Introduction

The wild turkey is an important component of our state's wildlife diversity. The goal of the Connecticut Wild Turkey Management Program is to manage the wild turkey population at a level compatible with available habitat and various land uses, and to allow for a sustained yield of turkeys for use by the people of Connecticut. Wild turkeys continue to be of moderate abundance throughout the state, providing the public with hunting and wildlife viewing opportunities.

To successfully manage a statewide wild turkey population, biologists must take a holistic approach. Factors that should be considered include harvest, hunter participation and effort, annual productivity, predator-prey interactions, seasonal weather conditions, species density dependence, diseases, and habitat modifications. On an annual basis, harvest, hunter dynamics, and productivity are presented in the Turkey Summary booklets. Other variables are obvious in effect, but their current influence is unknown (disease, predator-prey, and habitat). Other variables are known yet unpredictable (weather), and the influence of density dependence or lack thereof is not known. Because many factors play a role in the dynamics of a statewide wild turkey population, biologists must consider all parameters to facilitate positive changes and ensure that turkey populations are managed properly.

The 2022 wild turkey hunting seasons continued to emphasize changing conditions. From 2020 to 2022, harvest and hunter participation declined across all wild turkey hunting seasons. The 2022 totals were similar to pre-pandemic levels (2019), showing just 49 more hunters having purchased some form of the Resident Game Bird Conservation Stamp (RGBCS). Of note, previous summaries used the number of RGBCSs issued as a metric to calculate hunter participation. Hereafter, and including in this summary, all hunter data will be calculated using a count of unique Conservation ID numbers to which one or more RGBCSs were issued (i.e., an individual holding both a Landowner and statewide participation stamp will not be counted twice) as opposed to counting issuance.

Connecticut maintains three wild turkey hunting seasons, which include spring, fall archery, and fall firearms. For the majority of Connecticut's wild turkey hunters, spring is the most popular season, and for this reason, the 2022 spring season highlights are presented first, followed by the spring turkey hunter survey information, annual brood survey data, fall firearms season highlights, and fall archery season information.

2022 Spring Turkey Season

Overall Results

The 42nd annual statewide spring turkey season was open from April 27 – May 28, 2022. A total of 6,986 Resident Game Bird (RGB) hunters were eligible to participate in the spring season as of June 1 and 1,139 birds were harvested (Figure 1). The 2022 spring harvest consisted of 314 juvenile and 823 adult males and 2 bearded females. The number of hunters decreased by 9.3% (714 hunters) and harvest decreased by 8.7% (102 birds) from the 2022 totals (Tables 1 and 2).

To provide a quality turkey hunting experience for Connecticut’s junior hunters (ages 12 to 15), the 18th Annual Youth Wild Turkey Junior Hunter Training Days took place from Saturday, April 16 to Saturday, April 23, 2022 (excluding Sunday, April 17). Participants harvested 44 wild turkeys, 9 fewer birds than the previous year. For the 2022 season, 49 juniors harvested their first wild turkey, 55% (27) of which were during the junior season. Overall, 78 juniors (70% as derived from the spring turkey hunter survey) took part in the Junior Hunter Training Days with a 56% success rate. Junior Wild Turkey Hunter Training Days have been well received by all participants, both youth hunters and mentors.

Year	RGB Hunters	Participation Rate ³	Estimated Hunter Numbers
2021	7,700 ¹	72%	5,544
2022	6,986 ²	69%	4,820

¹ RGB hunters permitted from 12/1/20 to 6/1/21.

