## Introduction

The Office of Emergency Medical Services (OEMS) has statutory authority for the statewide collection of Emergency Medical System (EMS) data. The OEMS interacts within a network of local, regional, statewide, and national stakeholders and shares data with the National Emergency Medical Services Information System (NEMSIS). The office works with software vendors to standardize submissions and assure the correct processing of records. Data collection for year 2023 began in NEMSIS version 3.4.0, starting in June agencies transitioned to NEMSIS version 3.5.0. 174 of 178 agencies successfully switched to NEMSIS 3.5.0 by December 31st, 2023. While the two data standard versions are overall consistent, there are some noticeable differences between the data sets that will make certain comparisons between this annual report and those that came before difficult. For instance the change from one disposition element in NEMSIS 3.4.0 to four disposition elements in NEMSIS 3.5.0.

The purpose of this report is to meet the requirements of the [Connecticut General Statutes](#) (19a-177 (8)) and to provide statistics on Connecticut EMS calls filtered by demographics (i.e. age, sex, and race), time (i.e. day of the week, time of day), and location (i.e. town and county). This report only reflects what was reported by EMS providers in electronic patient care reports (ePCRs) to the OEMS.

Connecticut has 169 towns. It is the responsibility of OEMS and the individual jurisdiction to identify the primary service area (PSA) provider and to define the level of resources to be provided to that area. Connecticut issues licenses and certifications to ambulances and first responders to operate within specific geographic areas. We published Primary Service Area maps for first responder, basic, and paramedic levels in the [2022](#) annual report. Services throughout the state include volunteer, municipal, hospital-based and commercial organizations. It is up to the individual jurisdiction to define acceptable levels of service and response, including response time standards as part of their local EMS plan. Local agencies have to establish mutual aid agreements with back-up agencies in order to ensure continuity of service.

Requests for 911-response are handled by Public Service Answering Points (PSAPs) for the 396 EMS services throughout the state. Pre-hospital (field) to hospital communications (on-line medical direction) is coordinated via the 13 Centralized Medical Emergency Direction (CMED) communication centers situated throughout the state. EMS agencies are assigned specific CMED resources based on their geography and sponsoring hospital.

All licensed and certified services that transport patients are required by statute to collect and submit electronic data to OEMS. In 2023, 178 services submitted ePCRs to the state. See Table 1 for a summary of total ePCRs reported to the state as well as the minimum, maximum, and average validity scores for each reporting EMS service. For each ePCR, validation rules check for completeness and highlight fields red or orange if the rule is not satisfied thereby notifying users of data fields that require their attention. The validation score reflects the completeness of each ePCR and acts as the first round of quality assurance.

For the sections Complaints Reported by Dispatch, Unit Level Characteristics, All ePCR Responses, and Scene Info we used all submitted ePCRs or a subset of 911 responses from all submitted ePCRs. For patient level information we used a de-duplicated set of ePCRs as described in Section Patient Level Information.

## Complaints Reported by Dispatch

Complaints reported by dispatch for 911-responses were similar in pattern to dispatched calls in 2022 (Figure 1).

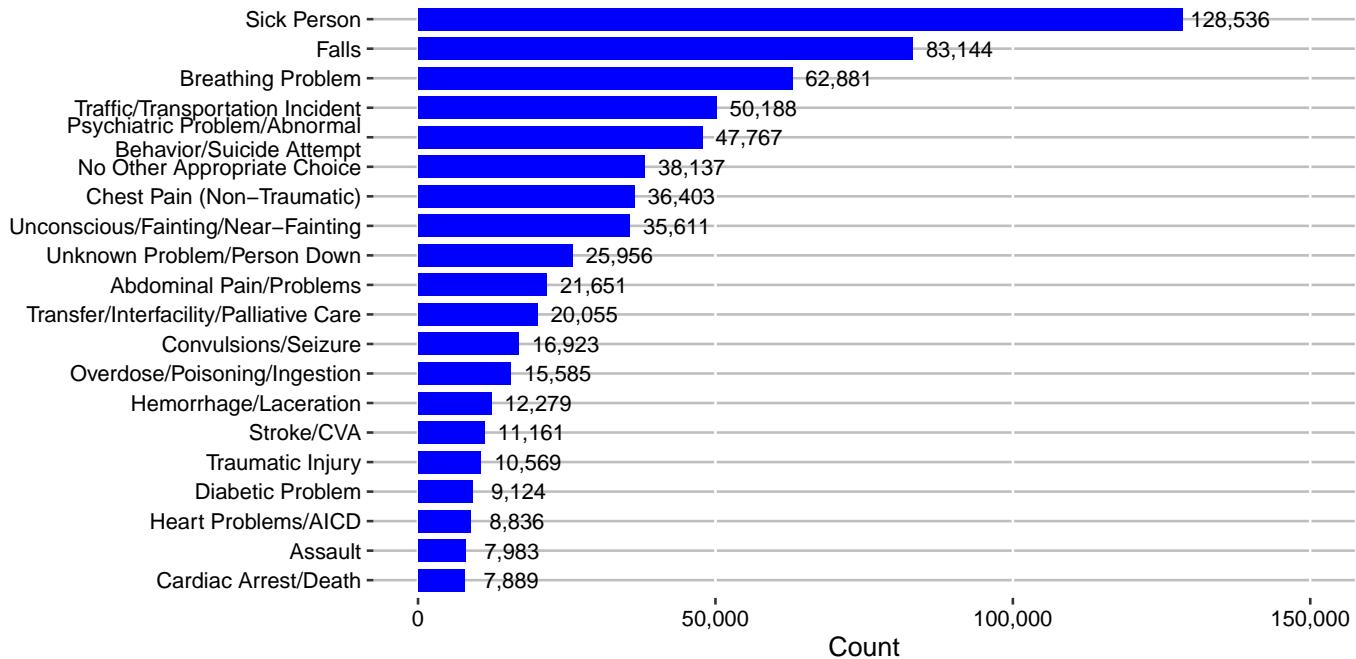

Figure 1: Top 20 Complaints Reported By Dispatch

## Unit Level Characteristics

For 56.68% of 911-responses (n= 396,401) the unit was equipped with advanced life support (ALS), for 43.28% of 911-responses (n= 302,668) the unit was equipped with basic life support (BLS), and for the remainder level of care of this unit was not recorded (n= 273). Table 2 provides a breakdown by agency of the level of care (ALS or BLS) the unit is able to provide based on the units' treatment capabilities for the specific EMS event regardless of patient need.

- **Advanced Life Support (ALS):** Transportation by ground ambulance vehicle with the provision of medically necessary supplies and services including the provision of at least one ALS intervention by ALS personnel trained to the level of the Advanced EMT or paramedic.
- **Basic Life Support (BLS):** Transportation by ground ambulance vehicle as defined by the state. The ambulance must be staffed by an individual who is qualified as an EMT-basic per state guidelines.

