Section 1 Background and Emissions Summary

1.0 Introduction

The State of Connecticut submits this Periodic Emissions Inventory (PEI) to comply with the implementation of the 2008 Ozone National Ambient Air Quality Standard (NAAQS) in accordance with [40 CFR 51.1115\(b\)](#).¹ It was developed in accordance with the EPA document [Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter NAAQS and Regional Haze Regulations](#).² The PEI is available to serve as the basis of future year emissions projections for both the State of Connecticut and regionally.

The Connecticut Department of Energy & Environmental Protection (CT DEEP) will use this PEI, with appropriate adjustments to account for banked offsets, when developing inventories for future requirements of Reasonable Further Progress, as well as upcoming Attainment Demonstrations and/or Maintenance State Implementation Plans (SIPs).

The PEI is comprised of emissions from all sources in Connecticut, and can be identified by their Source Classification Codes (SCCs). The EPA publishes a National Emissions Inventory (NEI) which contains emissions estimates for each SCC. For each SCC reported in this PEI, NEI data was evaluated and the values were either accepted or augmented with additional state data.

Unless otherwise noted in the source type documentation sections, emission factors were obtained from the [Compilation of Air Pollutant Emissions Factors](#) (AP-42) to calculate emissions. The United States Environmental Protection Agency (EPA) procedures have been followed in developing the emissions inventory for the State of Connecticut's SIP.

This PEI presents the 2017 emissions produced within Connecticut from the following source types:

Table 1-1: Sources Included in this Periodic Emission Inventory

Source Type	Inventory Background	Inventory Data
Stationary Point Sources	Section 2	Appendix C
Mobile Sources	Section 3	Appendices D, E, F, & G
Area Sources	Section 4	Appendices D, H & I
Biogenic Sources	Section 5	Table 5-1 & Table 5-2

1.0.1 Agencies/Contacts Responsible for Inventory

The lead agency responsible for the preparation and submittal of the PEI is the CT DEEP Bureau of Air Management (The Bureau). The Bureau is directly responsible for the collection of source level activity data, emission factor determination, emissions calculations, documentation, and quality assurance. Other CT DEEP Bureaus and State Agencies contribute necessary information for the preparation of emissions estimates. The Connecticut Department of Transportation (CT DOT) provides Vehicle Miles of Travel (VMT) data, daily and seasonal adjustment factor data, and documentation of the methodology used by CT DOT to estimate VMT data for the on-road mobile source inventory. The Connecticut Department of Motor Vehicles (CT DMV) provides vehicle registry data used to determine vehicle age distribution, develop base line county level vehicle populations, and to adjust vehicle mix distributions of the vehicle fleet in

Connecticut. The Connecticut Department of Labor (CT DOL) provides employment data by Standard Industrial Code (SIC) for determining source activity levels for on-road mobile source emissions inventories.

It should be noted that the PEI does not address the tracking of potential emissions offsets from shutdown sources.

The applicable points of contact for the 2017 PEI are listed below in Table 1-2:

Table 1-2: List of Contacts for the 2017 Connecticut Periodic Emissions Inventory

Responsibility	Contact	Phone Number	Agency
Inventory Planning & Development	Richard Rodrigue	(860) 424-3429	Connecticut Department of Energy & Environmental Protection Bureau of Air Management 79 Elm Street Hartford, CT 06106
Point Emissions Data and Activity Levels	Rebecca McLean	(860) 424-3511	
MOVES Mobile Emissions Data and Activity Levels	Lou Corsino	(860) 424-3544	
Aircraft, Commercial Marine Vessel, and Locomotive Data and Activity Levels	Steve Potter	(860) 424-3385	
Area Emissions Data and Activity Levels	Steve Potter	(860) 424-3385	
VMT Generation and Other On-Road Vehicle Data	Judy Raymond	(860) 594-2032	Connecticut Department of Transportation 2800 Berlin Turnpike Newington, CT 06111
Quality Assurance (Section 6)	Kristin Salimeno	(860) 424-3055	Connecticut Department of Energy & Environmental Protection Bureau of Air Management 79 Elm Street Hartford, CT 06106

1.1 Attainment Classifications of Geographic Areas in Connecticut

This emissions inventory encompasses all counties in Connecticut and any geographic area designated by the EPA as non-attainment or classified as maintenance.

Since the NEI only tracks emissions at the county level, emissions for this PEI are similarly provided for each county. A comprehensive map of Connecticut displaying all town and county boundaries are shown on the following page in Figure 1-A.

Ozone

In November 1991, the EPA designated Connecticut as not in attainment with the 1-hour ozone standard. An 8-hour ozone standard was introduced in 1997 to replace the 1-hour standard, which was completely phased out in 2005. The 8-hour non-attainment areas replaced the 1-hour non-attainment areas used in previous PEIs. The [8-hour ozone standard](#) was updated in 2008 and Connecticut was designated with two Non-Attainment areas with a 'Moderate' status: the Connecticut portion of the NY-NJ-CT Area, comprised of Fairfield, New Haven, and Middlesex counties, and the Greater Connecticut Area, which is comprised of all other counties.^{3,4} These areas are shown in Figure 1-B. The 8-hour ozone standard was again updated in 2015 with an ozone non-attainment redesignation effective date of 2018.⁵

Particulate Matter

In 2006, the EPA designated Fairfield and New Haven counties as part of the NY-NJ-CT non-attainment area for both the 1997 Annual and 2006 24-hour PM_{2.5} NAAQSs, while the rest of Connecticut was designated as being in attainment.⁶ The EPA re-designated the Connecticut portion of the NY-NJ-CT non-attainment area as attainment with a maintenance classification for both the 1997 Annual and 2006 24-Hour PM_{2.5} NAAQSs, effective October 12, 2013. In 2012, the EPA promulgated a new Annual PM_{2.5} NAAQS and the 1997 Annual PM_{2.5} NAAQS and its attainment areas were revoked on October 24, 2016. All of Connecticut was designated as in attainment with no classification for the 2012 Annual PM_{2.5} NAAQS effective April 15, 2015.⁷ The areas associated with the 1997 and 2006 PM_{2.5} NAAQSs are shown in Figure 1-C.

Carbon Monoxide

In November 1991, the EPA designated three areas in Connecticut as not in attainment with the 1971 CO NAAQSs. These non-attainment areas were distinguished as the Hartford-New Britain-Middletown Area, the New Haven-Meriden-Waterbury Area, and the Connecticut portion of the NY-NJ-CT Area. The EPA re-designated the Hartford-New Britain-Middletown non-attainment area as attainment effective May 14, 1996, the New Haven-Meriden-Waterbury non-attainment area as attainment effective October 5, 1998, and the Connecticut portion of the NY-NJ-CT non-attainment area as attainment effective March 10, 1999, making the entire state designated as attainment for CO.⁸ The 1971 CO NAAQSs maintenance areas are defined in Table 1-3 and are presented in Figure 1-D.

1.2 Emissions Summary

This PEI presents the emissions produced during the 2017 calendar year from stationary point sources, mobile sources, area sources, and biogenic sources located in each county as well as the ozone non-attainment and PM_{2.5} attainment areas within the State of Connecticut.

Connecticut submits the annual and summer day emissions produced in each ozone non-attainment area to comply with the provisions set forth for 2008 Ozone NAAQS PEIs.¹⁰ The pollutants reported are ozone precursor compounds, volatile organic compounds (VOCs) and oxides of nitrogen (NO_x), as well as carbon monoxide (CO).

The definition of aggregated VOC pollutant used in this PEI excludes non-reactive VOCs, such as methane, ethane, methylene chloride, 1,1,1-trichloroethane, perchloroethylene, acetone, methyl acetate, cyclic, branched, or linear completely methylated siloxanes, and dozens of organofluorine compounds. For a comprehensive list of excluded compounds, please refer to the federal definition of VOCs in [40 CFR Part 51.100\(s\)](#).¹¹

Connecticut also submits the annual and summer day emissions produced throughout the state and each of its counties, as well as in the two PM_{2.5} attainment areas. The pollutants reported for annual emissions are ozone precursor compounds (VOC & NO_x), CO, PM₁₀ Primary (PM₁₀-PRI), PM_{2.5} Primary (PM_{2.5}-PRI), sulfur dioxide (SO₂), ammonia (NH₃), and lead (Pb). Only ozone precursor compounds and CO are reported for summer day emissions.

Statewide annual and summer day emissions from stationary point sources, mobile sources, area sources, and biogenic sources are respectively presented in Table 1-4 below and Table 1-6 on page 1-12. These emissions are specified by county in Table 1-5 and Table 1-7, by ozone non-attainment area on page 1-14, and by PM_{2.5} attainment area on page 1-15.

Table 1-4: 2017 Annual Emissions of All Sources in Connecticut

County	Annual Emissions [TPY]							
	VOC	NO _x	CO	PM ₁₀ -PRI	PM _{2.5} -PRI	SO ₂	NH ₃	Lead

Section 2 Stationary Point Sources

2.0 Introduction

This section documents the identification of stationary air pollution sources active in Connecticut during the 2017 calendar year. It serves to characterize the point source component of the emissions inventory by describing data collection, verification, and emissions estimation techniques. For the purpose of this emissions inventory, point sources are defined as stationary commercial or stationary industrial operations or plants that were major sources during calendar year 2017.

The CT DEEP Bureau of Air Management is responsible for compiling the point source inventory. These responsibilities include identifying which plants meet the cut-off criteria, documenting the methods used to calculate emissions from the equipment at each of these plants, and summarizing and presenting the findings. Table 2-1 and Table 2-2, below, respectively present the annual and typical high ozone summer day emissions for all point sources in each county.

2.1 Identification of 2017 Point Sources

Since 2009, only Title V sources, defined in [RCSA Sec. 22a-174-33](#), that have a Title V permit or that have been specifically requested to file by CT DEEP are required to submit an emissions statement.¹² Beginning in 2014, companies were required to submit their emissions statements electronically via CT DEEP's software application, EMIT. Emissions of the following pollutants are collected using EMIT: VOC, NO_x, CO, PM₁₀ primary (PM₁₀-PRI), PM₁₀ filterable (PM₁₀-FIL), PM_{2.5} primary (PM_{2.5}-PRI), PM_{2.5} filterable (PM_{2.5}-FIL), PM condensable (PM-CON), SO₂, NH₃, and Hazardous Air Pollutants (HAPs), including lead (Pb).

The 2017 periodic stationary source inventory is primarily based on the emissions statement submittals, which reported the source's actual 2017 emissions signed by a corporate officer who attested to the accuracy of their calculations. Facility data for the eighty-three (83) Connecticut sites listed in Table 2-3 below were submitted for the 2017 National Emissions Inventory. Appendix A.0 Point Source List Development History further describes the 2017 periodic stationary source inventory. This state collected point inventory was supplemented by EPA 2017 Toxic Release Inventory data to obtain a more accurate point lead emission estimate.

Connecticut uses a combination of the town, premises within the town, and statewide client identification number to create a unique state facility ID that is used in EMIT.

2.2 Emissions Estimation Procedures

Emissions calculations should be based on the following methods, which are listed here in order of CT DEEP/EPA preference:

- 1) Continuous Emissions Monitoring Systems (CEMs) and Predictive Emissions Monitoring Systems (PEMs) that are required by statute, regulation, or Permit or Order condition. Emissions data generated by these systems shall serve as the basis for emissions reported in EMIT;
- 2) Reference method emissions testing that has been deemed by CT DEEP to be representative of current and normal operating conditions;
- 3) A facility-specific emissions factor that has either been approved by CT DEEP or is based on a material balance with supporting documentation provided to CT DEEP;
- 4) EPA-published emissions factors where available. Some of these factors are provided automatically in EMIT from WebFire based on SCCs;
- 5) Emissions factors from other industry and trade groups based on sound science. These should be discussed with CT DEEP prior to use;
- 6) Best engineering judgement.

Sites are allowed to report a rule effectiveness value for each source and pollutant when the emissions are controlled. EMIT automatically uses this rule effectiveness value to calculate emissions, unless the emissions are based upon CEM systems, the EPA tank model, or an after-control emissions factor.

Summer seasonal adjustments are included in the emissions estimates for applicable point source categories. The operating schedule for each material (SCC level), the seasonal rate of operation for the summer, and the days per week are used to determine daily emissions.

The following general equation was used to account for seasonal adjustments for point sources:

$$E_s = E_a * \frac{T_s}{D_s * W_s} * [1 - (Eff * Cap * Rule)]$$

Equation 1

Where:

- E_s = seasonally adjusted emissions in pounds per day
- E_a = annual uncontrolled emissions of VOC, NO_x, or CO in pounds per year
- T_s = throughput for Ozone as a fraction of total throughput
- D_s = days of operation per week
- W_s = weeks of ozone or CO season in weeks per year
- Eff = control efficiency as a fraction (i.e., Percent / 100)
- Cap = capture efficiency as a fraction (i.e., Percent / 100)
- $Rule$ = rule effectiveness as a fraction (i.e., Percent / 100)

See Appendix B for sample calculations of annual and seasonal adjustments, for several common source types.

2.3 Emissions Summary Tables

For the 2017 PEI, Connecticut is submitting all facilities that reported their actual 2017 emissions. The following tables were prepared to display the emissions data:

Table C-1	Annual Emissions of Point Sources
Table C-2	2017 Annual Toxic Release Inventory (TRI) Supplement to Connecticut Point Source Emissions
Table C-3	Summer Day Emissions of Point Sources
Table C-4	List of Source Classification Codes and Respective EMIT Default Emission Factors
Table C-5	Facility Level of 2017 Connecticut Point Source Inventory

Table C-2 represents the supplemented point inventory based on the EPA 2017 Toxic Release Inventory data in the 2017 National Emissions Inventory that was primarily used to obtain a more accurate point lead emission estimate.

2.4 Point Source Quality Control Procedures

To ensure a high-quality point source inventory is created, point source emissions data must be regularly updated in an accurate manner. Emissions data is reported annually by verified site editors using CT DEEP’s EMIT system and is then reviewed for accuracy and verified by CT DEEP staff prior to its submission to EPA.

See Appendix A.0 for the developmental history of quality control procedures in Connecticut.

2.4.1 Data Entry

EMIT has a number of required data fields that must be entered in by the site editor. To ensure there is no missing data for a site, site editors are unable to save and submit their emissions unless all required fields have been completed. In addition, there are a number of EMIT validation checks to ensure that the value entered into each field is within an acceptable range. Site editors will receive an error message if an entered value falls outside of the range. To support data consistency and quality control, wherever possible, users are provided a dropdown list where they can select from a predefined set of acceptable values. EMIT automatically performs a number of validation checks while sites are completing their emissions statement, prompting editors to provide missing data and correct errant or incongruent data.

Prior to CT DEEP implementing the EMIT system, sites were required to calculate their emissions and to submit their emissions statements on paper. One of the most common errors that occurred during this process was that they miscalculated their emissions. This is no longer an issue because the EMIT system calculates emissions for users at the SCC, source, and site level each time a parameter is updated. The calculation routines used by EMIT have been thoroughly tested and shown to be correct and, together with EMIT’s validation checks, help to minimize errors formerly caused by paper submission.

In addition, when sites attempt to submit their emissions statements, EMIT performs another series of quality assurance (QA) checks. Examples of validation rules that must be satisfied before a site can submit an emissions statement are as follows:

- The sum of all photochemically reactive VOC HAPs cannot exceed total VOC emissions.
- The PM₁₀ primary emissions cannot be less than the sum of the PM₁₀ filterable and PM condensable emissions.
- The PM_{2.5} primary emissions cannot be less than the sum of the PM_{2.5} filterable and PM condensable emissions.
- The PM₁₀ primary emissions cannot be less than the PM_{2.5} primary emissions

- Typical summer day activity was greater than the annual activity.
- The annual activity was zero and the annual emissions were greater than zero.
- The summer day activity was zero and the summer day emissions were greater than zero.
- The seasonal activity percentage breakdown must equal 100 percent.
- A source must have at least one SCC associated to it. Emissions are calculated at the SCC level and then aggregated up to the source and finally the site level.

2.4.2 Data Verification

Once emissions statements are submitted by sites, data verification is performed by CT DEEP staff to check for consistency and completeness of the reported data. QA reviews were conducted by staff via ad-hoc queries of submitted 2017 emissions statements. Companies were contacted and given the option to correct or confirm their submitted data if any of the following situations occurred:

- The PM₁₀ primary emissions for a process were greater than zero and the PM_{2.5} primary emissions were zero.
- The VOC emissions estimates included reductions due to control equipment, but no such reductions were applied in the estimation of VOC HAP emissions.

The Enforcement Division, through their Pre-Inspection Questionnaire (PIQ) and in-person inspections, verify on-site company records regarding fuel use, solvent use, and production rate data previously submitted in the emissions statement reports.

Efforts are made throughout this process to ensure that no point source is also included in the area source inventory. Although the method varies for different categories, generally, emissions accounted for in the point source inventory must be subtracted from the total emissions estimated for their corresponding area source categories.

After CT DEEP completes its quality control, the point source data is submitted to the EPA Emissions Information System (EIS) where EPA applies its own checks. In some cases, the action plan requires a response or re-submittal by emissions reporters. No records tagged by EPA review required corrections or re-submittals for this reporting year.

2.4.3 Additional Quality Control Procedures

In addition to being submitted for the PEI, point source inventory data is routinely used by various groups in the CT DEEP Bureau of Air Management.

For example:

- By the permitting group to assess permit processing fees
- By the modeling group for ambient impact analysis of new point sources
- By the administrative enforcement group for inspections, state orders, and notices of violation
- By the business office for Title V annual emissions fees

As errors are detected by any of these groups, the appropriate corrections are made in the point source inventory.

The last aspect of quality control involves internal measures used by point source inventory personnel. Reasonableness checks are made on important variables.

Section 3 Mobile Sources

Introduction

This section documents the procedures used to estimate emissions from mobile sources active in Connecticut during the 2017 calendar year. Mobile sources are comprised of two main groups: on-road mobile sources and non-road mobile sources.

On-road mobile sources are motor vehicles (e.g. automobiles, buses, and trucks) that travel on local roads and highways. A motor vehicle is defined in [40 CFR § 51.50](#) as “any self-propelled vehicle used to carry people or property on a street or highway”.¹³ Emissions from on-road vehicles are the result of several processes, including the combustion of fuel while vehicles are starting, idling, or moving; the evaporation of fuel from the fuel system and during refueling; as well as from the wearing of brakes and tires.

Non-road mobile sources are comprised of non-road engines and non-road vehicles, which are respectively defined in [40 CFR § 51.50](#) as “an internal combustion engine (including fuel system) that is not used in a motor vehicle or a vehicle used solely for competition, or that is not affected by sections [111](#) or [202](#) of the Clean Air Act” and “a vehicle that is run by a non-road engine and that is not a motor vehicle or a vehicle used solely for competition”.¹⁴ These sources include vehicles, engines, and equipment used for construction, agriculture, recreation, and many other purposes. The equipment must either move under its own power or be capable of being moved from site to site. Emissions from non-road vehicles come from both exhaust and non-exhaust processes, including the combustion of fuel while vehicles are starting, idling, or moving, as well as from the evaporation of fuel from the fuel system and during refueling.

The EPA also develops and maintains approaches for estimating emissions from aircraft, commercial marine vessels, and locomotives which are documented as part of the NEI program; these source categories are respectively addressed in Subsections 3.3 through 3.5.

The annual emissions for on-road and non-road mobile sources can be found on Table 3-1 and Table 3-2, respectively. Emissions for a typical high ozone summer day can be found on Table 3-3 and Table 3-4.

Connecticut	13,596	17,520	151,363	1317	331	97	856	0

Table 3-2: 2017 Annual Non-Road Emissions in Connecticut by County

County	Annual Emissions [TPY]							
	VOC	NO _x	CO	PM ₁₀ -PRI	PM _{2.5} -PRI	SO ₂	NH ₃	Lead
Fairfield	2,645	2,876	39,341	285	268	5	5	0.2545
Hartford	1,635	1,936	26,019	187	177	46	3	0.2963
Litchfield	840	491	8,027	55	52	1	1	0.0524
Middlesex	544	541	5,914	45	42	1	1	0.0493
New Haven	1,600	2,349	23,116	183	173	9	3	0.2119
New London	884	1,767	7,576	90	85	4	2	0.1082
Tolland	252	258	3,060	27	26	1	0	0.0764
Windham	348	332	3,392	34	32	1	1	0.1136
Connecticut	3,084	10,549	116,444	906	855	67	16	2.4262

Note: EPA estimated 2,527 lb/yr (1.26 Tons per Year) of statewide inflight lead emissions (SCC 22-75-087-000), which when added to the above statewide total of lead emitted below the boundary layer, results in an estimated statewide total of 4,841 lb/yr (2.42 Tons per Year) for 2017 lead emissions.

¹⁵ On-road refueling emissions are included in the Area Sources summary and are therefore excluded from on-road emissions.

Table 3-3: 2017 Summer Day On-Road Emissions Summary by County

County	Summer Weekday Emissions [lb/day]		
	VOC	NO _x	CO

Connecticut	60,292	68,954	879,353

3.0.1 Mobile Source Models

As directed by the [Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards \(NAAQS\) and Regional Haze Regulations](#), mobile source emissions are estimated by using the latest recommended mobile source model, the Motor Vehicle Emission Simulator (MOVES).¹⁶ The original version of MOVES, MOVES2010, replaced the previous EPA on-road simulator, MOBILE6.2. While MOBILE6.2 is now obsolete, some data infrastructure is still aligned with input into MOBILE6.2. For that reason, the EPA has released tools to convert data from the MOBILE6.2 format to MOVES format; this will be further discussed in Part 3.1.1. MOVES2014 was released in October 2014 and further improved mobile source modeling by integrating the latest EPA non-road model, NONROAD2008, into MOVES. This now allows all mobile source modeling, whether it is on-road or non-road, to be performed in a single simulator. MOVES2014 has been updated twice; the most recent version, MOVES2014b, was released in August 2018 and contains improvements in modeling non-road sources. Due to the improvements in the non-road sector, the modeling efforts in this PEI have been re-run in MOVES2014b to determine a more accurate estimate of emissions in Connecticut.

The inputs for MOVES are to be developed in accordance with the latest MOVES guidance. The available guidance, [MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity](#) (MOVES Technical Guidance), focuses on determining the appropriate inputs for MOVES and how the simulation should be run to develop representative emissions estimates for vehicles.¹⁷ The MOVES Technical Guidance describes when the default MOVES inputs are appropriate or when to consider providing locally-specific MOVES inputs.

3.0.2 Meteorological Inputs for Mobile Sources

The meteorological inputs used in MOVES to model annual on-road and non-road mobile sources are consistent with the meteorological inputs used to create Connecticut's Motor Vehicle Emissions Budgets (MVEBs) for annual NO_x and PM_{2.5} in accordance with the [1997 annual and 2006 24-hr PM_{2.5} NAAQS SIP](#).

The meteorological inputs used in MOVES to model summer day on-road and non-road mobile sources are consistent with the meteorological inputs used to create Connecticut's MVEBs for summer day NO_x and VOCs in accordance with the 2008 Ozone SIPs. For [Southwest Connecticut](#) and for [Greater Connecticut](#).