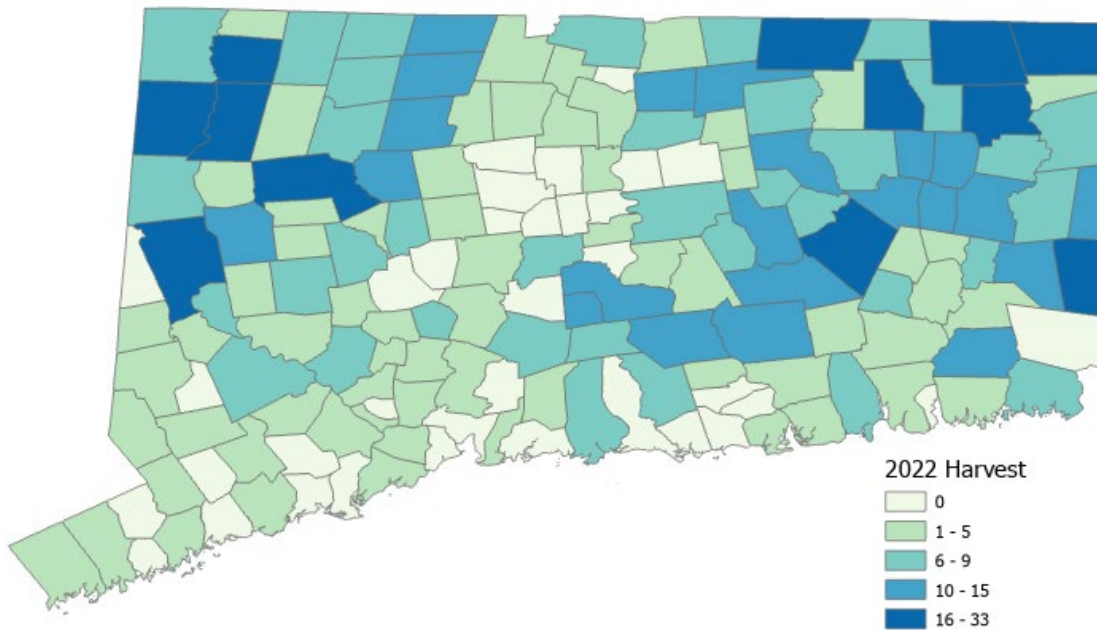

² RGB hunters permitted from 12/1/21 to 6/1/22.

³ Participation rates derived from the respective year’s Spring Turkey Hunter Surveys.

Harvest by Town

At least 1 bird was taken from 140 of Connecticut’s 169 towns (Figure 2, Appendix A). Twenty or more birds were taken from 10 towns and 30 or more birds were taken from 1 town. The towns of Cornwall (33), Sharon (24), and Woodstock (24) had the highest reported turkey harvest.

Figure 2. Distribution of the 2022 spring turkey harvest in Connecticut.

Zonal Harvest

Similar to 2021, the northeastern corner of the state (Turkey Management Zone 5) reported the highest harvest among Connecticut’s 13 Turkey Management Zones (TMZs) during 2022 (Table 3, Figure 3). Prior to 2004, northwest Connecticut (Zone 1) had typically held this distinction. Zone 4B recorded the lowest harvest. Zones 3, 4B, and 6 showed the largest decrease in harvest from 2021 to 2022. Although harvest was variable among zones, turkey populations exist in all zones and harvest is a function of hunter access and turkey densities.

Table 3. Turkeys harvested during the spring 2021 and 2022 seasons by Turkey Management Zone.

Zone	Harvest 2021	Harvest 2022	Percent Change
1	101	127	25.74
2	128	116	-9.38
3	109	65	-40.37
4A	68	62	-8.82

11	67	52	-22.39
12	62	82	32.26
Total	1,247	1,139	-8.66

Figure 3. Connecticut's 13 Turkey Management Zones, 2022.

Private and State Land Hunting

Private land accounted for the majority of the harvest (78%). Private land encompasses the largest amount of land, includes the best turkey habitat, and likely has more experienced hunters with lower hunter densities than state land (based on median age of successful hunters). Of the state-managed properties, Natchaug State Forest (24) in Eastford and Pachaug State Forest (23) in Voluntown yielded the most turkeys in 2022. The most productive state land turkey hunting areas (≥ 5 birds harvested/mi² and a minimum harvest of 4 birds) were Meadow Brook WMA in Colchester and Algonquin State Forest in Colebrook (Appendix B).

Harvest Distribution Among Hunters

Analysis of hunter reporting data indicates the distribution of harvest among spring turkey hunters has remained relatively consistent over time (Table 4). Further analysis indicates that the harvest of additional birds, of what would have been allowed under the pre-2020 spring regulations (3/private, 2/state bag limits, AM only harvest) for the 2022 season, makes up 4.4% of the total harvest. This percentage is an increase from 3.4% in 2021 but remains below the 5.4% seen in 2020 when regulations first changed.