## All ePCR Responses

There were a total of 935,372 ePCRs submitted to OEMS, including 699,344 for 911-response, 26,619 for intercepts, and 9,700 for mutual aid (Figure 2). 69.25% of 911-responses were treated and transported (n= 484,301) (Figure 2). There was an average of 58,279 911-responses per month and an average of 40,358 911-responses where the patient was treated & transported per month (Figure 3), and 808 mutual aid ePCRs submitted per month (Figure 3). The majority of 911-responses occurred between 9am and 4pm on weekdays (Figure 4). Figure 5 shows the total number of 911-responses for the past four years (2020-2023). Whereas figure 5 shows the total number of treated and transported 911-responses for the past four years (2020-2023).

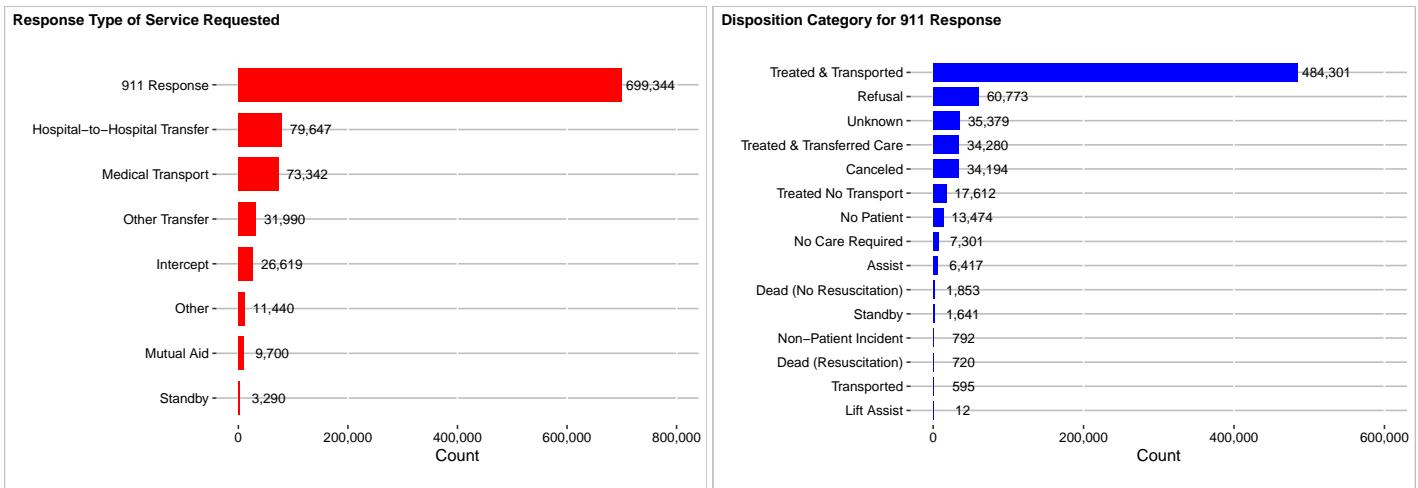

Figure 2: Response Type of Service Requested and Disposition Categories for 911-Response

Definitions for response type of service requested:

- **911 Response (Scene):** Emergent or immediate response to an incident location, regardless of method of notification
- **Medical Transport:** Transports that are not between hospitals or that do not require an immediate response. These are generally for the purpose of transportation to or from an appointment, performance of a procedure, or long-term care
- **Hospital-to-Hospital Transfer:** Any transfer, after initial assessment and stabilization, from and to a healthcare facility. This would include specialty hospitals, for the purpose of continuation of acute care, and emergent transfer requests. Relabeled from Interfacility Transport in NEMSIS 3.4.0
- **Intercept:** When one EMS provider meets a transporting EMS unit vehicle with the intent of receiving a patient or providing a higher level of care
- **Mutual Aid:** Unit responded to a request to assist another EMS service
- **Standby:** Initial request for service was for purposes of being available in case of a medical/traumatic emergency
- **Other Transfer:** Includes Non-Hospital Facility to Non-Hospital Facility Transfers and Non-Hospital Facility to Hospital Facility Transfers
- **Other:** Any other Response Type of Service Requested