3.0.2.1 Effect of Temperature and Humidity on Ozone Formation

The only two meteorological inputs MOVES requires are temperature and humidity due to their relationship with ozone-forming pollutants. Hot, sunny days are tightly correlated with increased production of ground-level ozone from NO_x and VOCs in several ways:¹⁸

- 1) Hot weather can create stagnant air conditions which causes ozone and its precursors to accumulate;
- 2) Sunlight gives energy to the photochemical reaction converting NO_x and VOCs into ozone;
- 3) Higher temperatures can lead to increased evaporation of VOC emissions;
- 4) Humidity is important for estimating the correct NO_x correction factor.

¹⁶ U.S. Environmental Protection Agency. 2017. "Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations". Pg 27.

¹⁷ U.S. Environmental Protection Agency. 2018. "MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity". <https://nepis.epa.gov/Exe/ZyPDF.cgi/P100V7EY.PDF?Dockey=P100V7EY.PDF>

¹⁸ National Weather Service. Clearing the Air on Weather and Air Quality. <https://www.weather.gov/wrn/summer-article-clearing-the-air>.

Therefore, local temperature and humidity data should be used to accurately model emissions in MOVES. These meteorological inputs are specified for zones (counties or non-attainment areas), months, and hours.

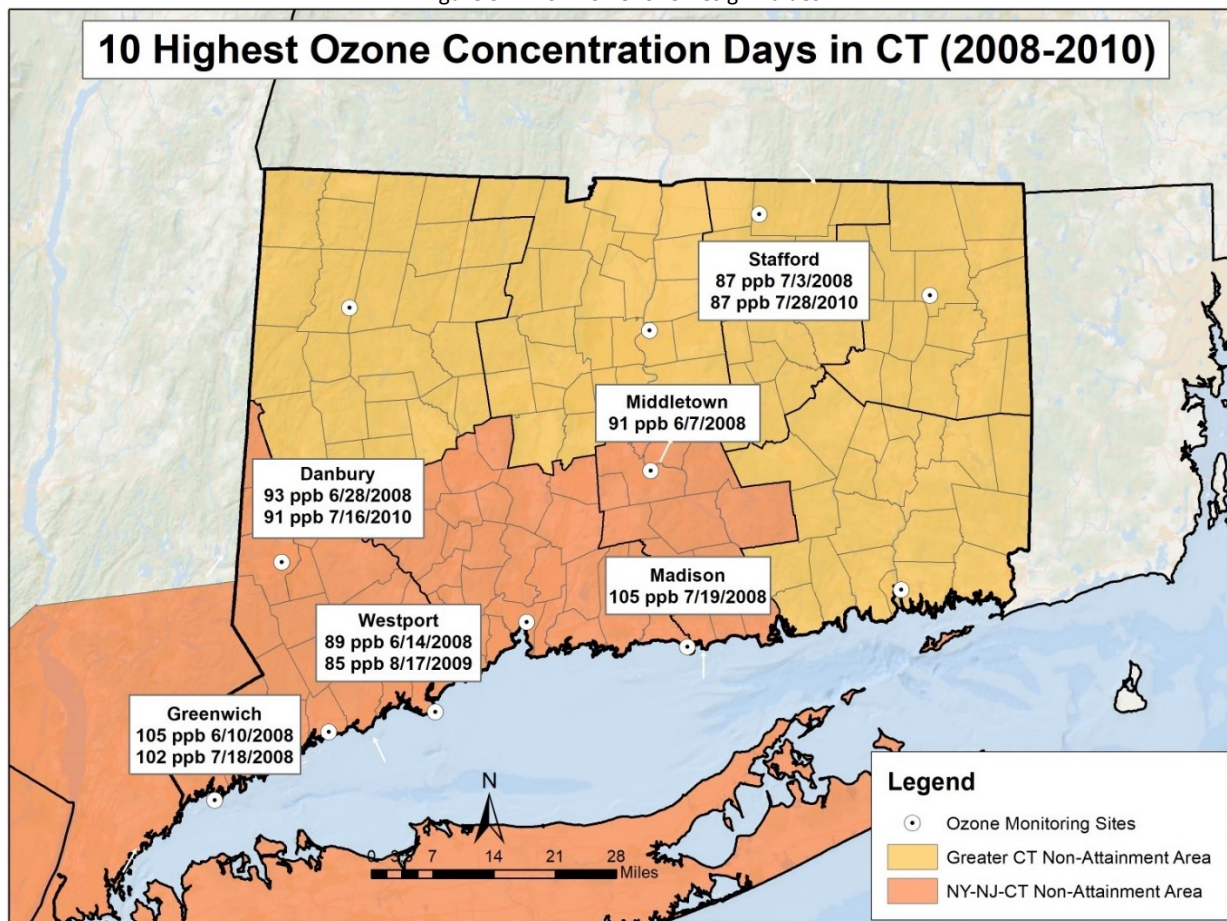

3.0.2.2 Annual Temperature Determination

MOVES meteorological inputs for the Mid-Atlantic Regional Air Management Association (MARAMA) annual modeling effort used the National Mobile Inventory Model (NMIM) National County Database (version NCD20090531) for 2007 analyses.¹⁹ The temperature and humidity used as an input for this 2017 PEI are consistent with the 2007 NCD20090531 data. The annual MOVES input data for each county in Connecticut can be found in Table E-1 through Table E-8.

3.0.2.3 Ozone Summer Day Design Temperature

Temperature inputs for a typical high ozone day for Connecticut's non-attainment areas were calculated by first determining the ten highest 8-hr ozone concentrations that occurred in the entire state on unique days in the months of June through August during the three-year period (2008-2010) preceding the base year (2011). These values were obtained from the [Connecticut Department of Energy and Environmental Protection Annual Summary Information for Ozone Website](#) as shown in Figure 3-A below.

Figure 3-A: 2011 CT Ozone Design Values

For each of the ten highest ozone days in Figure 3-A, the maximum and minimum temperatures that occurred each day were obtained from the [National Oceanic and Atmospheric Administration \(NOAA\) Local Climatological Data Publication](#)

¹⁹ Yang, H. 2012. Development of MANE-VU Onroad Mobile Source Emissions for 2007 and 2020 using MOVES. Northeast States for Coordinated Air Use Management (NESCAUM). <https://www.nescaum.org/documents/nescaum-2007-2020-moves-modeling-tsd-20120118.pdf>.

[Website](#) for Bradley International Airport in Windsor Locks for the greater Hartford ozone non-attainment area and Igor I. Sikorsky Memorial Airport in Bridgeport for the Connecticut portion of the NY-NJ-CT ozone non-attainment area.

Table 3-5: High and Low Temperatures for the Ten Highest Ozone Concentration Days ²⁰

Date	Greater CT Bradley International Airport		CT Portion of NY-NJ-CT Igor I. Sikorsky Airport	
	Max. Temp. [°F]	Min. Temp. [°F]	Max. Temp. [°F]	Min. Temp. [°F]
June 7, 2008	93	60	86	61
June 10, 2008	98	69	96	70
June 14, 2008	88	58	84	65
June 28, 2008	90	65	86	67
July 3, 2008	90	63	87	67
July 18, 2008	93	65	92	72
July 19, 2008	94	67	92	77
August 17, 2009	94	69	91	73
July 16, 2010	93	70	87	73
July 28, 2010	90	62	87	69
Average	92.3	65.8	89.8	69.4

The calculated average maximum and minimum temperatures for each nonattainment area were input into EPA's [Meteorological Data Converter MOBILE6](#) tool to produce a 24-hour temperature profile for a typical high ozone day in Connecticut for each non-attainment area.

Similarly, hour-by-hour humidity profiles were obtained from the [NOAA Quality Controlled Local Climatological Data Website](#) for the same locations and days listed in Table 3-5. An average humidity value was then calculated for each hour of the day, to produce a 24-hour humidity profile for a typical high ozone day in Connecticut for each non-attainment area. These profiles can be seen in Table 3-6 and Table 3-7 on the following page.

The ozone summer day temperature and humidity profiles are input into MOVES to obtain summer day emissions estimates for each Connecticut county.

The MOVES formatted input data for the summer day run are shown for the Connecticut portion of the NY-NJ-CT Ozone Non-Attainment area in Table E-9 and for the Greater Connecticut Ozone Non-Attainment area in Table E-10.

²⁰ These values were originally collected from the NOAA data on May 4, 2016 and may have been updated.

²¹ These values were originally collected from the NOAA data on May 4, 2016 and may have been updated.

3.1 On-Road Mobile Sources

To estimate on-road emissions in 2017, CT DEEP ran MOVES2014b for all eight Connecticut counties in inventory-mode using established annual and summer day input data. Vehicles are classified in MOVES according to thirteen source types and five Highway Performance Monitoring System (HPMS) vehicle types, as shown in Table 3-8 below. Part 3.1.1 of this subsection provides an explanation and basis for the input parameters used in MOVES2014b for this inventory.

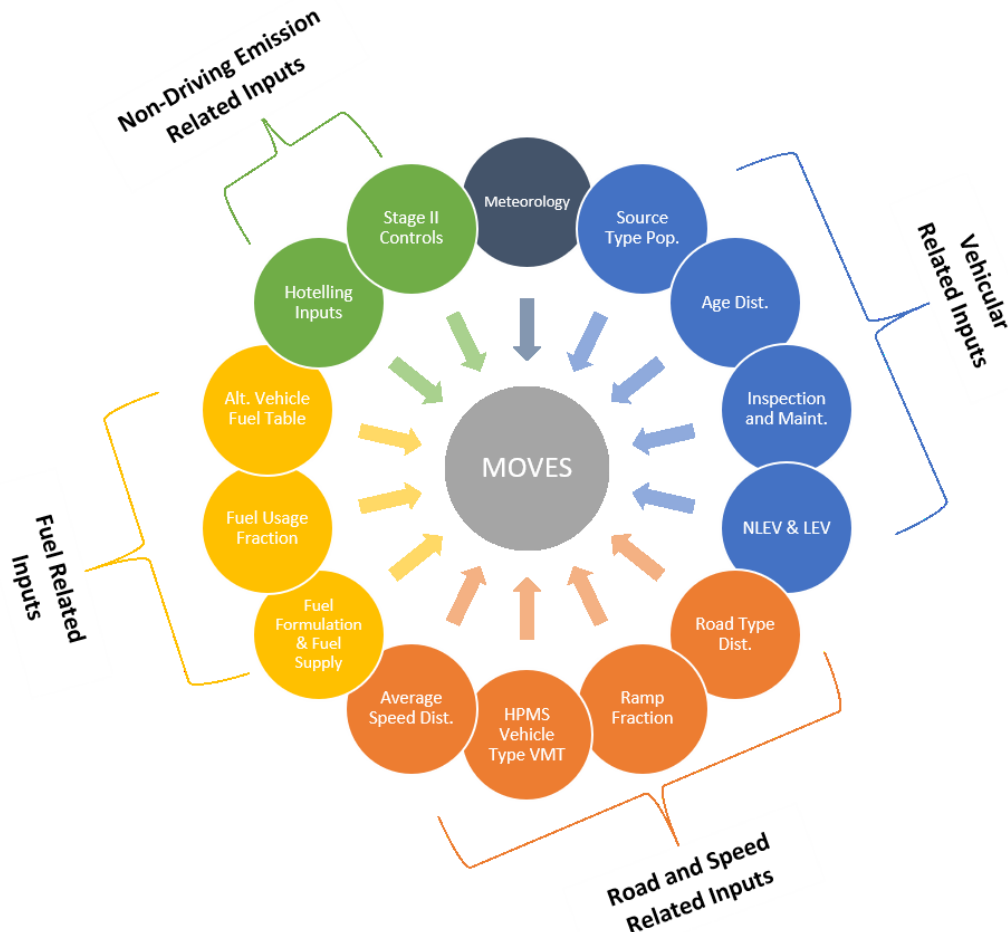

Table 3-8: Source Type and HPMS Vehicle Identification Numbers

Source Type ID	Source Type Description	HPMS Vehicle Type ID	HPMS Vehicle Type Description
11	Motorcycle	10	Motorcycles
21	Passenger Car	25	Light Duty Vehicles– Short and Long Wheelbase
31	Passenger Truck		
32	Light Commercial Truck		
41	Intercity Bus	40	Buses
42	Transit Bus		
43	School Bus		
51	Refuse Truck	50	Single Unit Trucks
52	Single Unit Short-haul Truck		
53	Single Unit Long-haul Truck		
54	Motor Home		
61	Combination Short-haul Truck	60	Combination
62	Combination Long-haul Truck		

3.1.1 MOVES On-Road Inputs

The following subparts provide details for on-road mobile source inputs used in MOVES2014b, as illustrated in Figure 3-B.

Figure 3-B: Visual of MOVES Inputs for On-Road Mobile Sources

These MOVES inputs can be roughly grouped by the following categories in general terms:

- **Vehicle-** This includes the age and type of vehicles, their compliance with Connecticut’s inspection and maintenance program, and emissions standards
- **Road and Speed-** This includes the type of roads and ramps, the vehicle miles traveled (by road and vehicle type), and the average speed (by road and vehicle type)
- **Fuel-** This includes fuel properties, fuel use, and alternative fuel capabilities of vehicle fleets
- **Non-Driving Emissions-** This includes emissions from parked trucks and emissions from refueling
- **Meteorology-** This includes temperature and humidity. Note these inputs are discussed in Part 3.0.2.

These inputs are defined in greater detail in the following subparts below, along with details on data sources, steps used to develop locally specific inputs, and in what cases it was appropriate to accept the default MOVES inputs.

3.1.1.1 Source Type Population

The *Source Type Population* is used by MOVES to calculate start and evaporative emissions. Start and evaporative emissions depend more on how many vehicles are parked and started than on how many miles they are driven. In MOVES, start and resting evaporative emissions are related to the population of vehicles in an area.

Local data from an analysis of 2017 Connecticut registration data from IHS, decoded by EPA for the 2017 NEI, was used for: 21 Passenger Car, 31 Passenger Truck, and 32 Light Commercial Truck source types. CT DEEP estimated the 2017 population for the remaining ten source types by extrapolating from the 2011 Connecticut motor vehicle registration data. The 2011 data was used because 2011 was when the most recent CT DEEP decode effort of local motor vehicle registration data was conducted.

Local data from an analysis of July 1, 2017 Connecticut registration data decoded by CT DEEP was used for: 11 Motorcycle, 43 School Bus and 54 Motor Homes source types. In addition, 41 Transit Buses and 42 Intercity Buses population counts were calculated as a total of all non-school bus busses and apportioned based on the ratios from a previous 2011 DEEP vehicle registration decode.

Local data from an analyses of 2017 Connecticut registration data from IHS, decoded by EPA, for the 2017 NEI was not deemed usable for vehicle population by EPA for heavy duty vehicles. This was due to some redistributions of heavy-duty vehicles that occurred between the 2014 and 2017 versions of IHS provided data. Instead, EPA used vehicle population splits from the 2016v1 NEI modeling platform to apportion heavy-duty VMT by HPMS road type and vehicle types to VMT by HPMS road type and MOVES source types. EPA then used an average miles/vehicle/year to back calculate vehicle population for heavy-duty MOVES source types. These population counts developed by EPA for the 2017 NEI are used in this analysis for 51 Refuse Trucks, 52 Single Unit Short Haul, 53 Single Unit Long Haul, 61 Combination Short Haul, and 62 Combination Long Haul.

Table E-11 summarizes the vehicle population inputs used for the MOVES runs.

3.1.1.2 Age Distribution of Vehicles by Type

The vehicle fleet is further defined by the age of vehicles. For each of the thirteen source types, vehicles are distributed into 31 age groups: one for each of the last thirty model years and a final group for all vehicles older than thirty years (model year of 1987 or earlier).

Local data from an analysis of 2017 Connecticut registration data from IHS, decoded by EPA, for the 2017 NEI was used for: 21 Passenger Car, 31 Passenger Truck, and 32 Light Commercial Truck source types. Because age distribution data was provided on a per county basis, the county level age distribution was used with the county vehicle population counts to obtain a statewide age distribution input.

Local data from an analysis of July 1, 2017 Connecticut registration data decoded by CT DEEP was used for: 11 Motorcycle, 43 School Bus, 54 Motor Homes, 41 Transit Buses, and 42 Intercity Buses. Statewide age distributions were developed directly from the registration data for each source type. Transit and Intercity buses were set to the same age distribution. No age cutoff was applied to these counts so all vehicles over 30 years old are in the 30+ category.

Age distributions developed by EPA, from Connecticut registration data provided by IHS, for use in the 2017 NEI were used for 51 Refuse Trucks, 52 Single Unit Short Haul, 53 Single Unit Long Haul, 61 Combination Short Haul, and 62 Combination Long Haul. Because age distribution data was provided on a per county basis, the county level age distribution was used with the county vehicle population counts to obtain a statewide age distribution input.

Table E-12 summarizes the statewide age distribution input used for the MOVES runs.

3.1.1.3 Inspection and Maintenance Coverage

The *Inspection and Maintenance* (I/M) input reflects the characteristics and SIP requirements of Connecticut’s I/M program. MOVES only calculates I/M program benefits for gasoline vehicles, so this subpart is limited to gasoline vehicles.

Connecticut’s I/M program requires gasoline vehicles that have a gross vehicle weight rating (GVWR) equal to or less than 10,000 pounds that are at least four years old (grace period) to receive an emissions-test every two years. Vehicles that are greater than 25 years old (model year 1993 or earlier for a 2017 analysis) are exempt. These exemptions are applied using appropriate I/M MOVES inputs. The MOVES I/M Coverage input table was adjusted to reflect the grace period exemption age plus one year to account for the misalignment between model and calendar years (model year 2014 is the latest model year provided an I/M input and model year 1993 is the earliest model year provided an I/M input for a 2017 analysis).

Connecticut’s SIP sets a minimum I/M compliance rate of 96% and a maximum waiver rate of 1%. The compliance rate (CR) is defined as “the percentage of vehicles in the fleet covered by the I/M program that completes the I/M program and receive either a certificate of compliance or a waiver” and the waiver rate (WR) is defined as “the percentage of vehicles that fail an initial I/M test and do not pass a retest, but do receive a certificate of compliance.”²² For this inventory analysis, I/M compliance and waiver rates were set to the actual compliance and waiver rates observed in 2017: 98.94% and 0.16%, respectively.²³ These values were used along with the regulatory class coverage adjustments (RCCA), defined as the “percentages of VMT by the various regulatory weight classes within a source type”, provided in [Appendix A of the MOVES Technical Guidance](#) to calculate a compliance factor (CF) for each I/M program type according to the following equation:²⁴

$$CF = CR * (100 - WR) * RCCA * \left(\frac{1}{100} * \frac{1}{100} \right)$$

Equation II: [Compliance Factor Equation](#)²⁵

Where:

- CF = the I/M program percentage of vehicles input into MOVES for each I/M program type according to the equation (Table 3-9 shows some calculated results)..
- CR = the percentage of vehicles in the fleet covered by the I/M program that completes the I/M program and receive either a certificate of compliance or a waiver.
- WR = the percentage of vehicles that fail an initial I/M test and do not pass a retest, but do receive a certificate of compliance
- RCCA = percentages of VMT by the various regulatory weight classes within a source type (Table 3-9 shows these values).

Note: the fractional terms $\left(\frac{1}{100} * \frac{1}{100} \right)$ are applied to ensure dimensional consistency.

Connecticut’s I/M program applies across the state, so all counties use the same I/M coverage inputs.

²² U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity. Pg 54-55

²³ de la Torre Klausmeier Consulting. August 2018. Annual Evaluation of Connecticut’s Inspection/Maintenance Program 2017 Final Report. Pgs 28-29. <https://portal.ct.gov/-/media/DEEP/air/mobile/Emissions-Testing/biennialimreport20162017completepdf.pdf>

²⁴ U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance. Pg 69-70.

²⁵ U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance. Pg 54-55

Passenger Cars (sourceTypeID - 21)

For 1995 & Older: Regulatory class adjustment factor is 100% for ASM2525 (Test Standard ID: 24) and gas cap test (Test Standard ID: 41) since all cars in this source type are under 8,500 lbs.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

For 1996 & newer: Regulatory class adjustment factor is 100% for OBD testing (Test Standard IDs: 51, 43) since all cars in this source type are under 8,500 lbs.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

Passenger Trucks (sourceTypeID - 31)

For 1995 & Older: Regulatory Class Adjustment for ASM2525 (Test Standard ID: 24) is 98% to cover the vehicles in this source type under 8,500 lbs.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(98\%) \frac{1}{100} * \frac{1}{100} = 96.81\%$$

For 1995 & Older: Because vehicles in this source type over 8,500 lbs get a PCTSI test (Test Standard ID: 12), and MOVES can't assign two test standards to one pollutant/sourcetype group, this part of the I/M program is not covered in these inputs. They could be included if a separate MOVES run was conducted and subtracting the difference. The emissions impact of not including this small portion of the I/M program in the MOVES input is very minimal.

For 1995 & Older: Regulatory Class Adjustment for Gas Cap Test (Test Standard ID: 41) is 100% since all vehicles in this source type up to 10,000 lbs get a gas cap test.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

For 1996 & newer: Regulatory Class Adjustment is 100% since all vehicles in this source type up to 10,000 lbs get an OBD test (51, 43).

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

Light Commercial Trucks (sourceTypeID - 32)

For 1995 & Older: Regulatory Class Adjustment for ASM2525 (Test Standard ID: 24) is 92% to cover the vehicles in this source type under 8,500 lbs.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(92\%) \frac{1}{100} * \frac{1}{100} = 90.88\%$$

For 1995 & Older: Because vehicles in this source type over 8,500 lbs get a PCTSI test (Test Standard ID: 12), and MOVES can't assign two test standards to one pollutant/sourcetype group, this part of the I/M program is not covered in these inputs. They could be included if a separate MOVES run was conducted and subtracting the difference. The emissions impact of not including this small portion of the I/M program in the MOVES input is very minimal.

For 1995 & Older: Regulatory Class Adjustment for Gas Cap Test (Test Standard ID: 41) is 100% since all vehicles in this source type up to 10,000 lbs get a gas cap test.

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

For 1996 & newer: Regulatory Class Adjustment is 100% since all vehicles in this source type up to 10,000 lbs get an OBD test (51, 43).

Compliance Factor Calculation:

$$CF = (98.94\%)*(100-0.16)\%*(100\%) \frac{1}{100} * \frac{1}{100} = 98.78\%$$

The Connecticut specific I/M program input developed for MOVES2014b includes the entire CT gasoline I/M testing program with the exception of 1995 and older passenger and light commercial trucks that are over 8,500 lbs, which weren't included due to limitations of MOVES and the minor impact on emissions.

Table 3-9: Summary of Regulatory Class Coverage Adjustments and Compliance Factors for Model Year 1995 & Older Vehicles Tested via ASM2525

SourceTypeID	Source Type Name	RCCA ²⁶	CF
21	Passenger Car	100%	98.78%
31	Passenger Truck	98%	96.81%
32	Light Commercial Truck	92%	90.88%

3.1.1.4 NLEV and LEV Databases

The National Low Emission Vehicle (NLEV) and California Low Emission Vehicle (LEV) standards were adopted by individual states to reduce the emissions from vehicles. These standards alter the default MOVES values for certain model years, so the EPA provides states with two databases to adjust the default values accordingly.

The NLEV Program was the result of an agreement between the EPA, states in the Ozone Transport Commission (OTC), and auto manufacturers to introduce new emission standards in those states beginning with the 1999 model year before implementing them in the rest of the country beginning with the 2001 model year. The default MOVES database does not include the effects of the early program before the national implementation. To account for this, the EPA provides the NLEV database to states in the OTC that simulates the effects of the program for model years 1999 and 2000. Because Connecticut adopted the NLEV program for the 1999 model year, this database was imported to adjust the default MOVES values to represent the effects of the NLEV standards.

