JOB 5: LONG ISLAND SOUND TRAWL SURVEY (LISTS)

OVERVIEW OF 2020 PROJECT RESULTS AND SPRING AND FALL SURVEY TIME SERIES

STUDY PERIOD AND AREA

The Connecticut DEEP Marine Fisheries Program did not complete its thirty-seventh year of the Long Island Sound Trawl Survey sampling in 2020. Due to the COVID-19 global pandemic, the State of Connecticut and CT DEEP instituted strict policies to prevent the spread of the virus as much as possible. These policies prohibited LISTS staff from working in the office and limited the crew size on the *R/V John Dempsey* to three (3) permanent staff members (no Seasonal Resource Assistants were allowed). Therefore, no sampling for Job 5 was completed in 2020. While working primarily from home, as much work as possible was completed, including ageing samples from previous years, fulfilling data requests, developing a post-processing QA/QC program, and database management.

The Long Island Sound Trawl Survey (LISTS) encompasses an area from New London to Greenwich, Connecticut and includes waters from 5 to 46 meters in depth in both Connecticut and New York state waters. Typically, Long Island Sound (LIS) is surveyed in the spring, from April through June, and during the fall, from September through October. This report includes results through the 2019 spring and fall sampling period (the most recent complete survey) and provides time series information since the commencement of the survey in 1984. The focus of this report is on the last year of sampling in 2019, however it also includes a summary and information on work completed during this last segment during the pandemic period.

GOAL

To provide long term monitoring of abundance, biomass and size composition of marine fishery resources along with environmental parameters, in order to evaluate the effects of fishing and environmental conditions on the distribution and abundance of living resources in Long Island Sound.

OBJECTIVES

- 1) Provide annual indices of counts and biomass per standard tow for 40 common species and age-specific indices of abundance for winter flounder, tautog, scup, summer flounder, bluefish (Age 0, 1+) and weakfish (Age 0, 1+).
- 2) Provide length-frequency distributions of bluefish, scup, summer flounder, winter flounder, tautog, striped bass, weakfish, black sea bass, and other ecologically important species.
- 3) Provide annual total counts and biomass for all finfish species taken and annual total biomass for all common macro-invertebrate species taken.
- 4) Provide species list for LIS based on LISTS sampling, noting the presence of additional species from other sampling conducted by the Marine Fisheries Programs.

- 5) Provide fishery independent survey data to cooperative state researchers or agencies, such as the National Marine Fisheries Service (NMFS), Atlantic States Marine Fisheries Commission (ASMFC), New England and Mid-Atlantic Fishery Management Councils (NEFMC and MAFMC, respectively), and researchers associated with state or local universities

INTRODUCTION

The Long Island Sound Trawl Survey (LISTS) was initiated in 1984 to provide fishery independent monitoring of important recreational species in Long Island Sound (LIS). A stratified-random design based on bottom type and depth interval was chosen and 40 sites were sampled monthly from April through November to establish seasonal patterns of abundance and distribution. Seven finfish species were initially of primary interest: bluefish, scup, striped bass, summer flounder, tautog, weakfish, and winter flounder. Length data for these species were collected from every tow; scup, tautog, and winter flounder were sampled for aging. Lobster were also enumerated and measured from every tow. All fish species were identified and counted.

Since 1984, several changes have been incorporated into the Survey. In 1991, the sampling schedule was changed to a spring/fall format, although sampling is still conducted on a monthly basis (April - June, September, and October). Beginning in 1992, species were weighed in aggregate with an onboard scale to provide indices of biomass. Furthermore, more species have been sampled for lengths, such as windowpane and fourspot flounders, and important forage species such as butterfish, long-finned squid, and several herring species. By 2003, the list of species measured expanded to 20 finfish species and two invertebrate species (lobster and long-finned squid), plus rarely occurring species. Beginning in 2014, lengths were collected from all finfish species on each tow. In addition, at various times during the time-series, age structures were collected from bluefish, menhaden, tautog, scup, winter flounder, weakfish or summer flounder. All of these changes serve to improve the quality and quantity of information made available to fishery managers for local and regional assessment of stock condition, and to provide a more complete annual inventory of LIS fishery resources.

METHODS

Sampling Design

LISTS is conducted from longitude 72° 03' (New London, Connecticut) to longitude 73° 39' (Greenwich, Connecticut). The sampling area includes Connecticut and New York waters from 5 to 46 m in depth and is conducted over mud, sand and transitional (mud/sand) sediment types. Sampling is divided into spring (April-June) and fall (Sept-Oct) periods, with 40 sites sampled monthly for a total of 200 sites annually. The sampling gear employed is a 14 m otter trawl with a 51 mm mesh codend (Table 5.1). To reduce the bias associated with day-night changes in catchability of some species, sampling is conducted during daylight hours only (Sissenwine and Bowman 1978).

LISTS employs a stratified-random sampling design. The sampling area is divided into 1.85 x 3.7 km (1 x 2 nautical miles) sites (Figure 5.1), with each site assigned to one of 12 strata defined by depth interval (0 - 9.0 m, 9.1 - 18.2 m, 18.3 - 27.3 m or, 27.4+ m) and bottom type (mud, sand, or transitional as defined by Reid et al. 1979). For each monthly sampling cruise, sites

are selected randomly from within each stratum. The number of sites sampled in each stratum was determined by dividing the total stratum area by 68 km² (20 square nautical miles), with a minimum of two sites sampled per stratum (Table 5.2, Gottschall et al. 2000). Discrete stratum areas smaller than a sample site are not sampled.

Sampling Procedures

Prior to each tow, temperature (°C) and salinity (ppt), conductivity (mS/m) and dissolved oxygen (mg/l) were measured using an YSI model EXO2 data sonde. 2017 was the first year the EXO2 sonde was used by LISTS, previously a hand-held YSI meter was used. The sonde records numerous water quality parameters while descending from surface to bottom and values are subsequently extracted at the depths most closely matching the 1m below surface and 0.5m above bottom depths used previously in the LISTS timeseries.

The survey's otter trawl was towed from the 15.2 m aluminum R/V John Dempsey for 30 minutes at approximately 3.5 knots, depending on the tide. At completion of the tow, the catch was placed onto a sorting table and sorted by species. Finfish, lobsters and squid were counted and weighed in aggregate (to the nearest 0.1 kg) by species with a precision marine-grade scale (30 kg, +/- 10 gm capacity). Catches weighing less than 0.1 kg were recorded as 0.1 kg. During the initial two years of the survey (1984 & 1985), lobsters were the only invertebrates recorded. Squid abundance has been recorded since 1986. Since 1992, additional invertebrate species have been weighed in aggregate, and some have been counted. The complete time series of species counted and weighed in the survey is documented in Appendix 5.4.

For all species where length was collected, electronic measuring boards were used to capture lengths to the millimeter. For finfish, either fork or total length was collected. Lobsters were measured to 0.1 mm carapace length. Squid were measured using the mantle length (mm), horseshoe crab measurements were taken using prosomal width (mm) and whelk (knobbed and channeled) shell widths were measured in millimeters. For analysis purposes, the lengths were put into centimeter grouped bins (e.g. measurements from 100 mm to 109 mm were processed as 10 cm).

The number of individuals measured from each tow varied by species, the size of the catch and range of lengths (Table 5.3). If a species was subsampled, the length frequency of the catch was determined by multiplying the proportion of measured individuals in each centimeter interval by the total number of individuals caught. Some species were sorted and subsampled by length group so that, for example, all large individuals were measured and a subsample of small (often young-of-year) specimens was measured. All individuals not measured in a length group were counted. The length frequency of each group was estimated as described above, i.e. the proportion of individuals in each centimeter interval of the subsample was expanded to determine the total number of individuals caught in the length group. The estimated length frequencies of each size group were then appended to complete the length frequency for that species. This procedure was often used with catches of bluefish, scup, and weakfish, which were usually dominated by young-of-year or discrete age/length classes.

Bluefish, menhaden, scup, summer flounder, tautog and winter flounder were sampled for age determination (Table 5.3). The target number of age samples (otolith) for bluefish were 50 from the spring period (defined by ASMFC Bluefish Technical Committee as Jan-July) and 50

from the fall period (August-December). However, bluefish catches are hard to predict so the number of age samples varied greatly; sometimes more than the target number was collected solely from LISTS samples but other times LISTS samples needed to be augmented with samples from the recreational fishery to meet the target number. Sufficient numbers of bluefish age samples from LIS would also make it possible to develop an LIS-specific age key, so bluefish age samples were sometimes still collected even after the target number was reached. Subsamples of scup, stratified by length group, were measured to the nearest mm (fork length) and scales from each individual were taken for ageing. Scup scales were removed posterior to the pectoral fin and ventral to the lateral line. The scales were pressed onto plastic laminate with an Ann Arbor roller press to obtain an impression of the scale, which was then viewed with a microfiche reader at 21x. Scales were also taken from a subsample of summer flounder stratified by length group of fish less than 60 cm and all fish greater than 59 cm. At least 15 scales were removed from the caudal peduncle area. These scales were pressed and aged to supplement the NMFS age key and were also included in the formulation of LISTS summer flounder catch-at-age matrix (see below). Subsamples of winter flounder, stratified by length group and area (as listed in bottom of Table 5.3), were iced and taken to the lab where they were measured to the millimeter (total length), weighed (gm) and sexed. Their maturity stage was determined (NMFS 1989), and otoliths were collected for age determination later. Amendment 2 of the ASMFC Atlantic menhaden Fishery Management Plan introduced a requirement of 10 fish for age samples per 300 metric tons landed in the commercial bait fishery to support improved stock assessments. Connecticut has such a small menhaden commercial fishery that one 10-fish sample would suffice. The same size/age component of the menhaden population taken in the commercial fishery was available to LISTS so menhaden scales were collected during LISTS sampling; 167 menhaden age samples were taken in 2019. LISTS age samples of menhaden provide one of the few fishery independent sources of age data for adult menhaden in northern waters and are therefore valuable for stock assessments. Menhaden fork length (mm) were recorded, and scales were taken about mid-body (lateral line) and below the insertion of the dorsal fin. The ASMFC Tautog Fishery Management Plan (FMP) requires CT DEEP to collect a minimum of 200 age structures per year. Due to the low numbers of tautog caught in LISTS in recent years (less than 250 fish), age structures were collected from most tautog taken in LISTS. Tautog were iced and taken to the lab, where their total length (mm), sex, and total weight (gm) were recorded and age structures were collected. LISTS has used opercula to age tautog since 1984 (Cooper 1967). The ASMFC Tautog Technical Committee requested that states collect paired age structures for comparison studies each year; therefore, LISTS began collecting tautog otoliths in addition to opercula in 2012. Results from an ASMFC Tautog Ageing Workshop in May 2012 indicated there was no clear benefit to switching from opercula to otoliths for Connecticut, so otoliths were collected (minimum of 50 paired structures per ASMFC) and archived for potential use in the future. Subsequent to the 2012 workshop, a study conducted by Massachusetts Division of Marine Fisheries showed pelvic fin spine sections may be a better structure (easier to read and non-lethal to collect) for ageing tautog (Elzey and Trull 2016). In 2016, LISTS started to collect tautog pelvic fin spines, archiving them for future ageing work.

In reports prior to 2001, three species were not included in annual and seasonal totals: American sand lance, bay anchovy, and striped anchovy. These species, with the possible exception of striped anchovy, can be very abundant in Long Island Sound, but are not retained well in the otter trawl. Additionally, many of these fish are young-of-year and often drop out of the net as it is retrieved and wound on the net reel. For this reason, they were not included in the

list of species to be counted when LISTS was started in 1984. However, to document the occurrence of these species in LISTS catches, American sand lance was added in 1994, striped anchovy was added in 1996, and bay anchovy was added in 1998. Since 2001, adults of these three species have been included in the annual and seasonal totals and young-of-year listed if present in the year's catch but are not quantified (Table 5.13, Appendix 5.4). Young-of-year for these three species are included in the database but are cataloged with a separate species identifier and quantities are considered estimates (Appendix 5.2).

Although endangered species research and monitoring work is not eligible for Sport Fish Restoration funding, there is the possibility of encountering protected species during the course of conducting the work authorized by this funding for eligible species. Aside from the handling and processing of incidental catches of protected species mandated by the NOAA Greater Atlantic Regional Fisheries Office (GARFO) Protected Species Division, no additional project resources are used on protected species work. Sampling procedures have been modified in recent years to minimize the likelihood of injury to Atlantic Sturgeon (a Federally listed endangered species since 2012). When sampling in a season and area where the chance of catching a sturgeon is high (based on historic LISTS catch) and water depth is greater than 27 m, gear retrieval speed is reduced to decrease the stress induced by rapid changes in pressure. When an endangered species is detected in the net, it is removed as quickly and carefully as possible. Subsequent handling and processing of endangered species adhere to the Reasonable and Prudent Measures as well as the Terms and Conditions specified in the ESA Section 7 Biological Opinion's Incidental Take Statement issued by NOAA for CT in January 2013 (http://www.greateratlantic.fisheries.noaa.gov/protected/section7/bo/actbiops/usfws_state_fisheries_surveys_2013.pdf). Additionally, handling and processing of sturgeon follow protocols described in A Protocol for Use of Shortnose, Atlantic, Gulf, and Green Sturgeons (Kahn and Mohead. 2010. U.S. Dep. Commerce, NOAA Tech Memo, NMFS-OPR-45, 62p., http://www.nmfs.noaa.gov/pr/pdfs/species/kahn_mohead_2010.pdf). Nine (9) Atlantic Sturgeon were captured on seven (7) of the 200 tows completed in 2019. No other protected species were encountered. All interactions with endangered species are detailed in Appendix 5.5.

Data Analysis

Indices of Abundance: Annual Mean Count and Weight per Tow

To evaluate the relative abundance of common species, an annual spring (April - June) and fall (September - October) geometric mean number per tow and weight per tow (biomass, kg) was calculated for the common finfish and invertebrate species. To calculate the geometric mean, the numbers and weight per tow were logged (\log_e) to normalize the highly skewed catch frequencies typical of trawl surveys:

$$\text{Transformed variable} = \ln(\text{variable}+1).$$

Means were computed on the log scale and then retransformed to the geometric mean:

$$\text{geometric mean} = \exp(\text{mean})-1.$$

The geometric mean count per tow was calculated from 1984 - 2019 for 38 finfish species, lobster, and long-finned squid (1986 - 2019). The geometric mean weight per tow was calculated using weight data collected since 1992 for the same species, plus an additional 13 invertebrates.

For the seven finfish species that were measured on every tow in the time-series (bluefish, scup, striped bass, summer flounder, tautog, weakfish, and winter flounder), biomass indices were calculated for the years 1984 - 1991 by using length/weight equations to convert length frequencies to weight per tow. Bluefish, scup, weakfish and winter flounder lengths were converted using equations from Wilk et al. (1978); striped bass conversions were accomplished using an equation from Young et al. (1994); summer flounder and tautog conversions were accomplished using equations developed from LISTS data from 1984 - 1987 and 1984 - 1996 respectively.

Indices of Abundance: Indices-at-Age and Age Group

Annual age specific indices (indices-at-age matrices) were calculated for scup, striped bass, summer flounder, winter flounder and tautog. The age data used to calculate the indices came from three sources: striped bass ages were derived using the von Bertalanffy (1938) equation; summer flounder age-length keys were obtained from the NMFS Northeast Fisheries Science Center spring and fall trawl surveys combined with LISTS ages (>59 cm); scup, winter flounder and tautog age-length keys (in 1 cm intervals) were obtained directly from LISTS and bluefish was derived using both ASMFC provided coastal keys for earlier years and LISTS keys since 2013. Since fish growth can fluctuate annually as a function of population size or other environmental factors, a year and season specific age-length key was used wherever possible. Once lengths had been converted to age, the proportion at age was multiplied by the abundance index of the appropriate season to produce an index of abundance at age.

Recruitment (young-of-year) and age 1+ (all fish age one and older) indices were calculated for weakfish by using observed modes in the LISTS length frequencies to separate the two groups. Prior to 2019, a recruitment index was similarly calculated for bluefish using modal length groups, however, the ASMFC bluefish Technical Committee has accepted and has used LISTS full index-at-age for assessment purposes since 2013. The bluefish index-at-age methodology is now presented and described below.

The specific methods used to calculate indices-at-age for each species were as follows:

- ◆ **Bluefish.** In 2012 a coast wide biological sampling program was initiated through ASMFC Addendum 1 of the bluefish management plan. This sampling program was initiated to address the lack of bluefish samples being collected by coastal states for use in the bluefish assessment. This was particularly a problem for the Northern States where few ages were available and contributing to the coastal key. Connecticut collected and aged bluefish samples in 1984, however few samples were collected annually after the initial Survey year. Since robust age-length keys were not available for the Long Island Sound region, until 2013, bluefish age keys for 1985-2012 were provided by the ASMFC Bluefish Technical Committee as combined coastwide annual keys for use to calculate indices-at-age for those earlier years. Currently the 1984 and the 2013-2019 index-at-age uses annual fall (Sept-Oct) age keys generated by CT LISTS ageing program. In 1984, 294 samples (scales) were aged and contributed to the key, along with 1,476 samples (otoliths) from the 2013-2019 period. In 2019, age samples were taken from 140 bluefish; one (1) from the spring period and 139 from the fall period.
- ◆ **Scup.** Scales from 627 scup were collected in 2019; 350 from the spring cruise and 277 from the fall cruise. Ageing is not yet complete for 2019. An index-at-age matrix was

developed for 1984-2019 using spring (May-June only) and fall (September-October) LISTS data (Table 5.1). April data was omitted since very few scup are taken during the month. A total of 15,852 scup aged between 1984 and 2018 were used to make year and season specific age-length keys (1 cm intervals). For 2019, a pooled three year key using 2016, 2017 and 2018 ages were used to calculate a preliminary 2019 index-at-age. Results will be updated when the 2019 ages are available. Prior to 2019, in the relatively few instances when the season/year specific key failed at a given 1 cm length interval, a three-year pooled key was used to determine the age. Three-year pooled keys were calculated using the years preceding and following the “run” year. For the terminal year, only two years were used for the pooled key. Indices-at-age were computed for both spring and fall each year. Since very few scup older than age 9 are taken (less than 4% in any given year), an age 10+ group was calculated by summing indices for ages 10 and up. To represent the full adult portion of the population an age 2+ index was calculated by summing the indices for ages 2 through 10+.

- ◆ **Striped bass.** To approximate the ages of striped bass taken in the spring survey (Table 5.22), the average of the Chesapeake Bay and Hudson River striped bass von Bertalanffy parameters ($L_{\max} = 49.9$ in, $K = 0.13$, $t_0 = 0.16$, Vic Crecco, pers. comm.) were used in the rearranged von Bertalanffy equation:

$$t = (1/K) * (-\log_e ((L_{\max} - L_t) / L_{\max})) + t_0$$

Since this equation estimates age t as a fraction of a year, the estimates were rounded to the nearest year (e.g. age 3 = ages 2.5 to 3.4). A spring catch-at-age matrix was developed for 1984 through 2019 by apportioning the spring index by the percentage of fish at each age (Table 5.23).

- ◆ **Summer flounder.** The year and season specific age-length keys (1 cm intervals) used to age LISTS catches were provided by NMFS from their spring and fall trawl surveys. These keys were supplemented with fish caught and aged by LISTS (typically 60 cm and over). LISTS also provides the age data from these fish (> 60cm) to NMFS. Only summer flounder greater than or equal to 60cm were sampled for age structures during the Spring 2017 LISTS cruise. Since the 2017 fall cruise, however, LISTS has also collected representative scale samples from smaller fluke to ensure a robust age-key once it became known that there would be no samples from NMFS for the fall 2017 period. The age-key was constructed using both LISTS and NMFS age data. In 2019, 576 summer flounder were aged: 419 from the spring (14 – 73 cm) and 157 from the fall (25 – 70 cm). Since 2001, whenever the season/year specific key failed at a given 1 cm length interval a pooled year key using only adjacent years was used (Gottschall and Pacileo 2002).
- ◆ **Tautog.** An index-at-age matrix was developed for 1984-2015 (Table 5.25). Annual keys were calculated by combining all months in a particular year since so few tautog are captured by LISTS. Preliminary aging from 2016 (n=276), 2017 (n=75), 2018 (n=201) and 2019 (n=274) has been completed but not validated. The index-at-age matrix will be updated upon completion of the validation and QA/QC.