Table 4. Harvest distribution among hunters, 2017-2022.

Year	Birds Harvested	Hunter Count	Percentage of Spring Hunters	Additional Birds
2017	5	19	0.4%	n/a

Spring Turkey Hunter Survey Results

The Spring Wild Turkey Hunter Survey is used to obtain a variety of information to better manage Connecticut's wild turkey resource. The survey provides valuable insight into population growth trends, economic expenditures, and recreational benefits. It also provides turkey hunters a forum to weigh in on potential changes to the program and overall satisfaction with the Wildlife Division's management of Connecticut's wild turkey population. Prior to 2010, each spring turkey hunter received a mail-in survey attached to their permit. Since then, in an effort to streamline the survey process, all individuals who purchased a RGBCS and provided an email address receive a survey.

In 2022, a total of 5,436 surveys were emailed to spring turkey hunters and 25% of those hunters responded (1,353). Thirty-one percent of the respondents had obtained a RGBCS by June 1 but did not participate in the 2022 spring turkey hunting season. This ratio was used to calculate total spring turkey hunter numbers. Of those that did hunt (total est. 4,820), most of their hunting activity occurred in Turkey Management Zones 2 and 5 which is consistent with 2021 (Figure 3; Table 5). On average, spring turkey hunters spent an estimated \$286 on hunting-related items (stamps and license not included) totaling \$251,637. An additional \$178,346 of revenue was generated through the sales of RGBCS (as of May 31, 2022).

Thirty-nine percent of spring turkey hunters (n=885) responding to the survey believed the turkey population was decreasing. Of the remainder, 4% believed it was increasing, 25% believed it was stable, and 12% had no opinion. Hunters were asked to rank the change in population from last year to this year as decreasing (0), slightly decreasing (1.5), stable (3.0), slightly increasing (4.5), or increasing (6.0). From this information, a turkey population growth index of 1.6 was derived for 2022, indicating a slightly decreasing turkey population. All Turkey Management Zones had a mean index below 3.0, suggesting statewide decline in wild turkey numbers from 2020 to 2022.

To collect data on ruffed grouse distribution in Connecticut, an additional question was added to the turkey hunter survey in 2005. Hunters were asked to report whether they observed ruffed grouse or heard grouse drumming and, if so, to provide the town in which the encounter occurred. During 2022, hunters reported 58 encounters with ruffed grouse in 39 towns. The town with the highest number of grouse encounters was Hartland (Appendix C). A grouse population index was derived by dividing total grouse observations into the total number of surveys returned and then multiplying by 100. This represents the average number of grouse encountered by 100 spring turkey hunters. The 2022 index was 4.3 (Figure 4). Overall, grouse population trends indicate that Connecticut's grouse numbers continue to decline. Only 5% of the spring turkey hunters encountered grouse during the season.

The survey was also used to assess hunter preferences and activities. The majority of hunters who purchased a RGBCS by June 1 intended to pursue wild turkeys (94%); 59% indicated they would hunt only wild turkeys, 34% wild turkeys and other gamebirds, 2% pheasants and other gamebirds, 4% only pheasants, and three individuals only hunted other game birds. Ninety percent of the hunters identified themselves as spring turkey hunters, 32% as fall archery turkey hunters, 33% as fall firearms turkey hunters, and 6% did not intend to hunt turkey in 2022. Of the 2022 spring hunters, 51% hunted turkeys on private land only, 12% on both private and state lands, and 36% on state land only. On average, 2022 spring turkey hunters spent approximately 4.9 days pursuing turkeys on private land and 5.3 days on state land (Figure 5). In 2020, hunting hours were extended from ending at noon until ending at sunset, giving hunters the option of afternoon hunting. Hunters were asked what percentage of time they spent hunting in the morning and afternoon; collectively the hunters indicated that 83% of their time was spent hunting during morning hours (a 3% increase from 2021) and 17% during the afternoon, a 2% decrease from the previous year. Most hunters still preferred morning hunts.