²⁶ U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity. Pg 69.

For the states that have adopted the California LEV program regulations, the EPA provides the California LEV database. The effects of these LEV standards are not included in the default MOVES emissions database. Connecticut implemented the California LEV standards in 2008, so CT DEEP modified the California LEV database to reflect the 2008 implementation year in accordance with the EPA document [Instructions for Using LEV and NLEV Inputs for MOVES2014](#) to create a Connecticut specific input.²⁷

3.1.1.5 Road Type Distribution

The *Road Type Distribution* input represents the percent of VMT on each of the five road types used in MOVES, detailed in Table 3-10. MOVES requires this distribution for each vehicle type.

Table 3-10: MOVES Road Types

ID	Name	Description
1	Off-Network	All locations where the predominant activity is vehicle starts, parking and idling
2	Rural Restricted	Rural highways that can only be accessed by an on-ramp
3	Rural Unrestricted Access	All other rural roads (arterials, connectors, and local streets)
4	Urban Restricted Access	Urban highways that can only be accessed by an on-ramp
5	Urban Unrestricted Access	All other urban roads (arterials, connectors, and local streets)

These inputs are created by utilizing a statewide EPA default VMT mix of VMT fraction by the MOBILE6.2 vehicle types and locally collected statewide HPMS vehicle mix containing the fraction of the CT DOT vehicle type counts on each roadway type by functional classification. CT DOT and CT DEEP created a VMT pre-processor, called the CT DOT PERSON FORcasting Model (PERFORM), that would reconcile the two VMT mixes by properly mapping the sixteen MOBILE6.2 vehicle types to the thirteen MOVES source types. The resultant VMT mix of HPMS road type, detailed in Table 3-11, by MOVES vehicle type fraction is then input into EPA's MOVES VMT converter to calculate and format VMT by source type and road type for input into MOVES.

Table 3-11: HPMS Road Types

Rural Road ID	Urban Road ID	Road Description
11	23	Interstate
12	25	Other Freeways and Expressways
13	27	Other Principal Arterial
15	29	Minor Arterial
17	30	Major Collector
19	31	Minor Collector
21	33	Local

The following is a list of tables in Appendix E that provide context for the *Road Type Distribution* input. These tables also provide context for the *Ramp Fraction*, *HPMS Vehicle Type VMT*, and *Average Speed Distribution* inputs, which are discussed in the following subparts.

²⁷ U.S. Environmental Protection Agency.2014. Instructions for Using LEV and NLEV Inputs for MOVES2014. <https://nepis.epa.gov/Exe/ZyPDF.cgi/P100KUFA.PDF?Dockey=P100KUFA.PDF>.

Table E-13	HPMS RURAL TRAVEL ACTIVITY PERCENTAGES BY VEHICLE TYPE AND FUNCTIONAL SYSTEM CONNECTICUT-2010
Table E-14	HPMS URBAN TRAVEL ACTIVITY PERCENTAGES BY VEHICLE TYPE AND FUNCTIONAL SYSTEM CONNECTICUT-2010
Table E-15	MOVES Converter Input for 2017 Fraction of VMT on HPMS Road Type by MOBILE6.2 16 Vehicle Type
Table E-16	CT MOBILE6 Hour Input File
Table E-17	Average 2017 Daily HPMS VMT (miles per day) for the 14 2010+ FHWA HPMS Road Types
Table E-18	2017 HPMSBaseYearVMT Annual Vehicle Miles Traveled (VMT)
Table E-19	2017 Summer Weekday Vehicle Miles Traveled (VMT)

3.1.1.6 Ramp Fraction

Ramp Fraction indicates the percent of vehicle-hours traveled that occurs on ramps for rural restricted access roadways (Road Type ID = 2) and urban restricted access roadways (Road Type ID = 4).

These inputs are generated starting with PERFORM using forecasted VMT figures by roadway type. The county level expressway and ramp VMT are divided into urban and rural designations and input into a MOVES ramp fraction pre-processor along with average speeds for urban and rural expressways and ramps. CT DOT designed this pre-processor to calculate the percentage of urban and rural expressway Vehicle Hours of Travel that occur on ramps within each county.

3.1.1.7 HPMS Vehicle Type VMT

The *HPMS Vehicle Type VMT* (HPMSvType) input represents annual vehicle-miles of travel in each county in Connecticut for each of the five HPMS vehicle types. The annual input for each county input is developed from the VMT fractions for each month, day, and hour. These fractions are respectively defined by:

- the fraction of total annual VMT that occur in a given month;
- the fraction of total monthly VMT that occur on weekdays versus weekends;
- the fraction of total daily VMT that occur in a given hour.

County-level VMT totals by HPMS road type are calculated in the CT DOT PERFORM statewide travel demand model. These VMT totals are based on 2015 HPMS VMT factors that have been derived from HPMS VMT figures categorized by HPMS urban area road types. The VMT mix by HPMS road type and MOVES source type, outlined in the *Road Type Distribution* subpart above, County VMT by road type, and locally collected fraction of VMT by hour are input into the EPA MOVES VMT converter to calculate and format daily VMT figures. These daily VMT figures from PERFORM, which utilize calculated seasonal VMT factors and default weekend day adjustment factors, are then input into EPA’s MOVES Annual Average Daily VMT converter to develop the annual *HPMS Vehicle Type VMT* input for each county.

3.1.1.8 Average Speed Distribution

The *Average Speed Distribution* input is the assignment of vehicle-hours traveled into sixteen unique speed bins in MOVES. PERFORM is used to develop these inputs, but because PERFORM was built using the data format of MOBILE6.2, an EPA convertor tool must be used to convert the PERFORM output data into a MOVES input.

Unlike MOVES, MOBILE6.2 uses only fourteen speed bins. As seen in Table 3-12, the first thirteen speed bins in each model are equivalent, whereas MOBILE6.2 speed bin 14 is split into MOVES speed bins 14, 15, and 16.

MOVES requires this information for every combination of vehicle source type, road type, and hour of the day. It is also separated by season to allow for summer, winter, and annual average adjustment factors.

Table 3-12: MOBILE6.2 and MOVES Speed Bins

Speed Bin Number		Speed [mph]		Abbr. Speed Bin Name
MOBILE6.2	MOVES	Min.	Max.	
1	1	0	2.5	2.5
2	2	2.5	7.5	5
3	3	7.5	12.5	10
4	4	12.5	17.5	15
5	5	17.5	22.5	20
6	6	22.5	27.5	25
7	7	27.5	32.5	30
8	8	32.5	37.5	35
9	9	37.5	42.5	40
10	10	42.5	47.5	45
11	11	47.5	52.5	50
12	12	52.5	57.5	55
13	13	57.5	62.5	60
14	14	62.5	67.5	65
	15	67.5	72.5	70
	16	≥72.5	-	75

3.1.1.9 Fuel Formulation and Fuel Supply

The *Fuel Formulation Table* defines properties, such as RVP, sulfur level, ethanol volume, etc., for each fuel. The *Fuel Supply Table* identifies the fuel formulations used in a region and the respective market share of each formulation.

The MOVES2014b default values are used to define both the fuel formulation and fuel supply values for the 2017 PEI analysis since a full local fuel property study for Connecticut was not available, as recommended in [Section 4.9.1 of the MOVES Technical Guidance](#).²⁸

3.1.1.10 Fuel Usage Fraction

The default fuel usage fractions within MOVES are used for all fuel types except E-85 fuel.

[Section 4.9.2 of the MOVES Technical Guidance](#) instructs the user to specify the fraction of E-85 used compared to conventional gasoline in E-85 capable vehicles, where a fraction of zero indicates that conventional gasoline is used 100% of the time.²⁹ According to the [USDOE Alternative Fueling Station Locator](#), there are only three E-85 stations located in Connecticut: A Navy exchange E-85 gas station and a single public E-85 gas station in New London County; and a single public E-85 gas station in Fairfield County. It is safe to conservatively assume that E-85 usage in E-85 passenger vehicles is minimal at this time.

²⁸ U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity. Pg 46.

²⁹ U.S. Environmental Protection Agency. MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance: Using MOVES to Prepare Emission Inventories for State Implementation Plans and Transportation Conformity. Pg 49.

3.1.1.11 Alternative Vehicle Fuel Table

The *Alternative Vehicle Fuel Table* (AVFT) is used to define the vehicle fleet in terms of which fuels a vehicle type is capable of utilizing. Fractional values, totaling one, are specified for each vehicle type by model year. For example, if half of model year 2017 transit buses are capable of using CNG and the other half are capable of using diesel, then the AVFT would list values of 0.5 under CNG and diesel for model year 2017 transit buses.

The purpose of the AVFT is only to define the vehicle fleet by capability, not by actual fuel usage; that is the purpose of the Fuel Usage Fraction Table. The values in the AVFT should only be modified from the default values if local data is available. Connecticut does not have local data for vehicle fleet capability, so the default data in MOVES2014b is used for each county.

3.1.1.12 Hotelling Inputs

The MOVES input, *hotelling*, refers to the time spent idling in a diesel long-haul combination truck (Source Type ID= 62) during federally- mandated rest periods for long-haul trips. Hotelling modes include extended idle, diesel auxiliary power unit use, battery power, and engine-off.³⁰ MOVES hotelling inputs are used to import total hotelling hours by hour of day, day type, month, and vehicle model year.

The MOVES hotelling hours input for the 2017 PEI were based on hotelling data developed by the EPA for the [2017 NEI](#), which is more representative for Connecticut than the default hotelling hours calculation described in the MOVES MOVES2014b Technical Guidance document. The default hotelling hours data would be calculated only for rural restricted roadways in each county, whereas both rural and urban roadways are accounted for in the 2017 NEI. For instance, hotelling is known to occur in Fairfield County; yet MOVES2014 default estimates would result in hotelling hours within Fairfield County because there are no rural restricted roads in the county. The hotelling hour estimate values from the 2017 NEI are more representative and therefore are preferred. For a detailed explanation of the basis for the 2017 NEI hotelling inputs, please refer to [Section 6.8.4.5 of the 2017 NEI TSD](#).³¹

3.1.1.13 Stage II Controls

The refueling emissions information and adjustments made for Stage II refueling and controls in Connecticut are discussed in Part 4.2.4 of Section 4.

3.1.2 MOVES On-Road Data

Information regarding MOVES2014b run specifications, input databases, and output databases used to calculate 2017 on-road mobile source emission estimates are available upon request. This is a large download (150 MB), and the database files require the supporting MOVES database application (currently MariaDB, formerly MySQL). Send an email to DEEP.BAM.TS@ct.gov using a subject line of "MOVES 2017 ONROAD File Request". Copying Richard.Rodrigue@ct.gov and Steven.Potter@ct.gov may improve the response time for your request. Instructions for accessing the files via secure file transport website (<https://sft.ct.gov/>) will be provided after we put the files on the secure file transport website.

These databases and files provide additional details beyond that provided in this document.

3.1.3 On-Road Mobile Sources Emissions Results

The annual and summer day emission estimates for on-road mobile sources were previously summarized by county in Table 3-1 and Table 3-3, respectively. The estimates for the entire state are summarized by sector on the following pages in Table 3-13 and Table 3-14. These emissions estimates are comprehensively shown by county and fuel type in Appendix F.

Table F-1	2017 Annual Onroad Emissions by SCC for Fairfield County (Excluding Refueling Emissions)

3.2 Non-Road Mobile Sources

The following MOVES default inputs have since been refined by the EPA in 2018 to include significant improvements to non-road inventory estimations and have been included in this updated 2017 PEI:

- Non-road growth indices
 - This decreases non-road equipment populations (and thus emissions), but results vary depending on the economic sector and the base year population of Connecticut and its counties.
- Tier 4 non-road diesel engine classifications, population splits, speciation, and emission rates
 - These changes better account for emissions from large diesel engines with advanced after-treatment. The changes generally decrease future year emissions.
- Non-road diesel fuel sulfur levels
 - This will affect non-road emissions for sulfate and particulate matter.

To estimate non-road emissions in 2017, CT DEEP ran MOVES2014b for all eight Connecticut counties in inventory-mode using established annual and summer day input data. Part 3.2.1 of this subsection provides an explanation and basis for the input parameters used in MOVES2014b for this inventory.

3.2.1 MOVES Non-Road Inputs

The following subparts document the sources of information used to develop locally specific inputs for the MOVES2014b non-road runs.

3.2.1.1 Fuel Formulation and Fuel Supply

As directed by the *Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter National Ambient Air Quality Standards (NAAQS) and Regional Haze Regulations*, fuel data, including fuel formulation and fuel supply, uses MOVES2014b defaults as is similarly done with the on-road runs to ensure the validity of the results.³² Further detail can be found in subpart 3.1.1.9.

3.2.1.2 Population Adjustment for Recreational Marine Sources

The default MOVES2014b values for the *nrbaseyearequippopulation* input are used for all non-road sources except recreational marine sources (sourcetypesIDs 2113 through 2159). This is because the default population growth among these source types is not reflective of boating population in Connecticut. Recreational marine estimates for 2014 are obtained from CT DMV boating registration data.

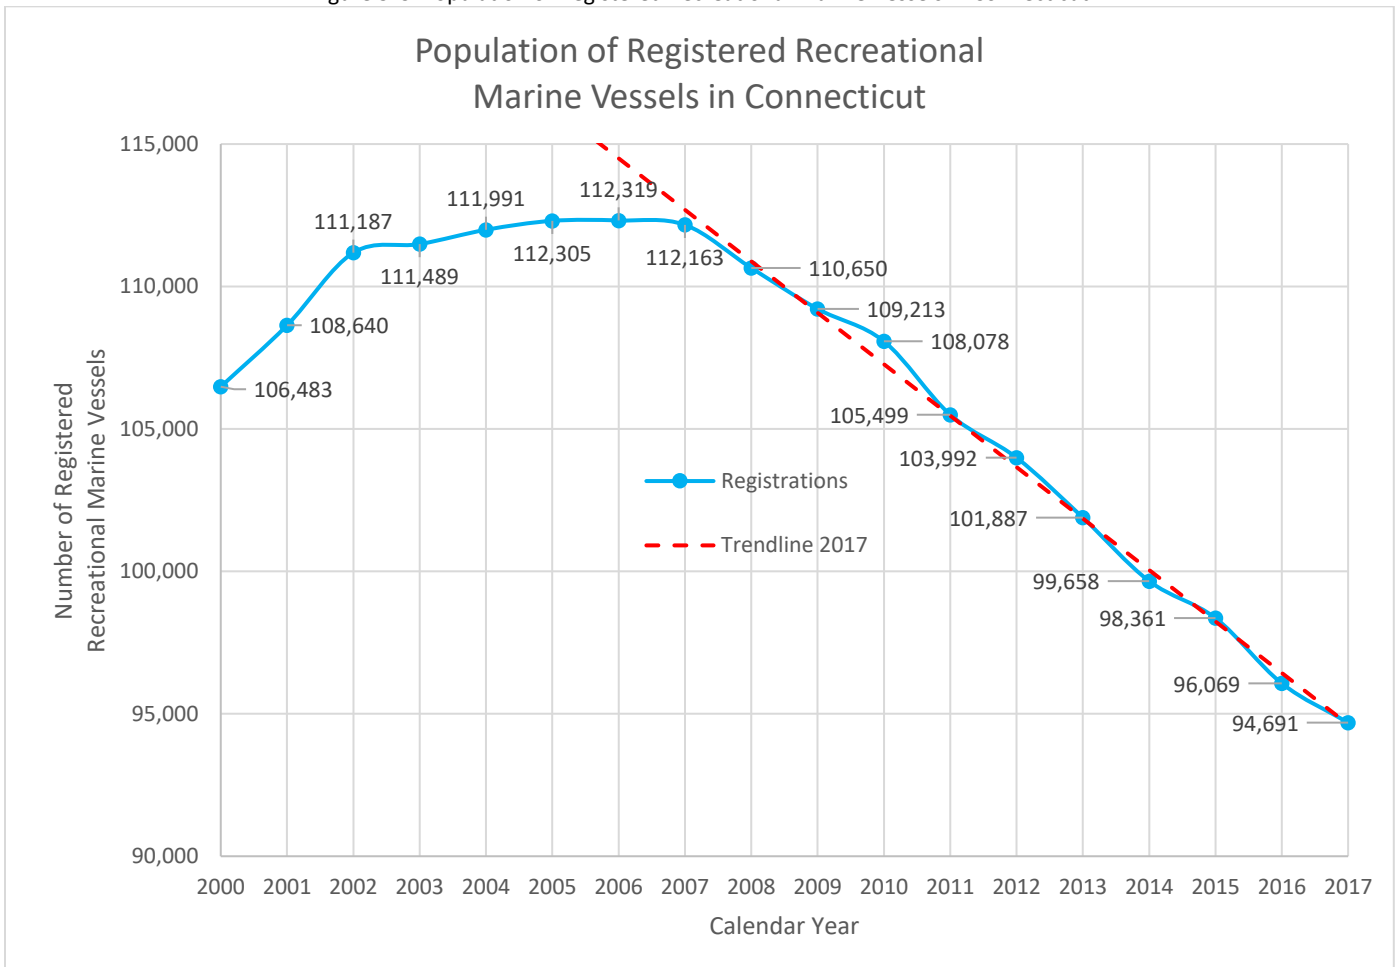

As seen in Figure 3- on the next page, since reaching a peak of more than 112,000 boating registrations between 2005 and 2007, boating registration numbers in Connecticut have steadily declined by about 1,700 registrations each year to a total of 94,689 boating registrations in 2017, a decline of approximately 15% over the last decade. The default MOVES2014b values increase the boating population in Connecticut, which is not representative of the local boating population, so the boating registration data is used. An analysis of the 2018 registration data was used to create an equipment population and distribution for each recreational marine source type and was scaled to the total boating population in 2017.

The population values of recreational marine sources used in MOVES are shown in Table G-17.

³² U.S. Environmental Protection Agency. *Emissions Inventory Guidance for Implementation of Ozone and Particulate Matter 2017*

Figure 3-C: Population of Registered Recreational Marine Vessels in Connecticut

3.2.2 MOVES Non-Road Data

Information regarding MOVES2014b run specifications, input databases, and output databases used to calculate 2017 non-road mobile source emission estimates are available upon request. This is a large download (1 GB), and the database files require the supporting MOVES database application (currently MariaDB, formerly MySQL). Send an email to DEEP.BAM.TS@ct.gov using a subject line of “MOVES 2017 NONROAD File Request”. Copying Richard.Rodrigue@ct.gov and Steven.Potter@ct.gov may improve the response time for your request. Instructions for accessing the files via secure file transport website (<https://sft.ct.gov/>) will be provided after we put the files on the secure file transport website.

These databases and files provide additional details beyond that provided in this document.

3.2.3 Non-Road Mobile Sources Emissions Results

The annual and summer day emission estimates for non-road mobile sources were previously summarized by county in Table 3-2 and Table 3-4, respectively. The estimates for the entire state are summarized by sector on the following page in Table 3-15 and Table 3-16. These emissions estimates are comprehensively shown by county and sector in Appendix G. While aircraft, commercial marine vessels, and locomotives are discussed in the following subsections, the emissions from these sectors are included in the summary tables.

Table 3-15: 2017 Annual Non-Road Sector Emissions in Connecticut

3.3 Aircraft

The aircraft sector is comprised of aircraft used for public, private, and military purposes; as well as aircraft auxiliary power units (APU) and ground support equipment (GSE), such as refueling and baggage handling vehicles. Aircraft are split into four categories: military, commercial, general aviation, and air taxis. All vehicles used for military aircraft operations are encompassed under military aircraft; commercial aircraft and air taxis are both used to transport passengers and freight; and general aviation aircraft include vehicles used for personal transportation and recreation. All aircraft and support equipment are generally defined under the following SCCs:

Table 3-17: SCCs to Define Aircraft and Support Equipment

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
22-75-00-1000	Mobile Sources	Aircraft	Military Aircraft	Total
22-75-02-0000	Mobile Sources	Aircraft	Commercial	Total
22-75-05-0011	Mobile Sources	Aircraft	General Aviation	Piston
22-75-05-0012	Mobile Sources	Aircraft	General Aviation	Turbine
22-75-06-0011	Mobile Sources	Aircraft	Air Taxi	Piston
22-75-06-0012	Mobile Sources	Aircraft	Air Taxi	Turbine
22-75-07-0000	Mobile Sources	Aircraft	Aircraft APU	Total
22-75-087-000	Mobile Sources	Aircraft	In-flight (non-Landing-Takeoff cycle)	Total
22-60-00-8005	Mobile Sources	Off-Highway Vehicle Gasoline	Airport GSE	Two-Stroke
22-65-00-8005	Mobile Sources	Off-Highway Vehicle Gasoline	Airport GSE	Four-Stroke

22-68-00-8005	Mobile Sources	Off-Highway Vehicle CNG	Airport GSE	Airport GSE
22-70-00-8005	Mobile Sources	Off-Highway Vehicle Diesel	Airport GSE	Airport GSE

While aircraft are modeled using MOVES, the associated emissions are classified in the NEI as a point source centered at an airport instead of as a non-road mobile source. In this PEI, however, aircraft emissions have been included as a component of the non-road sector. The emissions produced from aircraft exhaust, APUs, and GSE are considered to be part of an aircraft's Landing & Take-Off (LTO) cycle. The EPA provided draft estimates of the aircraft activity data for the 2017 NEI and allowed states to comment before the calculation of emissions. The EPA expressed interest in separating emissions from piston-engine and turbine-engine powered aircraft to obtain a more accurate estimate for lead. Thus, Connecticut submitted comments to identify the airports and heliports that exclusively use turbine-engine powered aircraft and to provide other updates to the activity data. SCC 22-75-087-000 is uniquely provided a statewide area source lead only emission estimate for in-flight aircraft emissions that occur above the boundary layer. The finalized EPA estimates used in the 2017 NEI for aircraft can be found in the **2017EPA_Airports** dataset available through the [EIS Gateway](#). Connecticut accepts these annual emissions estimates for each facility without adjustment. Connecticut does consider the estimates for small airports and heliports to be high, but these small airports and heliports do not significantly impact emissions estimates, as is evidenced by airport shutdowns and previous airport survey data. For

more information on how the EPA determined these estimates, please refer to [Section 3.2 of the 2017 NEI TSD](#).³³

Summer ozone emissions are calculated from the annual emissions using allocation factors. These allocation factors can be determined using [airport operation records](#) in the Federal Aviation Administration (FAA) Air Traffic Activity Data System (ATADS) and survey data.

