B. PREMISES DESCRIPTION

Algonquin Gas Transmission, LLC (Algonquin) transports natural gas via underground pipeline from New Jersey through southern New England to eastern Massachusetts or in reverse. At several points along the pipeline, the natural gas must be recompressed to ensure that it continues to move along the pipeline and can be delivered to customers at serviceable pressures. The natural gas is compressed at the Chaplin Compressor Station using four natural gas-fired turbine driven centrifugal compressors. The natural gas used to fuel the gas-fired units is supplied from Algonquin's pipeline. The Chaplin Compressor Station is one of three Algonquin compressor stations located in Connecticut.

The Chaplin compressor station is a Title V source located in a serious ozone non-attainment area as defined in RCSA §22a-174-1(105). The Chaplin Compressor Station is considered a major source for VOC. The Chaplin Compressor Station is a minor source for HAPs.

The main Emissions Units include the following:

- Three 7,700 hp Solar Taurus 60-7802 turbines
- One 6,300 hp Solar Centaur 50-6202
- One Waukesha (880 bhp) natural gas fired emergency generator