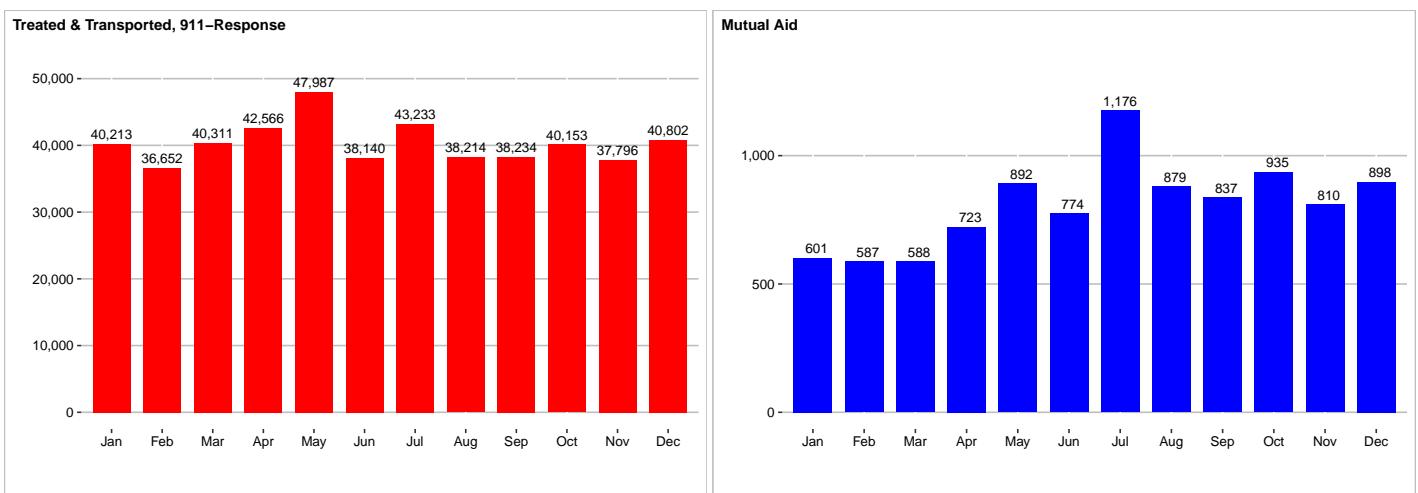

Figure 3: Treated and Transported and Mutual Aid by Month

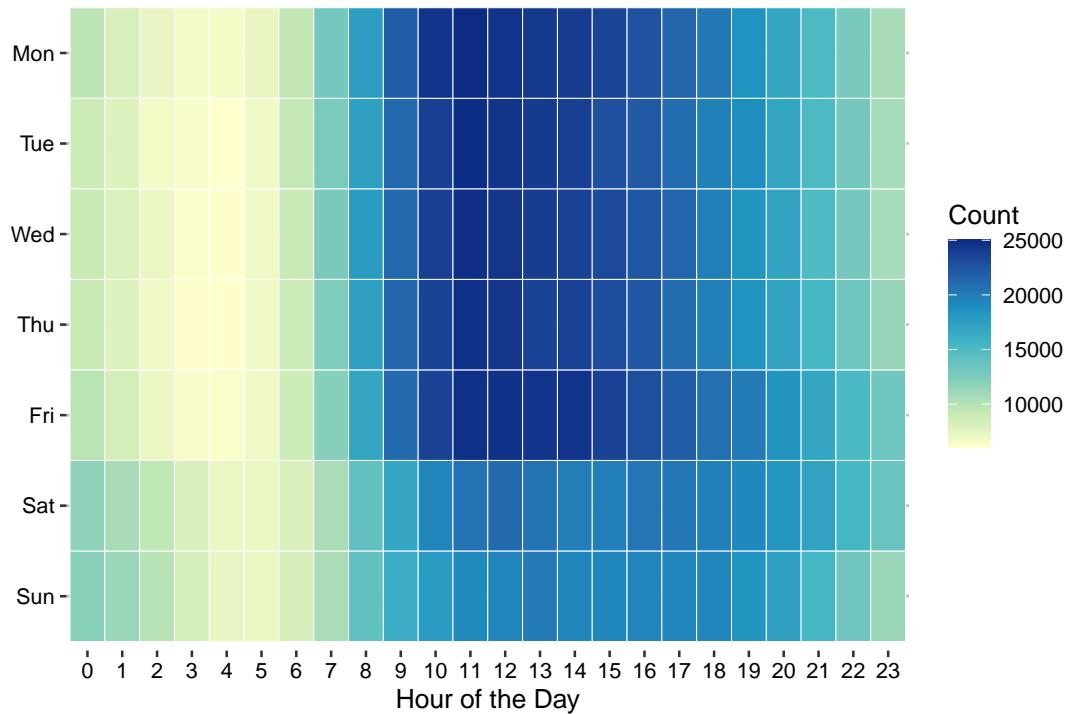

Figure 4: 911-Responses per Hour per Day

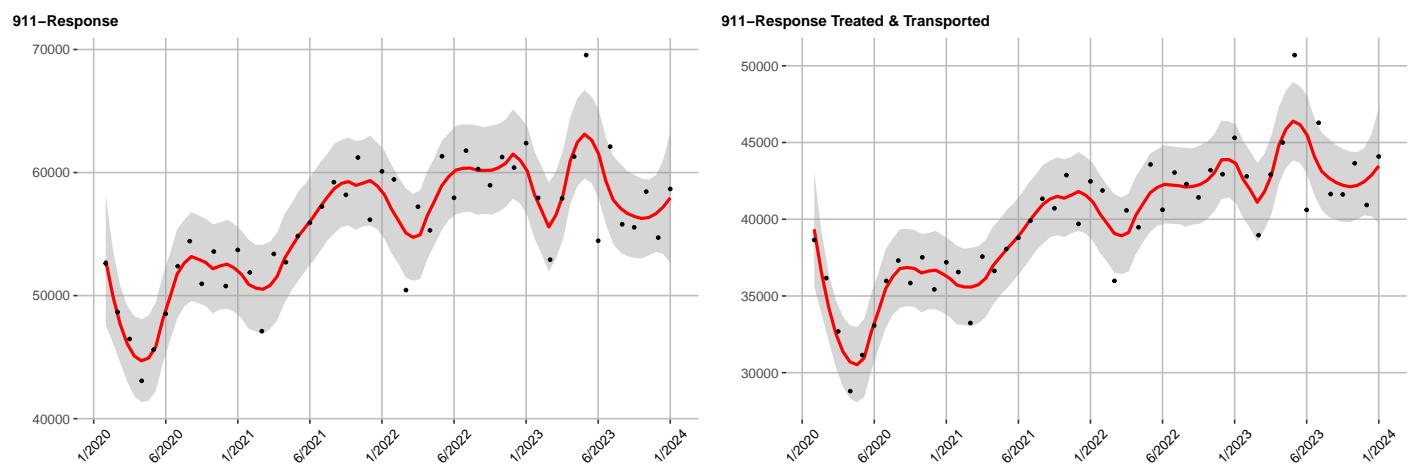

Figure 5: 911-Response and 911-Response Treated and Transported- Four Year Trend (2020-2023)

## Response Times

The response time metric was calculated as the difference between the time 'Unit Notified by Dispatch' to 'Unit Arrived on Scene'. This metric provides the time it takes a unit to respond to the scene location. Across all 911-responses (n=699,344) the average response time was **8.75** minutes.

However, there were potential outliers given that the minimum response time was  $-7.0553 \times 10^4$  minutes and the maximum response time was 195,843 minutes. We identified outliers by calculating the interval between the 2.5 and 97.5 percentiles of 911 response times. 911 response times under 1 minutes or over 20 minutes were excluded as they lay outside this 95% interval. This resulted in excluding 13% (n=96,285) of observations. After removing potential outliers, there were a total of 639,378 911-responses with a mean response time of **7.37** minutes (Figure 6 and Table 3).

The fractile times include the time from first tone to the service en-route to scene (Tone-En Route), the time to arrival at scene (En Route-Scene), time at scene (Scene-Depart Scene), time from scene to disposition (Depart Scene-Destination), and the turn around time (Destination-Back in Service). Figure 6 provides the average fractile times across all calls and Table 4 provides the fractile times for each town.