The FAA ATADS contains operations data for airports with FAA control towers. The following airports in Connecticut have FAA control towers:

- Bradley International Airport (BDL) - Windsor Locks, CT
- Danbury Municipal Airport (DXR) - Danbury, CT
- Groton-New London Airport (GON) - Groton, CT
- Hartford-Brainard Airport (HFD) - Hartford, CT
- Igor I. Sikorsky Memorial Airport (BDR) - Stratford, CT
- Tweed-New Haven Airport (HVN) - New Haven, CT
- Waterbury-Oxford Airport (OXC) - Oxford, CT

The FAA also estimates the annual operations for thirteen Connecticut airports in their [Traffic Area Forecast](#) (TAF), which includes the seven aforementioned airports in the ATADS and the following six airports:

- Chester Airport (SNC) – Chester, CT
- Danielson Airport (LZD) – Killingly, CT
- Meriden-Markham Municipal Airport (MMK) - Meriden, CT
- Robertson Field (4B8) – Plainville, CT
- Simsbury Airport (4B9) – Simsbury, CT
- Windham Airport (IJD) – North Windham, CT

Because the TAF is only an estimate of annual operations and are not specified by month, the allocation factors for these six airports, and all remaining airports and heliports in Connecticut, are determined from survey data collected from the facilities for the 2005 PEI. This makes the allocation factors used in this PEI consistent with previous PEIs. For a sample calculation of how summertime emissions are calculated in the aircraft sector, please refer to Example 6 in Appendix B.

The airport operations provided by survey responses are refined as necessary to ensure there is an allocation factor for each SCC in Table 3-17. This includes augmentations like separating the general aviation operations into piston-driven and turbine-driven aircraft. Military LTO estimates are not available for MMK and LZD, so a factor of 0.25 is used for MMK and a factor of 0.7 is used for LZD; these factors are consistent with the allocation factors for all other aircraft SCCs at these airports.

Aircraft APUs and GSE estimates are provided in the **2017EPA_Airports** dataset for a few Connecticut airports. While APU and GSE emission estimates are typically at the thirteen airports included in the FAA TAF, the FAA ATADS records and Connecticut airport survey responses do not explicitly identify APUs or GSE operations. The most representative type of aircraft operations at that airport are used as a surrogate to estimate summer day allocation factors for these APU and GSE SCCs at a particular airport. This is because APUs are specific to aircraft commonly used for commercial air carrier and air taxi services and GSE can be provided at the airport for passengers, luggage, and shipments at the airport. Airport specific activities thought to provide the most representative summer day can be applied independently but review of the data indicated that adopting an estimate that included both air carrier and air taxi activity together appeared to be reasonable. For example, the most significant APU and GSE emissions for Connecticut are at Bradley Airport (BDL). The 2017 air carrier commercial aircraft summer season allocation factor is estimates of 0.261 and a combined air carrier and air taxi summer day allocation factor is estimates of 0.262 were calculated from FAA ATADS data. A summer day allocation factor of 0.262 season was applied to the APU (22-75-070-000) and GSE SCCs (22-65-008-005, 22-67-008-005, 22-68-008-005, and 22-70-008-005) at BDL (See appendix table G-20). EPA APU and GSE emission

³³ U.S. Environmental Protection Agency. *Airports*. 2017 National Emissions Inventory: January 2021 Updated Release, Technical Support Document. https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf. Pgs 3-17 to 3-18

estimates for other airports were much smaller and an allocation factor based on a calculated combined air carrier and air taxi summer was used when needed. Appendix G only shows non-zero emissions. Airport ground support equipment SCC 22-60-008-005 (two stroke gasoline), SCC 22-67-008-005 (LPG), and SCC 22-68-008-005 (CNG) do not appear in Appendix G because these process SCCs have no emissions in Connecticut for 2017.

The emissions resulting from aircraft in Connecticut can be found in Appendix G.

3.4 Commercial Marine Vessels (CMV)

Marine vessels that are used to conduct commerce or for use by the Coast Guard are classified as commercial marine vessels (CMVs) and are reported under the following SCCs:

Table 3-18a: SCCs to Define Commercial Marine Vessels

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
22-80-002-101	Mobile Sources	Marine Vessels, Commercial	Diesel	C1C2 Port emissions: Main Engine
22-80-002-102	Mobile Sources	Marine Vessels, Commercial	Diesel	C1C2 Port emissions: Auxiliary Engine
22-80-002-103	Mobile Sources	Marine Vessels, Commercial	Diesel	C3 Port emissions: Main Engine
22-80-002-104	Mobile Sources	Marine Vessels, Commercial	Diesel	C3 Port emissions: Auxiliary Engine
22-80-002-201	Mobile Sources	Marine Vessels, Commercial	Diesel	C1C2 Underway emissions: Main Engine
22-80-002-202	Mobile Sources	Marine Vessels, Commercial	Diesel	C1C2 Underway emissions: Auxiliary Engine
22-80-002-203	Mobile Sources	Marine Vessels, Commercial	Diesel	C3 Underway emissions: Main Engine
22-80-002-204	Mobile Sources	Marine Vessels, Commercial	Diesel	C3 Underway emissions: Auxiliary Engine
22-80-003-103	Mobile Sources	Marine Vessels, Commercial	Residual	C3 Port emissions: Main Engine
22-80-003-104	Mobile Sources	Marine Vessels, Commercial	Residual	C3 Port emissions: Auxiliary Engine
22-80-003-203	Mobile Sources	Marine Vessels, Commercial	Residual	C3 Underway emissions: Main Engine
22-80-003-204	Mobile Sources	Marine Vessels, Commercial	Residual	C3 Underway emissions: Auxiliary Engine

SCCs previously used for reporting commercial marine vessels (CMVs) were retired in 2016 and are shown below:

Table 3-18b: Retired Commercial Marine Vessels SCCs

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
22-80-002-100	Mobile Sources	Marine Vessels, Commercial	Diesel	Port
22-80-002-200	Mobile Sources	Marine Vessels, Commercial	Diesel	Underway
22-80-003-100	Mobile Sources	Marine Vessels, Commercial	Residual	Port
22-80-003-200	Mobile Sources	Marine Vessels, Commercial	Residual	Underway

The emissions estimates for CMVs in Connecticut presented by the EPA in the 2017 NEI are accepted without modification. For more information on how the EPA determined these estimates, please refer to [Section 4.21 of the 2017 NEI TSD](#).³⁴

The annual estimates for 2017 are presented in Table G-22 and the estimates for a typical summer day are presented in Table G-23. The summer day emissions for CMVs are calculated using a factor based on continuous activity, which corresponds to the summer day apportionment factor of 5.495 lb/day to TPY listed in Table D-2. For a sample calculation of how summer day emissions are calculated in the CMV sector, please refer to Example 4 in Appendix B.

3.5 Locomotives

CT DOT has ownership of roughly 1,000 miles of track. Table 3-19 below shows the [fourteen companies](#) that operated locomotives in the State of Connecticut in 2017 by SCC:

³⁴ U.S. Environmental Protection Agency. 2017 National Emissions Inventory: January 2021 Updated Release, Technical Support Document https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf Pgs 4-255 to 4-257

Table 3-19: Locomotive Operations in Connecticut

SCC	Locomotive Class	Company
22-85-002-006	Class I Freight [†]	CSX Transportation (CSXT)
22-85-002-007	Class II/III Freight	Branford Steam Railroad (BRFD)
		Central New England Railroad (CNZR)
		Connecticut Southern Railroad (CSO)
		Housatonic Railroad (HRRC)
		Naugatuck Railroad (NAUG) [‡]
		New England Central Railroad (NECR)
		Pan Am Railways (PAR)
		Pan Am Southern Railroad (PAS)
		Providence and Worcester Railroad (PW)
Valley Railroad (VALE) [‡]		
22-85-002-008	Passenger	Amtrak (AMTK)
22-85-002-009	Commuter	Shore Line East (SLE)
		Metro-North Railroad (MNCW)
22-85-002-010	Yard Locomotives	(All have Yard activity)

[†] Railroad classes are determined by gross revenue, of which, the Class I designation has the largest revenue criteria, followed by Class II and then Class III.

[‡] Valley Railroad is actually tourist attraction (passenger) operations that was included in the inventory as a as Class II/III.

The 2017 NEI estimates assign zero emissions to Class I Operations (22-85-002-006) in Connecticut due to the small scale of these operations relative to national Class I values. CT DEEP provides its own estimates for Class I Operations formulated from a base year of 2005. 2005 data was used because a comprehensive survey was conducted that year with fuel use and track rights data collected from all rail lines in the State of Connecticut. The survey results were analyzed to apportion fuel usage to track mileage for each county, as shown in Table G-26.³⁵ The Class I values pertain only to CSXT, where Fairfield (146,415 gallons), and New Haven (111,555 gallons), respectively represent 3.2% and 2.4% of total statewide locomotive fuel use in 2005 (4,545,060 gallons) and 10.5% and 8.0% of total statewide freight locomotive fuel use in 2005 (1,398,920 gallons). The ratio of emissions associated with the 2005 total freight fuel use were used against EPA's 2017 Class II and III rail emission estimates to obtain proportional values the 2017 Class I emissions estimates. The results of this estimate are presented in the Table G-24 2017 annual estimates for Class I Operations (SCC 22-85-002-006).

Connecticut accepts the 2017 NEI EPA estimates for Class II/III Operations (SCC 22-85-002-007), passenger trains (SCC 22-85-002-008), commuter rail (SCC 22-85-002-009) and yard locomotives (22-85-002-010). Information on how the EPA determined these rail emission estimates are available in [Section 4.22 of the 2017 NEI TSD](#).³⁶

Yard locomotives (22-85-002-010) emissions were zero due to the small scale of these operations. EPA 2017 emissions estimates associated with rail yard locomotives were estimated as point source emissions (point SCC 2-85-002-01) in the 2017 NEI, and even Connecticut's largest switchyard was considered too small and were estimated as zero.

³⁵ State of Connecticut, Department of Energy and Environmental Protection, Bureau of Air Management. 2009. *2005 Periodic Ozone and Carbon Monoxide Emissions Inventory*. <https://portal.ct.gov/DEEP/Air/Emissions-Inventory/Emissions-Inventory>

³⁶ U.S. Environmental Protection Agency. 2017 National Emissions Inventory: January 2021 Updated Release, Technical Support Document https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf Pgs 4-256 to 4-258

The annual estimates for 2017 are presented in Table G-24 and the estimates for a typical summer day are presented in Table G-25. The summer day emissions for locomotives are calculated using a factor based on uniform activity of 24 hours a day, five days a week, which corresponds to the 7.692 lb/day to TPY summer day apportionment factor listed in Table D-2. For a sample calculation of how summertime emissions are calculated in the locomotive sector, please refer to Example 5 in Appendix B.

Section 4 Area Sources

4.0 Introduction

The Area Source Inventory estimates the emissions for those source categories that are too small and/or too numerous to be handled individually in the point source inventory (e.g., residential heating units). Table 4-1 and Table 4-2 present the total of all area source emissions for annual and typical high ozone summer day by county. Table 4-3 and Table 4-4 present the annual and summer day contributions from each area source sector by county. Appendix I Table I-1 presents annual emissions (TPY) by section number within Section 4 of this document, SCC and County. Appendix I Table I-2 lists the VOC, NO_x, and CO emissions for a typical ozone summer day (lb/day) by section number within Section 4 of this document, SCC and County. Appendix I also includes Table I-3 which defines the area source sector groups used in Tables 4-3 and 4-4.

Appendix D Table D-1 lists applicable Source Classification Codes (SCCs) for each section of this 2017 PEI together with an SCC description, the EPA data format (Data Category) and summer day allocation method. With the exception of Stage II Refueling, bulk plant and terminals, and landfill emissions, the allocation of annual emissions to summer day emissions for area source SCCs were generated based on the summer day allocation factors presented in Appendix D Table D-2. These allocation factors are applied on a SCC basis. An example of implementation of the Appendix D Table D-2 allocation factors are shown in Appendix B. Allocation factors generally remain consistent with values used in previous PEI documents and follow EPA SCC replacement mappings. Appendix D Table D-3 provides a listing of summer day allocation factor additions and modifications. The first column of the table indicates the type of change associated with the listed SCC (Correction, New, Replace, or Non-Zero). A single summer day allocation factor for industrial wood combustion was changed (Change Type Correction) to be consistent with other industrial SCCs. Thirteen (13) SCCs were identified to be new to the PEI, but only three (3) SCCs needed to be provided a summer day allocation factor (Change Type New). An additional twelve (12) SCCs were new replacement SCCs for 2017 NEI commercial marine vessels (Change Type Replace). Five SCCs had a zero annual 2014 emissions estimates for VOC, CO, and NO_x, but now required a summer day allocation because the annual 2017 emissions VOC, CO or NO_x were not zero (Change Type Non-Zero). Many summer day allocation factors could be set equal to values established for existing SCCs for similar process. EPA temporal profiles were evaluated when establishing new summer day allocation profiles for new processes. Appendix D Tables D-3 shows the summer day allocation factor and described the logic used in setting the summer day allocation factor for the 2017 PEI. Appendix D Table D-4 and Table D-5 show EPA temporal allocation information for new processes.

Connecticut has adopted EPA's area source emissions estimates for Connecticut, contained in the January 2021 version of EPA's 2017 NEI. Data for the Area Source section was extracted from the [2017 NEI Supporting Data and Summaries](#) link. This [parent directory](#) has links to [Nonpoint data](#) that was used for all aspects of the Area Source emissions estimates with the exception of Prescribed Burning and Wildfires, which has a separate "events' [link](#).

As part of the process of developing EPA's 2017 area source inventory, Connecticut reviewed and made corrections or enhancements where it was appropriate. Most area source categories were accepted as is. Reviews of source categories and the logic used to accept or recommend changes are documented below. Connecticut primarily reviewed source categories that were either impacted by Connecticut specific regulations or the source category had point source emissions that needed to be accounted for in the area source estimate to avoid double counting. Issues noted after the completion of the 2017 NEI are also addressed in this document and are reflected in revised emissions estimates as described.

Documentation for the 2017 NEI is provided in the [2017 NEI Technical Support Document](#). Supporting information is in various sections of the TSD. Specific information in the TSD can be most efficiently found using the section title or SCC description applicable to the area source section, whereas the detailed files supporting TSD calculations are usually better searched by SCC number. SCC information is available online and can be downloaded from EPA's [SCCs database](#). The SCC download contains many additional fields including SCC Sector and Tier information.

Table 4-1: 2017 Annual Area Source Emissions Summary by County

County	Annual Emissions [TPY]							
	VOC	NO _x	CO	PM ₁₀ -PRI	PM _{2.5} -PRI	SO ₂	NH ₃	Lead
Fairfield	7,923	2,833	6,924	4,045	1,850	364	438	0.0619

4.1 Fuel Combustion

4.1.1 Electric Utility Fuel Combustion

There are currently no area source electric utility SCCs, so nonpoint data for electric utility fuel combustion cannot be provided to the EPA EIS at this time. Connecticut includes smaller electric utilities in point source reporting and electric utilities are almost completely covered in the Stationary Point Sources Inventory. The smaller electric utilities that are not covered in the point inventory are listed in Table H-1. This list corresponds to facilities in the Energy Information Administration [2017 Form EIA-923 Report](#) that had an EIA-923 plant identifier but did not align to an EIS alternative identifier, such as, Integrated Planning Model (IPM) or Clean Air Markets Division (CAMD), for an EIS facility having 2017 emissions reported.³⁷ Total activity for all missing distillate and natural gas facilities was calculated to be 363.59 thousand gallons of distillate oil and 2,218.9 million cubic feet of natural gas, as described in the following subsection. This missing electric utilities' activity data was applied to the ICI combustion tool (described below), in order to include the associated emissions in the inventory.

4.1.2 Industrial, Commercial, and Institutional (ICI) Fuel Combustion

The Industrial, Commercial, and Institutional (ICI) fuel combustion source category overlaps with point source reporting, therefore point source reconciliation, also called point source subtraction, is needed to avoid double counting of reported point emissions. The EPA recommended an activity-based reconciliation rather than an emissions-based reconciliation for the 2017 NEI.

ICI fuel combustion point reconciliation was implemented using a mapping to the EIA-923 report data using the EPA IPM and CAMD alternate plant identifiers to the EIA Plant identifier and the NAICS and fuel type option (Option C) described in the EPA's ICI NEMO2 ([ICI NEMO FINAL 4-2 updated.docx](#)) created to support the 2017 NEI.

EPA's IPM and CAMD alternate plant identifiers were obtained from the EPA EIS Facility Configuration Facility Alternate Identifiers report. The North American Industry Classification System (NAICS) codes were obtained from the EPA EIS Facility Configuration Facility report, and other point reporting data including activity data obtained from Connecticut's point inventory system, EMIT. The linked EIA and point reported emissions inventory data shown in Table H-2 were reviewed for proper alignment, as well as for a reasonable expectation that the complete facility would correspond to the EIA classification stated in the EIA-923 report. The EIA-923 mapped data was supplemented with a NAICS based sector assignment based on the primary NAICS assigned to the facility in EIS and the Table 6 Mapping of NAICS code to ICI sector provided in EPA's ICI NEMO. Appendix H Table H-3 shows the resulting ICI Reconciliation Sector Assignment and Assignment Method.

Three reporting facilities have two corresponding EIA 923 mappings:

- 1) EIS facility identifier 590011 DEVON POWER, LLC maps to EIA plant identifier 544 Devon Station and plant identifier 57070 GenConn Devon LLC.
- 2) EIS facility identifier 715611 CRRA / MID-CONNECTICUT maps to EIA plant identifier 54945 CT Resource Rec Authority Facility and plant identifier 563 South Meadow.
- 3) EIS facility identifier 715711 MIDDLETOWN POWER LLC maps to EIA plant identifier 562 Middletown and plant identifier 57068 GenConn Middletown LLC.

Each of these mappings represent a situation where a single emissions statement is provided for a facility having two different operating companies at the facility. Division of units at the facility is not needed because the mapped sites

³⁷ U.S. Energy Information Administration, *Form EIA-923 detailed data with previous data form data (EIA-906/920)*, 2017
<https://www.eia.gov/electricity/data/eia923/>

have the same ICI Reconciliation Sector Assignment. Facilities assigned an Industrial or Commercial ICI Reconciliation Sector Assignment are applicable to ICI fuel combustion and need to be further processed into a suitable input for the EPA ICI Combustion Tool. Connecticut's EMIT point reporting emissions system requires the assignment of SCC unit of measure and material. This provides a better option for obtaining ICI combustion reconciliation data than Table 7 of the EPA's ICI NEMO, which inaccurately eliminates some SCCs when it should identify material and combustion processes. Processes having an appropriate material for ICI input, that are not related to petroleum distribution or evaporation, appear to cover the needed scope for ICI combustion point reconciliation.

A review of SCCs for the facilities assigned an Industrial or Commercial ICI Reconciliation Sector Assignment concluded that fuel consumption was reported separately from process materials (Chips fried, asphalt processed, etc.). This simplified the estimation of fuel use that could have been included under an SCC that was not explicitly associated with a fuel material and its corresponding fuel unit of measure.

The Connecticut facility specific results of the point ICI Reconciliation are shown in Table H-4 for each applicable fuel type. A statewide summary of these data by sector and fuel are provided in Table H-5. Table H-6 shows the final statewide point reconciliation activity input data results with a corresponding SCC assigned for use in the EPA's ICI Combustion Tool. This final result has 363.59 thousand gallons of distillate oil and 2,218.9 million cubic feet (MMCF) of natural gas removed for point reconciliation split equally from the commercial and industrial sectors to adjust electrical generation activity reported to EIA, but not reported as an emissions inventory point source. Part 4.1.1 of this section and Appendix H Table H-1 describe the calculations of the electrical generation activity reported to EIA but not reported as an emissions inventory point source.

Because the EIA only reports energy consumption down to the state-level, it is necessary to develop a procedure to allocate EIA's fuel consumption estimates (after adjustments noted in sections above) to counties. For the NEI, the procedure relies on the use of allocation factors developed from the county-level number of employees in the Industrial sector, and the county number of employees in the Commercial/Institutional sector. Industrial fuels were provided a profile, and commercial / institutional fuels were provided a different profile. Appendix H Table H-7 shows the county allocation profiles for industrial and commercial/institutional employment calculated from the ICI Combustion Tool activity output for Connecticut. ICI Combustion Tool compiled employment data for these NAICS codes from two Bureau of the Census publications— *County Business Patterns* (for private sectors), and *Census of Governments* (for public administration sectors). For more information on the developments of these profiles, please refer to [Section 4.13 of the 2017 NEI TSD](#).³⁸

The EPA ICI Combustion Tool was run to estimate activity and emissions based on the improved point reconciliation approach described above and the EPA defaults with modifications to inputs described below and explained in the individual fuel sections that follow. EIA State Energy Data System (SEDS) data series 2013F was used, with fuel-specific adjustments described the 2017 NEI TSD. Key state level inputs were as follows:

- ICI Point Source Reconciliation estimates using the 2017 methodology.
- ICI Distillate Boiler / Engine Split 95 / 5 for Commercial (and institutional) and 90/10 for Industrial.
- ICI Distillate Sulfur 0.05%.

³⁸ U.S. Environmental Protection Agency, "Fuel Combustion (ICI)". 2021. *January 2021 Release of the 2017 NEI Technical Support Document*, P 4-172 to 4-187, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=247

4.1.2.1 ICI Coal Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-001-000	Stationary Source Fuel Combustion	Industrial	Anthracite Coal	Total: All Boiler Types
21-02-002-000	Stationary Source Fuel Combustion	Industrial	Bituminous/ Subbituminous Coal	Total: All Boiler Types
21-03-001-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Anthracite Coal	Total: All Boiler Types
21-03-002-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Bituminous/ Subbituminous Coal	Total: All Boiler Types

The ICI Combustion tool outputs zero activity and zero emissions for ICI Coal Combustion. The annual estimates for this sector in 2017 are presented in Appendix Table I-1 and the estimates for a typical summer day are presented in Appendix Table I-2.

4.1.2.2 ICI Distillate Oil Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-004-001	Stationary Source Fuel Combustion	Industrial	Distillate Oil	All Boiler Types
21-02-004-002	Stationary Source Fuel Combustion	Industrial	Distillate Oil	All IC Engine Types
21-03-004-001	Stationary Source Fuel Combustion	Commercial/ Institutional	Distillate Oil	Boilers
21-03-004-002	Stationary Source Fuel Combustion	Commercial/ Institutional	Distillate Oil	IC Engines

The SEDS table within version 4.27.20 of the EPA's Wagon Wheel (ICI Combustion Tool) provided a base distillate oil activity input of 21,252 E3GAL (506 E3BBL) for industrial and 63,420 E3GAL (1,510 E3BBL) for commercial/ institutional. This base activity was reduced by state point reconciliation activity input of 334.8 E3GAL (7.97 E3BBL) for industrial and 1,387.6 E3GAL (33.04 E3BBL) for commercial/ institutional to avoid double counting of activity and emissions reported in the point sector. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).³⁹ The annual estimates for this sector in 2017 are presented in Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

It is important to differentiate distillate fuel consumption by boilers from consumption by internal combustion engines because the associated emission factors greatly vary. An example of this emission factor variation is the emission factor for NO_x used in the EPA ICI Tool for internal combustion engines, which is more than 30 times greater than the boiler NO_x emission factor. EPA Nonpoint Methods Advisory Workgroup (NOMAD) regional and state discussions directed attention to properly representing distillate fuel consumption. The split of distillate oil fuel consumption of 95% by boilers and 5% by internal combustion engines for commercial and institutional SCCs used by Connecticut in 2011 was

³⁹ U.S. Environmental Protection Agency, "Fuel Combustion (ICI)". 2021.

maintained, but in 2014 Connecticut applied a higher percentage consumption for industrial SCCs (90% by boilers and 10% by internal combustion engines).