- ◆ **Weakfish.** Age 0 and age 1+ indices were calculated for both spring (1984 – 2019) and fall surveys (1984 – 2009, 2011 - 2019) (Table 5.26). Since few weakfish are taken in April, the spring geometric mean was calculated using only May and June. All weakfish taken in spring are assumed to be age 1+. Similar to bluefish, the fall age 0 and 1+ indices were calculated by using length frequencies to separate the catch. Since a break in the fall length frequencies generally occurs between 24 and 32 cm each year (Table 5.57), weakfish less than 30 cm are considered to be age 0 while those greater than or equal to 30 cm are ages 1+.
- ◆ **Winter flounder.** An index-at-age matrix was developed for 1984-2019 using April and May LISTS data (Table 5.27). June data were not used since length frequency data suggest that many adult winter flounder have left the Sound by this time (an exception was made for 1984, the first year of LISTS, because very few samples were taken in the spring months). A total of 24,831 winter flounder aged between 1984 and 2019 were used to make year and region (east of Stratford Shoal, west of Stratford Shoal) specific age-length keys in 1 cm intervals. Similar to scup and summer flounder, three year pooled keys using only the adjacent years (two years for the terminal year runs) were used to assign ages if year specific keys were not available.

Each flounder aged as described above was also assessed for maturity stage by sex following Burnett (1989). CT DEEP staging of winter flounder was verified in a cooperative study with NMFS in 2009-2010 (Gottschall and Pacileo 2011). The percentage of male and female fish in each centimeter length group that was sexually mature (ripe, resting, or spent) was calculated in order to determine the length group at which 50% was mature each year.

Species Richness by Group

The Long Island Sound Trawl Survey monitors species richness using groups of species classified as either cold temperate or warm temperate. For the purposes of tracking species richness, American sand lance, bay anchovy, and striped anchovy were omitted (see *Sampling Procedures* section). All other finfish species captured in LISTS were divided into groups based on their temperature preferences and seasonal spawning habits as documented in the literature (Collette and Klein-MacPhee 2002, Murdy et al. 1997). Species in the cold temperate group prefer water temperatures below 15⁰C (60⁰F), tend to spawn at the lower end of their temperature tolerance range, and are more abundant north of Long Island Sound than south of New York. Species in the warm temperate group prefer warmer temperatures (11-22⁰C or 50-77⁰F), tend to spawn in the upper range of their temperature tolerance, and are more abundant south of the Sound than north of Cape Cod (Appendix 5.6). Species that are not tolerant of cold temperatures, are abundant only south of Chesapeake Bay but stray into northern waters mostly as juveniles, and spawn only in the mid-Atlantic Bight and south were placed into a separate group (subtropical) and were not included in the analysis because they are typically only present in the fall LISTS.

Open Water Forage Abundance

A Long Island Sound open water forage index of abundance was compiled to measure the available food base which supports resident and migratory species within the Sound. This index

is formulated as a biomass index that is assembled from 11 of the forage species that are most common in LISTS catches along with three other species that are considered forage at an early life stage (young-of-year or YOY). The species used to generate the index are: Atlantic herring, long-finned squid, butterfish, alewife, blueback herring, American shad, hickory shad, menhaden, whiting, spotted hake, and red hake along with young-of-year scup, bluefish, and weakfish (Figure 5.16). The geometric mean biomass is calculated using the aggregate of these 14 species on a per tow basis and calculated using the same methodology as described above for individual species biomass indices.

RESULTS AND DISCUSSION

Overview of 2020

Not surprisingly, the COVID-19 global pandemic up-ended the ‘normal’ ways in which the Long Island Sound Trawl Survey (LISTS) has been prosecuted from the previous 36 years. The State of Connecticut and CT DEEP instituted strict policies to prevent the spread of the virus as much as possible. These policies prohibited LISTS staff from working in the office and limited the crew size on the *R/V John Dempsey* to three (3) permanent staff members (no Seasonal Resource Assistants were allowed) in 2020. Therefore, no sampling for Job 5 was completed in 2020. While working primarily from home, as much work as possible was completed, including ageing samples from previous years, fulfilling data requests, developing a post-processing QA/QC program, database management, gear management and an analysis for 2021 sampling intensity.

Ageing backlog from previous years:

As a result of not conducting the Long Island Sound Trawl Survey sampling in 2020, ageing took priority and staff worked to process the 2019 samples as well as the backlog of samples from previous sampling years. A makeshift ageing lab was set up at staff residence as State derived COVID-19 protocols did not allow for entry to our facility ageing lab. Samples completed include Scup (2019 n=627), Bluefish (2019 n=140), Summer Flounder (2019 n=576), Winter Flounder (2019 n=302), and Tautog (2016 n=276, 2017 n=75, 2018 n=201, 2019 n=274). In addition to completing all 2019 age samples, staff participated in an ASMFC sponsored tautog ageing workshop and exchange. The purpose of this exchange was to compare accuracy and precision of three ageing structures between tautog ageing labs in hopes of determining whether spines are a viable ageing structure for this species. Paired samples of otolith, operculum and spines were provided by each state. Once the collection was combined, each participating state aged all three structures (n=215 samples). Results of that exercise to be released in 2021.

Gear Management:

At the end of the 2019 sample season, it was determined that the deck scale used to weight all the catch sampled aboard the *R/V John Dempsey* needed to be serviced. It was thought that cable connections from the scale platform to the scale head were occasionally causing irregular error messages. Staff corresponded with Marel scales and the company’s repair representatives to get the repairs completed. After replacing all the cables and connectors from the scale to the scale head all issues were resolved. This will be the primary scale used during the 2021 survey year.

Staff spent time coordinating with Levin Marine Supply Company during 2020 to build four new nets for future survey use. Description of the size and net style are incorporated in other portions of this report. These nets will be utilized during the 2021 sample season.

Post-processing QA/QC:

Since initiating a system to electronically record data while sampling in 2018, the procedures for error checking have evolved from looking for keypunch errors (dual entry), or errors occurring from calculations from subsampling, to new post processing procedures to handle changes that may be needed after the sample is electronically recorded. Any changes needed for a particular sample are subsequently captured in a metadata file and all original databases are maintained in a daily backup stored in a monthly folder. This maintains all original files and timestamps if needed during post-processing or needed in the future. There are two main onboard datasheets for handwritten notes taken during each sample. Appropriate notes are cataloged in one of the two deck sheets in the cases where either data needs to be changed or addressed in the database. Notes taken on these datasheets to address unusual events that have occurred during the tow such as gear interactions (not cataloged in the comments of the software program), unusual catches, or follow-up notes to help with analysis afterwards. Sometimes counts and other notes are recorded to confirm and check electronically recorded records. Final age sample tallies are recorded by species on one of the handwritten summary sheets as well for cataloging samples after being delivered to the lab each day.

Post processing files are created for each cruise by combining several Access databases if needed. Most changes as described above occur on the post processed file prior to making SAS datasets. Intermediate Excel files created from certain Access table level data are also utilized to help with post processing and error checking. A final annual SAS dataset is created and stored in the same format as in prior years so that users can continue to utilize time series analysis on all data. Furthermore, some of the same error checking SAS jobs that look for outliers and calculations of predicted weight per sample (by species) can be run to confirm recorded data is correctly cataloged. These procedures ensure that all data collected while onboard and all necessary changes needed are maintained with a record trail and can be accessed in the future (record and file level timestamps and through the use of metadata files).

Data requests:

Similar to 2019, in 2020, a significant amount of project staff time went toward fulfilling data requests for NOAA/NMFS, ASMFC, the New England and Mid-Atlantic Councils, several state agencies, Universities, and NGO's. More than thirty requests were fulfilled to these agencies and others in 2020.

2021 sampling intensity/planning:

In early 2021, the pandemic situation in CT had waned sufficiently for the Agency to increase the crew limit allowed on the *R/V John Dempsey* to five (5) permanent staff (still no seasonals). However, this is still less than the typical LISTS crew size (6-8). With the reduction in crew size mandated by COVID-19 restrictions, it would be unlikely the standard number of tows could be completed each month given the other limitations (day-light, number of work hours per day, number of days R/V is available, etc). Two mechanisms for reducing the amount of sampling to a manageable level with reduced staffing were considered: decreasing tow duration and decreasing number of tows per month.

Decreased Tow Duration: Tows of varying duration are present throughout the LISTS time-series. Standard LISTS protocols consider minimum acceptable tow duration to be 15 minutes and the catch from these “short” tows (any tow less than 30 minutes) are expanded to a “full” tow time of 30 minutes in the database. Standard LISTS protocols also do not distinguish between tows conducted in one part versus tows conducted in multiple parts (see Gottschall et. al. 2019 for discussion of short tows and multi-part tows). In this analysis of tow duration, only “short” tows of 15-20 minutes (inclusive) duration and “full” tows of 30 minutes duration were included. Additionally, only tows done in a single part were included; GPS towlogs were used to identify tows completed in one part. Since no GPS towlogs were recorded early in the time series, this precludes tows conducted prior to 1995 being used in the analysis. Tows were grouped into two categories for this analysis (30 minutes versus 15-20 minutes). Catch rates from tows with 15-20 minute durations were compared to catch rates from tows with 30 minute durations. Since planning discussions were focused on Spring sampling, Fall tows were not analyzed. And since April catches tend to be much different in species composition and abundance than May and June, no April tows were included. Ten of the more recreationally important or abundant species from the past few springs were selected to look for significant differences in catch rates using T-Tests. The test for equality of variances was used to determine whether to look at significance where variances were equal or unequal. Using 1,747 tows from May and June, differences in catch rates were statistically significant different ($Pr > |t| < 0.10$) for seven of the ten species: black sea bass, butterfish, northern sea robin, scup (porgy), striped bass, tautog (blackfish), and winter flounder. Catch rates were not statistically different ($Pr > |t| > 0.10$) for three of the ten species: summer flounder, smooth dogfish, and striped sea robin.

Decreased Number of Sites: Based on the staff resources available (only 5 permanent staff allowed onboard as compared to typical crew sizes of 6-8), it was determined that an approximately 20% reduction in sampling would be required in order to complete a monthly cruise in the number of days available for the survey. Standard LISTS sample design protocols randomly select 40 sites per month distributed proportionally among the strata based on area available for trawling with a minimum of two sites per stratum (see Table 2, Gottschall et.al. 2000). Systematically reducing the number of sites by approximately 20% while retaining the two sites per stratum minimum results in 33 sites per month, a 17.5% reduction.

It was decided that if a reduction in sampling was required based on CT DEEP COVID-19 policies in force at the time of sampling, reducing the number of sites per month to 33 was preferable to reducing tow duration to 15-20 minutes. These somewhat cursory analyses were suitable for the purposes of planning a temporary change to the LISTS survey design during a pandemic. However, if sustained changes to the standard LISTS survey design are contemplated in the future, more rigorous analyses should be conducted.

Overview of LISTS 2019 Spring and Fall Surveys (most recent year surveyed)

As noted in previous reports, the LISTS database of counts, weights and lengths were all collected electronically. This marks the second year in row in which the system was successfully used to capture all records electronically. Paper records were only used for ancillary notes (also known as metadata) and as a backup. See Job 6 in this report for details on the LISTS transition to electronic data acquisition.

April sampling started on April 10 and continued until May 1, completing 40 sites in nine (9) days underway. May sampling started on May 10 and continued until May 23, completing 40 sites in ten (10) days underway. June sampling began on June 4 and ended on June 24, taking ten (10) days underway to complete the 40 sites. The September Survey commenced on September 5 and concluded on September 26, completing 40 tows in twelve (12) days underway, not including six (6) days lost to inclement weather. The October Survey commenced on October 8 and concluded on October 30, completing 40 tows in ten (10) days underway, not including six (6) days lost to inclement weather. In total, 200 LISTS sites were completed in 51 days underway during the spring and fall 2019 surveys (Table 5.4), not including transit or changeover days.

Maps showing the sites selected versus the sites sampled during each month of sampling are provided in Figure 5.2 (April), Figure 5.3 (May), Figure 5.4 (June), Figure 5.5 (September) and Figure 5.6 (October). Within each figure the red bordered sites are the sites selected for the month and the solid blue dots indicate the actual sites sampled. If a site had to be relocated during sampling, an explanation of why it was moved is provided under the figure. Additional site/station information is provided in Table 5.5 (April), Table 5.6 (May), Table 5.7 (June), Table 5.8 (September) and Table 5.9 (October). These tables provide date of sample, time, tow duration, latitude/longitude, average tow speed, distance towed and approximate area swept for each tow. Surface, bottom temperature and salinity data were collected but not available at the time of this report.

Sometimes, a full 30-minute tow cannot be completed. Typical reasons for short tows include lack of room because of observed pot gear set in the immediate area, a drop in speed due to entanglement with some object on the bottom (frequently derelict pot gear), or a complete stop in forward motion (submerged wreck or rock pile). Survey crew will often attempt to finish an interrupted tow by clearing the net (if needed) and resetting beyond the obstruction or observed gear. If this is not possible, a site may have to be moved to another site nearby with the same stratum (bottom type and depth). If the site was moved, the data from the initial site will not be used. Typically, a minimum of 15-20 minutes of tow time is required for a LISTS tow to be recorded. However, there are occasions when a tow with less than 15 minutes will be accepted, usually because there is no alternate site in the designated strata in the vicinity. Short tow information for each month in the survey is summarized in Table 5.10.

Cooperative Sample and Data Collection

As resources permit, LISTS staff participate in cooperative efforts for sample collections, data requests, and special projects using survey personnel, equipment, and other resources. Most of these cooperative efforts are with state researchers or agencies such as the National Marine Fisheries Service (NMFS), Atlantic States Marine Fisheries Commission (ASMFC), New England and Mid-Atlantic Councils (Councils), and researchers or graduate students associated with state or local universities. In recent years, many requests for samples have also come from high schools, aquariums, or other educational organizations needing finfish and invertebrates for teaching purposes. Additionally, Fisheries Division staff often have sample or data requests for media or other public outreach events (see Job 11 of this report). In 2019, a significant amount of project staff time went toward fulfilling large data requests for NMFS, ASMFC, and the Councils. Samples were provided to NY Department of Environmental Conservation, NMFS, CT Health Department, University of Connecticut, Audubon and New England Science and Sailing.

Number of Species Identified

LISTS observed 56 finfish species in 2019 (Table 5.11). One new vertebrate species was encountered during the 2019 surveys, smooth puffer (*Lagocephalus Laevigatus*). From 1984 to 2019, LISTS has identified 112 finfish species (Appendix 5.1), averaging 57 species per year with a range of 43 to 70 species (Figure 5.7). In addition, a total of 41 types of invertebrates were collected in 2019 (Table 5.12). Most invertebrates are identified to species, however, in some cases, invertebrates were identified to genus or a higher level taxon.

Total Catch

Appendix 5.4 presents a time series (1984-2019) of the finfish species collected each year and their respective rank by numbers. Annual total biomass of invertebrates is also included in this appendix (1992-2019), ranked by weight (kg). A total of 133,439 finfish weighing 22,184.7 kg were sampled in 2019 (Table 5.13). In the spring of 2019, a total of 58,277 finfish weighing 14,803.0 kg were sampled and a total of 75,164 finfish weighing 7,381.7 kg were sampled in fall of 2019 (Table 5.14). A total of 1,176.2 kg of invertebrates were taken in 2019 (Table 5.13). The total biomass of invertebrate catch taken in the spring of 2019 was 569.5 kg while a total of 606.7 kg of invertebrates were taken in fall (Table 5.15).

Length Frequencies

Length frequency tables are provided primarily to give the reader an understanding of the size range of various species taken in LISTS. Lengths are converted to age frequencies for analysis of principal species such as scup, bluefish, striped bass, summer flounder, tautog, winter flounder, and weakfish. Changes such as an expansion in the size (age) range for some important recreational species are apparent in recent years including more large black sea bass (Table 5.37-5.38), scup (Table 5.51-5.52), and summer flounder (Table 5.55-5.56).

Length frequencies were prepared for 22 species:

alewife	spring and fall	1989 - 2019	Table 5.28;
American shad	spring and fall	1989 - 2019	Table 5.29;
American lobster	spring and fall (M&F)	1984 - 2019	Table 5.30-Table 5.34;
Atlantic herring	spring and fall	1989 - 2019	Table 5.35;
Atlantic menhaden	spring and fall	1996 – 2019	Table 5.36;
black sea bass	spring and fall	1987 – 2019	Table 5.37, Table 5.38
blueback herring	spring and fall	1989 - 2019	Table 5.39;
bluefish	spring and fall	1984 - 2019	Table 5.40, Table 5.41;
butterfish	spring and fall	1986 - 1990, 1992 - 2019	Table 5.42;
clearnose skate	spring and fall	1993 - 2019	Table 5.43, Table 5.44;
fourspot flounder	spring and fall	1989 - 1990, 1996 - 2019	Table 5.45;
hickory shad	spring and fall	1991 - 2019	Table 5.46;
horseshoe crab	spring and fall (M&F)	1998 - 2019	Table 5.47, Table 5.48;
long-finned squid	spring and fall	1986 - 1990, 1992 - 2019	Table 5.49, Table 5.50;
scup	spring and fall	1984 - 2019	Table 5.51, Table 5.52;
striped bass	spring and fall	1984 - 2019	Table 5.53, Table 5.54;
summer flounder	spring and fall	1984 - 2019	Table 5.55, Table 5.56;
tautog	spring and fall	1984 - 2019	Table 5.57, Table 5.58;
weakfish	spring and fall	1984 - 2019	Table 5.59, Table 5.60;
windowpane flounder	spring and fall	1989, 1990, 1994 - 2019	Table 5.61, Table 5.62;
winter flounder	April-May and fall	1984 - 2019	Table 5.63, Table 5.64;
winter skate	spring and fall	1995 - 2019	Table 5.65.

For the years where length data are available, length frequencies were prepared for the seasons or months for which the preferred indices of abundance and catch-at-age matrices are calculated; for some species length frequencies are provided for both seasons.

Seasonal Indices of Abundance

Relative indices of abundance, or the geometric mean counts per tow, were calculated from 1984-2019 for 38 finfish species plus lobster and long-finned squid (squid since 1986). All spring (April-June) and fall (September-October) data were used to compute the abundance indices presented in Tables 5.16 (spring) and 5.17 (fall), with the preferred seasonal index (for counts) denoted by an asterisk. Geometric mean biomass-per-tow indices have been calculated for 38 finfish and 15 invertebrate species (or species groups) since 1992, for both spring and fall (Table 5.18 and 5.19, respectively). Age specific indices of abundance were calculated for selected important recreational species, including scup, striped bass, summer flounder, and winter flounder (see below). Bluefish and weakfish recruitment indices were calculated using modal analyses of the length frequencies. For each of the 38 finfish species, plots including catch per tow in numbers and biomass in kilograms are illustrated in Figures 5.8 through 5.13. These figures also include plots of each of the age specific indices and recruitment indices mentioned above. Figure 5.14 provides plots of abundance (biomass) indices for crabs (lady, rock, spider; 1992-2019), American lobster (1984-2019), horseshoe crab (1992-2019), and long-finned squid (1986-2019).

Indices of Abundance: Important Recreational Species

Spring and fall abundance indices are presented in Tables 5.16-5.17. Indices of abundance at age were also calculated for seven important recreational species: bluefish (Table 5.20), scup (Table 5.21), striped bass (Table 5.22 age frequency, Table 5.23 indices at age), summer flounder (Table 5.24), tautog (Table 5.25), weakfish (Table 5.26) and winter flounder (Table 5.27). Bluefish and striped bass indices-at-age are based on the fall and spring surveys, respectively, whereas winter flounder indices-at-age are based on only the April and May cruises of the spring survey. Summer flounder, scup and weakfish indices-at-age are calculated and presented separately for each season. Modal distributions were used to calculate recruitment indices for bluefish and weakfish. Although age structures for bluefish are now being collected, it may take a few years before there is enough age data to construct a robust age key (see methods).