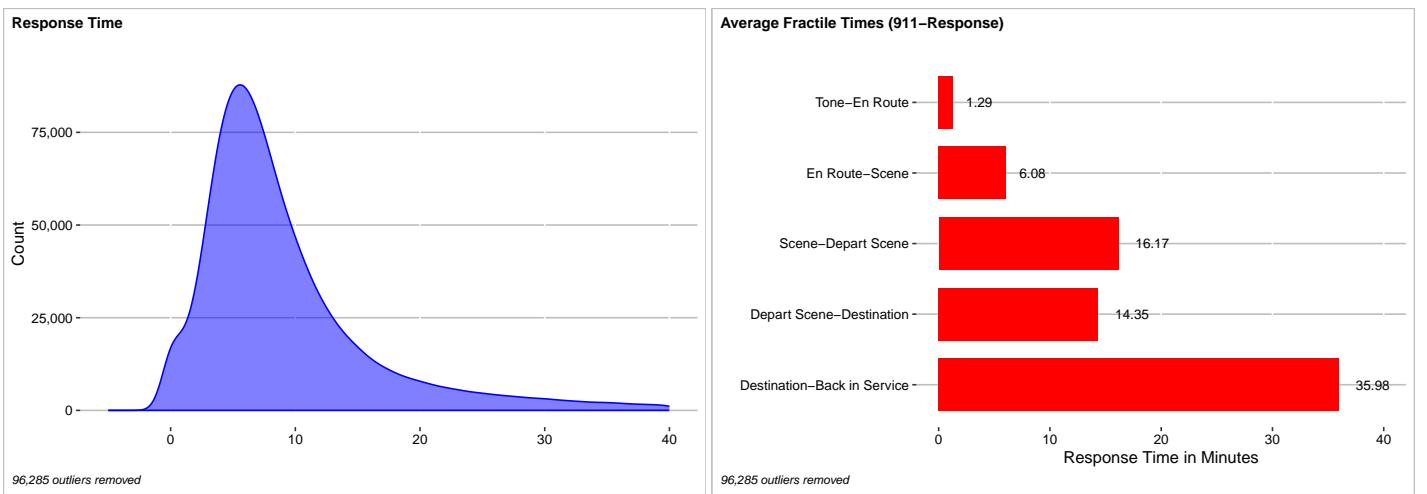

Figure 6: Overall Response Time and Average Fractile Times

## Response Times by Town, Class, and Mode

For the 633,205 911-responses where the incident town was one of the 169 town's in Connecticut, towns were categorized into urban, suburban, and rural classes by population density. The categories were based on the [US Census](#) definition of Urban (greater than or equal to 1,000 people per square mile) and the [Connecticut State Office of Rural Health](#) definition of Rural (10,000 people or less and less than 500 people per square mile). Figure 7 indicates which towns were classified as urban, suburban, and rural.

- **Urban** (n=45) with population density of greater than or equal to 1,000 people/square mile
- **Suburban** (n=33) with population density of less than 1,000 and greater than or equal to 500 people/square mile
- **Rural** (n=91) with population density less than 500 people/square mile and a population of 10,000 or less.

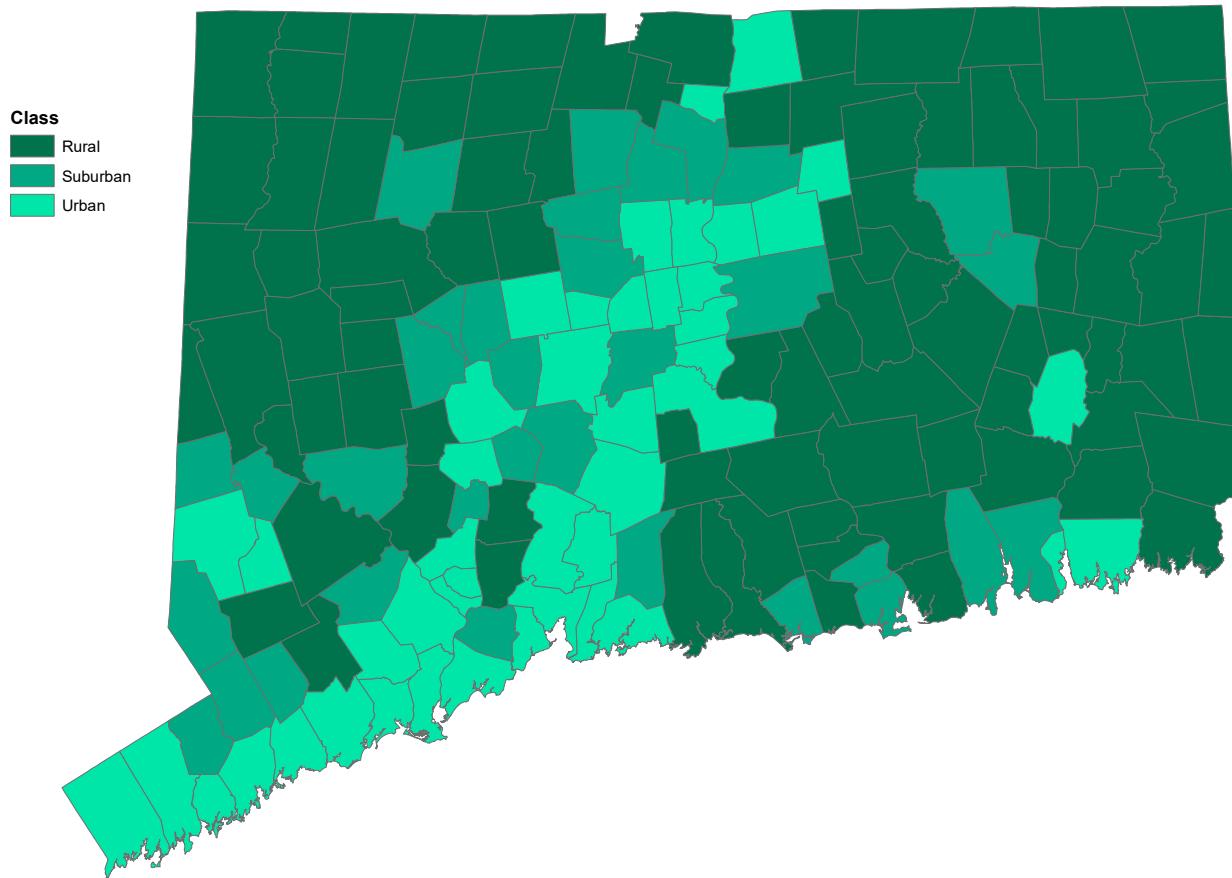

Figure 7: Town Class

Urban towns had the most 911-responses 461,086 and shortest average response time of 6.98 minutes. Suburban towns had 94,651 calls with an average response time of 7.83 minutes. Rural towns had the fewest calls 77,468 and the longest average response time of 9.1 minutes. Figure 8 shows the distribution of response times in minutes by class (Urban, Suburban, Rural). See Tables 5 for response times by town and class. Figure 8 shows the distribution of response times by response mode, i.e. whether the response was emergent or non-emergent. Figure 9 maps the mean response time for each town. Emergent responses had more calls (n=497,857) and a mean response time of 7.02 while Non-emergent responses had fewer calls (n=136,530) and a longer average response time 8.59. As can be seen from the density plot (Figure 9), Non-emergent response times are right skewed indicating a greater number that are longer than the median response time.

