^{*}Projects are proposed for these locations already. Costs estimated in this table are for adding ecological and water quality elements to the assumed original purpose of the proposed projects. Costs should be used for planning purposes only based on screening-level evaluations of site characteristics. Construction costs could vary significantly.

Other Green Infrastructure Retrofit Opportunities in the Mill River Watershed

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Cheshire HS	Cheshire	Large amount of impervious cover, multiple parking areas. Internal roof drainage from buildings.	Disconnect roof downspouts. Potential for infiltration or bioretention using existing landscaped areas in front lawn, just west of entrance, and/or under fire lane by gym. Replace impervious parking lots with pervious pavers. Lowlying area behind operations/maintenance building could also receive water.	
Cheshire Public Works/Town Hall	Cheshire	Large parking lot, drains via catch basins. Catch basin in NE corner of parking lot was observed to have moderate flow, despite no rain in past 24h. Dumpsters without secondary containment adjacent were located adjacent to another catch basin.	Potential for subsurface infiltration under NE corner at catch basin.	
Route 10 Corridor	Cheshire	Large amount of impervious cover, multiple parking areas many of which back up to the Mill River with little or no Riparian Buffer	Decrease impervious cover throughout Route 10 Corridor.	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Quinnipiac University - Albert Schweitzer Institute	Hamden	Paved parking lots with no storm drains next to Mill River	Install educational rain garden to capture runoff from the front parking area.	
Quinnipiac University – Bobcat way parking areas	Hamden	Extensive parking areas with curbed planted islands	Potential for bioretention in existing landscaped area with catch basin adjacent to each island	
Alice Peck School	Hamden	Roof leaders and parking lot drain to paved open channel. Renovations to the school are expected during 2019.	Potential for bioretention and swale between parking lot and baseball field.	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Hamden Public Works	Hamden	Large parking lot drains to low point on south side of lot. Discharges to eroded channel into wet, wooded area south of site. No curbing or catch basins.	Bioretention or created wetland at south side of parking lot. Replace parking lot with pervious pavers.	
Whitney Washington ROW	Hamden	Bituminous island at intersection.	Potential to install bioretention cell or infiltration practice and/or remove impervious cover.	
USPS Whitney Ave	Hamden	Existing catch basins full of sediment. Roof leaders buried, discharge to catch basin on property.	Disconnect roof downspout. Potential for subsurface infiltration in parking lot, under pervious pavement. Bioswale or linear bioretention between parking lot and road.	
Washington Ave between Lincoln and Harding	Hamden	Wide ROW, no curb, sediment collecting at grass edge. Onstreet parking.	Linear bioretention or bioswales along west side of street. Bioswales where practicable elsewhere on Washington Ave. Replace parking lanes on either side of street with pervious pavement.	