Species Richness by Group

The number of cold temperate and warm temperate species captured in each tow was averaged by seasonal cruise (April-June and September-October) for each year from 1984-2019 as an indicator of annual biological diversity or species richness. Trends in these indicators were tested for statistical significance by regression analysis. Results (Figure 5.18) show that the average number of warm temperate species captured/tow in spring and fall cruises has increased ($F=32.2$ and 86.7 respectively, $p<0.0001$); while the average number of cold temperate species has decreased, especially in spring ($F=52.5$, $p<0.0001$) but also in fall cruises ($F=20.2$, $p<0.0001$). Essentially, over the past couple decades, the finfish community structure in LIS has shifted away from the historical, two distinct winter-spring and summer-fall species assemblages and more toward a single spring-summer-fall species assemblage better adapted to the warming bottom water temperatures (Howell and Auster 2012).

MODIFICATIONS

Based on Agency guidelines for how many people could safely work aboard the *R/V John Demspey* while adhering to COVID-19 prevention protocols and on the analysis of tow duration versus catch estimates, sampling for LISTS in Spring of 2021 will most likely employ a reduced number of sites in any given month (rather than shorter tow durations). This approach will maintain the robustness of the LISTS sampling design and resultant data as much as possible given that reduced number of crew allowed on-board at any time will decrease the amount of sampling that can be completed.

TABLES 5.1 - 5.27
LISTS

Table 5.1. Specifications for the Wilcox 14 m high-rise trawl net and associated gear.

Component	Description
Headrope	9.1 m long, 13 mm combination wire rope
Footrope	14.0 m long, 13 mm combination wire rope
Sweep	Combination type, 9.5 mm chain in belly, 7.9 mm chain in wing
Floats	7 floats, plastic, 203 mm diameter
Wings	102 mm mesh, #21 twisted nylon
Belly	102 mm mesh, #21 twisted nylon
Tail Piece	76 mm mesh, #21 twisted nylon
Codend	51 mm mesh, #54 braided nylon
Ground Wires	18.2 m long, 6x7 wire, 9.5 mm diameter
Bridle Wires:	top legs 27.4 m long, 6x7 wire, 6.4 mm diameter
Bottom Legs	27.4 m long, 6x7 wire, 11.1 mm, rubber disc type, 40 mm diameter
Doors	Steel "V" type, 1.2 m long x 0.8 m high, 91 kg
Tow Warp	6x7 wire, 9.5 mm diameter

Table 5.2. The number of sites scheduled for sampling each month within the 12 depth-bottom type strata.

Bottom type	Depth Interval (m)				Totals
	0 - 9.0	9.1 - 18.2	18.3 - 27.3	27.4+	
Mud	2	3	5	5	15
Sand	2	2	2	2	8
Transitional	3	5	5	4	17
Totals	7	10	12	11	40

Table 5.3. Length and age data collected in 2019.

In addition to the species listed below, other rarely occurring species (typically totaling less than 30 fish/year each) were measured. During 2019, 18 other species were measured during LISTS sampling as either rarely occurring species or for other research related projects.

Species measured	Measurement	# tows/day	# fish measured
Alewife	FL (mm)	All	min of 15 / tow
American lobster	CL (0.1 mm)	All	min of 50 / tow
American shad	FL (mm)	All	min of 15 / tow
anchovy, bay	FL (mm)	All	min of 10 / tow
Atlantic herring	FL (mm)	All	min of 15 YOY and min of 30 adults / tow
Atlantic menhaden	FL (mm)	All	min of 15 / tow
Atlantic sturgeon	FL (mm)	All	All
Blueback herring	FL (mm)	All	min of 15 / tow
Bluefish	FL (mm)	All	min of 30 YOY / tow, all adults
black sea bass	TL (mm)	All	All
butterfish	FL (mm)	All	min of 15 YOY and 15 adults / tow
cunner	TL (mm)	All	All
dogfish, smooth	FL (mm)	All	All
dogfish, spiny	FL (mm)	All	All
fourspot flounder	TL (mm)	All	min of 30 / tow
hake, red	TL (mm)	All	min of 30 / tow
hake, silver (whiting)	TL (mm)	All	min of 30 / tow
hake, spotted	TL (mm)	All	min of 30 / tow
hickory shad	FL (mm)	All	All
hogchoker	TL (mm)	All	min of 30 / tow
horseshoe crab	PW (mm)	All	All
northern searobin	FL (mm)	All	min of 30 / tow
moonfish	FL (mm)	All	min of 10 / tow
smallmouth flounder	TL (mm)	All	min of 10 / tow
skate, clearnose	TL (mm)	All	min of 30 / tow
skate, little	TL (mm)	All	min of 30 / tow
skate, winter	TL (mm)	All	All
striped bass	FL (mm)	All	All
striped searobin	FL (mm)	All	min of 30 / tow
scup	FL (mm)	All	min of 15 YOY and 30 / mode for age 1+
long-finned squid	ML (mm)	All	min of 30 / tow
summer flounder	FL (mm)	All	All
tautog	TL (mm)	All	All
weakfish	FL (mm)	All	min of 15 YOY / tow, all adults
whelk , channeled	PW (mm)	All	All
whelk , knobbed	PW (mm)	All	All
windowpane flounder	TL (mm)	All	min of 50 / tow
winter flounder	TL (mm)	All	min of 100 / tow

Species aged	Structure	Subsample
bluefish	scales / otoliths	Collected each season. For each season, minimum of 50 scale and otolith samples collected from full length distribution. Spring collection may use other means of sampling to obtain the required minimum.
menhaden	scales	Collected each season. For each season, minimum of 50 scale samples collected from full length distribution.
scup	scales	Collected every month. For each month scales are taken from the following: 3 fish/cm <20 cm; 5/cm from 20-29 cm; and all fish > 30 cm.
summer flounder	scales	all fish > = 60 cm: for fish < 60 cm, scales collected from 3 fish / cm
tautog	opercular bones otoliths or pelvic fin rays	Collected from a minimum of 200 fish/year. collected from minimum 50 fish/year
weakfish	scales / otoliths	Ageing/collections discontinued in October 2014
winter flounder	otoliths	Collected during April and May from two areas in the Sound: eastern-central and western. For each month and area, subsamples are taken as follows: in the eastern-central area 7 fish / cm < 30 cm, 14 / cm from 30-36 cm, all fish > 36 cm. In the western area 5 fish / cm < 30 cm, 10/cm from 30-36 cm, all fish > than 36 cm.

Notes: min = minimum; YOY = young-of-year; FL = fork length; TL = total length; CL = carapace length; ML = mantle length; PW = prosomal width.

Table 5.4. Number of Long Island Sound Trawl Survey (LISTS) samples taken by year and cruise.

In 1984, thirty-five sites per monthly cruise from April through November were scheduled for sampling. Starting in 1985, forty sites per cruise were scheduled. In 1991, the Trawl Survey was modified to a spring (April - June) and fall (September - October) format--July, August and November sampling was suspended. In 1993 and 1994, an additional cruise of 40 sites was added to the fall period. The additional fall cruise was suspended in 1995. One hundred twenty tows were conducted in 2006 due to delays in rebuilding the main engine on the R/V John Dempsey (spring) and mechanical failure/overhaul of the hydraulic power take-off (fall). Delays in overhauling the transmission in the fall of 2008 resulted in missing September sampling. The June cruise and all of fall sampling in 2010 were canceled for an engine replacement in the R/V John Dempsey. Due to delays in engine replacement, begun in 2010 but not completed until late April 2011, April sampling in 2011 was abbreviated. In 2017, commencement of the spring survey was delayed until late-May due to repairs to the research vessel. In 2018, April sampling was curtailed due to delays in getting the Halon fire suppression system inspected/repared on the research vessel.

Table 5.7. Station information for LISTS June 2019.

Standard LISTS tows in the spring begin with SP and fall begins with FA. Latitude (N) and Longitude (W) are displayed in decimal degrees. Water temperature and salinity data are not yet available. Area swept is estimated by assuming the effective sweep is 2/3rds of the footrope length.

Table 5.9. Station information for LISTS October 2019.

Standard LISTS tows in the spring begin with SP and fall begins with FA. Latitude (N) and Longitude (W) are displayed in decimal degrees. Water temperature and salinity data are not yet available. Area swept is estimated by assuming the effective sweep is 2/3rds of the footrope length

Sample Number	Date	Site Number	Bottom Type	Depth Interval	Time Start	Duration (min)	Latitude	Longitude	S_Temp (sfc, C)	S_Salinity (sfc, ppt)	B_Temp (btm, C)	B_Salinity (btm, ppt)	Ave Speed (knots)	distance (nm)	Area Swept (sq.nm)

Table 5.10. Samples with non-standard tow durations and reasons for incomplete tows, spring and fall 2019.*Standard LISTS tows begin with SP (spring) or FA (fall).*

Sample	Date	Site	Bottom Type	Depth Interval	Time	Duration	Reason	Comments
April								
SP2019035	4/30/2019	06-14	M	2	14:09	21	Pots	Three part tow due to multiple pot interations.
SP2019038	5/1/2019	00-15	T	4	12:15	25	Ran out of room	
May								
SP2019061	5/17/2019	15-29	T	1	13:56	25	Ran out of room	Hung on string of old pots. Broke port wing cable.
SP2019067	5/21/2019	06-14	M	2	8:29	21	Pots	
June								
SP2019082	6/4/2019	05-30	S	3	10:07	23	Pots	Avoiding gear interation.
SP2019089	6/6/2019	14-37	T	4	15:26	26	Hang/Pots	Two part tow. Hung down, reset, slowed, hauledback.
SP2019113	6/20/2019	03-12	M	3	11:23	16	Pots	Two part tow. Gear on initial haulback.
SEPT								
FA2019030	9/19/2019	03-12	M	3	13:33	18	Hang	Hung after 18 minutes. Port side hang, but gear clean
OCT								
FA2019042	10/8/2019	17-40	T	2	9:35	28	Speed drop	Speed drop at start of boost (28 minutes). Gear clean upon retrieval.
FA2019068	10/25/2019	01-15	M	4	10:50	24	Speed drop	String of old gear on starboard wing
FA2019071	10/28/2019	03-13	M	3	8:41	25	Speed drop	Old gear outside of net, two pots outside the mouth of net had to be cut

Table 5.11. List of finfish species observed in 2019.

Fifty-six finfish species were observed in 2019. Since 1984, one hundred-twelve species of finfish have been identified in LISTS (see Appendix 5.1 for the full list of species).

Common Name	Scientific Name	Common Name	Scientific Name
anchovy, bay	<i>Anchoa mitchilli</i>	jack, crevalle	<i>Caranx hippos</i>
anchovy, striped	<i>Anchoa hepsetus</i>	kingfish, northern	<i>Menticirrhus saxatilis</i>
bigeye	<i>Priacanthus arenatus</i>	lizardfish, inshore	<i>Synodus foetens</i>
black sea bass	<i>Centropristis striata</i>	mackerel, Spanish	<i>Scomberomorus maculatus</i>
blue runner	<i>Caranx crysos</i>	menhaden, Atlantic	<i>Brevoortia tyrannus</i>
bluefish	<i>Pomatomus saltatrix</i>	moonfish	<i>Selene setapinnis</i>
butterfish	<i>Peprilus triacanthus</i>	perch, white	<i>Morone americana</i>
cod, Atlantic	<i>Gadus morhua</i>	pipefish, northern	<i>Syngnathus fuscus</i>
cusk-eel, fawn	<i>Lepophidium profundorum</i>	puffer, northern	<i>Sphoeroides maculatus</i>
dogfish, smooth	<i>Mustelus canis</i>	puffer, smooth	<i>Lagocephalus laevigatus</i>
dogfish, spiny	<i>Squalus acanthias</i>	ray, roughtail stingray	<i>Dasyatis centroura</i>
eel, American	<i>Anguilla rostrata</i>	rockling, fourbeard	<i>Enchelyopus cimbrius</i>
eel, conger	<i>Conger oceanicus</i>	sculpin, longhorn	<i>Myoxocephalus octodecemspin</i>
filefish, planehead	<i>Monacanthus hispidus</i>	scup	<i>Stenotomus chrysops</i>
flounder, fourspot	<i>Paralichthys oblongus</i>	searobin, northern	<i>Prionotus carolinus</i>
flounder, smallmouth	<i>Etropus microstomus</i>	searobin, striped	<i>Prionotus evolans</i>
flounder, summer	<i>Paralichthys dentatus</i>	sennet, northern	<i>Sphyraena borealis</i>
flounder, windowpane	<i>Scophthalmus aquosus</i>	shad, American	<i>Alosa sapidissima</i>
flounder, winter	<i>Pseudopleuronectes american</i>	shad, hickory	<i>Alosa mediocris</i>
goosefish	<i>Lophius americanus</i>	skate, clearnose	<i>Raja eglanteria</i>
hake, red	<i>Urophycis chuss</i>	skate, little	<i>Leucoraja erinacea</i>
hake, silver	<i>Merluccius bilinearis</i>	skate, winter	<i>Leucoraja ocellata</i>
hake, spotted	<i>Urophycis regia</i>	spot	<i>Leiostomus xanthurus</i>
harvestfish	<i>Peprilus paru</i>	striped bass	<i>Morone saxatilis</i>
herring, Atlantic	<i>Clupea harengus</i>	sturgeon, Atlantic	<i>Acipenser oxyrinchus</i>
herring, alewife	<i>Alosa pseudoharengus</i>	tautog	<i>Tautoga onitis</i>
herring, blueback	<i>Alosa aestivalis</i>	toadfish, oyster	<i>Opsanus tau</i>
hogchoker	<i>Trinectes maculatus</i>	weakfish	<i>Cynoscion regalis</i>

Names taken from: Common and scientific names of fishes from the United States, Canada and Mexico, Sixth Edition (Nelson et al. 2004).

Table 5.12. List of invertebrates observed in 2019.

In 2019, forty-one invertebrate "species" were identified. In most cases, invertebrates are identified to species; however, species that are very similar are identified to genus, and in difficult cases, to a higher taxon.

Common Name	Scientific Name	Common Name	Scientific Name
arks	<i>Noetia-Anadara spp.</i>	polychaetes	<i>Class polychfeta</i>
bryozoan, bushy	<i>Phylum Bryozoa</i>	sea cucumber	<i>Class Holothuroidea</i>
clam, hard clams	<i>Artica-Mercinaria-Pitar sp.</i>	sea grape	<i>Molgula spp.</i>
clam, surf	<i>Spisula solidissima</i>	sea urchin, green	<i>Strongylocentrotus droebach</i>
coral, star	<i>Astrangia poculata</i>	sea urchin, purple	<i>Arbacia punctulata</i>
crab, mud	<i>Family Xanthidae</i>	shrimp, coastal mud	<i>Upogebia affinis</i>
crab, Japanese shore	<i>Hemigrapsus sanguineus</i>	shrimp, ghost	<i>Gilvossius setimanus</i>
crab, blue	<i>Callinectes sapidus</i>	shrimp, mantis	<i>Squilla empusa</i>
crab, flat claw hermit	<i>Pagurus pollicaris</i>	shrimp, northern red	<i>Pandalus montagui</i>
crab, horseshoe	<i>Limulus polyphemus</i>	shrimp, sand	<i>Crangon septemspinosa</i>
crab, lady	<i>Ovalipes ocellatus</i>	slipper shell, common	<i>Crepidula fornicata</i>
crab, rock	<i>Cancer irroratus</i>	sponge spp.	<i>sponge spp.</i>
crab, spider	<i>Libinia emarginata</i>	sponge, deadman's fingers	<i>Haliclona spp.</i>
hydroid spp.	<i>hydroid spp.</i>	sponge, red bearded	<i>Microciona prolifera</i>
jelly, comb	<i>Phylum Ctenophora</i>	squid, longfin inshore	<i>Doryeuthis pealeii</i>
jelly, moon	<i>Aurelia aurita</i>	starfish spp.	<i>Asteriid spp.</i>
jellyfish, lion's mane	<i>Cyanea capillata</i>	Tubularia hydroids	<i>Tubularia, spp.</i>
lobster, American	<i>Homarus americanus</i>	whelk, channeled	<i>Busycotypus canaliculatus</i>
mussel, blue	<i>Mytilus edulis</i>	whelk, knobbed	<i>Busycon carica</i>
northern moon snail	<i>Lunatia heros</i>	worms, fan	<i>Myxicola infundibulum</i>
oyster, common	<i>Crassostrea virginica</i>		

Names taken from: A Field Guide to the Atlantic Seashore, Peterson Field Guide Series, 1978 (Gosner, 1978).

Table 5.13. Total number and weight (kg) of finfish and invertebrates caught in 2019.

Finfish species are in order of descending count. Invertebrate species are in order of descending weight (nc = not counted). Young-of-year anchovies and Gadids are neither separated by species nor quantified; young-of-year Atlantic herring and American sand lance are not quantified. Number of tows (sample size) = 200.

species	count	%	weight	%	species	count	%	weight	%
scup	53,617	40.2	11,169.4	50.3

Table 5.19. Finfish and invertebrate biomass indices for the fall sampling period, 1992-2019.

The geometric mean weight (kg) per tow was calculated for 38 finfish and 15 invertebrate species for the fall (Sept-Oct) sampling period. There was no fall sampling in 2010.

Table 5.20. Bluefish indices-at-age, 1984-2019.

The 1984 and the 2013-2019 index-at-age uses annual fall age keys generated by CT LISTS ageing program. Bluefish age keys for 1985-2012 were provided by the ASMFC Bluefish Technical Committee as a combined coastwide annual age keys to calculate LISTS indices-at-age for those earlier years.

Table 5.22. Age frequency of striped bass taken in spring, 1984-2019.

Ages were derived from trawl survey length data using the average of Hudson River and Chesapeake Bay von Bertalanffy parameters.

Note: number of fish taken but not measured = one in 1984, one in 1988, two in 1990.

Table 5.23. Striped bass indices-at-age, 1984-2019.

Spring length data was converted to ages using the average of Hudson River and Chesapeake Bay von Bertalanffy parameters (Vic Crecco, pers comm). Indices-at-age were then determined by apportioning the spring indices (from Table 5.18) by the percentage of fish in each age.

Year	Index	Spring

Table 5.24. Summer flounder indices-at-age, 1984-2019.

Year and season specific age keys obtained from the NMFS spring and fall surveys were used to convert LISTS length frequencies to ages. Starting in 2000 LISTS ageing data (60 cm and over) were added to the age key to supplement the older age groups. In 2015-2018, LISTS age data for smaller fish were also incorporated into the age key. Indices-at-age were determined for each season by apportioning the spring and fall overall indices (from Table 5.18 and Table 5.19) by the percentage of fish in each age.

Year	Spring

note: 1984-1999 indices-at-age were run using a GT 60cm group in the age key.

Table 5.25. Tautog indices-at-age, 1984-2015.

Year and season specific age keys obtained from the LISTS spring and fall surveys were used to convert LISTS length frequencies to ages. Indices-at-age were then determined for each season by apportioning the spring and fall overall indices (from Table 5.18 and Table 5.19) by the percentage of fish in each age, and then summing the spring and fall indices-at-age. The age 1-20+ index is the sum of indices ages 1 – 20+. The age 20+ category includes 36 fish ranging from 20 to 30 years of age.

Table 5.26. Weakfish age 0 and age 1+ indices of abundance, 1984-2019.

Using spring (May, June) and fall (September, October) length data, the geometric mean catch per tow was calculated for three groups of weakfish: fall age-0, spring - all fish age 1 and older (1+), and fall - all fish age 1 and older (1+). Weakfish less than 30 cm fork length in the fall were defined as age-0.

Year	Fall		Fall		Spring

Table 5.27. Winter flounder indices-at-age, 1984-2019.