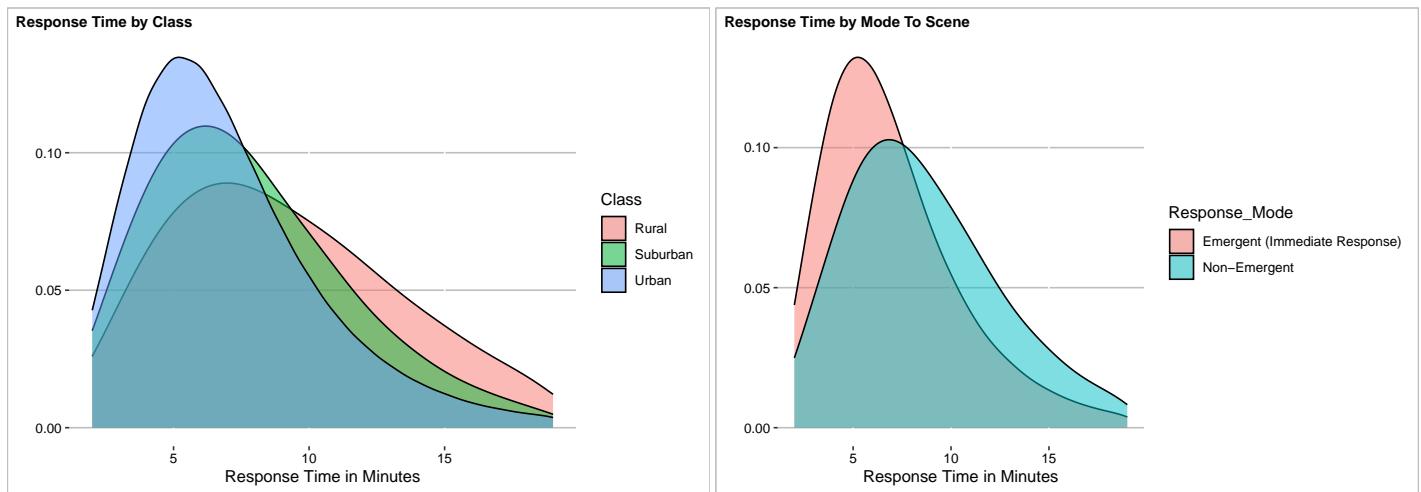

Figure 8: Distribution of Response Time by Class and Response Mode

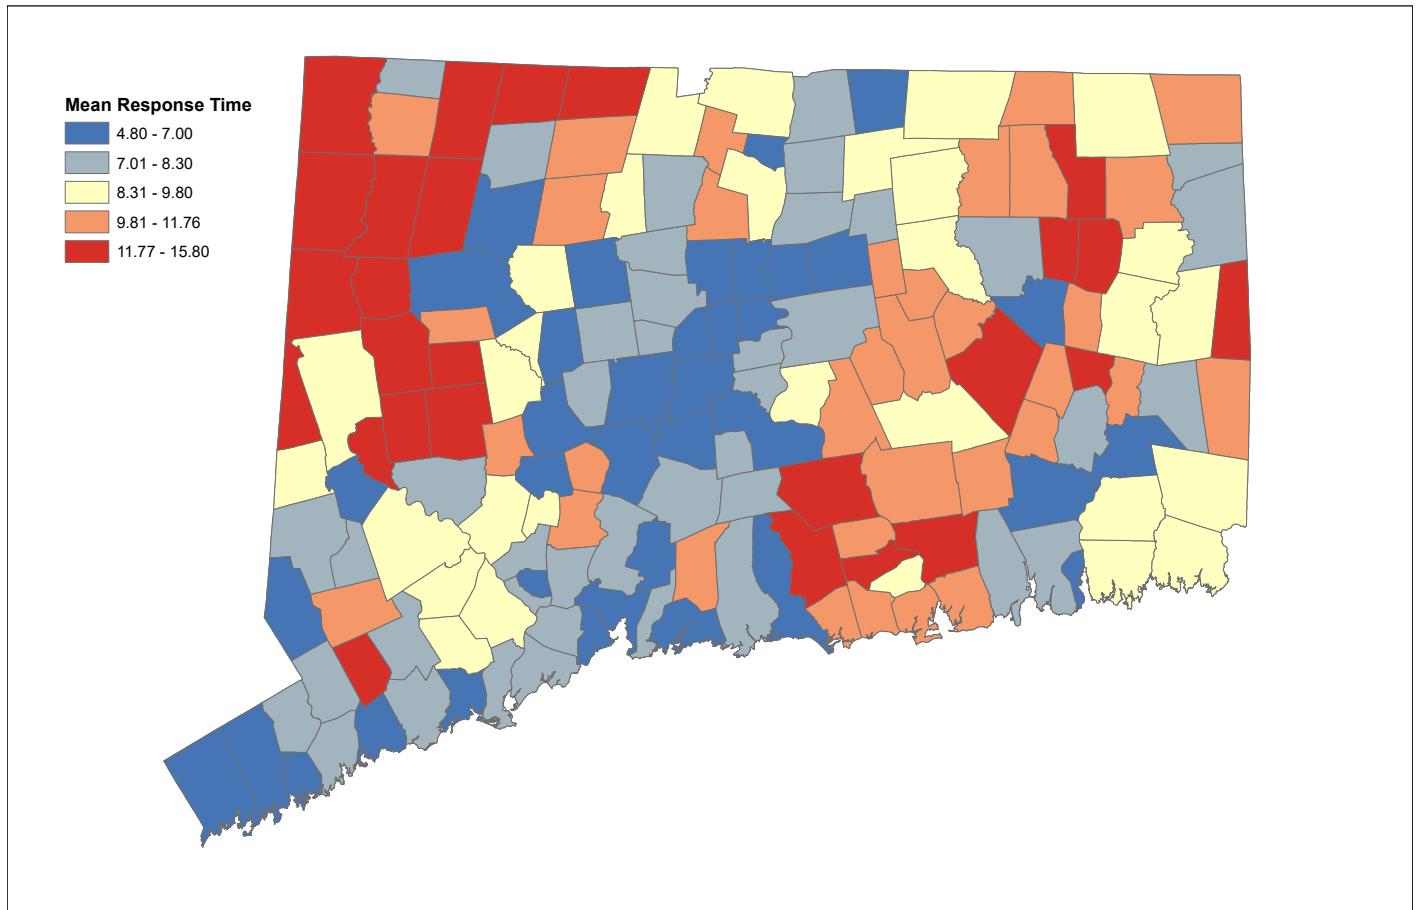

Figure 9: Town Response Time

## Scene Info

144,897 (20.72%) of 911-responses used lights and sirens to the scene (Figure 10). Response delay is defined as the reason the EMS crew was delayed responding to the patient and scene delay is defined as the reason the EMS crew was delayed reaching the patient once on scene. Distance and Traffic were the most cited reasons for response delay (Figure 10). Safety and patient access were the most cited reasons for scene delay (Figure 11). Map 12 shows the distribution of all submitted 911-response ePCRs by town and the rate of 911-responses per 1,000 people for each town. For example, a rate of 50 means there were 50 calls for every 1,000 people.