Connecticut’s 2017 ICI Combustion tool input for the distillate boiler/engine split of 95%/5% for commercial and institutional SCCs and 90%/10% for industrial SCCs. The EPA ICI Combustion tool updated distillate boiler/engine split national default values to 60%/40% for industrial and 95%/5% for commercial in May 31, 2017 issue of the Version 1.6 of the tool. EPA indicated that states should update these national defaults based on state specific evaluation. The evaluation of Connecticut data for 2011 supported a boiler/engine split of 95%/5% for both commercial/institutional and industrial. An evaluation for the 2014 NEI was extended to include consideration of a review of Massachusetts data to ensure a representative sample of smaller facilities were included in the inventory. The boiler engine split ratio has come up a number of times and will likely come up in the future, so the following key points are noted.

- Turbine related distillate oil consumption is excluded from consideration in determining the distillate oil boiler/engine split.
- The distillate oil boiler/engine split relates to fuel consumption percentages and not equipment population percentages.
- Fuel cost and availability, particularly natural gas availability impact the distillate oil boiler/engine split, but capital cost of the boiler provides inertial stability for short term price differences. Generally, natural gas availability reduces distillate oil boiler fuel consumption.
- Regulations that prohibit emergency generator use for non-emergency behind the meter electrical generation reduce distillate oil engine fuel consumption.

Connecticut distillate oil sulfur regulations changed from 3000 ppm (0.3% by weight) to a low sulfur limit 500 ppm (0.05% by weight) effective July 1, 2014. The 2014 distillate oil sulfur input for the ICI combustion tool was conservatively set to the regulatory sulfur limits (0.05% by weight). Table 19b-1 of [RCSA § 22a-174-19b](#), “Fuel sulfur content limitations for stationary sources”, indicates that the sulfur limits that was in effect for 2017 was 0.05% by weight.⁴⁰

4.1.2.3 ICI Residual Oil Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-005-000	Stationary Source Fuel Combustion	Industrial	Residual Oil	Total: All Boiler Types
21-03-006-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Residual Oil	Total: All Boiler Types

The SEDS table within version 4.27.20 of the EPA’s Wagon Wheel (ICI Combustion Tool) provided a base residual oil activity of 84 E3GAL (2 E3BBL) for industrial and 1,470 E3GAL (35 E3BBL) for commercial/ institutional. Point reconciliation activity adjustments to avoid double counting of activity and emissions reported in the point sector were not required. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).⁴¹ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

⁴⁰ RCSA § 22a-174-19b. https://eregulations.ct.gov/eRegsPortal/Browse/RCSA/Title_22aSubtitle_22a-174_HTML/#_22a-174-19b.

⁴¹ U.S. Environmental Protection Agency, “Fuel Combustion (ICI)”. 2021.

Table 19b-1 of [RCSA § 22a-174-19b](#), “Fuel sulfur content limitations for stationary sources”, indicates that residual oil fuel sulfur limit did not change from the 10,000 ppm limit that existed in 2011.⁴² This value corresponds to the default value (1.00% by weight) provided by EPA in the ICI combustion tool.

4.1.2.4 ICI Natural Gas Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-006-000	Stationary Source Fuel Combustion	Industrial	Natural Gas	Total: Boilers and IC Engines
21-03-006-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Natural Gas	Total: Boilers and IC Engines

The SEDS table within version 4.27.20 of the EPA’s Wagon Wheel (ICI Combustion Tool) provided a base natural gas activity of 24,557 MMCF for industrial and 52,513 MMCF for commercial/ institutional. This base activity was reduced by state point reconciliation activity input of 8,556.3 MMCF for industrial and 5,112.2 MMCF for commercial/ institutional to avoid double counting of activity and emissions reported in the point sector. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).⁴³ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.1.2.5 ICI LPG Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-007-000	Stationary Source Fuel Combustion	Industrial	Liquefied Petroleum Gas (LPG)	Total: All Boiler Types
21-03-007-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Liquefied Petroleum Gas (LPG)	Total: All Combustor Types

The SEDS table within version 4.27.20 of the EPA’s Wagon Wheel (ICI Combustion Tool) provided a base Liquefied Petroleum Gas activity of 5,838 E3GAL (139 E3BBL) for industrial and 34,020 E3GAL (810 E3BBL) for commercial/ institutional. This base activity was reduced by state point reconciliation activity input of 54.849 E3GAL for industrial and 14.034 E3GAL for commercial/ institutional to avoid double counting of activity and emissions reported in the point sector. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).⁴⁴ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

⁴² RCSA § 22a-174-19b.

⁴³ U.S. Environmental Protection Agency, “Fuel Combustion (ICI)”. 2021.

⁴⁴ U.S. Environmental Protection Agency, “Fuel Combustion (ICI)”. 2021.

4.1.2.6 ICI Wood Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-008-000	Stationary Source Fuel Combustion	Industrial	Wood	Total: All Boiler Types
21-03-008-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Wood	Total: All Boiler Types

The SEDS table within version 4.27.20 of the EPA's Wagon Wheel (ICI Combustion Tool) provided a base wood combustion activity of 921 E6BTU for industrial and 4,087 E6BTU for commercial/ institutional. Point reconciliation activity adjustments to avoid double counting of activity and emissions reported in the point sector were not required. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).⁴⁵ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.1.2.7 ICI Kerosene Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-02-011-000	Stationary Source Fuel Combustion	Industrial	Kerosene	Total: All Boiler Types
21-03-011-000	Stationary Source Fuel Combustion	Commercial/ Institutional	Kerosene	Total: All Combustor Types

The SEDS table within version 4.27.20 of the EPA's Wagon Wheel (ICI Combustion Tool) provided a base Kerosene combustion activity of 1,638 E3GAL (39 E3BBL) for industrial and 168 E3GAL (13 E3BBL) for commercial/ institutional. Point reconciliation activity adjustments to avoid double counting of activity and emissions reported in the point sector were not required. For more information on the fuel specific adjustments to EIA data, please refer to [Section 4.13 of the 2017 NEI TSD](#).⁴⁶ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.1.3 Residential Fuel Combustion

4.1.3.1 Residential Coal Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-04-001-000	Stationary Source Fuel Combustion	Residential	Anthracite Coal	All Boiler Types
21-04-002-000	Stationary Source Fuel Combustion	Residential	Bituminous/ Subbituminous Coal	All Boiler Types

Coal is not utilized for residential heat in Connecticut. EPA activity estimate is zero for Connecticut. Connecticut accepts the EPA Residential Coal Combustion emissions estimates. For more information on these estimates, please refer to

⁴⁵ U.S. Environmental Protection Agency, "Fuel Combustion (ICI)". 2021.

⁴⁶ U.S. Environmental Protection Agency, "Fuel Combustion (ICI)". 2021.

[Section 4.14 of the 2017 NEI TSD](#).⁴⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.1.3.2 Residential Distillate Oil Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-04-004-000	Stationary Source Fuel Combustion	Residential	Distillate Oil	Total Boilers and IC Engines

Connecticut accepts the EPA estimates for residential distillate oil combustion. The EPA default 2017 sulfur concentrations of 500 ppm for residential distillate oil were consistent with General Statutes of Connecticut [§16a-21a\(a\)\(2\)](#) and did not require modification.⁴⁸

For more information on these estimates, please refer to [Section 4.14 of the 2017 NEI TSD](#).⁴⁹ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA 2016 NEI activity data for the State of Connecticut (used for the 2017 Inventory) was based on EIA [SEDS](#) Distillate Fuel Oil consumption data.⁵⁰ This data file can be accessed [here](#). EIA Mnemonic Series Name (MSN) DFRCP (Distillate fuel oil consumed by the residential sector) were estimated at 7,870 E3BBL or 330,539 E3GAL in 2017.

The EPA county allocation shown in Table 4-5 was provided through support files found in the 2017 NEI TSD sourced from the U.S. Census Bureau's American Community Survey 2017 CT County [House Heating Fuel](#) 5-year estimates (Fuel Oil, Kerosene, etc).⁵¹

Table 4-5: 2017 County Allocation of Residential Distillate Oil and Kerosene Consumption

County	EPA County Allocation
Fairfield	23.4%
Hartford	20.3%
Litchfield	7.2%
Middlesex	6.6%
New Haven	22.2%
New London	10.3%
Tolland	5.4%
Windham	4.5%

4.1.3.3 Residential Residual Oil Combustion

The Residential Residual Oil Combustion SCC (21-04-005-000) was retired and not replaced by the EPA. Therefore, there was no EPA estimate for combustion of residual oil in the residential sector for Connecticut or any other state.

4.1.3.4 Residential Natural Gas Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-04-006-000	Stationary Source Fuel Combustion	Residential	Natural Gas	Total: Boilers and IC Engines

Connecticut accepts the EPA Residential Natural Gas Combustion emissions estimates. For more information on these estimates, please refer to [Section 4.14 of the 2017 NEI TSD](#).⁵² The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA 2016 NEI activity data for the State of Connecticut (used for the 2017 Inventory) was based on EIA [SEDS](#) natural gas consumption data.⁵³ This data file can be accessed [here](#). EIA MSN NGRCP (Natural gas consumed by (delivered to) the residential sector) was estimated at 48,431 MMCF.

The EPA county allocation shown in Table 4-6 was provided through support files found in the 2017 NEI TSD sourced from the U.S. Census Bureau's American Community Survey 2017 CT County [House Heating Fuel](#) 5-year estimates (Utility Gas).⁵⁴

Table 4-6: 2017 County Allocation of Residential Natural Gas Consumption

County	EPA County Allocation
Fairfield	28.4%
Hartford	34.7%
Litchfield	2.5%
Middlesex	2.0%
New Haven	26.9%
New London	3.2%
Tolland	1.4%
Windham	1.0%

4.1.3.5 Residential LPG Combustion

Source Classification Code	SCC Description

4.1.3.6 Residential Wood Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-04-008-100	Stationary Source Fuel Combustion	Residential	Wood	Fireplace: general
21-04-008-210	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: fireplace inserts; non-EPA certified
21-04-008-220	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: fireplace inserts; EPA certified; non-catalytic
21-04-008-230	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: fireplace inserts; EPA certified; catalytic
21-04-008-310	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: freestanding, non-EPA certified
21-04-008-320	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: freestanding, EPA certified, non-catalytic
21-04-008-330	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: freestanding, EPA certified, catalytic
21-04-008-400	Stationary Source Fuel Combustion	Residential	Wood	Woodstove: pellet-fired, general (freestanding or FP insert)
21-04-008-510	Stationary Source Fuel Combustion	Residential	Wood	Furnace: Indoor, cordwood-fired, non-EPA certified
21-04-008-530	Stationary Source Fuel Combustion	Residential	Wood	Furnace: Indoor, pellet-fired, general
21-04-008-610	Stationary Source Fuel Combustion	Residential	Wood	Hydronic heater: outdoor
21-04-008-620	Stationary Source Fuel Combustion	Residential	Wood	Hydronic heater: indoor
21-04-008-630	Stationary Source Fuel Combustion	Residential	Wood	Hydronic heater: pellet-fired
21-04-008-700	Stationary Source Fuel Combustion	Residential	Wood	Outdoor wood burning device, NEC (fire-pits, chimneys, etc)
21-04-009-000	Stationary Source Fuel Combustion	Residential	Firelog	Total: All Combustor Types

Connecticut accepts the EPA Residential Wood Combustion emissions estimates. For more information on these estimates, please refer to [Section 4.15 of the 2017 NEI TSD](#).⁵⁸ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

⁵⁸ U.S. Environmental Protection Agency, "Fuel Combustion (Residential-Wood)". 2021. January 2021 Release of the 2017 NEI Technical Support Document, P 4-196 to 4-204, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=271

4.1.3.7 Residential Kerosene Combustion

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
21-04-011-000	Stationary Source Fuel Combustion	Residential	Kerosene	Total: All Combustor Types

Connecticut accepted the EPA kerosene combustion emissions estimates. General Statutes of Connecticut [§16a-21a\(a\)\(2\)](#) specifies sulfur limit of residential heating distillate oil of 500 ppm.⁵⁹ Table 19b-1 of [RCSA § 22a-174-19b](#), “Fuel sulfur content limitations for stationary sources” specifies a 400 ppm SO₂ sulfur concentration. Emissions for kerosene reflect an average sulfur value of 400 ppm for 2017 consistent. This sulfur value is not a conservative assumption, but it does not correspond to significant emissions impact and it may reflect a probable reality due to the use of a common fuel supply system.

For more information on these estimates, please refer to [Section 4.14 of the 2017 NEI TSD](#).⁶⁰ The annual estimates for this sector in 2017 are presented in Appendix I Table I 1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA 2017 NEI activity data for the State of Connecticut was based on EIA [SEDS](#) kerosene consumption data.⁶¹ This data file can be accessed [here](#). EIA MSN KSRCP (Kerosene consumed by the residential sector) were estimated at 13 E3BBL or 546 E3GAL.

The EPA county allocation previously shown in Table 4-5 was provided through support files found in the in the 2017 NEI TSD sourced from the U.S. Census Bureau’s American Community Survey 2017 CT County [House Heating Fuel](#) 5-year estimates (Fuel Oil, Kerosene, etc).⁶²

4.2 Storage & Transport (Gasoline and Fuel Distribution)

In general terms, gasoline distribution emission estimates are broken out in the numbered section groupings or alternatively into the following “stages”:

Stage 1 gasoline distribution emissions are the emissions associated with gasoline handling excluding emissions from refueling activities. Stage I gasoline distribution includes the following gasoline emission points: 1) bulk terminals; 2) pipeline facilities; 3) bulk plants; 4) tank trucks; and 5) unloading at service stations. Emissions from Stage I gasoline distribution occur as gasoline vapors are released into the atmosphere. These Stage I processes are subject to EPA’s maximum available control technology (MACT) standards for gasoline distribution.⁶³

⁵⁹ Conn. Gen. Stat. Sec. 16a-21a. “Sulfur content of home heating oil and off-road diesel fuel”.

https://www.cga.ct.gov/current/pub/chap_296.htm#sec_16a-21a⁶⁰ U.S. Environmental Protection Agency, “Fuel Combustion (Residential)”. 2021.

⁶⁰ U.S. Environmental Protection Agency, “Fuel Combustion (Residential)”. 2021.

⁶² U.S. Census Bureau. Table Code B25040. 2017.

⁶³ U.S. Environmental Protection Agency, “National Emission Standards for Source Categories: Gasoline Distribution (Stage I), 40 CFR Part 63.” Office of Air Quality Planning and Standards, February 28, 1997. Pages 9087-9093.

<https://www.govinfo.gov/content/pkg/FR-1997-02-28/pdf/97-4885.pdf>

Stage 2 involves the emissions from refueling activities, which could include filling of onroad or nonroad vehicles at the gasoline station pump, filling of portable fuel containers (PFC) at the gasoline station pump, or transfer of fuel from the tanker trucks into general aviation aircraft.⁶⁴

4.2.1 Bulk Plants and Bulk Terminals

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
25-01-050-120	Storage and Transport	Petroleum and Petroleum Product Storage	Bulk Terminals: All Evaporative Losses	Gasoline
25-01-055-120	Storage and Transport	Petroleum and Petroleum Product Storage	Bulk Plants: All Evaporative Losses	Gasoline

A bulk gasoline terminal in [40 CFR § 63.11100](#) is defined as “any gasoline storage and distribution facility that receives gasoline by pipeline, ship or barge, or cargo tank and has a gasoline throughput of 20,000 gallons per day or greater”. Similarly, a bulk gasoline plant is defined as “any gasoline storage and distribution facility that receives gasoline by pipeline, ship or barge, or cargo tank, and subsequently loads the gasoline into gasoline cargo tanks for transport to gasoline dispensing facilities and has a gasoline throughput of less than 20,000 gallons per day”.⁶⁵

Some of [Section 4.7 of the 2017 NEI TSD](#) apply to Connecticut nonpoint gasoline distribution data, but bulk plant and bulk terminal emissions were developed using an alternative method that is different from the EPA method. The Connecticut point emissions inventory does not have any current reported bulk plant SCC emissions and CT DEEP does not have any knowledge of any bulk plants within Connecticut state boundaries. All bulk gasoline storage appears to be covered by bulk terminals, which almost exclusively are accounted for as point sources. Reported 2017 point source bulk terminal activity and emissions are summarized in Table H-8 and an estimate of bulk terminal emissions not reported as point sources are presented in Appendix H Table H-9.

Bulk plant (SCC 25-01-055-120) area source emissions were set to zero for all counties and bulk terminal (SCC 25-01-050-120) were set to the Appendix H Table H-9 values. The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.2.2 Aviation Gasoline, Stage 1 and 2 Distribution

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
25-01-080-050	Storage and Transport	Petroleum and Petroleum Product Storage	Airports: Aviation Gasoline	Stage 1: Total
25-01-080-100	Storage and Transport	Petroleum and Petroleum Product Storage	Airports: Aviation Gasoline	Stage 2: Total

⁶⁴ U.S. Environmental Protection Agency, “Aviation Gas”, *January 2021 Release of the 2017 NEI Technical Support Document*, P 4-89, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=164

Table 4-8: 2017 County-Level Aviation Gasoline Consumption Allocation ⁶⁶

County Name	County-Level AvGas Consumption [gal]	SEDS State AvGas Consumption [gal]
Fairfield	174,777	798,000
Hartford	204,343	798,000
Litchfield	36,115	798,000
Middlesex	33,834	798,000
New Haven	145,491	798,000
New London	72,423	798,000
Tolland	52,676	798,000
Windham	78,342	798,000
Total	798,000	

Connecticut accepts the EPA Stage 1 and 2 Aviation Gasoline emission estimates.⁶⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

As shown in Table 4-8: County-Level Aviation Gasoline Consumption Allocation (2017) Table 4-8, the EPA 2017 NEI activity data for the State of Connecticut was based on CSV zip file data from [EIA SEDS data set for Consumption](#) SEDS in years 1960-Present.

Stage 1 distribution for aviation gasoline pertains to the displacement vapors between tank trucks and storage tanks during transfer; whereas Stage 2 distribution involves the transfer of fuel from tanker trucks into general aviation aircraft.⁶⁸ The calculations for estimating emissions from stage 1 and 2 aviation gasoline distribution involve first estimating the amount of aviation gasoline consumed in each county based on state-level aviation gasoline consumption data from the Energy Information Administration (EIA). State-level aviation gasoline consumption is distributed to the counties based on the proportion of Landing-Take Offs (LTOs) for piston driven aircraft. The total amount of gasoline consumed was used to estimate VOC and lead emissions. For more information on these estimates, please refer to [Section 4.7 of the 2017 NEI TSD](#).

The 2017 methodology included no significant changes from the methodology used to calculate the 2014 v2 NEI emissions, except Aviation Gasoline Distribution Stage 2 emission factor was significantly decreased. The Aviation Gasoline Distribution Stage 2 VOC emission factor for fuel transfer from tanker trucks to aircraft was decreased from a

⁶⁸ U.S. Environmental Protection Agency, "Aviation Gas", *January 2021 Release of the 2017 NEI Technical Support Document*, P 4-89, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=164

value of 1.36E-2 lbs. VOC/gallon AvGas used in the 2014 NEI to a value of 8.27E-4 lbs. VOC/gallon AvGas used in the 2017 NEI after reviewing the emission factor reference more carefully.⁶⁹

4.2.3 Stage I Gasoline Distribution

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
25-01-060-051	Storage and Transport	Petroleum and Petroleum Product Storage	Gasoline Service Stations	Stage 1: Submerged Filling
25-01-060-052	Storage and Transport	Petroleum and Petroleum Product Storage	Gasoline Service Stations	Stage 1: Splash Filling
25-01-060-053	Storage and Transport	Petroleum and Petroleum Product Storage	Gasoline Service Stations	Stage 1: Balanced Submerged Filling
25-01-060-201	Storage and Transport	Petroleum and Petroleum Product Storage	Gasoline Service Stations	Underground Tank: Breathing and Emptying

Connecticut accepts EPA's Stage 1 Gasoline Distribution emissions estimates. For more information on these estimates, please refer to [Section 4.7 of the 2017 NEI TSD](#).⁷⁰ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The calculations for estimating VOC and HAP emissions from gasoline service station unloading involve first calculating county-level total gasoline consumption by summing monthly onroad gasoline consumption and nonroad gasoline consumption in each county by fuel subtype. Monthly county-level gasoline consumption is then allocated to submerged, splash, and balanced filling technologies based on assumptions about the percentage of each filling technology used in each county.⁷¹ Connecticut estimates used a conservative assignment of 5% submerged filling, 0% splash filling, and 95% balanced submerged filling. A conservative assignment of technology was used because the exact throughput of the limited number of small gasoline dispensing facilities is difficult to obtain. [Connecticut regulation RCSA § 22a-174-20\(a\)\(5\)](#) essentially requires submerged filling for all stationary-gasoline dispensing stations and [RCSA § 22a-174-30a](#) requires balanced submerged filling for any gasoline dispensing station with throughput over 10,000 gallons per month.^{72,73}

4.2.4 Stage II Refueling

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
22-01-00-0062	Mobile Sources	Highway Vehicles- Gasoline	Refueling	Total Spillage and Displacement
22-02-00-0062	Mobile Sources	Highway Vehicles- Diesel	Refueling	Total Spillage and Displacement

EPA provided an estimate of diesel refueling in the 2017 NEI data under SCC 22-02-00-0062. Connecticut accepts EPA's emission estimates for SCC 22-02-00-0062.

Connecticut Stage II gasoline emissions (SCC 22-01-00-0062) were estimated using the Connecticut specific MOVES run for the 2017 PEI. Reported point emissions (SCC 4-06-004-02) overlap with SCC 22-01-00-0062 emissions so point reconciliation was applied as described in this section. Stage II refueling emissions estimates are presented below and in Appendix I. The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The requirement for Stage II gasoline vehicle fueling controls was eliminated in Connecticut by [Public Act No. 13-120](#) on June 18, 2013 and became effective immediately.⁷⁴ This act immediately repealed the requirement to install and test Stage II vapor recovery systems and replaced it with language mandating the decommissioning of all Stage II systems by July 1, 2015. Because Stage II controls were either removed or not tested, Connecticut assigned the *refuelingVaporProgramAdjust* and *refuelingSpillProgramAdjust* inputs in the MOVES2014b countyyear table to correspond to no Stage II program (i.e. "0" for both fields) for each Connecticut county in 2017. This method to "turn-off" Stage II controls is consistent with guidance provided in [Section 4.15 of the MOVES2014, MOVES2014a, and MOVES2014b Technical Guidance](#).⁷⁵

Table 4-9 contains the VOC annual and typical ozone season day emissions from Stage II gasoline vehicle fueling and Stage II diesel vehicle fueling after applying point source subtraction. Only gasoline summer day and annual refueling emissions were obtained from MOVES2014b model runs with point source subtraction applied, as the annual diesel refueling emissions estimates provided by EPA were thought to be adequate. Summer day stage II diesel refueling emissions estimates were obtained by multiplying the annual emissions times a historical used allocation factor (5.767 pounds per day / tons per year), which is calculated based on 26.24% of the VOC emissions occurring during the summer season. The gasoline annual and summer day refueling emissions were obtained directly from MOVES2014b using Stage II program adjustments described above together with other MOVES inputs described in Section 3 of this document.