The Long Island Sound Trawl Survey April and May catch and age data was used to calculate the geometric mean indices-at-age. An April-May age key was used to convert lengths to ages, and an overall April-May index (the ages 1-13 index in the table) was apportioned by the percentage of fish at age. The 4+ index is the sum of indices ages 4-13 and represents the abundance of winter flounder that are recruited to the fishery. The age-0 indices were obtained from the Estuarine Seine Survey (Job 8).

Year	Catch-at-age: numbers			April-May

Note years with non-standard # of tows: 1984: April = 0 tows, May = 13 tows, and 19 tows in June used to increase sample size; 1985: April = 0 tows, May = 41 tows; 1992 and 2006: April = 0 tows, May = 40; 1996: April = 17 tows, May = 63 tows; 2005: April = 35 tows, May = 45 tows; 2007: April = 35 tows, May = 45 tows; 2008: April = 36, and May = 44 tows; 2010: May = 38 tows; 2011: April = 12 tows; 2016: April = 36 tows; 2017: April = 0 tows, May = 24 tows; 2018: Apr=12 tows, May 40 tows.

**TABLES 5.28 - 5.65
LENGTH FREQUENCIES
LISTS**

Table 5.28. Alewife length frequencies, spring and fall, 1 cm intervals, 1989–2019.

From 1989 - 1990, lengths were recorded from the first three tows of each day; since 1991, lengths have been recorded from every tow.

length	Spring

Table 5.31. American lobster length frequencies-spring, female, 1 mm intervals, 1984-2019.

Lobsters were measured from each tow.

Table with columns for Female (1984-2019) and Spring (2001-2019) and rows for Length (16-112 mm). Includes a Total row and a legal size row.

Table 5.32. American lobster length frequencies—fall, female, 1 mm intervals, 1984–2019.

Lobsters were measured from each tow.

Table 5.35. Atlantic herring length frequencies, spring and fall, 1 cm intervals, 1989-2019.*From 1989 - 2013, Atlantic herring lengths were recorded from the first three tows of each day; since 2014, lengths have been recorded from every tow.*

Table 5.36. Atlantic menhaden length frequency, spring and fall, 1 cm intervals, 1996-2019.

Menhaden are scheduled to be measured from every tow. However, the following numbers of menhaden were not measured: 5 juveniles and 4 adults in 1996, and 7 adults in 1997.

Table 5.39. Blueback herring length frequencies, spring and fall, 1 cm intervals, 1989-2019.

From 1989 - 1990, lengths were recorded from the first three tows of each day; since 1991, lengths have been recorded from every tow.

Table 5.42. Butterfish length frequencies, 1 cm intervals, spring and fall, 1986-1990, 1992–2019.*Prior to 2014, length frequencies of butterfish were taken from the first three tows of each day; since 2014, lengths have been recorded from every tow.*

Table 5.45. Fourspot flounder length frequencies, spring and fall, 2 cm intervals (midpoint given), 1989, 1990, 1996-2019.
Prior to 2014, Fourspot flounder lengths were recorded from the first three tows of each day; since 2014, lengths have been recorded from every tow.

Table 5.46. Hickory shad length frequencies, spring and fall, 1 cm intervals, 1991-2019.

Hickory shad were measured from every tow, with the exception of one fish in each of fall 1996, fall 1997, and fall 1998.

Table 5.53. Striped bass length frequencies, spring, 2 cm intervals (midpoint given), 1984–2019.

All striped bass taken in the Survey were measured, with the exception of one fish taken in 1984, one in 1988, and two in 1990.

Table 5.56. Summer flounder length frequencies, fall, 1 cm intervals, 1984-2019.

All summer flounder taken in the Survey were measured, with the exception of two fish in 1985.

Table 5.60. Weakfish length frequencies, fall, 2 cm intervals (midpoint given), 1984-2019.

Weakfish were measured from every tow, with the exceptions of 968 juveniles in 1988 and 863 juveniles in 1989 that were not measured.

Table 5.61. Windowpane flounder length frequencies, spring, 1 cm intervals, 1989, 1990, 1994-2019.

Prior to 2014, lengths were recorded from the first three tows of each day; since 2014, lengths have been recorded from every tow.

Table 5.62. Windowpane flounder length frequencies, fall, 1 cm intervals, 1989, 1990, 1994-2019.

Prior to 2014, lengths were recorded from the first three tows of each day; since 2014, lengths have been recorded from every tow.

Table 5.65. Winter skate length frequencies, spring and fall, 2 cm intervals (midpoint given), 1995-2019.

Winter skate were scheduled to be measured from every tow. However, the following numbers of skate were not measured: 4 in 1995, 10 in 1996, and 2 in 1997.

**FIGURES 5.1 - 5.18
LISTS**

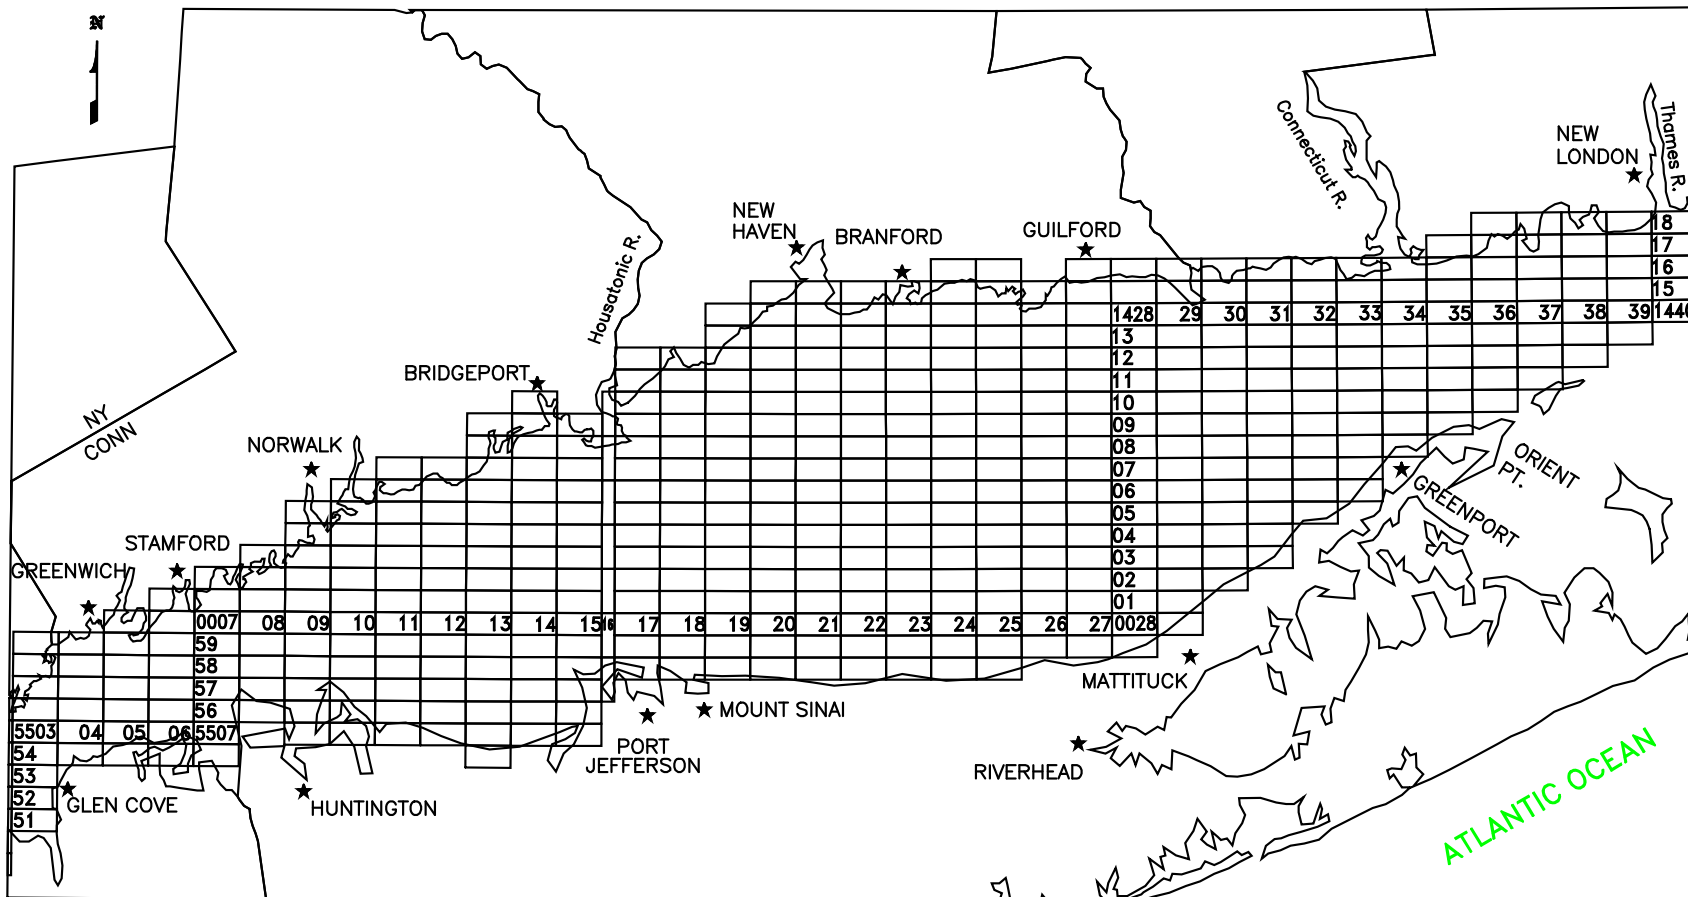

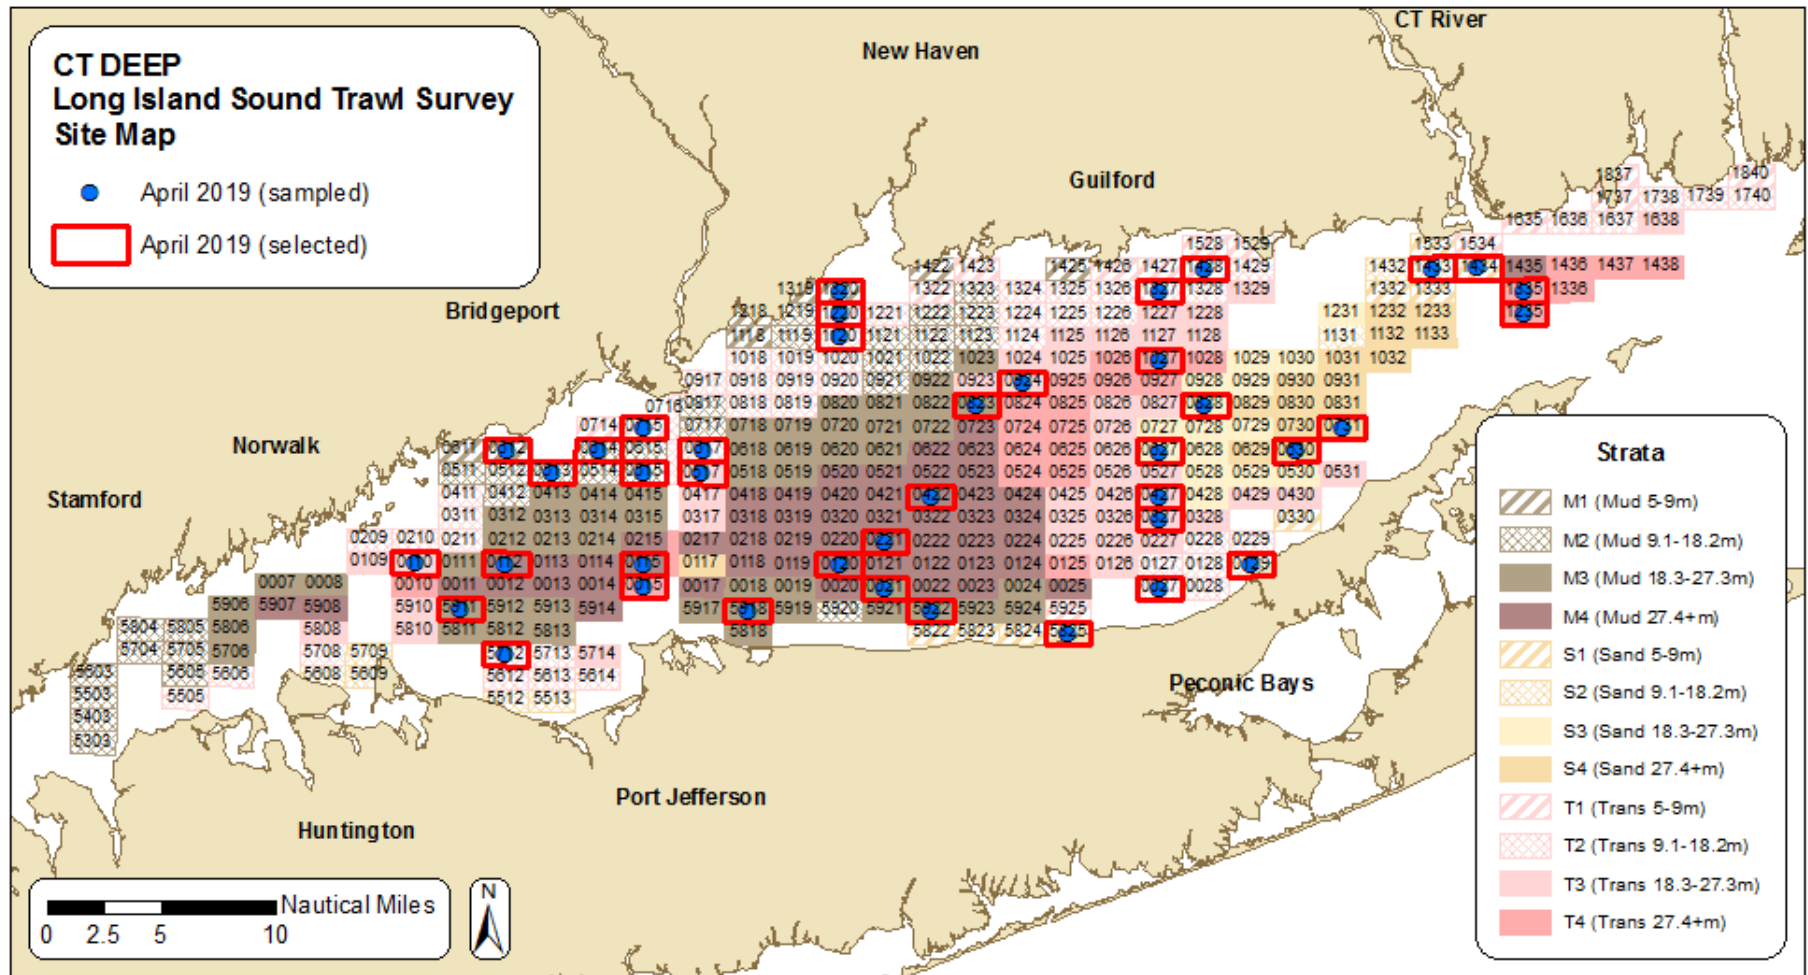

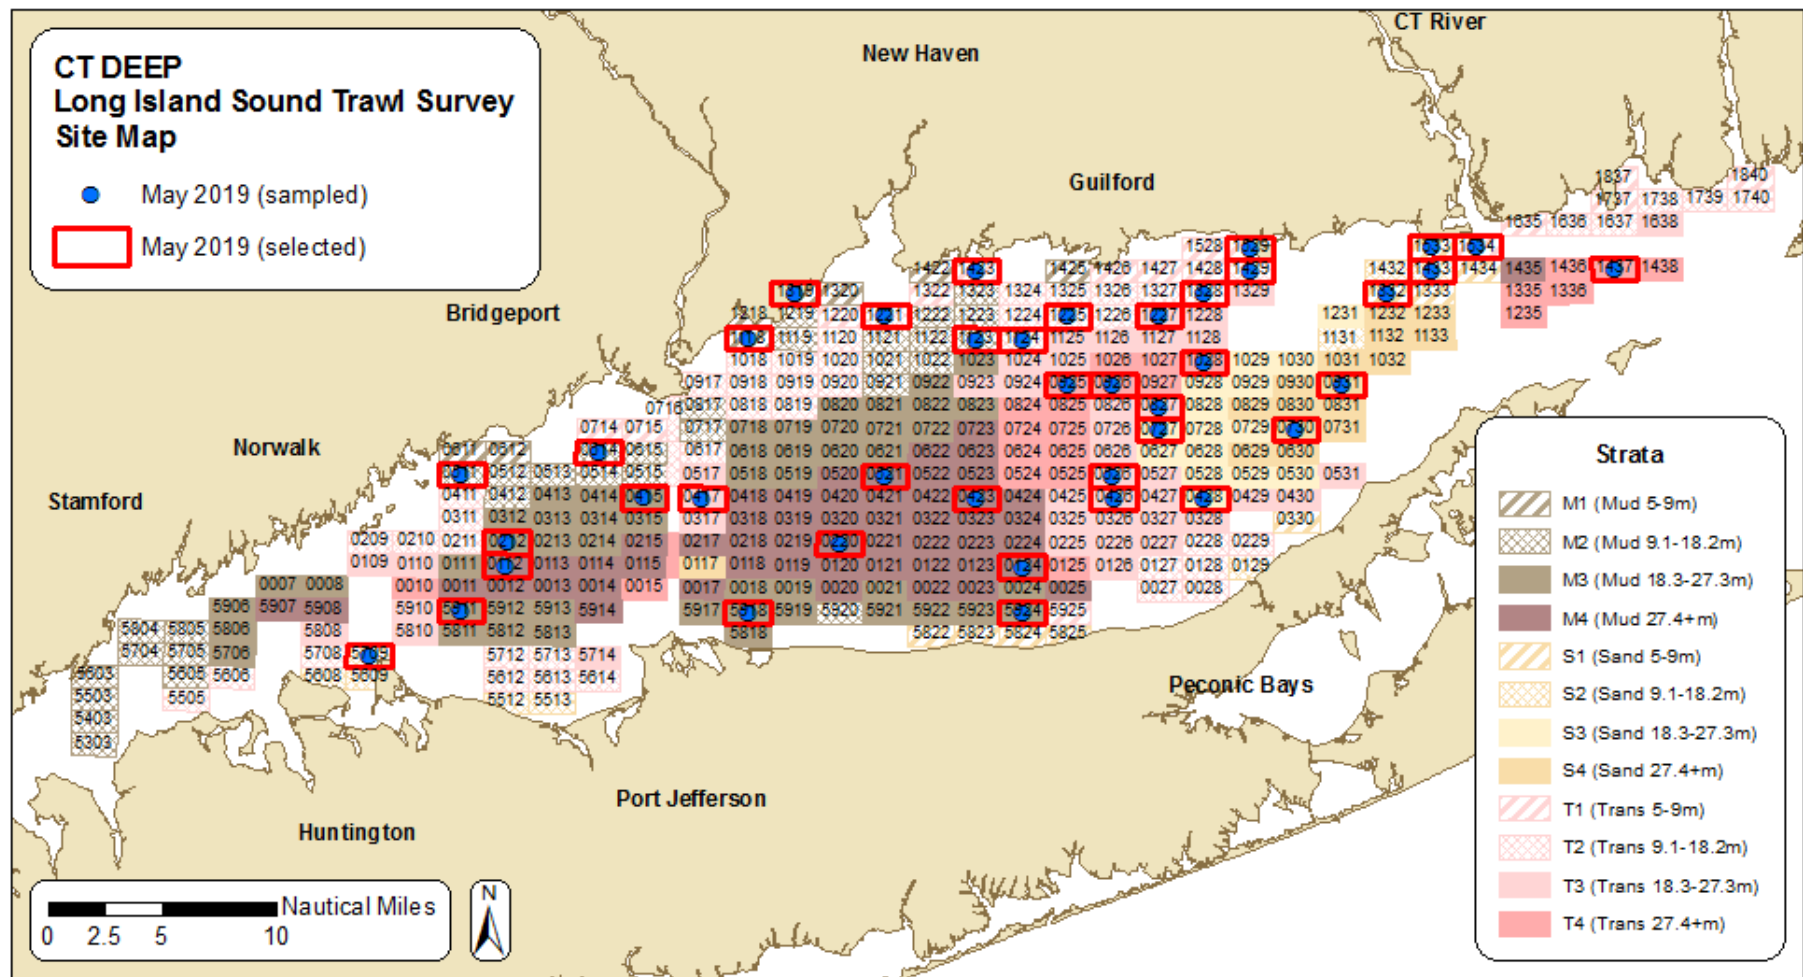

Figure 5.1. Trawl Survey site grid. Each sampling site is 1x2 nmi (nautical miles). A four-digit number identifies the site: the first two digits are the row numbers (corresponding to minutes of latitude) and the last two digits are the column numbers (corresponding to two nautical miles in length on the longitudinal axis). Examples: site 1428 near Guilford and 0028 near Mattituck. (Note: The sites in column 16 are approximately 2x1 nmi. The grid was drawn on the Eastern and Western Long Island Sound 80,000:1 nautical charts, which overlap by the area in column 16.)