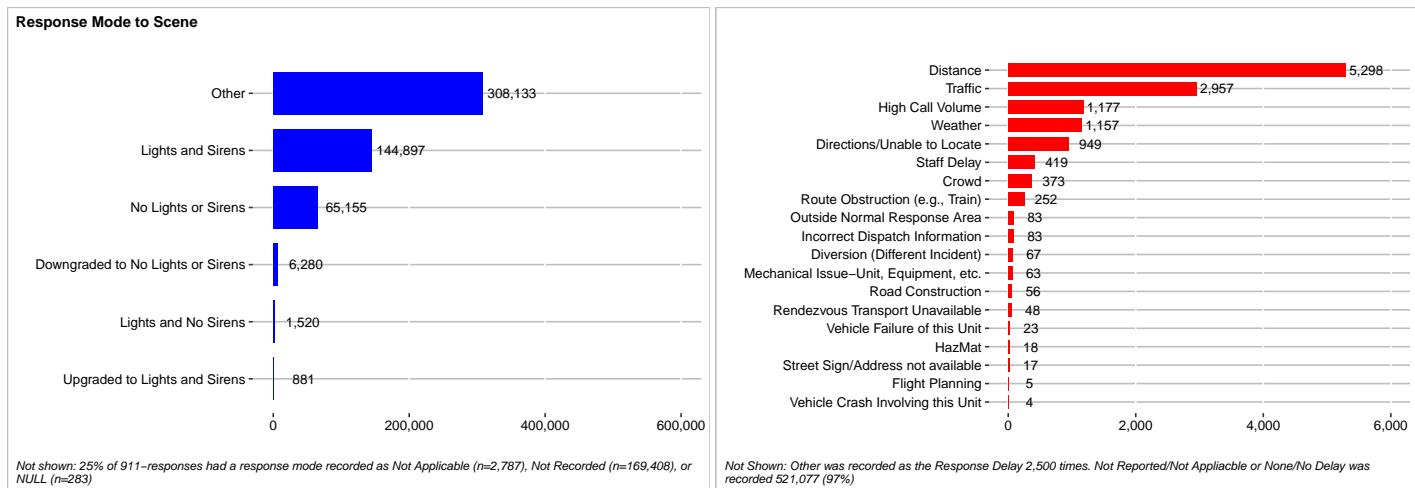

Figure 10: Response Mode and Response Delay for 911-Responses

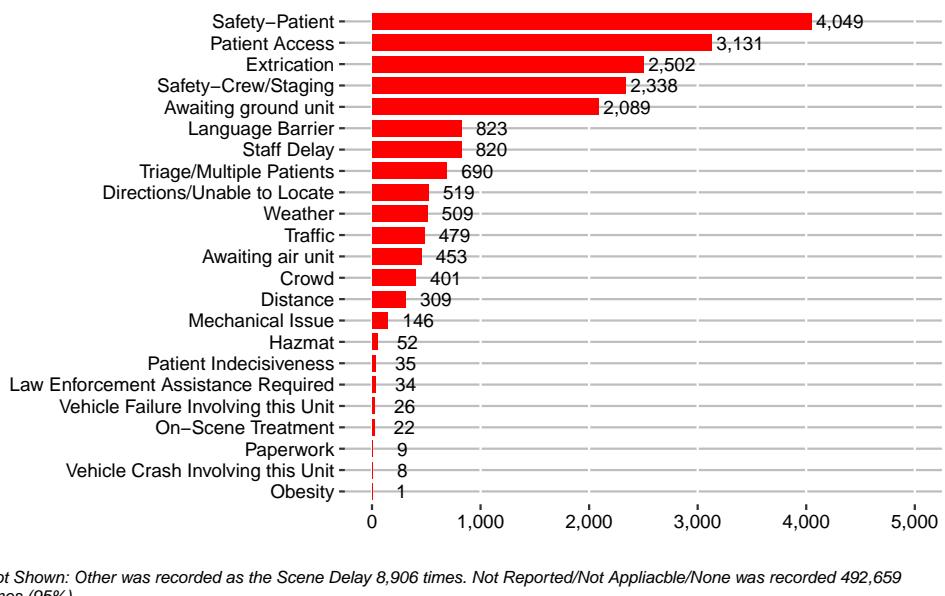

Figure 11: Scene Delay for 911-Responses

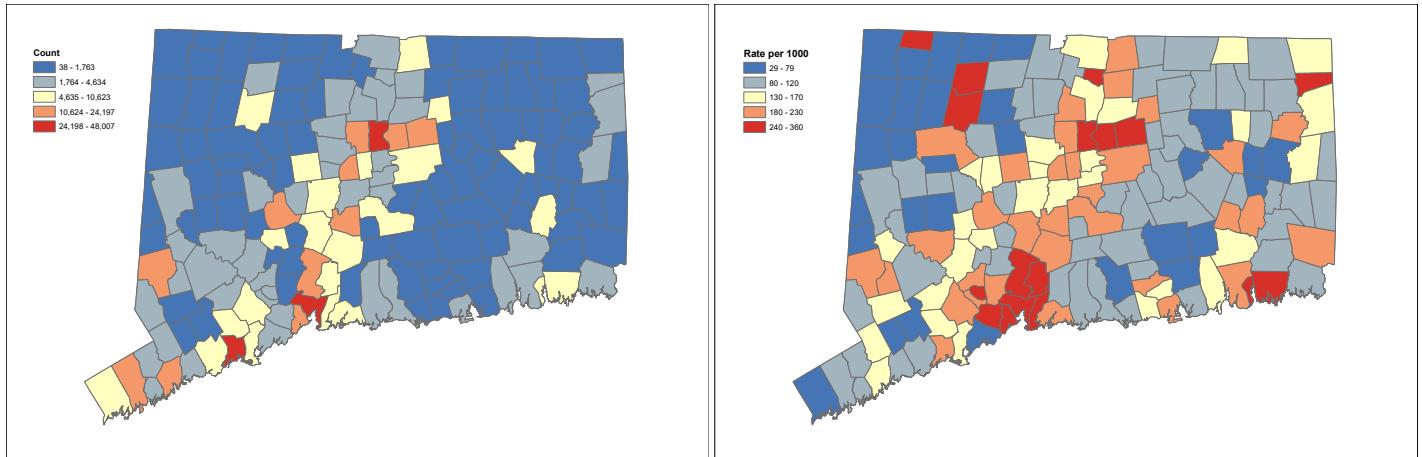

Figure 12: Town Call Volume – All Submitted ePCRs

## Crew Info

There were 7,364 unique, active EMS professionals as identified by the reported crew member IDs on the ePCRs. The number of EMS professionals has increased over time since 2020 (Figure 13). Table 6 provides the number of active members as reported on ePCRs broken down by agency and year. Some EMS professionals ride for multiple EMS agencies.