The 2022 state land spring turkey hunters encountered over three times more hunter interference from other hunters than private land hunters (16% vs. 5%), and almost three times as much interference from non-hunters (11% vs. 4%). These numbers are very similar to 2021, where the only difference was a 1% decrease in non-hunter interference on state land (Table 6). Overall, it appears that most 2022 spring hunters were satisfied with the quality of the Connecticut hunt experience: excellent – 11%, good – 27%, fair – 24%, poor – 20%, and very poor – 15%. Generally, it appears that positive season satisfaction correlates to higher harvest rates (Figure 6).

2022 Fall Firearms Turkey Season

The fall firearms season was open statewide in 2022 for the 27th year in Connecticut. Hunters who purchased a RGBCS were able to hunt on any state land open to turkey hunting and all private lands where hunters obtained a signed landowner consent form. An estimated 1,088 hunters (derived from preliminary responses from the 2022/2023 Resident Game Bird Hunter Survey) participated during the fall firearms wild turkey season. Hunters harvested 69 birds (Appendix D) during the 29-day, 2022 fall firearms season and posted a success rate of 6.3%. Hunters harvested 61 birds on private land and 8 birds on state land (Table 7). Three hunters harvested 3 birds, 18 harvested 2, and 24 harvested 1 during the season. The harvest consisted of 64% adults, 36% juveniles, 41% males, and 59% females. Overall, from 2021 to 2022, the fall firearms harvest increased by 36%.

Fall firearms hunters reported taking at least 1 bird from 28 of Connecticut’s 169 towns. The towns reporting the highest harvests were Colchester, Stafford, and Woodstock (6) (Table 8). In addition, Turkey Management Zone 4A (13 birds) reported the highest zonal harvest (Table 9).

2022 Fall Archery Turkey Season

Connecticut's 39th fall archery turkey season was open statewide and ran concurrently with the 2022 archery deer season. The purchase of a RGBCS allowed archers to participate in the 2022 season. These hunters could harvest turkeys on any state land open to fall archery turkey hunting or any private land where written landowner consent was obtained. An estimated 1,071 hunters (derived from preliminary responses from the 2022/2023 Resident Game Bird Hunter Survey) participated during the fall archery wild turkey season. Archers reported a harvest of 82 birds and posted a success rate of 7.6%. Harvest was reported in 49 towns with Guilford (4), Lebanon (4), and Winchester (4) reporting the highest harvest (Table 10). Turkey Management Zones 12 (12), 11 (10), and 5 (10) reported the highest zonal harvest (Table 11). Because the fall archery wild turkey season runs concurrently with the archery deer season, hunters in Zones 11 and 12 have the additional month of January to harvest wild turkeys; all other zones close at the end of December. The 2023 January season yielded no harvest with an estimated 115 participating hunters.

Thirty-eight of the 82 birds harvested by archers were males (27 adults, 11 juveniles) and 43 were females (39 adults, 4 juveniles). The fall archery turkey harvest increased by 22% from 2021 to 2022 (Appendix E).

Wild Turkey Brood Survey

Since 2007, turkey brood surveys have been conducted annually from June 1 through August 31 to assess annual fluctuations in statewide wild turkey recruitment. Volunteers and DEEP staff were requested to report turkey sightings, categorized by total hens, total poults, and total number of hens with poults, and beginning in 2021 tom and jake sightings were also collected. Numbers for 2021 male sightings were excluded due to low reporting. These observations were analyzed to obtain an annual productivity index and evaluate fall recruitment. The productivity index, or ratio of young per adult hen, was historically derived by dividing the total number of poults by the total number of hens. By evaluating recruitment over time, biologists can monitor changes and trends in Connecticut’s statewide wild turkey population.

Modifications were made to the 2022 brood survey to improve data quality and bring data collection and analysis in line with the standards prepared by the National Wild Turkey Federation Technical Committee in 2019 (within Table 11 the previous calculation method can be found in parenthesis since 2018 with the new index analysis to be the sole number reported moving forward). Additionally, to increase data collection among volunteers, announcements of the survey were made in invitations to the Spring Wild Turkey Hunter Survey; to further improve data quality, revisions to instructions to improve clarity were implemented in mid-July.