Figure 5.2. April 2019 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Samples collected from a different site than published in the “Notice to Fishermen” are noted in table below map.

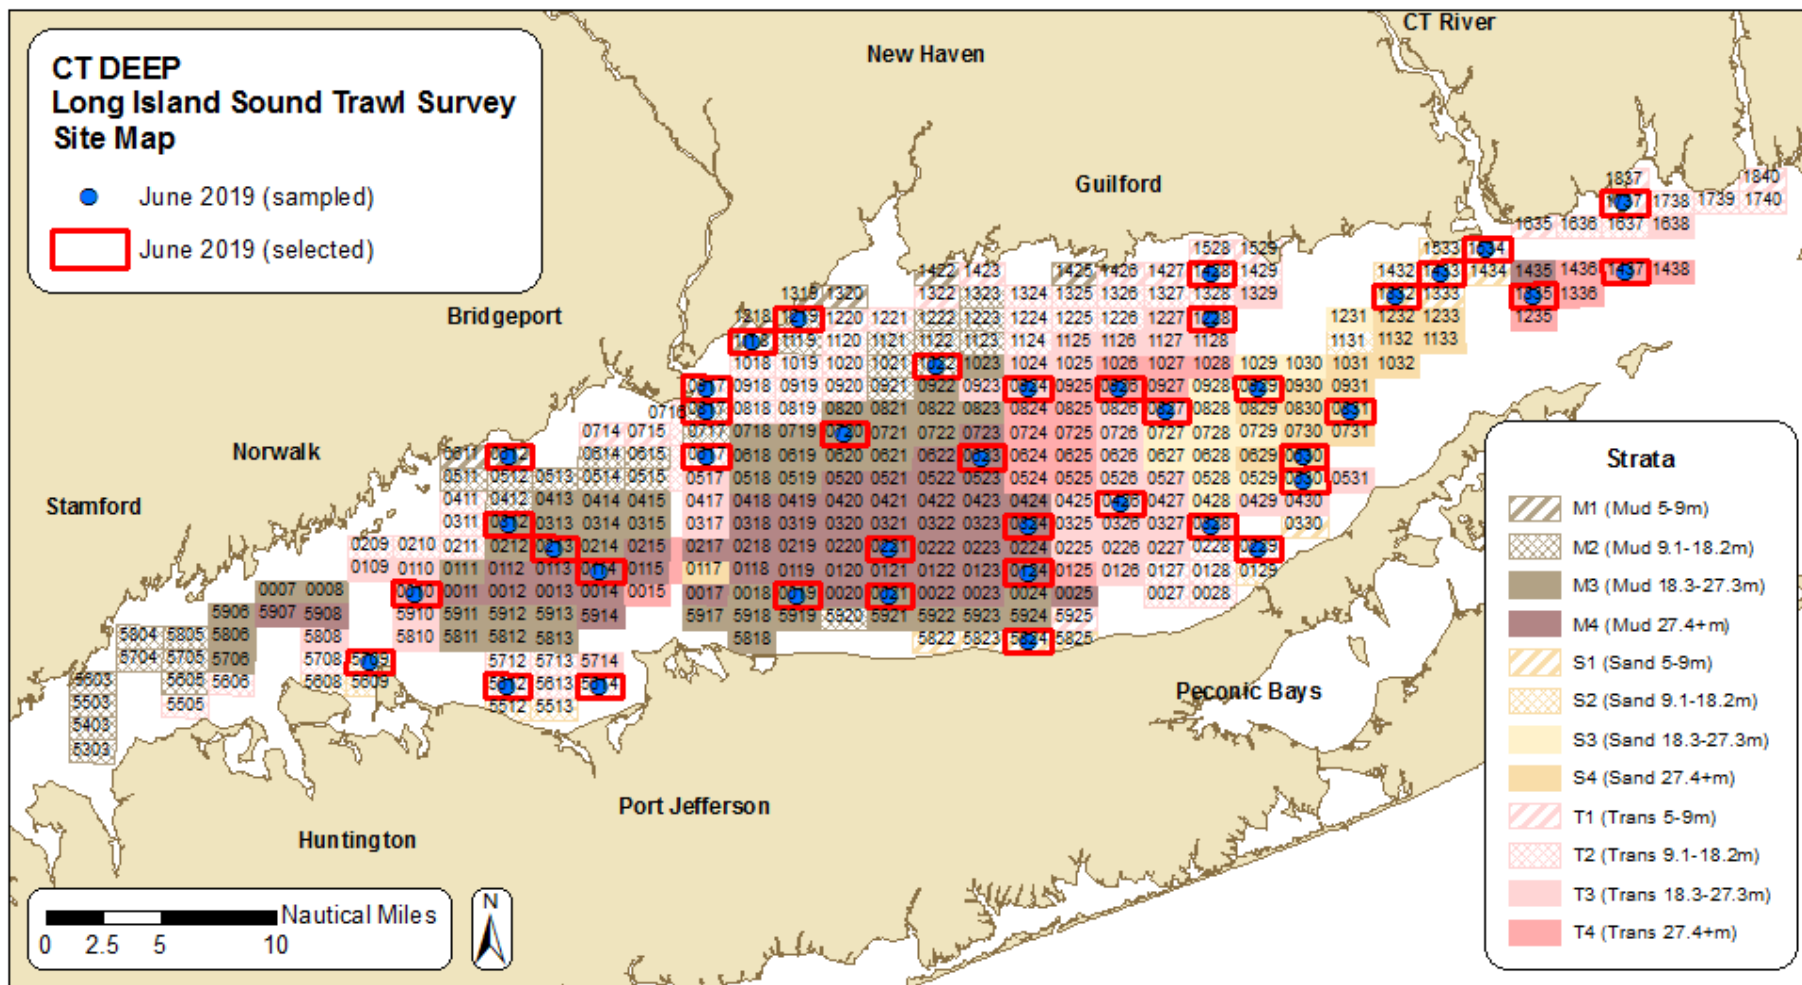

Sample	Site Sampled	Sampled Strata	Site Selected	Selected Strata	Reason Moved
					No sites were moved during this cruise

Figure 5.3. May 2019 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Samples collected from a different site than published in the “Notice to Fishermen” are noted in table below map.

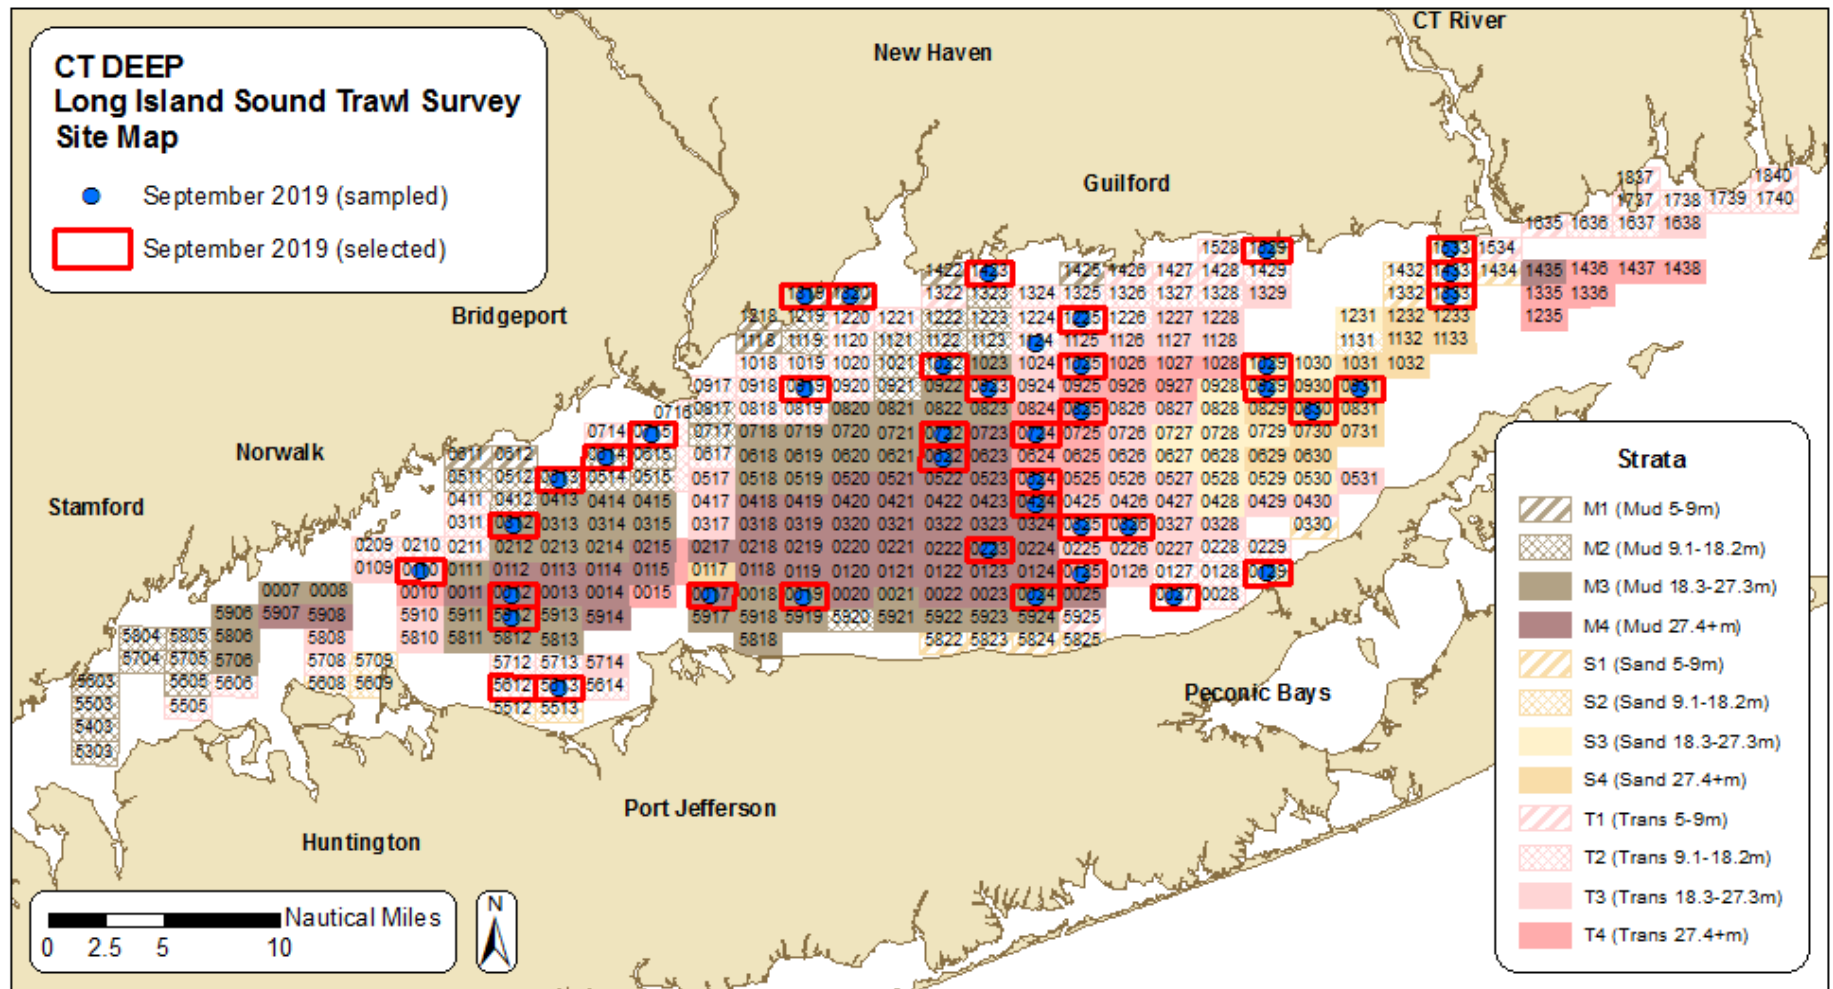

Sample	Site Sampled	Sampled Strata	Site Selected	Selected Strata	Reason Moved
					No sites were moved during this cruise

Figure 5.4. June 2019 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Samples collected from a different site than published in the “Notice to Fishermen” are noted in table below map.

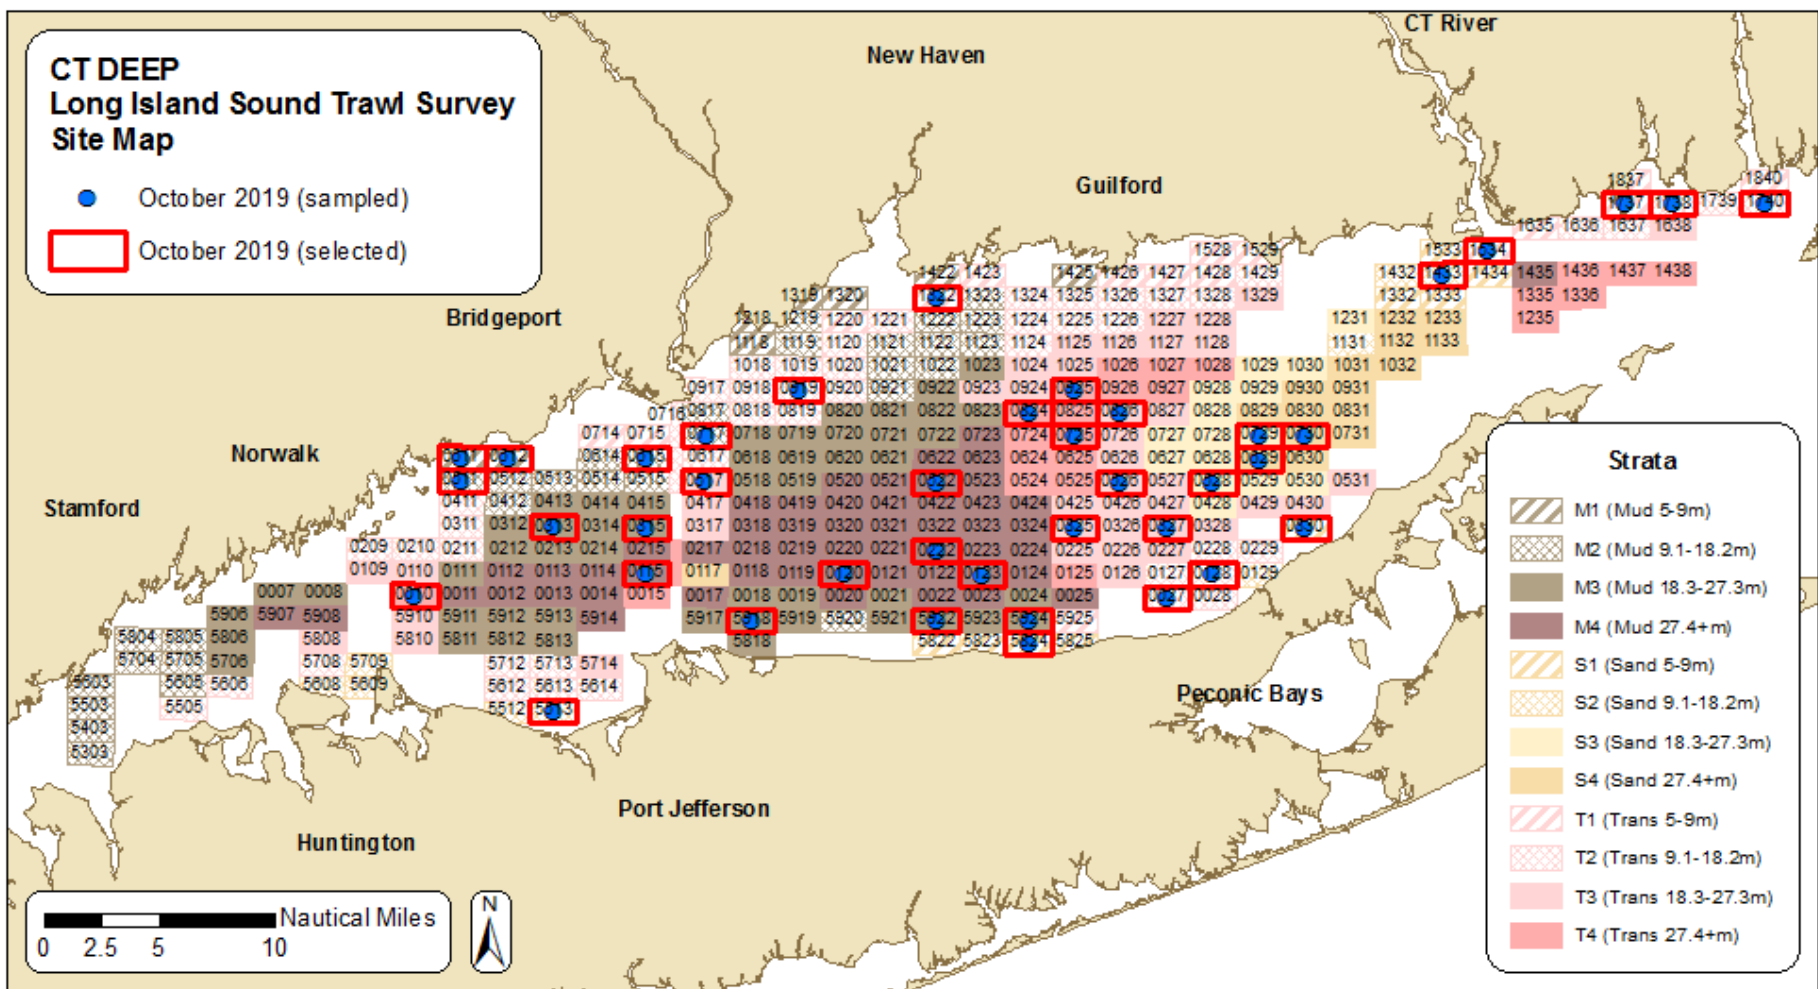

Sample	Site Sampled	Sampled Strata	Site Selected	Selected Strata	Reason Moved
					No sites were moved during this cruise

Figure 5.5. September 2019 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Samples collected from a different site than published in the “Notice to Fishermen” are noted in table below map.

Sample	Site Sampled	Sampled Strata	Site Selected	Selected Strata	Reason Moved
FA2019037	1124	T2	5612	T2	Have had trouble with pot gear here in the past

Figure 5.6. October 2019 sites selected and sampled. The red outlined rectangles are the sites selected for the cruise and the blue dots are the sites sampled. Samples collected from a different site than published in the “Notice to Fishermen” are noted in table below map.