Table 4-10 presents the emissions reductions applied as result of point source subtraction together with the point source SCC that was used to report the emissions. Only a single point source SCC was found to have a mapping and only the gasoline SCC 22-01-00-0062 needed to be adjusted for point source emissions for three facilities reported in 2017. Stage II refueling remains in Section 4 Area Sources of this document, because Stage II refueling is a fixed nonpoint

4.2.5 Industrial Processes – Storage and Transfer – Truck or Pipeline

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
25-05-030-120	Storage and Transport	Petroleum and Petroleum Product Transport	Truck	Gasoline
25-05-040-120	Storage and Transport	Petroleum and Petroleum Product Transport	Pipeline	Gasoline

Connecticut accepts EPA's Storage and Transfer, Truck or Pipeline emission estimates. For more information on these estimates, please refer to [Section 4.7 of the 2017 NEI TSD](#).⁷⁶ The annual estimates for this sector in 2017 are presented in Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

⁷⁶ U.S. Environmental Protection Agency, "Nonpoint gasoline distribution", *January 2021 Release of the 2017 NEI Technical Support Document*, P 4-88 to 4-122, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=163

The EPA 2017 NEI activity data and apportionment for the State of Connecticut is also described in [Section 4.7 of the 2017 NEI TSD](#).

4.2.6 Portable Fuel Containers Estimates

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
25-01-011-011	Storage and Transport	Petroleum and Petroleum Product Storage	Residential Portable Gas Cans	Permeation
25-01-011-012	Storage and Transport	Petroleum and Petroleum Product Storage	Residential Portable Gas Cans	Evaporation (includes Diurnal losses)
25-01-011-013	Storage and Transport	Petroleum and Petroleum Product Storage	Residential Portable Gas Cans	Spillage During Transport
25-01-011-014	Storage and Transport	Petroleum and Petroleum Product Storage	Residential Portable Gas Cans	Refilling at the Pump -Vapor Displacement
25-01-011-015	Storage and Transport	Petroleum and Petroleum Product Storage	Residential Portable Gas Cans	Refilling at the Pump -Spillage
25-01-012-011	Storage and Transport	Petroleum and Petroleum Product Storage	Commercial Portable Gas Cans	Permeation
25-01-012-012	Storage and Transport	Petroleum and Petroleum Product Storage	Commercial Portable Gas Cans	Evaporation (includes Diurnal losses)
25-01-012-013	Storage and Transport	Petroleum and Petroleum Product Storage	Commercial Portable Gas Cans	Spillage During Transport
25-01-012-014	Storage and Transport	Petroleum and Petroleum Product Storage	Commercial Portable Gas Cans	Refilling at the Pump -Vapor Displacement
25-01-012-015	Storage and Transport	Petroleum and Petroleum Product Storage	Commercial Portable Gas Cans	Refilling at the Pump -Spillage

Portable fuel containers (PFC) are used for storage and transport of gasoline. PFC related emission processes include vapor displacement and spillage while refueling the gas can at the pump, spillage during transport, permeation and evaporation from the gas can during transport and storage, and vapor displacement and spillage while refueling equipment. Vapor displacement and spillage while refueling nonroad equipment from PFCs are included in the nonroad inventory.

Connecticut accepts the EPA Portable Fuel Containers emissions estimates. For more information on these estimates, please refer to [Section 4.20 of the 2017 NEI TSD](#).⁷⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

Key references for EPA Portable Fuel Container Emissions Factors include EPA reports ([EPA420-R-07-001](#) & [EPA-420-R-11-018](#)) and a consultant report by Harold Haskeew and Associates on [Evaporative Emissions from In-Use Vehicles](#).^{78, 79, 80}

4.3 Solvent Utilization

[Section 4.25 of the 2017 NEI TSD](#) discusses all nonpoint solvent sources except for agricultural pesticide application and asphalt paving which are found in Parts 4.4.5 and 4.3.6 of this this document, respectively. ⁸¹ These sections are discussed separately because the EPA methodologies for estimating the emissions are different.

SCCs in Parts 4.3.1 through 4.3.5 of this PEI were estimated using the [EPA's 4/27/2020 Wagon Wheel](#) and the procedures and data mappings described in the [final 7/8/2019 Solvent Nonpoint Emissions Methodology and Operating instructions \(NEMO\) 2017](#). The activity data for solvent utilization varies by SCC; it is based on population data from the U.S. Census Bureau, lane miles data from the Federal Highway Administration, or employment data from the U.S. Census Bureau. In general, commercial and industrial solvent use are based on county level employment with county level point reconciliation. The specific SCCs that are estimated based on county level employment data are listed in Table 3 of the 2017 Solvent NEMO. The point reconciliation details are based on uncontrolled emissions and are shown in Appendix H Table H-10, Table H-11, and Table H-12. Connecticut accepts these EPA estimates which included point reconciliation data provided by Connecticut.

4.3.1 Solvent – Degreasing

Point source subtraction is handled using the EPA Solvent tool where Point SCCs are mapped to nonpoint SCCs.

The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.3.6 Asphalt Paving – Cutback and Emulsified

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
24-61-021-000	Solvent Utilization	Miscellaneous Non-industrial: Commercial	Cutback Asphalt	Total: All Solvent Types
24-61-022-000	Solvent Utilization	Miscellaneous Non-industrial: Commercial	Emulsified Asphalt	Total: All Solvent Types

Accepted EPA estimates that the annual emissions in Connecticut from cutback and emulsified asphalt are zero. Connecticut agrees with these estimates because Connecticut effectively prohibits the usage of cutback and emulsified asphalt containing greater than 0.1% VOC during the period of May 1st through September 30th in accordance with [RCSA § 22a-174-20k](#).⁸⁴ For more information on these estimates, please refer to [Section 4.24 of the 2017 NEI TSD](#).⁸⁵ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

⁸⁴ RCSA § 22a-174-20k, “Restrictions on VOC emissions from cutback and emulsified asphalt”, https://eregulations.ct.gov/eRegsPortal/Browse/RCSA/Title_22aSubtitle_22a-174_HTML/#_22a-174-20

28-05-001-050	Miscellaneous Area Sources	Agriculture Production-Livestock	Turkeys	Dust Kicked-up by Feet

Connecticut opted to use the 2014 EPA estimates for Agricultural tilling (SCC 28-01-000-003) for Tolland County due to a discrepancy in activity data. This value is deemed to be acceptable on the basis of comparable crop production (sales) between year 2012 and 2017 according to the U.S. Department of Agriculture [Quickstats](#) used in EPA activity estimation.⁸⁶ For more information on these estimates, please refer to [Section 4.3 of the 2017 NEI TSD](#).⁸⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2. 4.5.3.3 Road Construction

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
23-11-030-000	Industrial Processes	Construction: SIC 15-17	Road Construction	Total

Connecticut accepts the EPA road construction emissions estimates. For more information on these estimates, please refer to [Section 4.9.5 of the 2017 NEI TSD](#).¹³⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA 2017 NEI activity data for the State of Connecticut was based on statistics from the [U.S. Federal Highway Administration](#), Florida Department of Transportation, and the [U.S. Census Bureau](#).^{138, 139, 140}

The EPA emissions factor for Road Construction was based on a report from the Midwest Research Institute and the U.S. Department of [Agriculture Soil Characteristic Database](#).^{141, 142, 143}

4.6 Oil and Gas Production

Appendix H Table H-13 provides a listing of areas source oil and gas production SCCs used by EPA in the 2017 NEI, please refer to [Section 4.17 of the 2017 NEI TSD](#). The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

Connecticut does not have oil and gas production activity within the state, but a single oil and gas production SCC (3-10-003-07) was assigned to a natural gas distribution facility in Connecticut. This single process assignment was for source E0001 - Station Emergency Shutdown Device Natural Gas Venting at Iroquois Pipeline Operating Co facility (EIS Identifier 14621711, EIS State Identifier T028P0049C08044).

Connecticut accepts EPA's estimates for Connecticut's oil and gas production source category. EPA county level nonpoint emissions estimates for Connecticut's oil and gas production source category are not presented in Appendix I when emissions estimates were zero emissions for all pollutants and all counties.

Connecticut accepts the EPA Commercial Cooking emissions estimates. For more information on these estimates, please refer to [Section 4.8 of the 2017 NEI TSD](#).¹⁴⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The 2017 NEI EPA-developed emissions for the State of Connecticut was based on [data](#) from the Dun & Bradstreet (D&B) Hoovers Database and [information](#) from a California Air Resources Board (CARB) sponsored survey. The amount of french fries cooked by the foodservice industry was from a [report](#) prepared for Potatoes USA ^{148, 149, 150}

The total amount of meat or french fries cooked on each device is multiplied by emissions factors for CAPS including, VOC, CO, PM10 and PM25, and various HAPs to estimate emissions of these pollutants from commercial cooking. Emissions factors for CAPs and HAPs from commercial cooking are reported in Table 6 and Table 7 in the [Commercial Cooking NEMO FINAL document](#). CAP emissions factors are taken from the article *Emissions from Charbroiling and Grilling of Chicken and Beef* and a South Coast Air Quality Management District Report (SCAQMD). HAP emissions factors are also from *Emissions from Charbroiling and Grilling of Chicken and Beef* and an EPA report on emissions from street vendor cooking devices.^{151, 152, 153} There are no controls for this category.

4.7.3 Residential Charcoal Grilling

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
28-10-025-000	Miscellaneous Area Sources	Other Combustion	Residential Grilling*	Total

*See 23-02-002-XXX for Commercial

Connecticut accepts the EPA Residential Charcoal Grilling emissions estimates. For more information on these estimates, please refer to [Section 4.19 of the 2017 NEI TSD](#).¹⁵⁴ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA 2017 NEI activity data for the State of Connecticut was based on [data](#) from the U.S. Census Bureau and [reports](#) from the Hearth, Patio, & Barbecue Association.^{155, 156, 157, 158, 159}

¹⁴⁷ U.S. Environmental Protection Agency, "Commercial Cooking", January 2021 Release of the 2017 NEI Technical Support Document, P 4-123 to 4-130. https://www.epa.gov/sites/default/files/202102/documents/nei2017_tsd_full_jan2021.pdf#page=198

The EPA emissions factor for Charcoal Grilling are from EPA's report, [Emissions from Street Vendor Cooking Devices \(Charcoal Grilling\)](#). There is also a separate emissions factor for VOC from lighter fluid, based on South Coast Air Quality Management District Rule 1174, Association. The HAP emission factors are speciation factors from the EPA SPECIATE database, which are speciation factors for charbroiling meat.^{160, 161, 162}

4.8 Prescribed Burning and Wildfires (Events)

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
28-10-001-001	Miscellaneous Area Sources	Other Combustion-as Event	Forest Wildfires	Smoldering
28-10-001-002	Miscellaneous Area Sources	Other Combustion-as Event	Forest Wildfires	Flaming
28-11-015-001	Miscellaneous Area Sources	Other Combustion-as Event	Prescribed Forest Burning	Smoldering
28-11-015-002	Miscellaneous Area Sources	Other Combustion-as Event	Prescribed Forest Burning	Flaming

Connecticut accepts EPA's prescribed burning and wildfires event emission estimates as described in [Section 7.1 of the 2017 NEI TSD](#).¹⁶³ The additional SCC 28-01-500-170 listed in the NEI TSD is not applicable to Connecticut and therefore not included. Event type source categories (prescribed burning and wildfires) emissions were available in the EIS 2017NEI file. The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA used an improved satellite-based approach and added a distinction between grass and pasture burning processes. For wildfires and prescribed fires, the EPA used 2017-specific satellite data, and collected 2017-specific

¹⁶³ U.S. Environmental Protection Agency, "Wild and Prescribed Fires", January 2021 Release of the 2017 NEI Technical Support Document, Pgs 7-1 to 7-24,- https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=468

ground based observational data from many state forestry agencies. For these fires, the EPA also estimated the flaming and smoldering components of emissions separately and retained this delineation in the final inventory. Finally, the EPA revised several HAP emissions factors based on the peer reviewed literature.

Wildfires and prescribed burns (Wildland Fires in sum, WLFs) that occur during the inventory year are included in the NEI as event sources. Emissions from these fires, as well as agricultural fires, make up the National Fire Emissions Inventory (NFEI). For the 2017 NFEI, the EPA calculated emissions from agricultural fires separately from WLF emissions as described separately in [Sections 4.12](#) and [7.1 of the 2017 NEI TSD](#).¹⁶⁴

Wildland fire activity is categorized by the conditions under which the fire occurs. These conditions influence important aspects of fire behavior, including smoke emissions. In the 2017 NEI, data processing is conducted differently depending on the fire type, as defined below:

- Wildfire (WF): “any fire started by an unplanned ignition caused by lightning; volcanoes; other acts of nature; unauthorized activity; or accidental, human-caused actions, or a prescribed fire that has developed into a wildfire.”
- Prescribed (Rx) fire: “any fire intentionally ignited by management actions in accordance with applicable laws, policies, and regulations to meet specific land or resource management objectives.” Prescribed fire is one type of fuels treatment. Fuels treatments are vegetation management activities intended to modify or reduce hazardous fuels. Fuels treatments include prescribed fires, wildland fire use, and mechanical treatment.

Agricultural burning is a type of prescribed fire, specifically used on land used or intended to be used for raising crops or grazing. This is dealt with in a different section of this document. Pile burning is a type of prescribed fire in which fuels are gathered into piles before burning. In this type of burning, individual piles are ignited separately. Pile burn emissions are not currently included in the NEI due to lack of usable data and methods. EPA continues to work to develop methods for estimating emissions of this source type.

4.9 Waste Disposal & Recycling

4.9.1 Greenwaste Composting

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-80-003-000	Waste Disposal, Treatment, and Recovery	Composting	Greenwaste	All Processes

[Section 4.26 of the 2017 NEI TSD](#) defines EPA Greenwaste composting as including the diversion of yard waste, food waste, and other biogenic waste (not included in this estimate) from landfills to composting facilities. This source category does not include the composting of biosolids from wastewater treatment plants, manure management facilities, or backyard composting.¹⁶⁵

¹⁶⁴ U.S. Environmental Protection Agency, “Fires- Agricultural Field Burning”, January 2021 Release of the 2017 NEI Technical Support Document, Pgs 4-165 to 4-172,- https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=240

¹⁶⁵ U.S. Environmental Protection Agency, “Greenwaste Composting”, January 2021 Release of the 2017 NEI Technical Support Document, Pgs 4-307 to 4-314, https://www.epa.gov/sites/default/files/202102/documents/nei2017_tsd_full_jan2021.pdf#page=382

Table 4-18: Food waste composting in Connecticut for 2017 NEI¹⁶⁶

State	Food Composted [Tons]	Data Year
Connecticut	4,644	2013

The EPA county allocation was based on the number of landfill employees per county under the assumption that greenwaste composting facilities are co-located with solid waste landfills. In the absence of exact employment data, a facility is given a code in the [U.S Census Bureau's 2016 County Business Patterns](#) that corresponds to a range that the number falls within for NAICS Code 562212. The EPA recommends using the midpoint of the range to assign the county allocation.

Table 4-19: Compost County Allocations for 2017 NEI¹⁶⁷

County	Employment Code	Employment Ranges	Midpoint	County Allocation
Fairfield	-	-	-	-
Hartford	B	20-99	60	0.75
Litchfield	-	-	-	-
Middlesex	-	-	-	-
New Haven	A	0-19	10	0.125
New London	A	0-19	10	0.125
Tolland County	-	-	-	-
Windham County	-	-	-	-

Connecticut accepted the EPA's estimates for the greenwaste composting source category in Connecticut. The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

4.9.2 Open Burning

4.9.2.1 Yard Waste – Brush and Leaves

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-10-000-100	Waste-Disposal, Treatment, and Recovery	Open Burning	All Categories	Yard Waste-Leaf Species Unspecified
26-10-000-400	Waste-Disposal, Treatment, and Recovery	Open Burning	All Categories	Yard Waste-Brush Species Unspecified

The 2017 NEI TSD describes open burning of yard waste debris as “the purposeful burning of leaf and brush species in outdoor areas”. [Section 4.27.3 of the 2017 NEI TSD](#) outlines the EPA procedure for estimating emissions for land clearing

¹⁶⁶ U.S. EPA. 2016. “Food Waste Management in the United States”, 2014. Office of Resource Conservation and Recovery, Pg 5, https://www.epa.gov/sites/default/files/2016-12/documents/food_waste_management_2014_12082016_508.pdf#page=5

¹⁶⁷ U.S. Census Bureau. “2016 County Business Patterns”, <https://www.census.gov/content/census/en/data/datasets/2016/econ/cbp/2016-cbp.html>¹⁶⁸ U.S. Environmental Protection Agency, “Open Burning”, January 2021 Release of the 2017 NEI Technical Support Document, P 4-316 to 4-321, https://www.epa.gov/sites/default/files/202102/documents/nei2017_tsd_full_jan2021.pdf#page=391

debris. EPA emissions estimates for leaf and brush waste burning are a function of the amount of waste burned per year.¹⁶⁸

Connecticut accepted the EPA’s estimates for the open burning of brush in Connecticut. Connecticut updated county level emissions to reflect zero activity and zero emissions in Connecticut for open burning of leaf debris consistent with Connecticut regulations.

Connecticut regulates open burning under [CGS 22a-174\(f\)](#) which requires permits for open burning to be issued prior to open burning activities in Connecticut.¹⁶⁹ Connecticut regulations forbid the burning of leaves. Connecticut regulations allow the burning of brush on residential property conducted by the resident of the property or the agent of the resident. For these reasons Connecticut set the emissions from the burning of leaves to zero and accepted EPA’s estimates for the burning of brush.

The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2. The leaf emissions estimates for open burning of leaves are zero, which is consistent with Connecticut regulations.

4.9.2.2 Open Burning of Land Clearing Debris

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-10-000-500	Waste-Disposal, Treatment, and Recovery	Open Burning	All Categories	Land Clearing Debris (use 28-10-005-000 for Logging Debris Burning)

The 2017 NEI TSD describes open burning of land clearing debris as “the purposeful burning of debris, such as trees, shrubs, and brush, from the clearing of land for the construction of new buildings and highways”.¹⁷⁰ [Section 4.27.4 of the 2017 NEI TSD](#) outlines the EPA procedure for estimating emissions for land clearing debris. EPA emissions estimates from open burning of land clearing debris are a function of the amount of material or fuel subject to burning per year.

Connecticut accepted the EPA’s county level emissions estimates, which reflect zero activity and zero emissions in Connecticut for open burning of land clearing debris consistent with Connecticut state regulations.

Connecticut regulates open burning under [CGS 22a-174\(f\)](#). Open burning to clear land of debris is not allowed and a permit must be issued prior to other types of open burning activities which are allowed in Connecticut.¹⁷¹

The nonpoint emissions estimates in Appendix I are zero for this SCC, consistent with Connecticut regulations.

¹⁶⁸ U.S. Environmental Protection Agency, “Open Burning”, January 2021 Release of the 2017 NEI Technical Support Document, P 4-316 to 4-321, https://www.epa.gov/sites/default/files/202102/documents/ nei2017_tsd_full_jan2021.pdf#page=391

¹⁷⁰ U.S. Environmental Protection Agency, “Land Clearing”, January 2021 Release of the 2017 NEI Technical Support Document, P 4-321 to 4-339, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=396

¹⁷¹ CGA § 22a-174(f), “Powers of the Commissioner”.

4.9.2.3 Household Waste

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-10-030-000	Waste-Disposal, Treatment, and Recovery	Open Burning	Residential	Household Waste (use 26-10-000-XXX for Yard Wastes)

The 2017 NEI TSD describes open burning of residential municipal solid waste (MSW) as “the purposeful burning of MSW in outdoor areas”.¹⁷² [Section 4.27.5 of the 2017 NEI TSD](#) outlines the EPA procedure for estimating emissions for land clearing debris. EPA emissions estimates for MSW burning are a function of the amount of waste burned annually per capita.¹⁷³

Connecticut updated nonpoint county level emissions for SCC 26-10-030-000 to reflect zero activity and zero emissions for Connecticut open burning of residential municipal solid waste consistent with Connecticut state regulations.

Connecticut regulates open burning under [CGS 22a-174\(f\)](#). Open burning of MSW is not allowed and a permit must be issued prior to other types of open burning activities which are allowed in Connecticut.¹⁷⁴

The nonpoint emissions estimates presented in Appendix I are zero for this SCC, consistent with Connecticut state regulations.

4.9.3 Publicly Owned Treatment Works (POTW)

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-30-020-000	Waste-Disposal, Treatment, and Recovery	Wastewater Treatment	Public Owned	Total Processed

Connecticut accepts the EPA POTW emission estimates. Connecticut followed directions provided in the EPA [Nonpoint Emissions Methodology and Operation instructions](#) (NEMO) and provided point source reported POTW activity template input to EPA in support of accurate NEI emission estimates.¹⁷⁵ [Section 4.28 of the 2017 NEI TSD](#) documents the EPA methodology.¹⁷⁶ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

The EPA changed the 2017 emission calculation methodology. County-level flow rates in 2017 were determined by summing facility-level data to the county-level rather than using the method used in 2014. The EPA 2014 methodology allocated the national flow rate to counties based on the ratio of county population to US population.

¹⁷² U.S. Environmental Protection Agency, “Household Waste”, January 2021 Release of the 2017 NEI Technical Support Document, P 4-339 to 4-347, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=414

¹⁷⁶ U.S. Environmental Protection Agency, “Nonpoint POTW”, January 2021 Release of the 2017 NEI Technical Support Document, Pgs 4-347 to 4-351, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=422

The point SCCs used in the past for POTW point source reconciliation (SCCs 5-01-007-01 through 5-01-007-81 and 5-01-007-91 through 5-01-825-99) were reviewed against the EPA SCC list. The SCC comparison evaluation included a complete list of all SCC with a SCC Level Two of “Solid Waste Disposal – Government”. SCC 50100789 was excluded from the original list due it being a gas flare process. This point POTW SCC reconciliation list was considered adequate and was used. A search of the EMIT database was conducted for these SCCs for the 2017 reporting period and five sources were identified and listed below in Table 4-20.

Table 4-20: POTW Point Source Subtraction Facility with Emission Unit Point Identifier

Site Name	County Name	Point Identifier	SCC	Reported Flow Rate (E6GAL)
MDC /Hartford WPCF	Hartford	E0002	5-01-007-01	18,733.89
MDC /Hartford WPCF	Hartford	E0003	5-01-007-01	177.04
Manchester-Landfill Premises	Hartford	E0009	5-01-007-01	2,120.6
Kimberly-Clark Corp.	Litchfield	E0013	5-01-007-01	1,097.7
Kimberly-Clark Corp.	Litchfield	E0014	5-01-007-01	953.8

The total annual POTW activity reported for 2017 emissions statement reporting are shown below. The two sources in Litchfield were eliminated from POTW point source subtraction, because an industrial wastewater point SCC rather than a POTW SCC should have been applied to those sources. This reconciliation eliminates double counting of emissions and is performed as a procedural element of preparing an accurate emissions inventory. The emissions presented in Appendix I reflect an appropriate reduction of associated emissions amounts or a zero value when reported point activity for a county is greater than the allocated nonpoint county estimate.