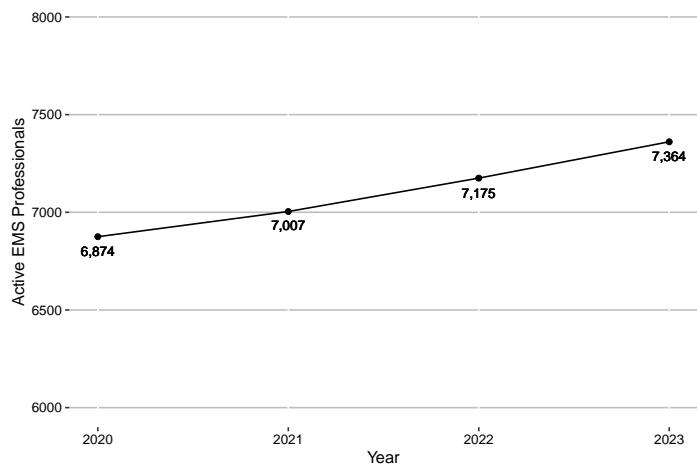

Figure 13: Active EMS Professionals over Time

# Patient Level Information

## Deduplication of Records

There were a total of 935,372 ePCRs and 699,344 911-response ePCRs submitted to OEMS in 2023. Because multiple agencies and EMS providers may respond to and then submit an ePCR for the same patient, in the 2023 annual report we are reporting on a de-duplicated set of ePCRs when referring to patient level data. De-duplication was accomplished by taking into account the patient's last name, date of birth, and incident city and then prioritizing by level of service whereby if a paramedic and an EMT submitted an ePCR for the same patient the paramedic's ePCR was retained for patient level analysis. Through this de-duplication process we are better able to estimate the number of pre-hospital patients in Connecticut. There were a total of 678,219 de-duplicated ePCRs and 505,581 911-response ePCRs identified in 2023. Therefore the data presented in this 2023 report at the patient level should not be directly compared to the data presented in the annual reports from 2021 and 2022 as these reports were not de-duplicated.

## Scene Incident Location

Scene incident location was categorized into 13 categories. 46.45% of 911-responses are called to a private residence (n= 117,255) (Figure 14).

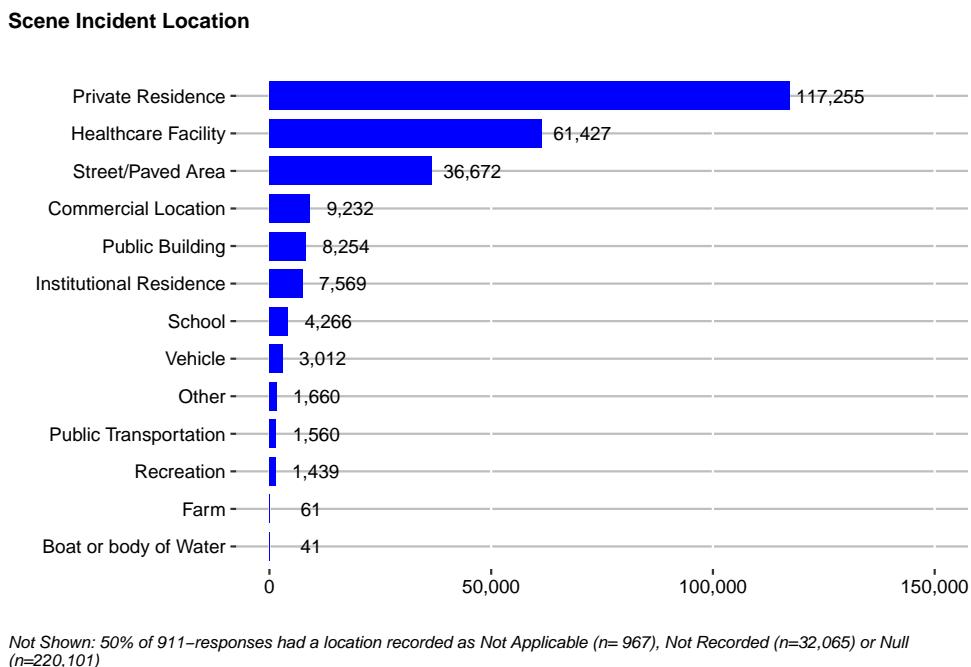

Figure 14: Incident Location

## Patient Demographics

47.87% of patients (n= 242,024) were male, 50.15% of patients (n= 253,534) were female (Figure 15). 44% of patients were white (n=220,981), 14% were Black or African American (n=68,793), 10% were Hispanic (n=50,697), and 3% of patients were recorded as Asian, other, Indian, or Hawaiian. The other 30% (n=150,410) of patients did not have a race recorded (Figure 15). Of patients with a recorded race, 98% were reported as single race while 2% were reported with multiple races. Males and females between the ages of 50 and 90 represented the majority of 911-responses (Figure 16).