Sample	Site Sampled	Sampled Strata	Site Selected	Selected Strata	Reason Moved
					No sites were moved during this cruise

Figure 5.7. Number of finfish species observed annually, 1984-2019. *Note: not all years have the same number of tows. See Table 5.4 for details on number of tows completed each year. Average number of finfish species caught per year is 57.4 for the time-series*

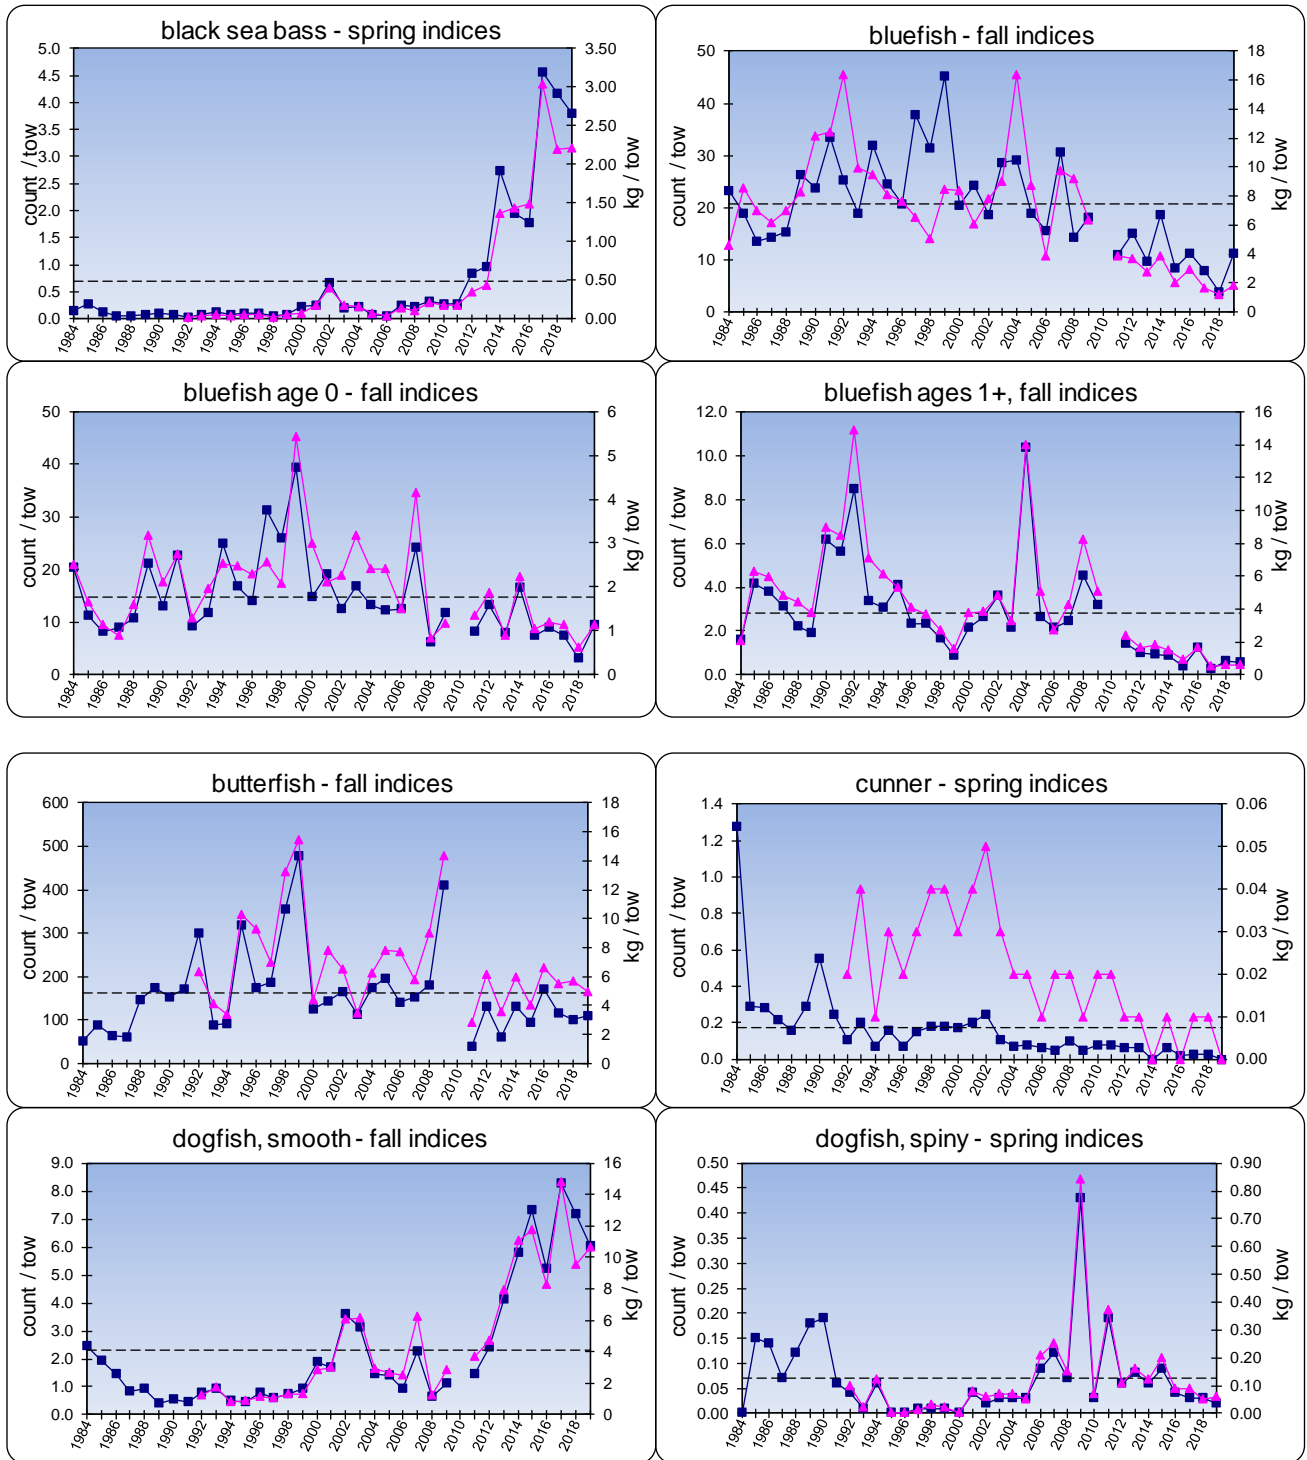

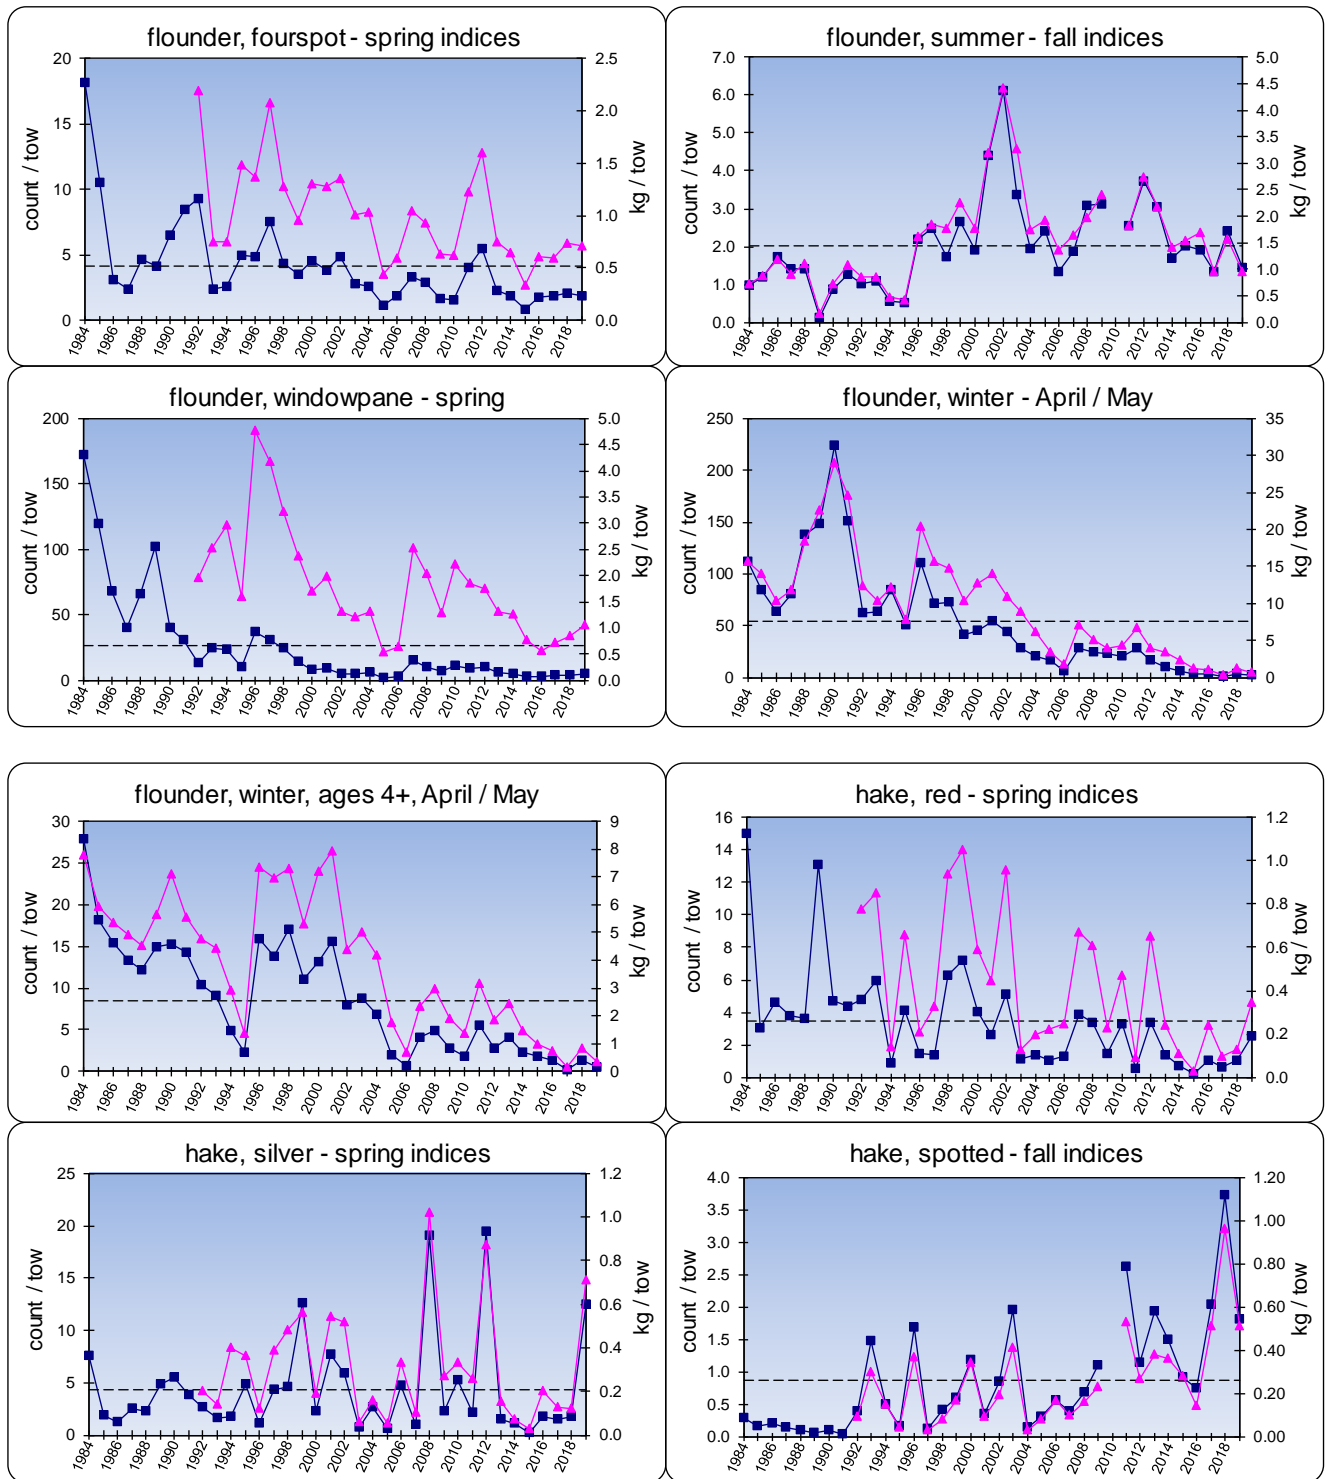

Figure 5.8. Plots of abundance indices for: black sea bass, bluefish (total, age 0, and ages 1+), butterfish, cunner, and dogfish (smooth and spiny).

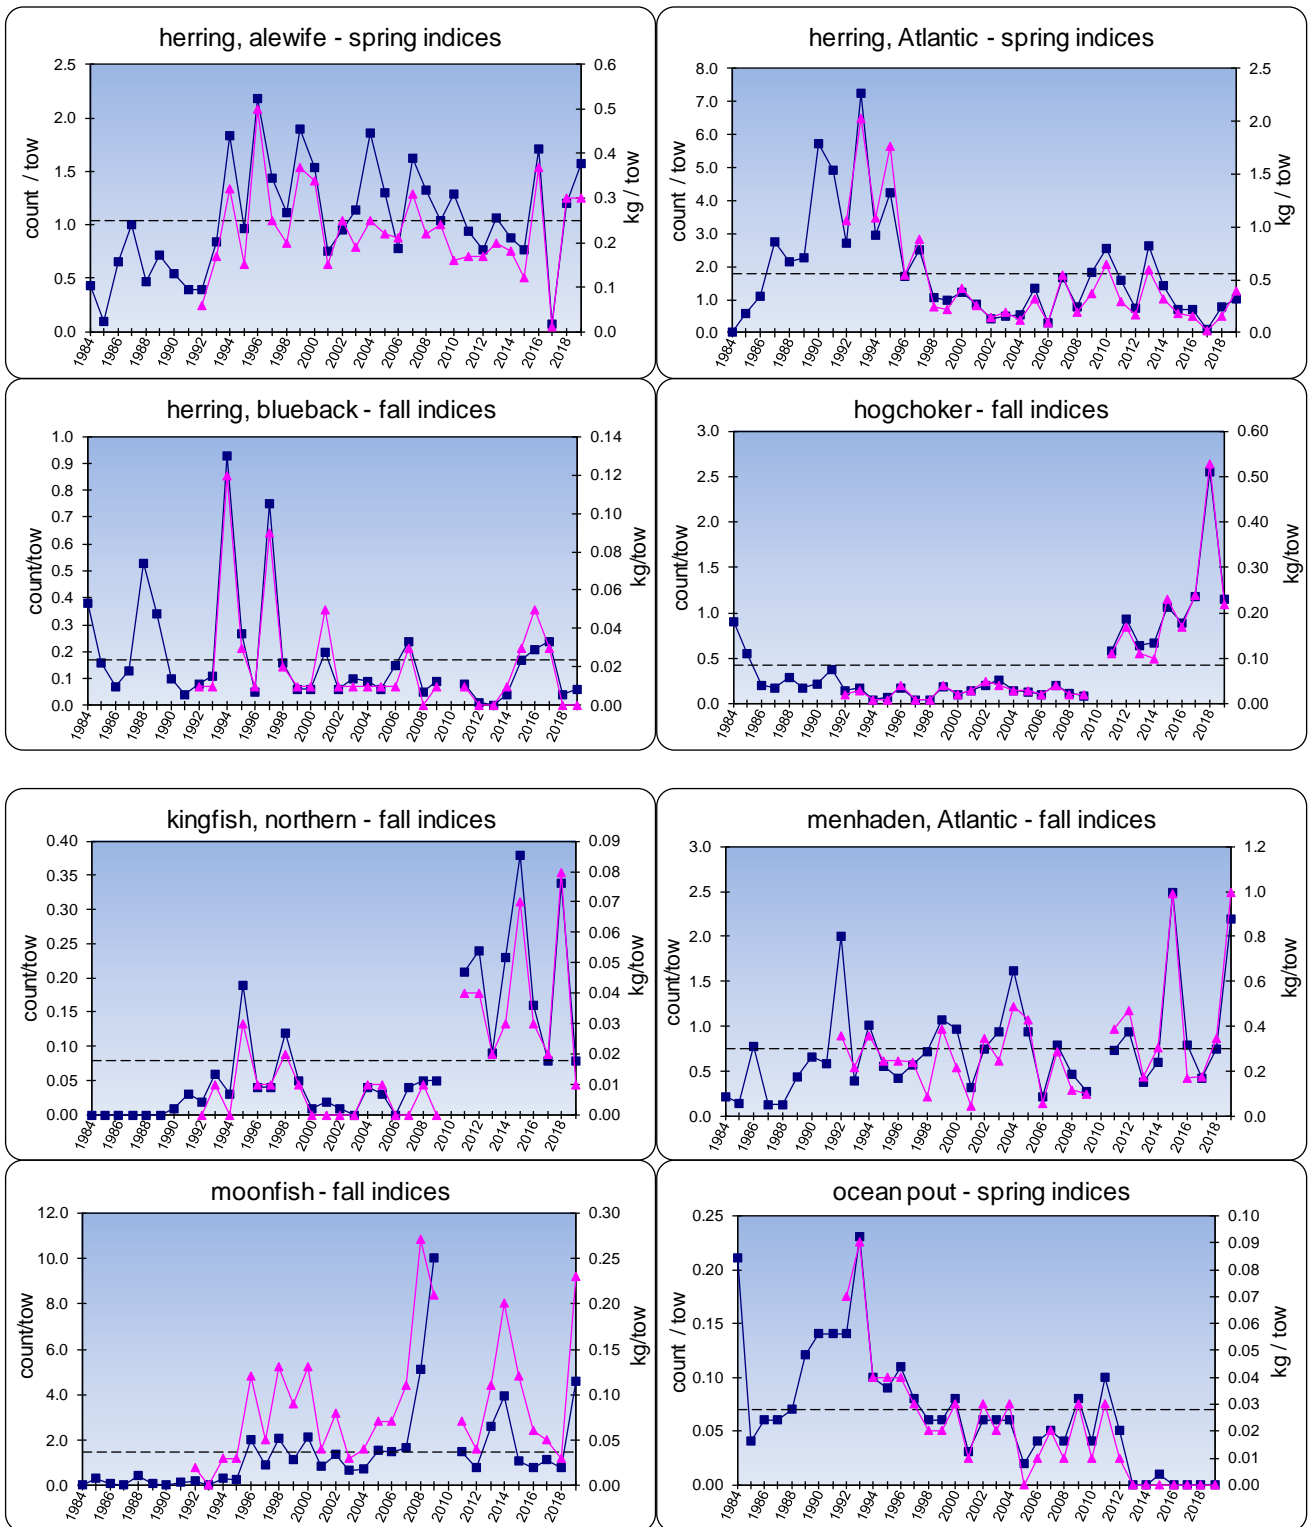

Legend:
■ = count / tow
▲ = kg / tow
 ---- = mean count / tow

Figure 5.9. Plots of abundance indices for: flounders (fourspot, summer, windowpane, winter, and winter ages 4+) and hakes (red, silver, and spotted).