Table 4-21: 2017 Annual Point Reported POTW Activity

FIPS State and County Code	County	Point Reported Flow Rate	Units
09003	Hartford	21,031.54	E6GAL

4.9.4 Nonpoint Non-Combustion-Related Mercury Sources – Including Human Cremation

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-20-030-001	Waste Disposal, Treatment, and Recovery	Landfills	Municipal	Dumping/Crushing/ Spreading of New Materials (working face)
26-50-000-000	Waste Disposal, Treatment, and Recovery	Scrap and Waste Materials	Scrap and Waste Materials	Total: All Processes
26-50-000-002	Waste Disposal, Treatment, and Recovery	Scrap and Waste Materials	Scrap and Waste Materials	Shredding
28-10-060-100	Miscellaneous Area Sources	Other Combustion	Cremation	Humans
28-10-060-200	Miscellaneous Area Sources	Other Combustion	Cremation	Animals
28-50-001-000	Miscellaneous Area	Health Services	Dental Alloy	Overall Process

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
	Sources		Production	
28-51-001-000	Miscellaneous Area Sources	Laboratories	Bench Scale Reagents	Total
28-61-000-000	Miscellaneous Area Sources	Fluorescent Lamp Breakage	Non-recycling Related Emissions	Total
28-61-000-010	Miscellaneous Area Sources	Fluorescent Lamp Breakage	Recycling Related Emissions	Total

EPA includes the following mercury emission categories under the heading of nonpoint non-combustion-related mercury sources. Landfills (working face), Switches and Relays, Fluorescent Lamp Breakage, Dental Amalgam, General Laboratory Activities, Thermostats, Thermometers, Fluorescent Lamp Recycling, and Batteries are described in [Section 4.2 of the EPA 2017 TSD](#). Human and animal cremation estimates include CAPs as well as mercury and are discussed later in [Section 4.18 of the 2017 NEI TSD](#). SCCs 28-10-060-100 and 28-10-060-200 are the only SCCs where EPA estimated non-zero criteria pollutant emissions and therefore are the only SCCs included in Appendix I

Point source reconciliation for crematory emissions was not required for 2017 emission estimates. While Connecticut has permitted human and animal crematories, human and animal crematory emissions were not reported in the stationary point sources inventory.

Connecticut accepts EPA emissions estimates for emissions calculated by the EPA's Mercury Tool. For more information on these estimates, please refer to [Section 4.18 of the 2017 NEI TSD](#).¹⁷⁷ The annual estimates for this sector in 2017 are presented in Appendix I Table I-1 and the estimates for a typical summer day are presented in Appendix I Table I-2.

Updates in 2017 EPA methodology include switching human cremation to a per weight versus a per body basis and the inclusion of non-mercury emission estimates for animal cremation. The 2014 methodology for the estimation of emissions from human cremation for mercury emissions from cremation of blood and tissues was in units of per cremation, where the 2017 EPA methodology used the same emissions factor, but converted it to a per-ton emissions factor. The per-ton human cremation for mercury emissions factor was multiplied by the number of tons cremated in each county. The most significant difference for animal cremation is that EPA now estimates emissions of pollutants other than mercury. In the 2017 methodology, EPA uses the emissions factors for cremation of human blood and tissues to estimate emissions from animals. The animal cremation emission estimates are low and round to zero in the Appendix I Table I-1 and Appendix I Table I-2.

4.9.5 CT Landfill Emissions Estimates

Source Classification Code	SCC Description			
	Level 1	Level 2	Level 3	Level 4
26-20-030-000	Waste Disposal, Treatment, and Recovery	Landfills	Municipal	Total

¹⁷⁷ U.S. Environmental Protection Agency, "Cremation", January 2021 Release of the 2017 NEI Technical Support Document, Pgs 4-231 to 4-243, https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=306

Methane (CH₄) and carbon dioxide (CO₂) are the primary constituents of landfill gas and are produced by anaerobic decompositions of refuse in solid waste landfills. Landfill gas also contains a very small amount of non-methane organic compounds (NMOC). This NMOC fraction contains photochemically reactive and non-reactive VOC. The [AP-42 Section 2.4](#) guidance for estimating VOC emissions from MSW landfills, released November, 1998 was used to estimate the emissions for this category (26-20-030-000-Municipal Solid Waste Landfills).¹⁷⁸

CT DEEP created an inventory of VOC emissions from MSW landfills as an initial step in the implementation of the emissions guidelines and new source performance standards for MSW landfills (MSW landfills compliance study).¹⁷⁹ This inventory contains the following information for each landfill in Connecticut: an estimate of the waste in place; the year the landfill opened; the year it was closed if it is no longer accepting waste; whether the landfill accepted industrial hazardous waste; and the amount of NMOC emitted in 1999. The NMOC emissions estimates in the MSW landfills compliance study used the regulatory default value for total NMOC of 4,000 ppmv, expressed as hexane. This regulatory default value was developed for regulatory compliance purposes and should not be used to estimate actual emissions.

The intent of the Periodic Inventory is to estimate actual emissions. [AP-42 Section 2.4](#) lists default NMOC concentrations for the purpose of estimating actual emissions depending on the type of waste the landfill accepted. According to [AP-42](#), if no site specific data are available and the landfill is known to have co-disposed of MSW and non-resident waste, a default (NMOC) value of 2,420 ppmv as hexane, should be used to estimate actual emissions. If the landfill is known to contain only MSW or have very little organic commercial/industrial wastes, then the total NMOC value of 595 ppmv as hexane should be used. In addition, for co-disposal landfills, [AP-42](#) estimates that 85% of the NMOC is made up of photochemically reactive VOC. For non-codisposal landfills only 39% of the NMOC are made up of photochemically reactive VOC. In the MSW landfills compliance study, facilities which reported receiving industrial hazardous waste were considered co-disposal landfills. All other facilities were considered non-codisposal. The same designation will be used for this inventory. If a facility reported receiving industrial hazardous waste then a default VOC value of 2,060 ppmv as hexane was used. For all other landfills a VOC value of 235 ppmv as hexane was used.¹⁸⁰

The amount of waste in place at each landfill was obtained from the MSW landfills compliance study. There were five landfills that reported the amount of ash in place (Hartford, New Haven, Groton, Bristol, and Shelton). In the MSW landfills compliance study the amount of waste in place at these five landfills included the ash.¹⁵¹ Since ash is a nondegradable refuse, the amount of ash was subtracted from the amount of waste in place for these five landfills. The Montville SCRRRA Ash landfill contains only ash, therefore, the amount of waste in place was set to zero. Review of the survey data against data presented in the Landfill Methane Outreach Program (LMOP) Project and Landfill Data for Connecticut resulted in increasing the amount of waste in place from 5,300,619 MG to 6,700,000 tons for the New Milford Landfill. All other waste in place data was found to be consistent or conservative.

In 2017 there were no landfills in Connecticut accepting municipal solid waste (MSW). The Windsor-Bloomfield landfill was the last landfill accepting MSW and the landfill stopped accepting MSW in 2015. There were 8 landfills that actively accepted construction and demolition waste but no MSW in 2017. These landfills are as follows: Avon; Canaan; Essex;

¹⁷⁸ U.S. Environmental Protection Agency. Municipal Solid Waste Landfills, AP-42, Vol 1, Ch 2.4. 1998.

<https://www3.epa.gov/ttnchie1/ap42/ch02/final/c02s04.pdf>

¹⁷⁹ Koschwitz, S. Description of Establishment of Municipal Solid Waste Landfill Inventory. 1998. Connecticut Department of Environmental Protection.

¹⁸⁰ U.S. Environmental Protection Agency. AP-42, Vol 1, Ch 2.4. 1998.

Lyme; Manchester; North Stonington; Salem; Suffield. It was assumed for the purpose of estimating emissions that these 8 landfills were closed when they stopped accepting MSW.

To determine the average annual refuse acceptance rate (R) the waste in place (not including the ash) was divided by the number of years the landfill accepted waste.

It was assumed that landfills emit NMOC 365 days uniformly throughout the year.

The annual estimates for this sector in 2017 are presented in Table I-1 and the estimates for a typical summer day are presented in Table I-2.

Equations 1, 3, and 4 in [AP-42 Section 2.4](#) were combined resulting in the following equation, which was used to estimate the daily NMOC emissions from landfills in Connecticut.^{181, 182, 183}

$$E_{unctrl} = (7.062 \times 10^{-9}) \times L \times R \times VOC \times (e^{(-kc)} - e^{(-kt)}) \times \left(\frac{2,000 \text{ lbs per ton}}{365 \text{ days per year}}\right)$$

Where:

E_{unctrl} = uncontrolled mass emissions of VOC as hexane, lbs/day

7.062×10^{-9} = conversion factor, assuming 55% of landfill gas is CH₄ and 45% is CO₂, N₂, and other constituents, and expresses VOC as hexane

L = methane generation potential, m³ CH₄/Mg refuse (EPA default = 100 m³/Mg)

R = average annual refuse acceptance rate during active life Mg/yr

VOC = concentration of VOC in landfill gas, parts per million by volume (ppmv)

e = base log, unitless

k = methane generation rate constant, yr⁻¹ (EPA default = 0.04/yr)

c = time since landfill closure, yrs (c = 0 for active landfills)

t = time since the initial refuse placement, yrs

2,000 = conversion factor 2,000 pounds per ton

365 = 365 days per year of operation

A sample calculation of the daily pounds of uncontrolled VOC emissions from the Hartford Landfill is:

$$E_{unctrl} = (7.062 \times 10^{-9}) \times 100 \times 106,566 \times 19,564.25 \times (e^{(-0.04 \times 30)} - e^{(-0.04 \times 62)}) \times \left(\frac{2000}{365}\right)$$

E_{unctrl} = 203.49 pounds VOC per day

A sample calculation of the daily pounds of uncontrolled VOC emissions from the Manchester Landfill is:

¹⁸¹ U.S. Environmental Protection Agency. "Air Emissions from Municipal Solid Waste Landfills - Background Information for Proposed". 1991. Office of Air Quality Planning and Standards. EPA-450/3-90-011a.

<https://nepis.epa.gov/Exe/ZyPDF.cgi/9100AEYT.PDF?Dockey=9100AEYT.PDF>

¹⁸² Zison, S. Landfill gas production curves: myths vs. reality. in Proceedings of GRCD/SWANA Landfill Meeting. 1990. Vancouver, Canada

¹⁸³ Pelt RL. Memorandum: Methodology Used to Revise the Model Inputs in the Municipal Solid Waste Landfills Input Data Bases (Revised), prepared for the Municipal Solid Waste Landfills Docket A-88-09(IV-M-4) April 28, 1993.

$$E_{\text{unctrl}} = (7.062 \times 10^{-9}) \times 100 \times 98,483 \times 2,366.91 \times (e^{(-0.04 \times 18)} - e^{(-0.04 \times 65)}) \times \left(\frac{2000}{365}\right)$$

$E_{\text{unctrl}} = 32.61$ pounds VOC per day

The emissions generated by the AP-42 equation listed above do not take into account the VOC emissions removed by control equipment. There were about eight landfills that had control equipment in use in 2017. Only one of these landfills, Manchester, is a Title V source and is required to report their after control emissions to the DEEP every year, see Table 4.9.5-1. The VOC's removed by controls were subtracted from the uncontrolled VOC emissions estimates for this landfill. The 2017 after control emissions for the remaining seven landfills were not part of the point inventory, so no adjustments were made to their uncontrolled emissions estimates or corresponding VOC/methane combustion products.

The VOC after control emissions for the Manchester landfill are already accounted for in the point source section of this inventory, therefore, these emissions will not be included in the area source inventory. The daily amount of VOC's removed by controls for these two landfills were estimated using the following equation:

$$E_{\text{rem}} = \frac{VOC_{\text{ctrl}}}{1 - EFF}$$

Where:

E_{rem} = daily VOC emissions removed by control equipment, expressed in pounds per day

EFF =VOC control efficiency

VOC_{ctrl} =daily VOC emissions exiting control equipment, expressed in pounds per day

A sample calculation for the pounds of VOC removed by the control equipment at the Manchester Landfill is:

$$E_{\text{rem}} = \frac{0.075}{1 - 0.99}$$

$E_{\text{rem}} = 7.50$ pounds VOC removed per day

Tables 4.9.5-2 through 4.9.5-9 contain the VOC annual and typical ozone season day emissions from municipal solid waste landfills for each county in Connecticut. The emissions from municipal solid waste landfills occur seven days a week uniformly throughout the year. The equation used to calculate daily VOC emissions for this category is as follows:

$$E = E_{\text{unctrl}} - E_{\text{rem}}$$

Where:

E = daily landfill VOC emissions expressed in pounds per day

E_{unctrl} = daily uncontrolled VOC emissions expressed in pounds per day

E_{rem} = daily VOC emissions removed by control equipment, expressed in pounds per day

A sample calculation for the Manchester Landfill is:

$E = 32.61 - 7.5$

$E = 25.11$ pounds of VOC per day

Table 4.9.5-1						
Summary of Landfills that Reported Having Used Control Equipment in 2017						
Landfill	Control Efficiency	Annual VOC After Control (Tons/year)	Daily VOC After Control (Tons/day)	Annual Emissions Removed by Control (Ton/year)	Daily Emissions Removed by Control (Tons/day)	Controlled Emissions In Point Section of SIP

Section 5 Biogenic Sources

Connecticut accepts the EPA biogenic emissions estimates as published in the 2017 NEI, which only included VOCs, NO_x, and CO. For more information on these estimates, please refer to [Section 4.6 of the 2017 NEI v1 TSD](#).¹⁸⁴ The annual estimates for this sector in 2017 are presented in Table 5-1 and the estimates for a typical summer day are presented in Table 5-2.

County SCC-level emissions data were provided through EPA’s EIS, 2017 NEI Final V1 dataset, while the 2017 NEI Data – Data Summaries page “Biogenics” link ([2017nei_beld5_biogenics_report.xlsx](#)) data file provided county-sector emissions data. Data in the dataset was consistent with the data file, which confirmed that the unit of measure for the data file was tons.

Summer day emissions were calculated from an average daily estimate of the June, July and August emissions presented on the 2017 NEI Data – Data Summaries page “Biogenics” link ([2017nei_beld5_biogenics_report.xlsx](#)) data file. Employing the same column names from the data file, the equation used to calculate the summer day emissions becomes as follows:

$$E_i = 2000 * \frac{jun\ value_i + jul\ value_i + aug\ value_i}{days}$$

Where:

- E_i = Total biogenic emissions of pollutant I in pounds per day for a county
- 2000 = Conversion factor of pounds per ton
- $jun\ value_i$ = Total biogenic emissions of pollutant I in tons for a county in the month of June.
- $jul\ value_i$ = Total biogenic emissions of pollutant I in tons for a county in the month of July.
- $aug\ value_i$ = Total biogenic emissions of pollutant I in tons for a county in the month of August.
- $days$ = Total numbers of days in the months of June, July, and August (92 days)

A sample calculation of VOC emissions in Fairfield County is shown for data from the file as follows:

$$E_i = 2000 * \frac{1760.8364 + 2214.35 + 1644.613}{92\ days} = 122,170 \frac{lb\ VOC}{day}$$

¹⁸⁴ U.S Environmental Protection Agency, “Biogenics”. January 2021 Release of the 2017 NEI Technical Support Document.Pgs 4-82 to 4-88. https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf#page=157

Table 5-1: 2017 Annual Emissions of Biogenic Sources

County	Annual Emissions [TPY]		
	VOC	NO _x	CO

Section 6 Quality Assurance Audit

This section is currently under internal review in conjunction with the public comment period.

Appendices

Appendix A Emissions Reporting History

A.0 Point Source List Development History

This Appendix describes the development of the initial point source list from which point source emissions for the 2017 Connecticut Periodic Inventory were estimated. This Appendix is included in order to demonstrate that the source list is as complete as possible.

Former Section 19-508-2 of the Regulations of Connecticut State Agencies (RCSA) required new and existing stationary sources to be either registered or permitted. Subject equipment operating prior to June 1, 1972 were required to register, while equipment installed after that date needed permits to construct and operate. Companies were required to submit detailed information about their equipment on forms supplied by CT Department of Environmental Protection (DEP), now known as CT DEEP. All taxable employers were notified of the registration and permit requirements. All municipalities, school systems and state agencies were separately notified in a second mailing. In a third mailing, Federal facilities were notified of their requirement to comply with the registration and permitting requirements of the RCSA.

The deadline for submission of the registration forms was October 1, 1972. The Permitting section of the CT DEEP Air Bureau processed the registration forms. Permittees reviewed the registration forms for completeness; assigned identification numbers (i.e., Town #, Premises #, Registration #, and Stack #); assigned special codes (i.e., National Emissions Data System (NEDS) County #, NEDS town #, Standard Industrial Class (SIC) #, Source Classification Code (SCC) #, and control equipment #); and determined stack coordinates. The data from the forms were coded onto special computer forms, key punched onto IBM cards, and entered into the database. Over 13,000 registrations were processed in this manner. The initial phase was completed by the end of 1973.

The next phase was to ensure that all facilities had submitted their applications for equipment requiring registrations and permits. The Enforcement section systematically contacted plants, which were listed in industrial directories. Screening letters, which requested basic information on the equipment and materials used at a facility, were mailed to those potential sources. Plants that responded positively to the questions in the screening letter were then sent a Pre-Inspection Questionnaire (PIQ), which requested detailed information on the processes and materials used in the plant. Equipment requiring registration were identified and the plant was issued a notice of violation, which would be closed out only upon receipt of a completed registration form. Over 500 equipment registrations were added to the inventory through the inspection program. In subsequent years, new plants have been identified through the Connecticut Department of Labor listing of new manufacturing firms and from articles in local newspapers.

The primary method by which new equipment is added to the point source inventory is through the permit program. Approximately 100 new permits are issued each year. There is high awareness of permit requirements among the regulated community through the State Implementation Plan Revision Advisory Committee (SIPRAC) of the Connecticut Business & Industry Association (CBIA). Members of CBIA are informed about any regulatory or procedural changes with regards to air pollution.

Prior to 1990, the point source inventory was kept current through timely updates of all emissions sources. In general, plants that had an EPA class of A1 were updated annually; plants with an EPA class of A2 were updated every second year; and plants with an EPA class of B were updated every three to five years. Since 1979, updates of the point source inventory have been incorporated into the Enforcement compliance inspection process. Along with each PIQ mailed to the plant, the Enforcement Division includes update forms for the registered and permitted equipment. The plant is required to provide current data on annual fuel usage, process weight rates, solvent usage, operating hours, and

seasonal rates for summer, fall, winter and spring. During the compliance inspection, Enforcement personnel review the completed update forms with the plant personnel to ensure the accuracy and completeness of the data. The Inventory group further reviews the forms for completeness, and revisions are compared with previous data. If there are apparent discrepancies, the update forms are returned to Enforcement personnel for clarification.

For plants that are inspected, Enforcement personnel calculate the total plant usage for each volatile organic compound (VOC) as listed in the PIQ. Plant usage is then adjusted for other media disposal. The total VOC from registered and permitted sources is subtracted from the adjusted total plant VOC. The balance is the actual unregistered VOC emissions. These estimates of unregistered VOC emissions are entered into a separate file, which contains basic company data, specific SCC code, and emissions in terms of tons per year.

For the 1990 base year ozone and carbon monoxide inventory development effort in 1992, source update forms were mailed to all facilities known to be active during 1990. This was done to verify which facilities in the inventory were active during 1990, and to update all data contained in the inventory that was at least two years old. For more detailed information about the 1990 inventory, please refer to the_1990 Base Year Ozone And Carbon Monoxide Emissions Inventory, created by the Planning and Standards Division of the CT DEEP Air Bureau in November 1993.

In 1993 to meet the emissions statement reporting requirements outlined in Title I, Section 182(a)(3)(b) of the 1990 Clean Air Act (CAA), the state developed and implemented an emissions statement reporting schedule. Connecticut's emissions statement program was submitted to and approved by EPA as a formal amendment to the SIP. The Department phased in the implementation of the emissions statement program beginning with the first reporting year (1993). Companies were required to file an emissions statement if the actual calendar year 1992 emissions from all sources at a plant site totaled 25 tons per year or more of VOC, NO_x, or CO. This first mailing involved 156 companies. Beginning in the reporting year 2006, the reporting threshold was set to any facility that is a major source or emitted 10 tons per year or more of actual VOC or NO_x, or 25 tons per year or more of actual CO emissions in calendar year 2005. There were 135 companies involved in this mailing.

In 2009, CT DEEP rolled out a new software application, EMIT, that allowed companies to submit their emissions statements electronically via the internet and report a number of new pollutants that the previous system could not accommodate. The additional pollutants collected in 2009 were PM₁₀ filterable, PM_{2.5} primary, PM_{2.5} filterable, PM condensable, Ammonia and Sulfur Dioxide in lieu of Sulfur Oxides. Since there is a lack of emissions factors for PM₁₀ and PM_{2.5} filterable and PM condensable these pollutants were often unreported. Additionally, beginning in 2009, only sites considered a major source were required to submit an emission statement.

Beginning in reporting year 2010, CT DEEP has required companies to report their HAP emissions.

The 2017 periodic stationary source inventory was based on emissions statements, which reported the source's actual 2017 emissions signed by a corporate officer who attested to the accuracy of their calculations. Emissions for 83 facilities were submitted to EIS for the 2017 National Emissions Inventory. Data for 79 facilities were obtained from normal emissions statement reporting. Data for one facility (NORWICH PUBLIC UTIL/ELECT EIS Facility identifier 16708211) was obtained via annual compliance reporting documentation, where data for two other sites (Tunnel Station and STRATFORD SCHOOL FOR AVIATION EIS Facility identifiers 16708111 and 14623911, respectively) were estimated based on earlier emissions reporting data. The remaining facility Empire Tire Of Edgewater II LLC EIS Facility identifier 2766111 did not operate in 2017 and has been shuttered. Compliance with the emissions statement program was 97 percent from all Title V facilities, with a shuttered facility and a small once in always in facility being the only outliers.

A.1 Historical Quality Control Procedures

Quality Control (QC) measures for the point source inventory were originally instituted for the 1979 Ozone SIP. Those measures consisted of three separate activities. First, a procedure was developed to update the point source inventory. Second, the data must be verified by CT DEEP personnel. Third, the data must be entered accurately.

All registered or permitted sources were required to fill out a Pre-Inspection Questionnaire (PIQ) Inventory Update form prior to a scheduled inspection. Originally, the PIQ Inventory Update form was designed to provide CT DEEP with the yearly changes in fuel use and process weights for the registered and permitted equipment at the inspected plants. In general, plants that had an EPA class of A1 (actual emissions > 100 TPY) were updated annually; plants with an EPA class of A2 (potential emissions > 100 TPY) were updated every second year; and plants with an EPA class of B (potential emissions < 100 TPY) were updated every third to fifth year.

Since 1993, the Inventory update procedure has been phased out with the implementation of our Emissions Statement Program. From the inception of the emissions statement program through the 2008 emissions statement cycle, the Bureau's SAS based system was used to process and database emissions statement submittals. In 2008, the Bureau contracted with CIBER to develop a new software application that would allow sites to report their emission statements electronically. This system is referred to as EMIT and replaces the SAS based system. Using the EMIT system, sites report their usage and process data on both a summer day and annual basis to calculate their emissions. Prior to CT DEEP implementing the EMIT system, sites were required to calculate their emissions and to submit their emission statements on paper. One of the most common errors that occurred during this process was that they miscalculated their emissions. The EMIT system allows a direct entry of an emissions value for Continuous Emissions Monitoring System (CEMS) measurements and for calculated tank emissions. Otherwise, the EMIT system calculates emissions for users at the SCC, source, and site level each time a parameter is updated. The calculation routines used by EMIT have been thoroughly tested and shown to be correct and, together with EMIT's validation checks, help to remedy errors formerly created by paper submission.