The 2022 brood index was 3.87 young per adult for all hens observed and 4.47 young per adult for hens observed with at least one poult (Table 12, Figure 7). A total of 838 cooperators reported 386 wild turkey observations, including 684 hens (615 with broods and 69 without broods). The brood index was found to be variable throughout the summer months (Table 13). During 2021, the updated brood index was 4.31 young per adult for all hens observed and 4.84 young per adult for hens observed with at least one poult. Participants reported 328 observations, which included 579 hens and 1,920 poults. The brood survey information indicates that wild turkeys had a slightly above average (5-year average of 3.34) productivity in Connecticut during 2022. Variance in the poults reported by month is to be expected based on detectability and discernibility based on time of year. The 2022 spring weather was relatively warm and dry throughout Connecticut, continuing a trend from 2021. Fair conditions were present during both the nesting (May 1 – May 31) and brooding (June 1 – June 30) periods; while the nesting period

was drier than 2021 and two degrees warmer, the brooding period in 2022 was noted to be wetter (by 5/100” on average) and an average of three degrees cooler than 2021, however.

Table 12. Wild turkey brood survey data for Connecticut, 2007 – 2022.

Year	Total Hens	Total Young	Total Hens and Young	Hens without Young	Young per Hen	Young per Brood	Total Males	M:F Ratio	No. of Reports
2007	731	1,900	2,631	270	2.6	4.1	-	-	405

July	362	1,151	187	1.94	6.16
Aug.	193	560	99	1.95	5.66
Total	684	2,217	386	1.77	5.74

Population Dynamics

In Connecticut, to obtain insight into long-term wild turkey population trends, biologists collect data on spring wild turkey harvest, hunter participation, and a hunter perception population growth index (PPGI). The spring season information was used to represent a population index, because this was the most popular season, with the highest number of hunters and harvest. The turkey population growth index is derived from a question on the annual Spring Turkey Hunter Survey (See Spring Hunter Survey Results, Figure 8). When all of these parameters were reviewed from 2000 to 2022, both indices show a downward trend (Figures 8 and 9), though a longer perspective and PPGI dataset might be desired to assess the overall trend of the population.

The ratio of juvenile to adults in the spring harvest, along with brood survey information, can also provide insight into wild turkey population dynamics. For example, in 2010 and 2019, data showed that a lower number of juvenile birds were harvested, indicating lower poult production the previous year (juvenile birds are approximately 1 year old). Therefore, it was expected that in 2009 and 2018 brood indices should be lower than average; the brood index in 2009 was 1.7 and

in 2018 was 2.4 (2018) (Table 11, Figure 10). In 2011, the juvenile to adult ratio was the highest it had been since 1994, indicating exceptional productivity; the brood index for 2010 was the highest ever recorded (3.6). It appears that the brood survey data can provide some insight as to what the juvenile harvest will be the following spring, at least when the brood index is exceptionally high or low; the indices are less reliable when they tend towards the long-term average.

Figure 8. Perception of hunters regarding wild turkey population growth from 2000 – 2022.

Figure 9. Trend in spring turkey harvest success from 1981-2022.

Note: Data from 2022 reflects the change from RGBCS issued to RGB hunters used to calculate success rate.

Figure 10. Ratio of juvenile to adult turkeys taken during Connecticut’s spring wild turkey seasons, 1981 – 2022.

Summary

The state's wild turkey population appears stable from 2021 to 2022. Spring harvest success rates varied little from the 2021 season (Figure 9), even when considering variations in source data (hunter numbers vs permit issuance varied by <400, the index would have remained flat as opposed to increased should issuance have been used). The brooding season offered reasonable conditions and the poult per hen index indicated a greater than average year of recruitment. While fall harvest increased by a significant percent, its scale (a total of 151 birds harvested statewide, 32% juvenile, 52% female) and the relatively mild winter were unlikely to cause significant impact on the breeding population for the spring of 2023.