Mill River Watershed – Other Green Infrastructure Opportunities

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Hamden Municipal Campus	Hamden	Large parking lots at Hamden Senior Center, Library, Middle School, and Town Hall.	Develop a Municipal Campus Stormwater Masterplan.	
Dixwell Ave./ Shepard Ave./ Skiff Street	Hamden	Busy intersection near many large parking lots and commercial center.	Potential for bioretention or infiltration in ROW island and linear practices in ROW. Paved ROW could, at minimum, be replaced with pervious cover.	
Ridge Road Elementary	Hamden	Cracked pavement in parking lot, may be due for repaving.	Regrade parking lot, remove western curb and install bioretention or infiltration practice. Potential to replace parking lot with pervious pavers.	
Spring Glen School	Hamden	Medium sized parking lot, recent pavement, trees in median.	Potential for bioretention in existing landscaped area with catchbasin adjacent to lower play area. Rain garden at SW corner of site.	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Town Center Park	Hamden	Town Park that receives runoff from 88 acres or surrounding urban land use (commercial and residential). Impervious cover is estimated to be 21%.	Installation of best management practices (BMPs) that slow, treat, capture, and filter the stormwater before it reaches the Pardee Brook diversion channel and Shepard Brook. The designs consist of reinforcing the existing plunge pool with a boulder overflow weir; installing a sediment filter riverbed, a stormwater treatment pond, constructed wetland and rain garden; and restoring the meadow area to create an emergent marsh. This series of engineered but natural stormwater management practices will reduce pollutant loading and erosion entering Pardee Brook **High Priority Project	
RWA Water Center	Hamden	Hard packed access road with downspout discharging to access road	Install Rain barrel to capture roof runoff. Potential for demonstration bioretention.	
Eli Whitney Museum	Hamden	Hard pack and paved parking area with catch basins discharging directly to river; curbed island and planters in the center of parking lot	Potential to retrofit curbing and islands in the center of the parking lot to be used for bioretention. Potential to install bioswales in grass areas along the paved driveway. Potential to install rain barrels to capture water from existing building and reuse onsite.	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Hooker Middle School	New Haven	Church converted to school in 2009. Island in turnaround. Catch basins in parking lot, including beneath dumpsters. Former PTA constructed native habitat, but now is not maintained (invasives present). School has signage about native habitat and outdoor classroom.	Potential for green roof above main entrance, bioretention in island and at lower elevation on property in existing, unmaintained habitat garden. Recommend native plantings in bioretention. Rain garden by eastern gate Secondary containment around dumpsters.	
Hooker Elementary School	New Haven	Moderately old street/sidewalk, possibly separated sewer/past CSO. Buried roof leaders to catchbasins.	Linear bioretention to subsurface infiltration along Canner, east of Livingston. Replace paved ROW area on Livingston, south of the school, with bioretention; connect to low points of playground via trench drain or replace with pervious pavers.	
Jocelyn Square Park	New Haven	Broken 6' wide sidewalk on north side of park. Drainage existing along Humphrey. Leaching catch basin in private parking lot across Humphrey, at 175 Humphrey St.	Bioswale in ROW between utility poles. Potential for subsurface storage/infiltration under paved park entrance.	
Humphrey Street and Mill River Street	New Haven	Large parking area comprised of sand, gravel and pavement, which slopes towards the Mill River. The stream bank is eroded with no riparian area.	Potential for living shoreline	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Radiall America	New Haven	Large parking lot, buried roof leaders	Disconnect roof leaders, bioretention in existing landscaped areas.	
United Way	New Haven	Large parking area, landscaped islands.	Bioretention in islands.	Control of the second of the s
Haven Street	New Haven	Existing drainage along Haven Street captures private driveway.	Potential for bioretention to capture road runoff and stormwater from residential properties and to serve as connection to the Mill River Trail.	

Site Location	Municipality	Existing Conditions	Recommendation	Photo
Fair P.A.C Housing	New Haven	Large parking lot and connected roof leaders	Potential for retention in the vegetated areas in the front and rear of the building	
St James Unity	New Haven	Buried roof leaders, underutilized parking area.	Disconnect roof leaders, potential for pervious pavement.	
Yale Divinity	New Haven	Buried roof leaders, potential evidence of gray water from building in catch basins along driveway between Divinity School buildings and adjacent conference center. Drainage system appears to drain east towards large landscaped area and potentially out to Whitney Ave. Possible existing infiltration basins at conference center.	Potential for curb cuts to bioretention, potential for subsurface infiltration, disconnect roof leaders.	
First Unitarian Church	New Haven	Buried roof leaders, compacted gravel. Paved play area sheet flow to parking lot.	Potential for subsurface infiltration.	
Orange/Edward Canner/Foster	New Haven	Cracking pavement. Possibly separated sewer/past CSO area. No Standing Anytime signs on all corners.	ROW bump-out bioretention or bioswale at intersection without removing on-street parking or infringing on bike lane. Potential for pervious pavers in parking/cycling lane.	

Mill River Watershed – Other Green Infrastructure Opportunities

Site Location	Municipality	Existing Conditions	Recommendation	Photo
James and River Street	New Haven	Curbed bump out with gutter	Potential to retrofit bump out for use as bioswale. Location next to Criscuolo park also offers potential for education and outreach.	
Criscuolo park	New Haven	Heavily used urban park and playing fields	Potential for riparian plantings and demonstration rain garden.