Appendix B Sample Emissions Calculations

Point emissions were calculated using the Bureau's EMIT software application. EMIT calculates Summer Day and Annual emissions based on entered activity, emission factors, and controls. EMIT does not calculate emissions when the emissions were estimate using the TANKS model or when they were derived using continuous emission monitoring (CEM). In these instances, EMIT requires the user to manually enter the emissions directly after identifying that the emissions are based upon one of these two methods.

Several basic emissions calculations are illustrated in Examples 1 to 6. The application of the Summer Day allocation factor is not needed within EMIT because the reporters address this outside of the application.

- Example 1 illustrates the use of AP-42 emissions factors to calculate Annual and Summer Day emissions for many sources, typically boilers and incinerators that do not have controls.
- Example 2 illustrates the calculation of Summer Day VOC emissions for gasoline loading facilities using the formula from [Section 5.2 of AP-42](#). This example is typical of all process sources that use emissions factors to calculate emissions. Since this source has emissions controls, rule effectiveness is also illustrated.
- Example 3. illustrates the calculation of the summer day apportionment factor and summer day emissions.
- Example 4 illustrates application of Example 3 equations in calculating Commercial Marine Vessel summer day emissions.
- Example 5 illustrates application of Example 3 equations in calculating Locomotive summer day emissions.
- Example 6 illustrates the calculation of Aircraft summer day emission using an approach similar to Example 3 equations.

B.0 List of Equations

The seasonal adjustment for point sources ([Equation I](#)) and the MOVES ONROAD Compliance Factor ([Equation II](#)) are contained in the main body of document and are not listed or shown below.

Equation III:

$$E_a = \frac{F * EF}{2,000}$$

Equation III: Annual Actual Emissions

Equation IV:

$$E_s = F * EF * \frac{T_s}{W_s * D_s}$$

Equation IV: Seasonal Actual Emission Rate

Equation V:

$$E_s = 2,000E_a \frac{T_s}{W_s * D_s}$$

Equation V: Seasonal Actual Emission Rate (Substituting Equation III into Equation IV)

Variable	Unit	Description
E_a	TPY	Annual Actual Emissions Rate
E_s	$\frac{lb}{day}$	Seasonal Actual Emissions Rate
F	$\frac{10^3 \text{ gal}}{year}$	Actual Annual Fuel Use
EF	$\frac{lb}{10^3 \text{ gal}}$	Emissions Factor
T_s	$\frac{\% \text{ year}}{season}$	Seasonal Rate of Use
W_s	$\frac{week}{season}$	Weeks of Operation in Season
D_s	$\frac{days \text{ operated}}{week}$	Days of Operation per Week in Season

Equation VI:

$$L_L = \frac{S * TVP * M_v}{R * T} = 12.46 \frac{S * TVP * M_v}{T}$$

Equation VI: Emissions from Loading Petroleum Liquid (U.S. Environmental Protection Agency 2008)

Where:

Variable	Unit	Description
L_L	$\frac{lb}{10^3 gal}$	Loading Loss (Emissions factor for VOCs) from Loading Petroleum
S	–	Saturation Factor (See AP-42 Table 5.2-1)
TVP	$psia$	True Vapor Pressure (TVP) of Liquid Loaded (See AP-42 Table 7.1-3)
M_v	$\frac{lb}{lbmol}$	Molecular Weight of Vapor (See AP-42 Table 7.1-2)
R	$\frac{psia * 10^3 gal}{lbmol * ^\circ R}$	Ideal Gas Constant ($R^{-1} = 12.46$)
T	$^\circ R$	Absolute Temperature of Bulk Liquid

B.1 Examples

Example 1 Fuel Burning Source

In 2013, Company A used 601,000 gallons of no. 6 fuel oil to operate their commercial boiler. The boiler is capable of producing more than 100 million BTU/hr, is normal-firing, and is not equipped with control equipment (SCC 1-03-004-01). The boiler operated every day of the week for the entire summer with a 10% seasonal rate of use. What were the daily emissions rates of NO_x, CO, and VOC from this boiler during the summer of 2013?

Find: E_{s,NO_x} , $E_{s,CO}$, $E_{s,VOC}$

To find E_s , Equation IV should be used.
$$E_s = F * EF * \frac{T_s}{W_s * D_s}$$

Given values:
$$F = 601,000 \frac{gal}{year} = 601 \frac{10^3 gal}{year}$$

$$T_s = 10\%$$

$$W_s = 13 \frac{weeks}{summer}$$

$$D_s = 7 \frac{days}{week}$$

Values to be found in AP-42:
$$EF_{NO_x} = 47 \frac{lb}{10^3 gal} \text{ (AP-42 Table 1.3-1)}$$

$$EF_{CO} = 5 \frac{lb}{10^3 gal} \text{ (AP-42 Table 1.3-1)}$$

$$EF_{VOC} = 1.605 \frac{lb}{10^3 gal} \text{ (AP-42 Table 1.3-3)}$$

Solution:

$$E_{s,NO_x} = \frac{601 \frac{10^3 gal}{year} * 47 \frac{lb}{10^3 gal} * 10 \frac{\% year}{summer}}{13 \frac{weeks}{summer} * 7 \frac{days}{week}} = \boxed{31.04 \frac{lb}{day}}$$

$$E_{s,CO} = \frac{601 \frac{10^3 gal}{year} * 5 \frac{lb}{10^3 gal} * 10\% \frac{year}{summer}}{13 \frac{weeks}{summer} * 7 \frac{days}{week}} = \boxed{3.30 \frac{lb}{day}}$$

$$E_{s,VOC} = \frac{601 \frac{10^3 gal}{year} * 1.605 \frac{lb}{10^3 gal} * 10\% \frac{year}{summer}}{13 \frac{weeks}{summer} * 7 \frac{days}{week}} = \boxed{1.06 \frac{lb}{day}}$$

Company A's boiler emitted NO_x, CO, and VOCs at rates of 31.04 lb/day, 3.30 lb/day, and 1.06 lb/day, respectively, in the summer of 2013.

Example 2 Gasoline Loading Facility

A gas station was supplied with 90 million gallons of gasoline (RVP=10) in 2012. The station is classified as a gasoline submerged loading balance service (SCC 4-06-001-41) and is equipped with a vapor recovery system which captures 98% and collects 97% of VOCs. The regulations for this type of source have been determined to have an effectiveness of 100%. This gas station does not receive shipments on Sundays and 27% of the total throughput was provided during the summer. Assuming a constant bulk temperature of 60 °F for the gasoline, what was the emissions rate of VOCs at this gas station in the summer of 2012?

Find: $E_{s,VOC}$

To find E_s , Equation IV should be used with the Equation I control efficiency terms:

$$E_s = F * EF_{VOC} * \frac{T_s}{W_s * D_s} * [1 - (Eff * Cap * Rule)]$$

Given values:

$$F = 90,000,000 \frac{gal}{year} = 90,000 \frac{10^3 gal}{year}$$

$$T_s = 27\%$$

$$W_s = 13 \frac{weeks}{summer}$$

$$D_s = 6 \frac{days}{week}$$

$$Eff = 97\%/100$$

$$Cap = 98\%/100$$

$$Rule = 100\%/100$$

The only unknown variable is EF_{VOC} . Because this is a problem on the emissions from the transportation of petroleum, Equation VI can be used to find this value.

$$EF_{VOC} = L_L = 12.46 \frac{S * TVP * M_v}{T}$$

Values to be found in AP-42:

$$S = 1.00 \text{ (AP-42 Table 5.2-1)}$$

$$TVP = 5.2 \text{ psia (AP-42 Table 7.1-2)}$$

$$M_v = 66 \frac{lb}{lbmol} \text{ (AP-42 Table 7.1-2)}$$

Solution:

$$EF_{VOC} = 12.46 \frac{lbmol * ^\circ R}{psia * 10^3 gal} \frac{1.00 * 5.2 \text{ psia} * 66 \frac{lb}{lbmol}}{(60 + 459.67) ^\circ R} = 8.23 \frac{lb}{10^3 gal}$$

$$E_{s,VOC} = \frac{90,000 \frac{10^3 gal}{year} * 8.23 \frac{lb}{10^3 gal} * 27\% \frac{year}{summer}}{13 \frac{weeks}{summer} * 6 \frac{days}{week}} * [1 - (0.97 * 0.98 * 1)] = \boxed{127 \frac{lb}{day}}$$

The gas station emitted approximately 127 pounds of VOCs per day of operation in the summer of 2012.

Example 3 Summer Apportionment Factor

The summer day apportionment factor portion of Equation IV is broken out and shown below. The remaining portion of the Equation IV summer day emissions calculation is also shown below. Application of these equation are shown in Examples 4 and 5.

$$Sd_j = 2000 * \frac{Spa_j}{100 * Wps_j * Dpw_j}$$

$$E_{ij} = E_{aij} * Sd_j$$

Where:

E_{ij} = Total emissions of pollutant i, in pounds per day, produced for SCCj

E_{aij} = Total annual emissions of pollutant i, in tons per year, produced for SCCj Annual emissions can be found in the various Appendicies within this document.

Sd_j = Summer day fraction with tons per year to pounds per day conversion included for SCCj

Spa_j = Summer percentage of annual emissions, (e.g.- 25% of annual emissions when a uniform seasonal profile is expected).

Wps_j = Weeks of emissions per summer (13 weeks per summer season for a uniform 24 x 7 operation)

Dpw_j = Days per week (7 days per week for a 24 x 7 operation)

2000 = Conversion factor for pounds per ton

Example 4 Commercial Marine Vessels

A sample calculation implementing the Example 3 equation for SCC 22-80-002-100 annual VOC emissions in Fairfield County from the first row of of Appendix G Table G-22 is shown below. The calculated results are consistent with the summer day VOC emissions for 22-80-002-101 in Fairfield County of Appendix G Table G-23

$$Sd_j = 2000 * \frac{Spa_j}{100 * Wps_j * Dpw_j}$$

$$Sd_j = 2000 * \frac{25}{100 * 13 * 7} = \boxed{5.495}$$

$$E_{ij} = E_{aij} * Sd_j$$

$$E_{ij} = 0.2 * 5.495 = \boxed{1.10 \frac{lbs}{day}}$$

Example 5 Locomotives

A sample calculation implementing the Example 5 equation for SCC 22-85-002-006 annual NO_x emissions in Fairfield County from the first row of Appendix G Table G-24 is shown below. The calculated results are consistent with the summer day NO_x emissions for SCC 22-85-002-006 in Fairfield County of Appendix G Table G-25.

$$Sd_j = 2000 * \frac{Spa_j}{100 * Wps_j * Dpw_j}$$

$$Sd_j = 2000 * \frac{25}{100 * 13 * 5} = \boxed{7.692}$$

$$E_{ij} = Ea_{ij} * Sd_j$$

$$E_{ij} = 60.63 * 7.692 = \boxed{466.4 \frac{lb}{day}}$$

Example 6 Aircraft

Summer day emissions were calculated using a methodology similar to that previously used in earlier inventories. The LTO, seasonal adjustments, and tonnage conversions were also factored in the following equation. Note that this equation resembles that used in Example 3, 4, and 5, except that S_j is a seasonal fraction instead of a S_{dj} summer day fraction.

$$E_{ij} = Ea_{ij} * S_j * \frac{2000}{Days}$$

Where:

E_{ij} = Total emissions of pollutant i, in pounds per day, produced by the composite aircraft type makeup for SCCj for all LTO cycles

E_{aij} = Total annual emissions of pollutant i, in tons per year, produced by the composite aircraft type makeup for SCCj for all LTO cycles. These emissions are shown in Appendix C Table 5 under the Annual Emissions (TPY) column, where a summation of the EPA annual emissions estimate for the airport are presented in tons per year for each of the pollutants needing a summer day emissions estimate.

S_j = Summer season fraction of Landing and Take-Off Cycles for composite aircraft type makeup for SCCj (The summer season fraction represents the fraction of total annual Landing and Take-Off Cycles that occurred during the summer season for the specific source classification code (SCCj) at the airport. These fractions are shown in Appendix G Table G-20.

2000 = Conversion factor of pounds of ton

Days = Days in Ozone Season

A sample calculation for VOC emissions from SCC 22-75-050-012 at Bridgeport Hospital Heliport in Fairfield County can be shown using the first record in both Appendix G Table G-19 and Table G-20 as follows:

$$E_i = 0.11 * 0.16 * \frac{2000}{92 \text{ days}} = \boxed{0.38 \frac{lbs \text{ VOC}}{day}}$$

Table D-3: New Allocation Factors for SCCs

Table D-3: New Allocation Factors for SCCs

Change Type	SCC	Annual Ton to Summer Pound Factor	Summer Season Adjustment Factor [%]	Days per Week	Weeks per Summer	Summer Season Adjustment Factor Justification (See Tables D-4 and D-5 where an EPA Temporal Profile is mentioned)
Correction	21-02-008-000	6.410	25	6	13	This industrial SCC was set to 0% summer season activity, where other industrial fuel use SCCs are conservatively set at 25% summer season activity with 6 days of operation. 0% summer season activity wood burning for heat is used for residential SCCs. Summer season activity allocation for this industrial SCC was revised to 25%.
New	21-04-008-530	0	0	7	13	Historical (2002 and 2005) Allocations. Allocation assumed to be consistent with SCC 2280003100, SCC 2104008100, 2104008210, 2104008220, 2104008230, 2104008310, 2104008320, 2104008330, 2104008400, 2104008510, and 2104008610.

The above HPMS VMT has an average annual statewide daily total of 85,520,807 miles per day.

Note: Road Type 12 and 30 were added with the associated road descriptions and mappings were added; and the associative meaning of road types 13 and 31 were modified from what is established in NMIM and the Source Classification definitions. These additions and modified meanings are totally contained within the converter and should not be applied to any Road Type definitions other than the updated converter. Do not use the modified or added identifiers or the associated meaning provided in the table below for anything other than understanding the mapping of 2010+ FHWA HPMS Road Types to MOVES Road Types within the updated converter.

¹⁸⁷ The native MOVES population input (nrbaseyearequippopulation) table does not include descriptions, so experts at the EPA's MOVES support email address provided the needed SQL relationships. The SQL used for the above data is as follows:

```
SELECT a.SCC, a.description, nrfueltype.fuelTypeDesc, b.hpAvg, c.* FROM movesdb20210209.nrscc AS a,
movesdb20210209.nrsourcetype AS b,
2014_pei_2014_nonroad_annual_in.nrbaseyearequippopulation AS c, movesdb20210209.nrfueltype
WHERE c.StateID = 9 and a.SCC=b.scc and b.sourcetypeid = c.sourcetypeid and nrfueltype.fuelTypeID= a.fuelTypeID;
```

State Total	All				2,314.16*

*The EPA estimated 2,527 lb/yr (1.26 Tons per Year) of statewide inflight lead emissions (SCC 22-75-087-000), which when added to the above statewide total of lead emitted below the boundary layer at specific airports, results in an estimated statewide total of 4,841 lb/yr (2.42 Tons per Year) for 2017 airport emissions.

Appendix H Area Source Calculation Support Tables

Table H-1: EIA-923 Electrical Generation Missing from Connecticut's 2017 Point Source Inventory

EIA / EPA IPM Plant Identifier	Plant Name	Operator Name	EIA Sector Number and Name	Reported Prime Mover ¹⁸⁸	AER Fuel Type ¹⁸⁹	Annual Activity	Physical Unit Label
57598	Bridge Street 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	718	barrels
57598	Bridge Street 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	RFO	0	barrels
57599	Fort Hill 1, 2, 3 & 4	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	1,674	barrels
57601	Gary Court 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	972	barrels
57602	Jewett City 1	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	485	barrels
57603	LNG 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	997	barrels
57604	Lebanon Pines 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	903	barrels
57605	Water Treatment 1 & 2	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	982	barrels
57689	Norden 1-3	Third Taxing District of Norwalk	1 - Electric Utility	IC	DFO	137	barrels
58551	Dominion Bridgeport Fuel Cell, LLC	Dominion Renewable Energy	2 - NAICS-22 Non-Cogen	FC	NG	776,963	mcf
58948	Bristol Myers Squibb Wallingford	Bristol-Myers Squibb Co	2 - NAICS-22 Non-Cogen	GT	NG	369,134	mcf
58948	Bristol Myers Squibb Wallingford	Bristol-Myers Squibb Co	2 - NAICS-22 Non-Cogen	IC	DFO	28	barrels
59415	Backus Microgrid Project	Connecticut Mun Elec Engy Coop	1 - Electric Utility	IC	DFO	1,761	barrels
59801	IBM Southbury	Bloom Energy	2 - NAICS-22 Non-Cogen	FC	NG	50,819	mcf
60040	UI RCP New Haven Fuel Cell	United Illuminating Co	1 - Electric Utility	FC	NG	326,390	mcf
60054	UI RCP Bridgeport Seaside	United Illuminating Co	1 - Electric Utility	FC	NG	389,324	mcf
60109	UDR Glastonbury Fuel Cell	UIL Distributed Resources, LLC	2 - NAICS-22 Non-Cogen	FC	NG	177,724	mcf
60593	UI RCP Woodbridge FC	United Illuminating Co	1 - Electric Utility	FC	NG	125,098	mcf

¹⁸⁸ FC for Fuel Cell, IC for Internal Combustion Engine, and GT for Gas Turbine

¹⁸⁹ DFO for Distillate Fuel Oil, RFO for Residual Fuel Oil, and NG for Natural Gas

EIA / EPA IPM Plant Identifier	Plant Name	Operator Name	EIA Sector Number and Name	Reported Prime Mover ¹⁸⁸	AER Fuel Type ¹⁸⁹	Annual Activity	Physical Unit Label
60683	TRS Fuel Cell	TRS Fuel Cell, LLC	3 - NAICS-22 Cogen	FC	NG	3,428	mcf
Total of Missing Activity for Distillate Petroleum Units ¹⁹⁰						363.59	E3GAL
Total of Missing Activity for Natural Gas Units						2,218.9	MMCF

¹⁹⁰ 1 barrel = 42 gallons

Table H-5: Connecticut Statewide Summary Data for ICI Industrial and Commercial/Institutional for 2017 Point Reconciliation

Sector	Fuel Type	Total Fuel Use (without Electrical Generation Adjustment)	Unit
Industrial	Distillate fuel oil	511.41	E3GAL
Industrial	Kerosene	0	E3GAL
Industrial	LPG	54.849	E3GAL
Industrial	Natural Gas	9,601.3	E6FT3
Industrial	Residual fuel oil	0	E3GAL
Commercial	Distillate fuel oil	1,564.1	E3GAL
Commercial	Kerosene	0	E3GAL
Commercial	LPG	14.034	E3GAL
Commercial	Natural Gas	6,157.2	E6FT3

Electrical Generation Adjustments were applied to Industrial and Commercial Sectors equally to account for missing 2017 Energy Administration Information activity not reported as point Electrical Generation in the 2017 NEI.

Table H-6: Connecticut Statewide Summary Data for Industrial and Commercial/Institutional for 2017 Point Reconciliation with Adjustment for Missing Electrical Generation Activity

Sector	Fuel Type	Total Fuel Use	Unit	Submitted Total Fuel Use	Unit
Industrial	Distillate fuel oil	329.61	E3GAL	7.97	E3BBL
Industrial	Kerosene	0	E3GAL	0	E3BBL
Industrial	LPG	54.849	E3GAL	1.31	E3BBL
Industrial	Natural Gas	8,491.8	E6FT3	8,556.3	E6FT3
Industrial	Residual fuel oil	0	E3GAL	0	E3BBL
Commercial	Distillate fuel oil	1,382.3	E3GAL	33.04	E3BBL
Commercial	Kerosene	0	E3GAL	0	E3BBL
Commercial	LPG	14.034	E3GAL	0.33	E3BBL
Commercial	Natural Gas	5,602.4	E6FT3	5,112.2	E6FT3

Data available at the time of the 2017 NEI NONPOINT data submittal (Submitted Total Fuel Use) can differ slightly from latest available data (Total Fuel Use).

‡Annual 2016 / 2017 VOC emissions reported as part of synthetic minor site wide reporting (GPLPE reporting) were available for three facilities listed above. GPLPE compliance reporting does not require summer day emissions reporting. The above summer day emissions were calculated from point reported data for the facility for the latest available reporting period (year of data indicates the year the data was reported in an emission statement or in facility level compliance report). A factor of 6.521739 times the annual emissions was used and is based on seasonal factor of 30 percent with a 92 day season and a 2000 pound per ton unit of measure conversion factor.

Table H-13: Industrial Processes - Oil and Gas Exploration and Production SCCs

Source Classification Code	Description	
	SCC Level Three	SCC Level Four
23-10-000-220	All Processes	Drill Rigs
23-10-000-551	All Processes	Produced Water from CBM Wells
23-10-000-552	All Processes	Produced Water from Gas Wells
23-10-000-553	All Processes	Produced Water from Oil Wells
23-10-000-660	All Processes	Hydraulic Fracturing Engines
23-10-010-100	Crude Petroleum	Oil Well Heaters
23-10-010-200	Crude Petroleum	Oil Well Tanks - Flashing & Standing/Working/Breathing
23-10-010-300	Crude Petroleum	Oil Well Pneumatic Devices
23-10-011-001	On-Shore Oil Production	Associated Gas Venting
23-10-011-201	On-Shore Oil Production	Tank Truck/Railcar Loading: Crude Oil
23-10-011-501	On-Shore Oil Production	Fugitives: Connectors
23-10-011-502	On-Shore Oil Production	Fugitives: Flanges
23-10-011-503	On-Shore Oil Production	Fugitives: Open Ended Lines
23-10-011-505	On-Shore Oil Production	Fugitives: Valves
23-10-011-600	On-Shore Oil Production	Artificial Lift Engines
23-10-021-010	On-Shore Gas Production	Storage Tanks: Condensate
23-10-021-030	On-Shore Gas Production	Tank Truck/Railcar Loading: Condensate
23-10-021-100	On-Shore Gas Production	Gas Well Heaters
23-10-021-102	On-Shore Gas Production	Natural Gas Fired 2Cycle Lean Burn Compressor Engines 50 To 499 HP
23-10-021-202	On-Shore Gas Production	Natural Gas Fired 4Cycle Lean Burn Compressor Engines 50 To 499 HP
23-10-021-251	On-Shore Gas Production	Lateral Compressors 4 Cycle Lean Burn
23-10-021-300	On-Shore Gas Production	Gas Well Pneumatic Devices
23-10-021-302	On-Shore Gas Production	Natural Gas Fired 4Cycle Rich Burn Compressor Engines 50 To 499 HP
23-10-021-351	On-Shore Gas Production	Lateral Compressors 4 Cycle Rich Burn
23-10-021-400	On-Shore Gas Production	Gas Well Dehydrators
23-10-021-501	On-Shore Gas Production	Fugitives: Connectors
23-10-021-502	On-Shore Gas Production	Fugitives: Flanges
23-10-021-503	On-Shore Gas Production	Fugitives: Open Ended Lines
23-10-021-505	On-Shore Gas Production	Fugitives: Valves
23-10-021-506	On-Shore Gas Production	Fugitives: Other
23-10-021-603	On-Shore Gas Production	Gas Well Venting - Blowdowns
23-10-023-102	Coal Bed Methane Natural Gas	CBM Fired 2Cycle Lean Burn Compressor Engines 50 To 499 HP

Source Classification Code	Description	
	SCC Level Three	SCC Level Four
23-10-023-202	Coal Bed Methane Natural Gas	CBM Fired 4Cycle Lean Burn Compressor Engines 50 To 499 HP