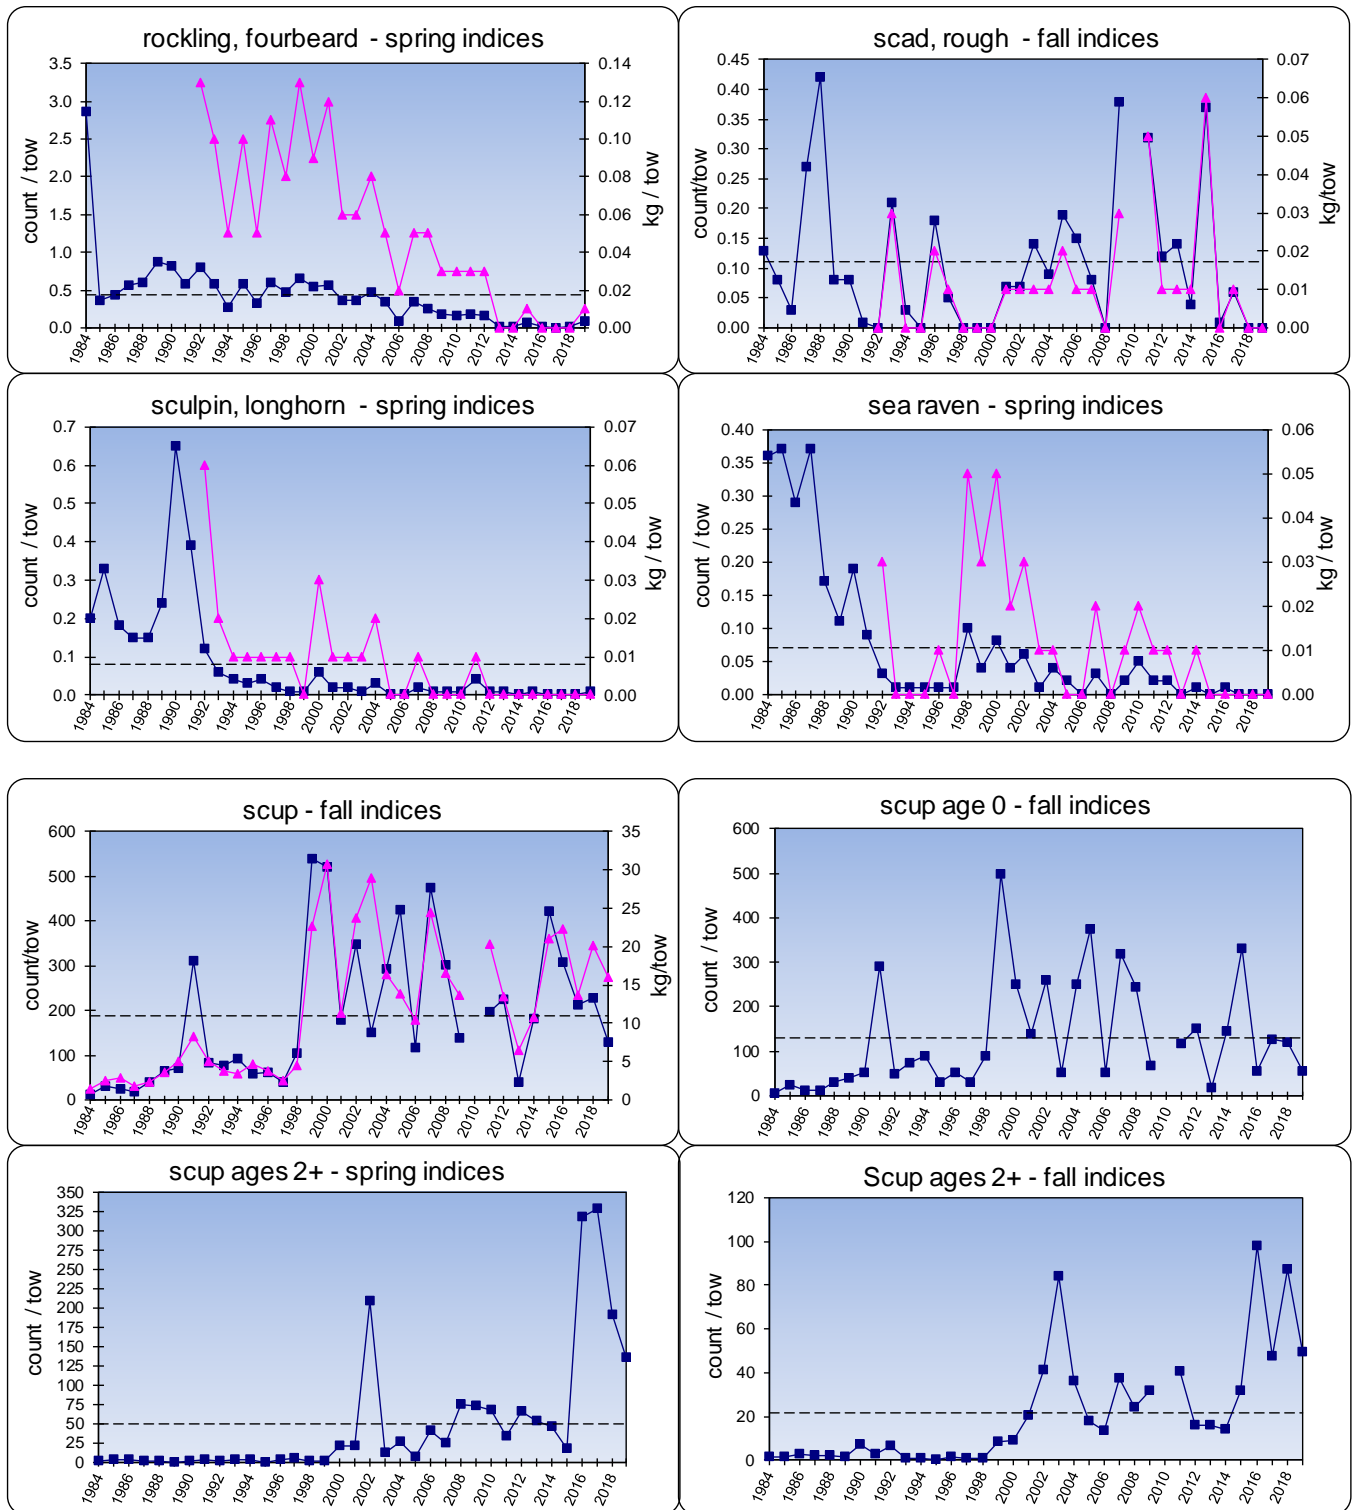

Legend:
■ = count / tow
▲ = kg / tow
 ---- = mean count / tow

Figure 5.10. Plots of abundance indices for: herrings (alewife, Atlantic, and blueback), hogchoker, Northern kingfish, Atlantic menhaden, moonfish, and ocean pout.

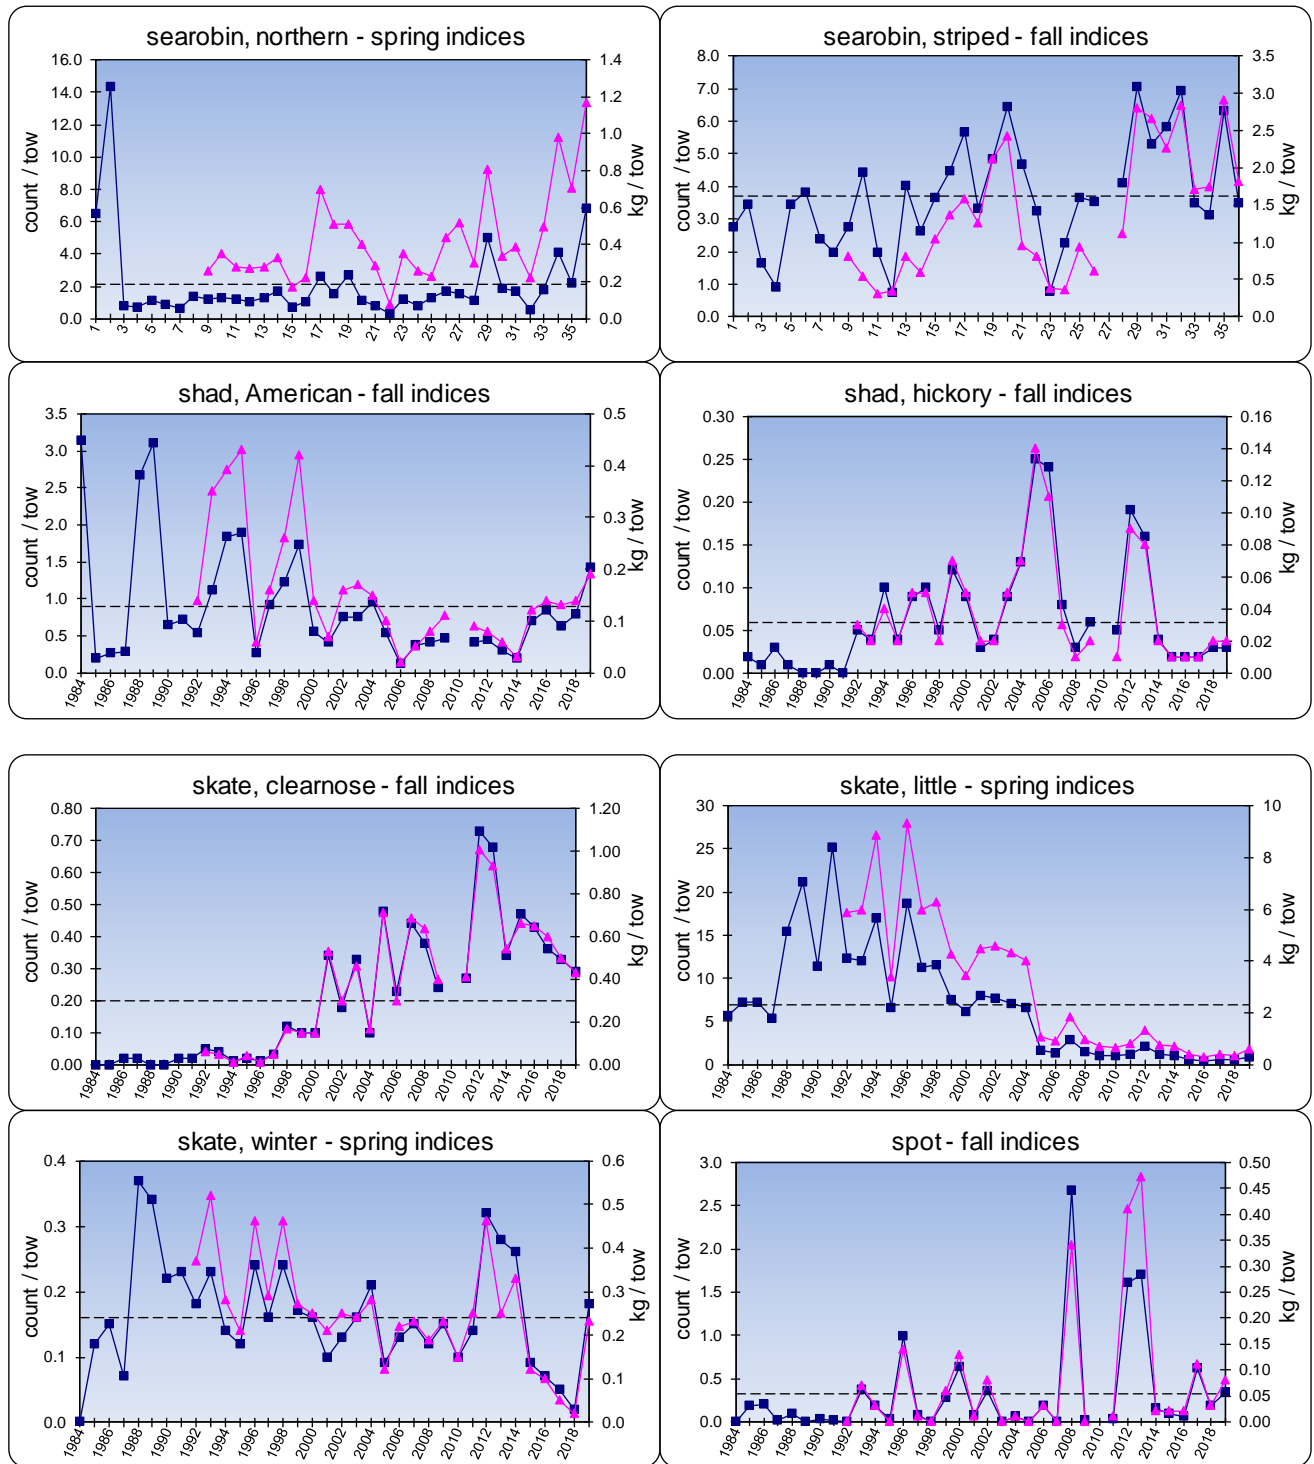

Legend:
■ = count / tow
▲ = kg / tow
 ---- = mean count / tow

Figure 5.11. Plots of abundance indices for: fourbeard rockling, rough scad, longhorn sculpin, sea raven, and scup (all ages, age 0, and ages 2+).

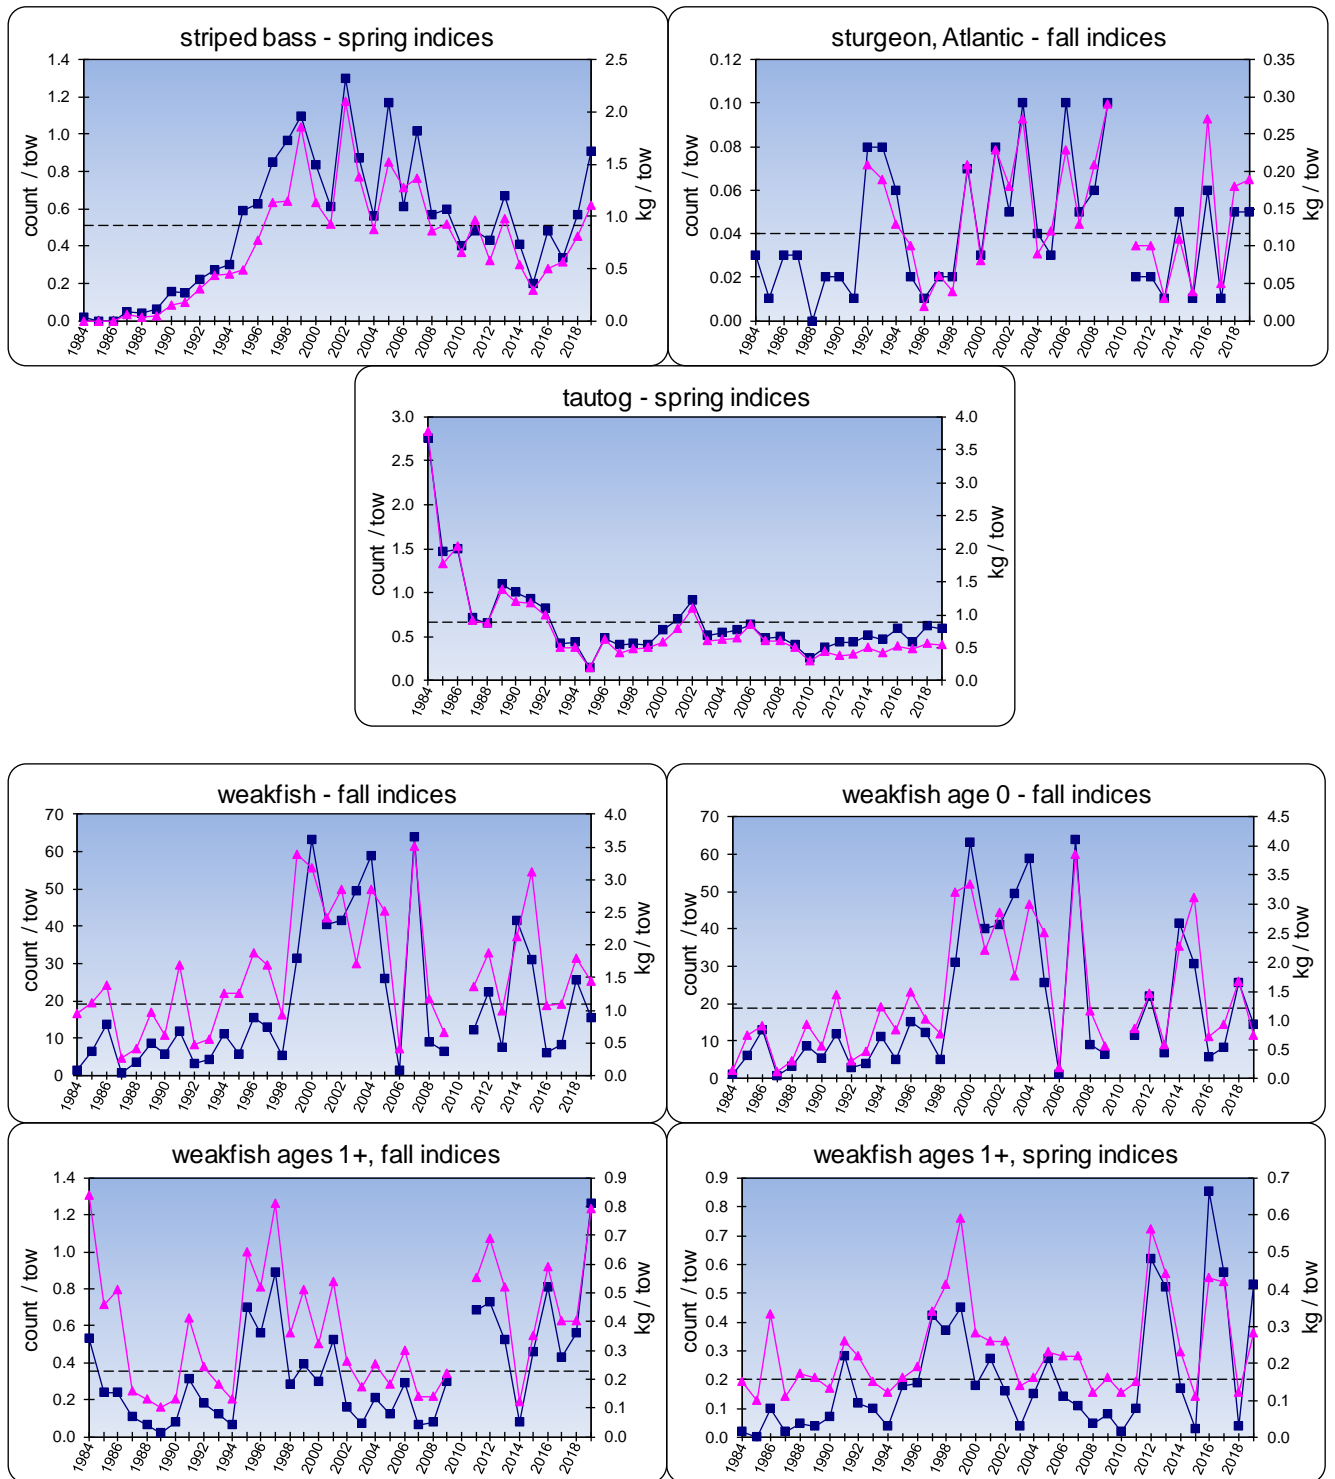

Legend:
■ = count / tow
▲ = kg / tow
 ---- = mean count / tow

Figure 5.12. Plots of abundance indices for: searobins (striped and northern), shad (American and hickory), skates (clearnose, little, and winter), and spot.

