting for fronts a challenge.
