1200 Pennsylvania Ave. NW
Washington, DC 20460
Attention Docket ID No. EPA-HQ-OAR-2013-0743

Re: *Comments of the Connecticut Department of Energy and Environmental Protection on the 2011 Emissions Modeling Platform*

Dear Docket Administrator:

The Connecticut Department of Energy and Environmental Protection (DEEP) is pleased to have the opportunity to comment on the 2011 emissions modeling platform. We recognize the importance of the data in the modeling platform to air quality modeling that will be used to develop future air regulations, such as the next interstate transport rule, which will be crucial to Connecticut's ability to comply with current and future national ambient air quality standards. We thus provide these comments to improve the accuracy and specificity of the inventory data for Connecticut sources. Please note that submissions of data have been made directly to the Emissions Inventory System (EIS), as mentioned in association with each topic highlighted below.

General Comments

DEEP has three broad comments to make with respect to information DEEP has provided or intends to provide:

- DEEP has filed updated point source emissions in the EIS in support of a more accurate National Emissions Inventory (NEI) Version 2. These updated point source emissions represent minor corrections made by companies following the NEI Version 1 data snapshot.
- DEEP intends to provide an update of Stage 2 refueling emission estimates that does not use the MOVES default vapor control efficiency of 95%, which is too high for Connecticut. DEEP worked with EPA Region I to establish an appropriate vapor control efficiency value of 80% consistent with the inspection frequency of Stage 2 controls and exempt Stage 2 gasoline sales.
- DEEP intends to provide an update to the MOVES inputs to reflect revised information already supplied to the EPA's 2011 modelers plus a few additional minor corrections.

Specific Comments

DEEP offers the following comments on specific topics related to the 2011 emissions modeling platform. DEEP is particularly interested in emissions reporting for the electric generation sector (EGU) and several of the comments below are related to EGU emissions. DEEP believes the EGU sector emissions are improved by these comments and associated data, particularly with respect to EGUs that operate intermittently to meet peak electrical demand.

Continuous Emissions Monitoring System (CEMS) data differing from NEI values

EPA seeks comment on specific instances in which the NEI data and CEMS data are not consistent.

DEEP requests that EPA use NEI data for the electricity generating unit (EGU) point sources listed in the Attachment 1 tab of the attached workbook because NEI data represent more accurate annual emission estimates. As EPA notes, several units do not report annual CEMS data. Also, there are several units that do not have CEMS for sulfur dioxide. DEEP notes the following in explanation of some of the unit data in Attachment 1:

- ORIS 546 units 10 and 11 identifiers are missing from EPA's table but are provided in Attachment 1.
- DEEP has updated emissions for Waterbury Generation to account for emission calculation corrections implemented as a result of an inspection at the facility.
- ORIS and EIS identifiers are provided for the large generating units at Fusion Paperboard and Pfizer. This matching should be used to obtain any additional information needed from EIS and to avoid possible double counting of emissions. (Note that Pfizer and Fusion Paperboard are not EGUs, but are in EPA's Air Markets Program Data (AMPD) because they are Clean Air Interstate Rule sources.)

For some electrical generation peak demand units, the CEMS data are calculated by using default rates, so that is another source of discrepancy between CEMS data and NEI values. In the third tab of the attached workbook, DEEP has provided annual NO_x ton values for some of the units with emissions calculated by default rates.

There are some units listed in EPA's "CEMS data differing from NEI" spreadsheet that have emissions values missing from the 2011 NEI for EGUs. **DEEP requests that EPA include the EGUs listed in the Attachment 2 tab of the attached workbook with associated 2012 or 2011 SO₂ and NO_x emissions. When data are not available for 2011, 2012 emissions data are provided as a surrogate.**

Note that all missing information referred to in this comment has been submitted to the EIS.

Existing control techniques

EPA seeks comment on whether information on existing controls given in the inventory flat files is incomplete or erroneous. DEEP provides control device codes for the EGU point source emission units in the Attachment 4 tab of the attached workbook. Note that the ORIS 546 units 10 and 11 identifiers are missing from EPA's table. DEEP intends to submit control device code categories for other sectors of the NEI at a later date.

Also, EPA provides a control device code for Low Nitrogen Content Fuel, but does not appear to provide a control device code for Low Sulfur Content Fuel. Connecticut has many sources that use low sulfur content fuel, and there are likely many units in other states that also use low sulfur content fuel. **DEEP recommends that EPA provide a control device code for Low Sulfur Content Fuel.**

Boiler design capacity

EPA seeks comment on the design capacity as characterized in the DESIGN_CAPACITY and DESIGN_CAPACITY_UNITS columns of point source emission inventory flat files.

DEEP has submitted design capacities to EPA's EIS for combustion sources that were reported in 2011 or that were electrical generation peak demand units in 2011. These updated data are available in EIS. While the units of measure for the design capacity are often in MMBtu/hr, **DEEP recommends that EPA include the units of measure (i.e., the column designated DESIGN_CAPACITY_UNITS) in reports from EIS to assign the appropriate unit of measure to each design capacity.**

Stack parameter information

DEEP has added stack parameter information to EPA's EIS for electrical generation peak demand units. The Attachment 5 tab of the attached workbook provides a listing of the EIS identifiers for the 20 stacks.

Temporal allocation

In Attachment 3 of the attached workbook, DEEP provides 2011 temporal NOx information (NOx tons and fuel use) for some of the EGUs with emissions not included in the 2011 NEI as well as for some of the EGUs with emissions included in the 2011 NEI. All of these EGUs are peak demand units and generally operate only during periods of high electricity demand. Since NEI emission estimates can differ significantly from AMPD annual emission estimates, **DEEP recommends that EPA develop a plan for temporally allocating partial year (i.e., 6 months) AMPD reporters. Some of the partial year AMPD reporters may have emissions calculated by default rates or missing data algorithms, so DEEP recommends that EPA use actual state data in those instances, if state data are available.**

Unit retirements

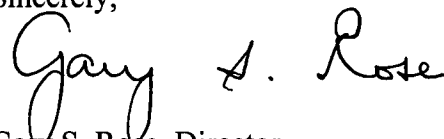

DEEP notes that the seven EGUs in the Attachment 6 tab of the attached workbook have retired and five of the seven units no longer have licenses to operate.

Unit assigned to the oil and gas sector

Connecticut has a single unit listed as being in the oil and gas exploration sector (i.e., an SCC beginning with 2310). SCC 31000307 appears to be the most appropriate SCC for this natural gas distribution processing facility operated by Iroquois Pipeline Operating Company. **DEEP recommends that EPA adjust the SCC for this unit to SCC 31000307 because the unit is a natural gas transmission relief valve process.**

Thank you for the opportunity to provide this information. Please do not hesitate to contact Richard Rodrigue (860-424-3429) should you have any questions concerning these comments.

Sincerely,

Gary S. Rose, Director
Engineering & Enforcement Division

cc: Richard Rodrigue, DEEP