Legend:
■ = count / tow
▲ = kg / tow
 ---- = mean count / tow

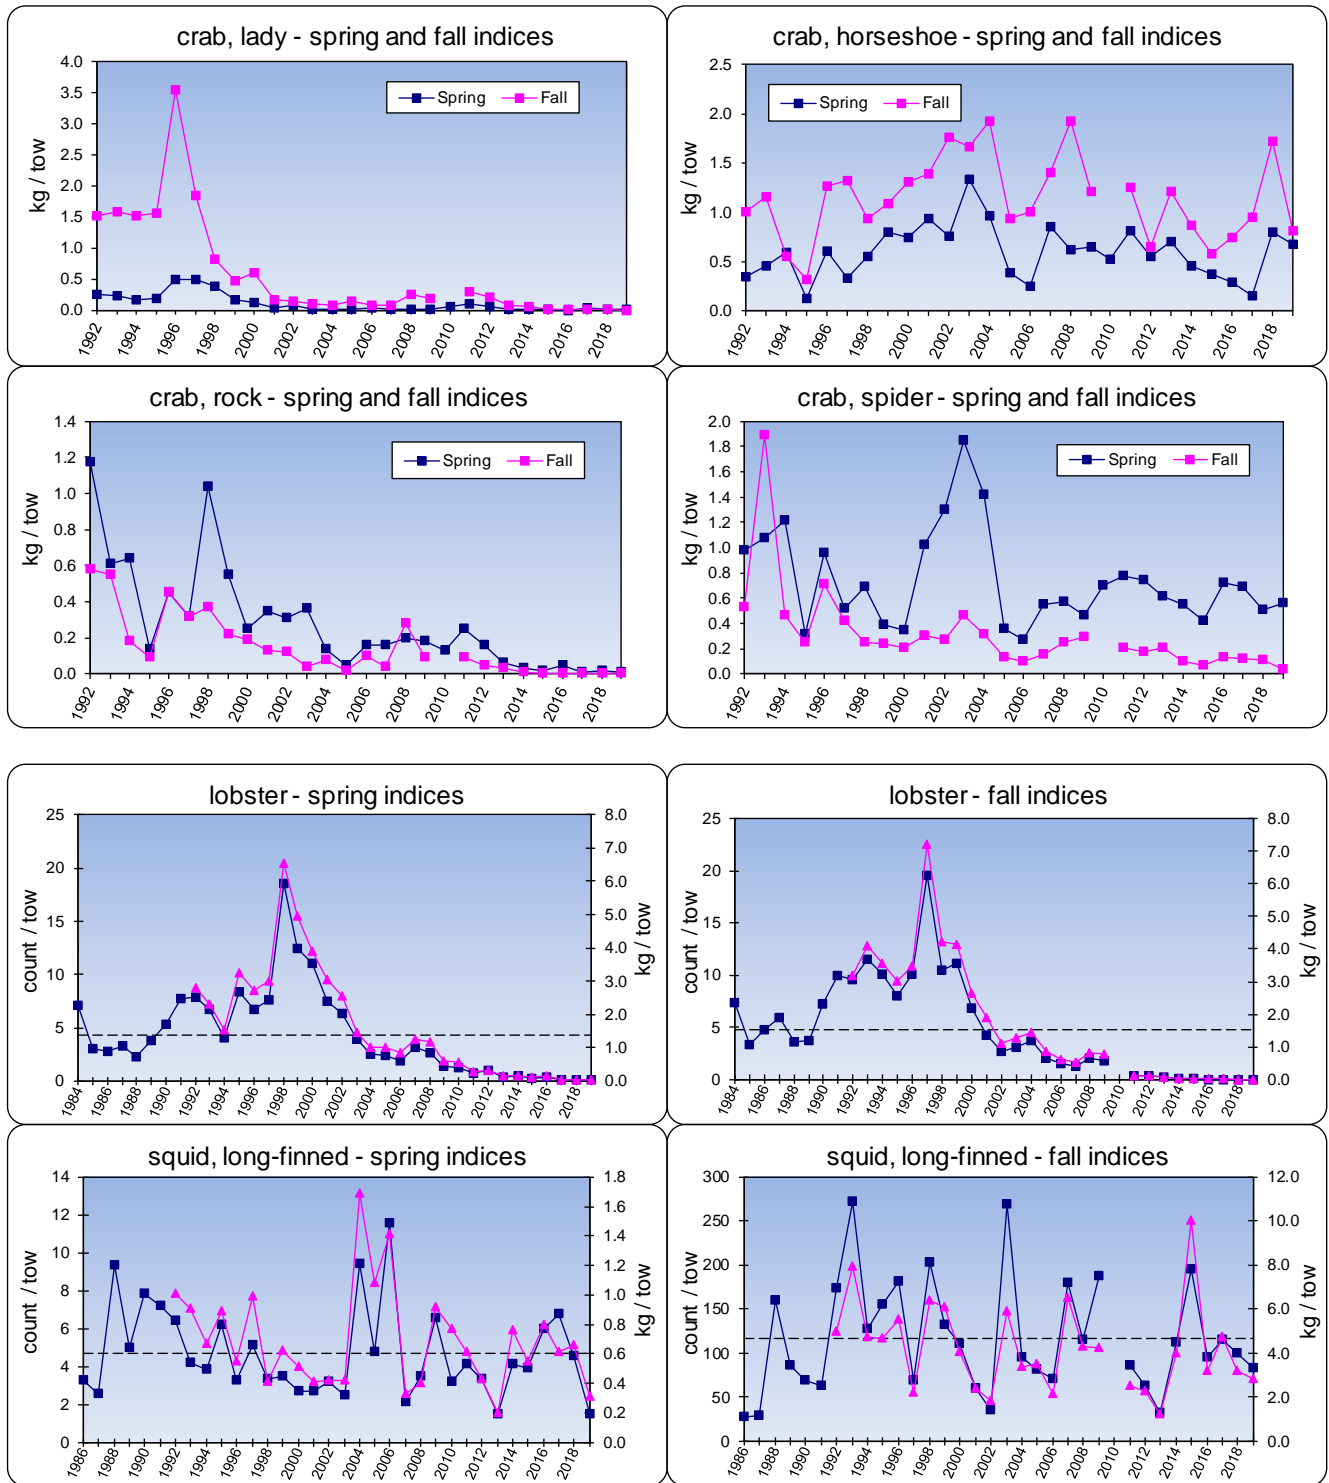

Figure 5.13. Plots of abundance indices for: striped bass, Atlantic sturgeon, tautog, and weakfish (all ages, age 0, and ages 1+).

Legend:

- = count / tow
- ▲ = kg / tow
- = mean count / tow

Figure 5.14. Plots of abundance and biomass indices for: crabs (lady, rock, and spider), horseshoe crab, American lobster, and long-finned squid.

Legend for bottom four graphs:

- = count / tow
- ▲ = kg / tow
- = mean count / tow

Figure 5.15. Mean number of finfish species per sample, spring and fall, 1984-2019. This index measures the diversity of species supported within the Sound's various habitats.

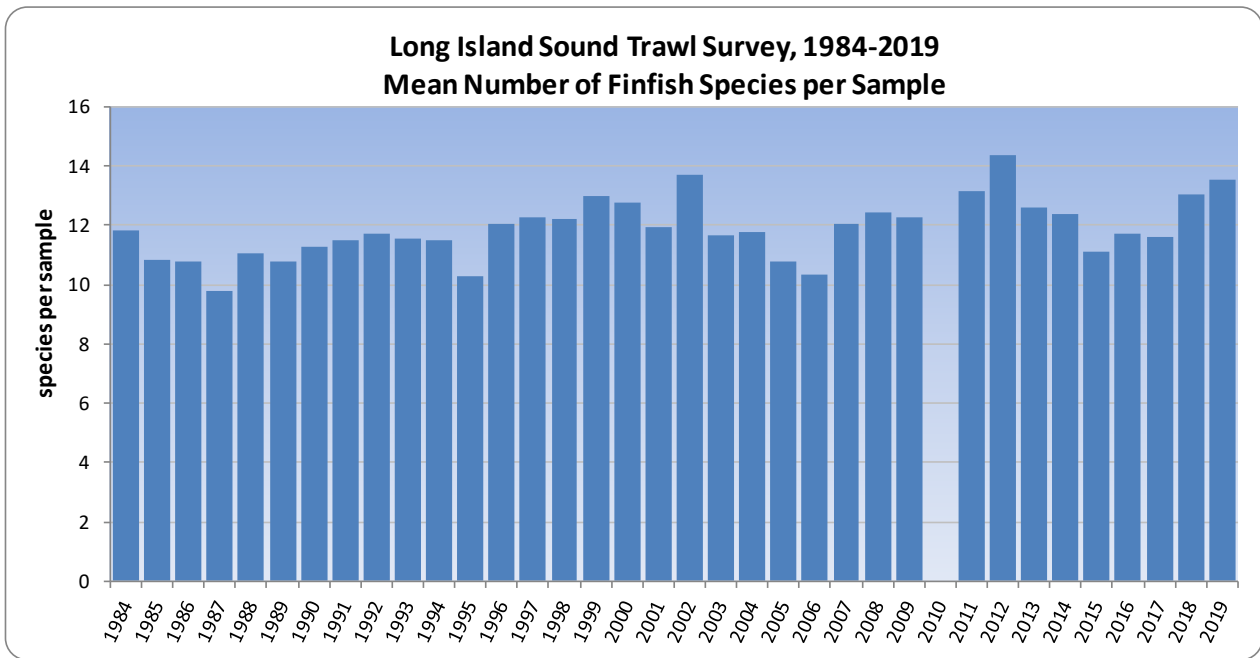

Figure 5.16. Open water forage abundance, 1992-2019. The geometric mean is calculated as the aggregate sample biomass per tow of 14 of the most common forage species sampled in the survey. This index measures the available food base which supports both resident and migratory species. The average since 1992 is 14.41 kg/tow (red line).

Figure 5.17. Geometric mean biomass of finfish and invertebrates per sample, spring and fall, 1992-2019.
 This index measures the diversity of species supported within the Sound's various habitats.

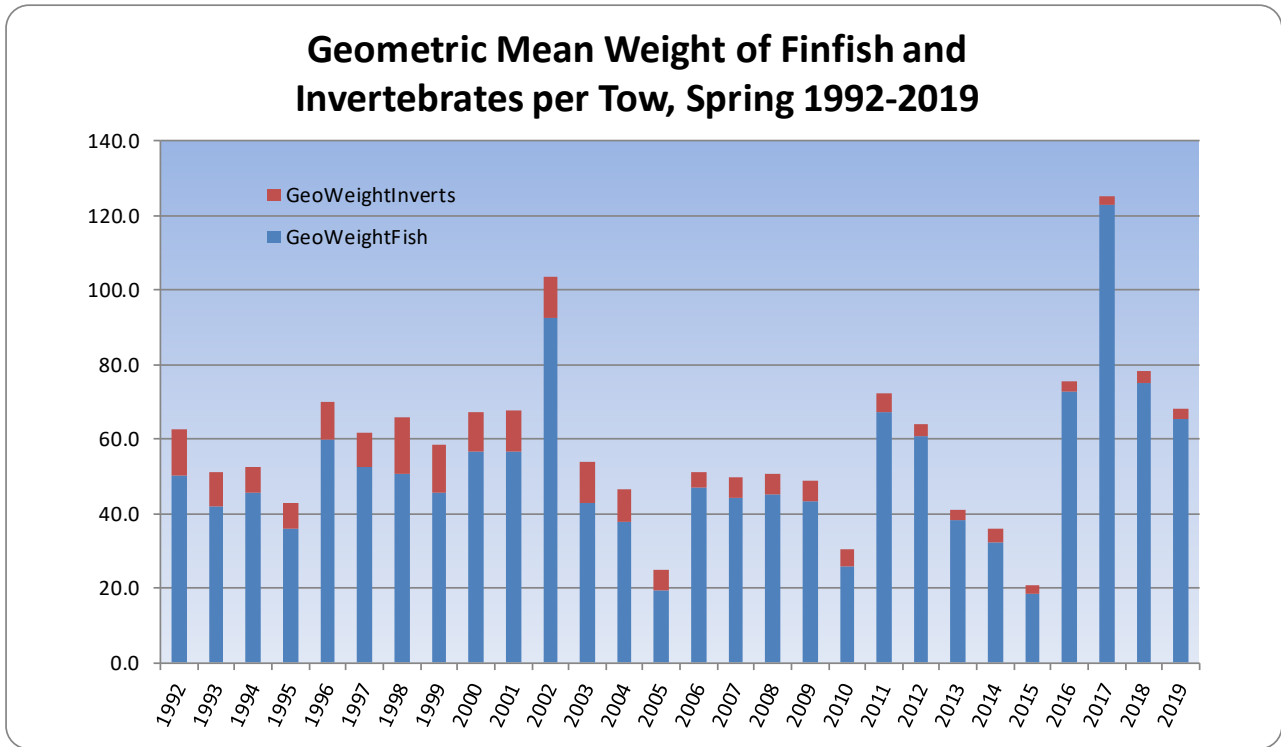

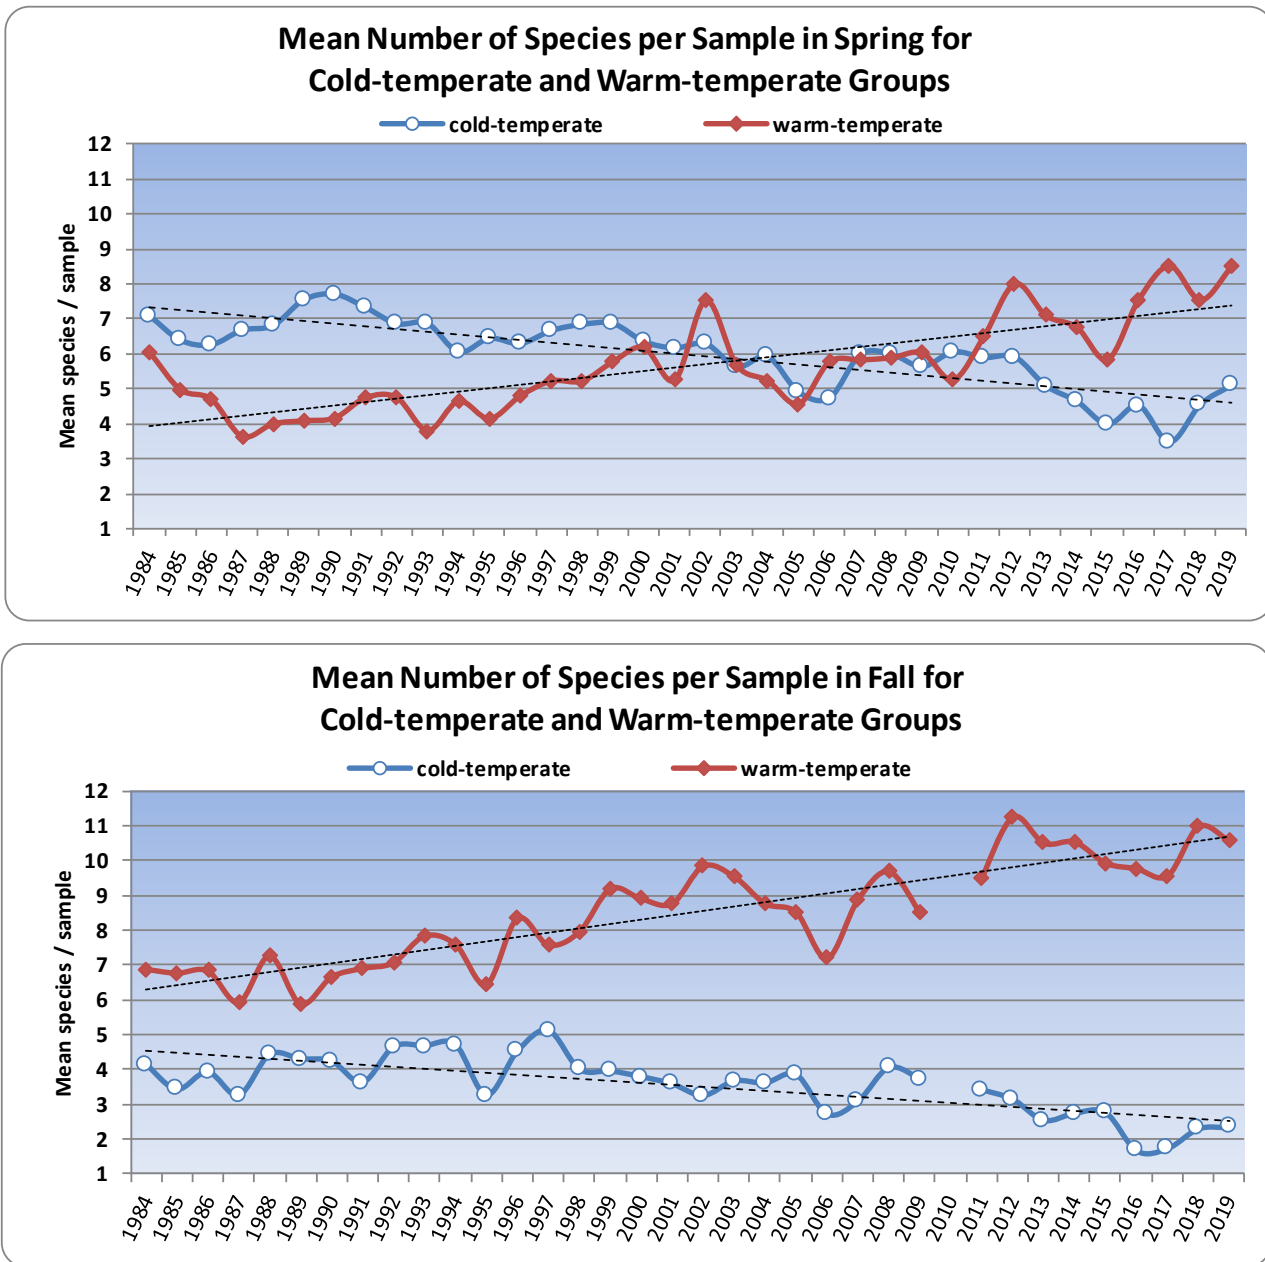

Figure 5.18. Trends in the number of cold temperate versus warm temperate species per sample captured in spring and fall LIS Trawl Surveys. See Appendix 2.5 for list of species included in analysis.

**APPENDICES
LISTS**

Appendix 5.1. List of finfish species identified by A Study of Marine Recreational Fisheries in Connecticut (F54R) and other CT DEEP Marine Fisheries programs. LISTS has collected one hundred-eleven (112) finfish species from 1984-2019.

This appendix contains a list of 157 species identified from all sampling programs conducted since 1984 **except** Marine Angler Surveys (Jobs 1-3). Species are listed alphabetically by common name (Nelson et al. 2004). Sampling program abbreviations, survey time periods and gear type are as follows:

Survey Abbreviation	Survey Description	Time Period	Gear Type
CTR	CT River Creel Survey	1997-1998	bus stop creel survey mainstem of CT River
EPA	cooperative sampling in western LIS with EPA	1986-1990	used LISTS net
ESS (F54R)	Estuarine Seine Survey	1988 to present	7.6m (25 ft) beach seine
IS (F54R)	Inshore Survey of Juvenile Winter Flounder	1990-1994	beam trawls (also a little data from 1995-1996)
ISS (non-F54R & F54R)	Inshore Seine Surveys in CT and/or TH rivers	1979 to present	15.2m (50 ft) bag seine set by boat
LISTS (F54R)	Long Island Sound Trawl Survey	1984 to present	14m (50 ft) trawls with 2" codend mesh
MISC	misc sampling conducted on R/V Dempsey	various	various
NCA	"inshore" EPA NCA C2K sampling	2000	skiff trawls
NRRWS	sampling in western end of LIS, the "Narrows"	2000-2007	14m (50 ft) trawls with 2" codend mesh
SNFH (F54R)	Study of Nearshore Finfish Habitat	1995-1996	plankton net
SS (F54R)	Summer Survey	1991-1993, 1996	14m (50 ft) trawls with codend liner in LIS
TN	Trap Net Survey	1997-1998	trap nets in rivers

Appendix 5.2. Annual total count of finfish, lobster, horseshoe crab and squid taken in the LISTS, 1984-2019.

Counts include all tows- number of tows conducted shown in second row. Refer to Appendix 5.4 for details on number of tows conducted per month. Note: nc = not counted. Anchovy spp., (yoy), Atlantic herring (yoy), and sand lance, (yoy) are estimated.

Appendix 5.3. Annual total weight (kg) of finfish, lobster, horseshoe crab and squid taken in LISTS, 1992-2019.

Weights include all tows – number of tows shown in second row. Refer to Appendix 5.4 for details on number of tows conducted per month. Note: nw = not weighed.

Appendix 5.5: Endangered Species Interactions: Nine (9) Atlantic Sturgeon were captured on seven (7) of the 200 tows completed in 2019; an encounter rate (3.5%) comparable to the average for the LISTS time series of tows (2.4%). The captures occurred at seven sites in the deeper mud and transition sites off the North shore of Long Island and central Sound. All encounters were reported to NMFS within 24 hours and all fish were released alive and uninjured. Details are provided below:

Appendix 5.6: Cold and warm temperate species captured in LISTS. Thirty-three (33) species are included in the cold temperate group, while thirty-four (34) species are included in the warm temperate group. Cold temperate species are defined as being more abundant north of Cape Cod, MA than south of New York, behaviorally adapted to cold temperatures including subfreezing but prefers ~3-15⁰C, and spawns at lower end of temperature tolerance. Warm temperate species are defined as being more abundant south of New York than north of Cape Cod, MA, behaviorally avoids temperatures < 7-10⁰C; prefers ~11-22⁰C, and spawns at higher end of temperature tolerance.