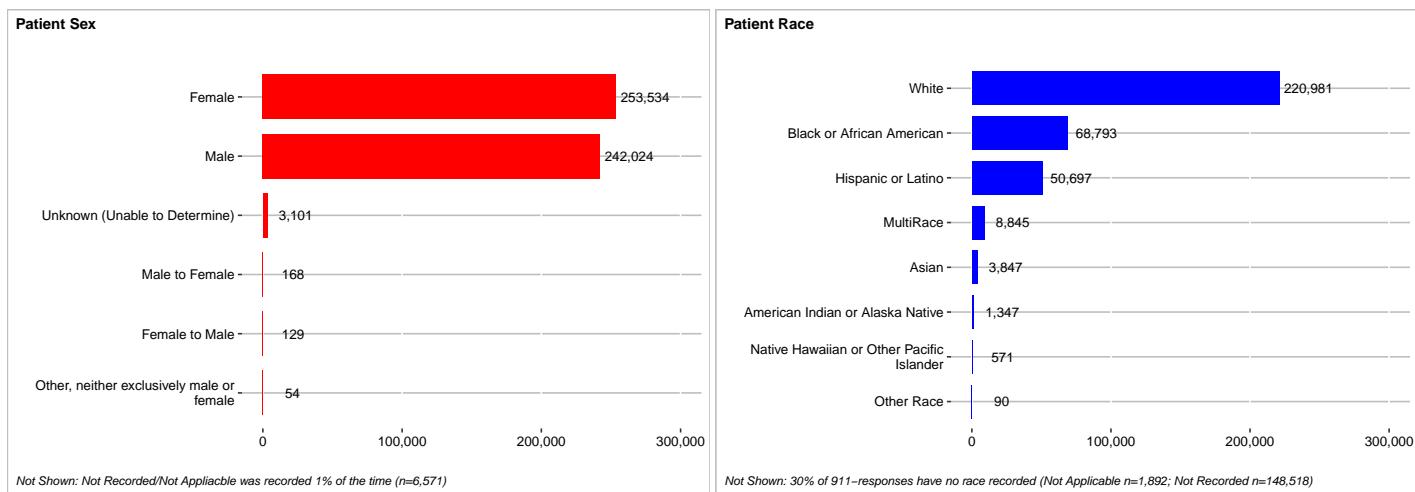

Figure 15: Patient Sex and Race

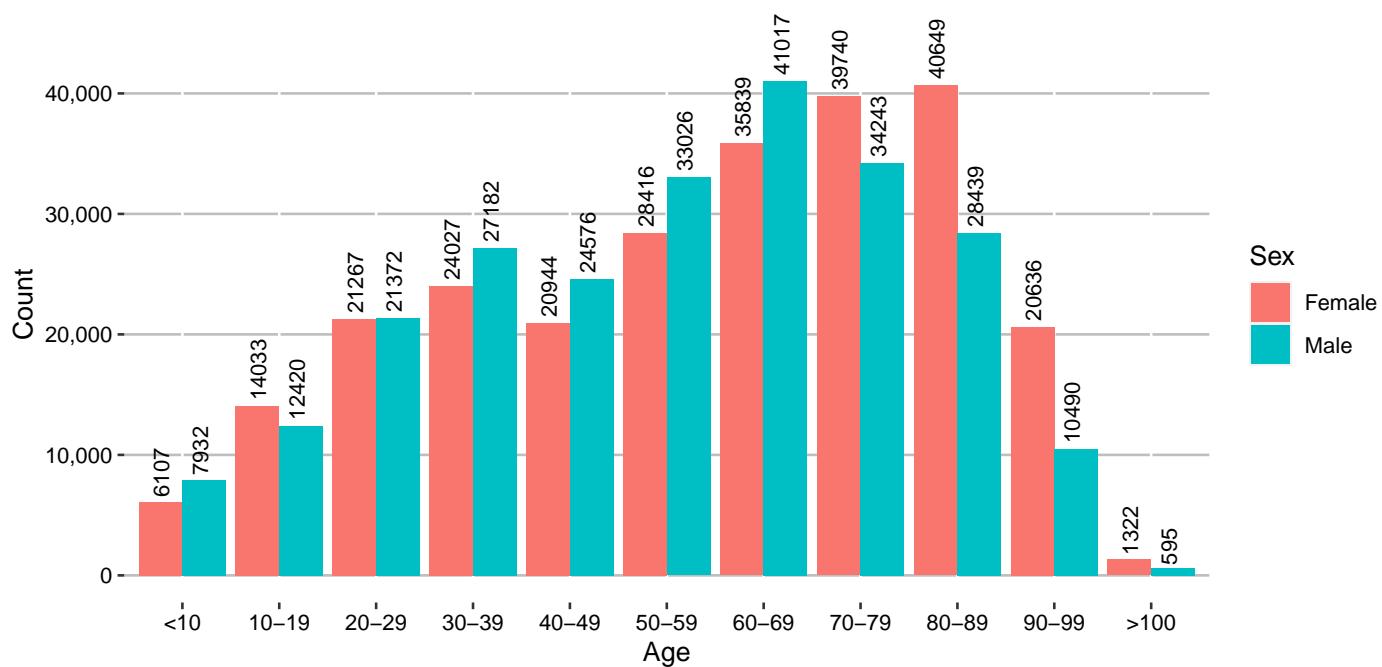

Figure 16: Patient Age and Sex

## Pediatric Calls

7% (n=37,348) of patients were 18 or younger. Figure 17 shows pediatric 911-responses broken down by age and gender and the location of pediatric 911-responses with most occurring in private residences. Figure 18 shows the 911-response call volume for pediatric patients as well as broken down by age categories for subsets of pediatric patients. Overall mental illness is the highest primary impression reported for pediatric patients but this is only true for pediatric patients over 10 years of age, for patients 1-9 it is unspecified injury, and for patients less than 1 it is fever (18).

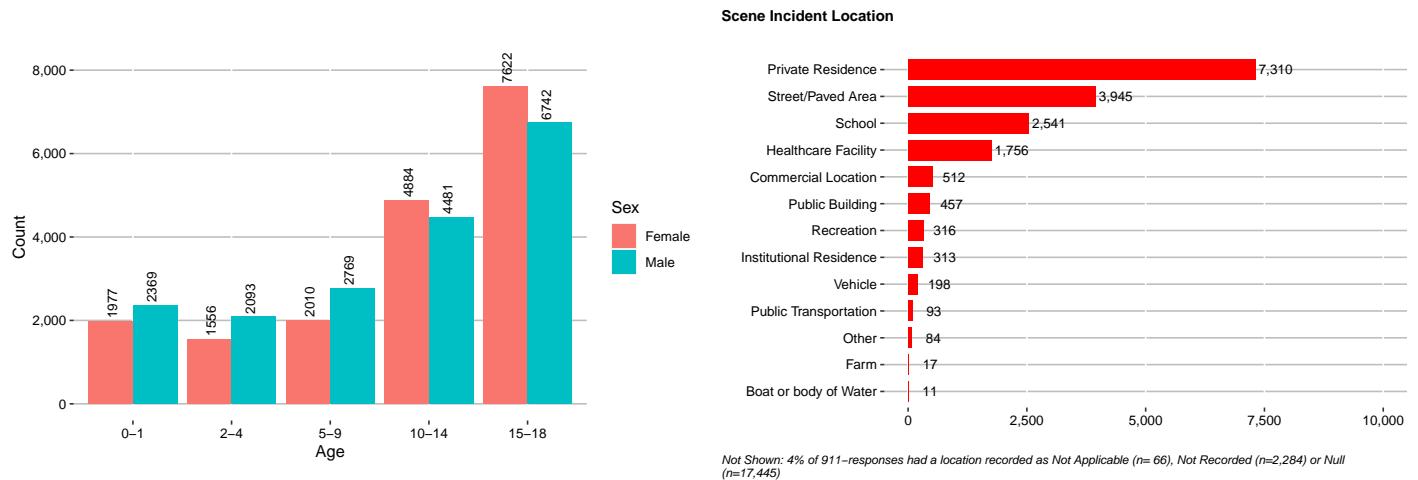

Figure 17: Patient Age and Sex and Patient Incident Location

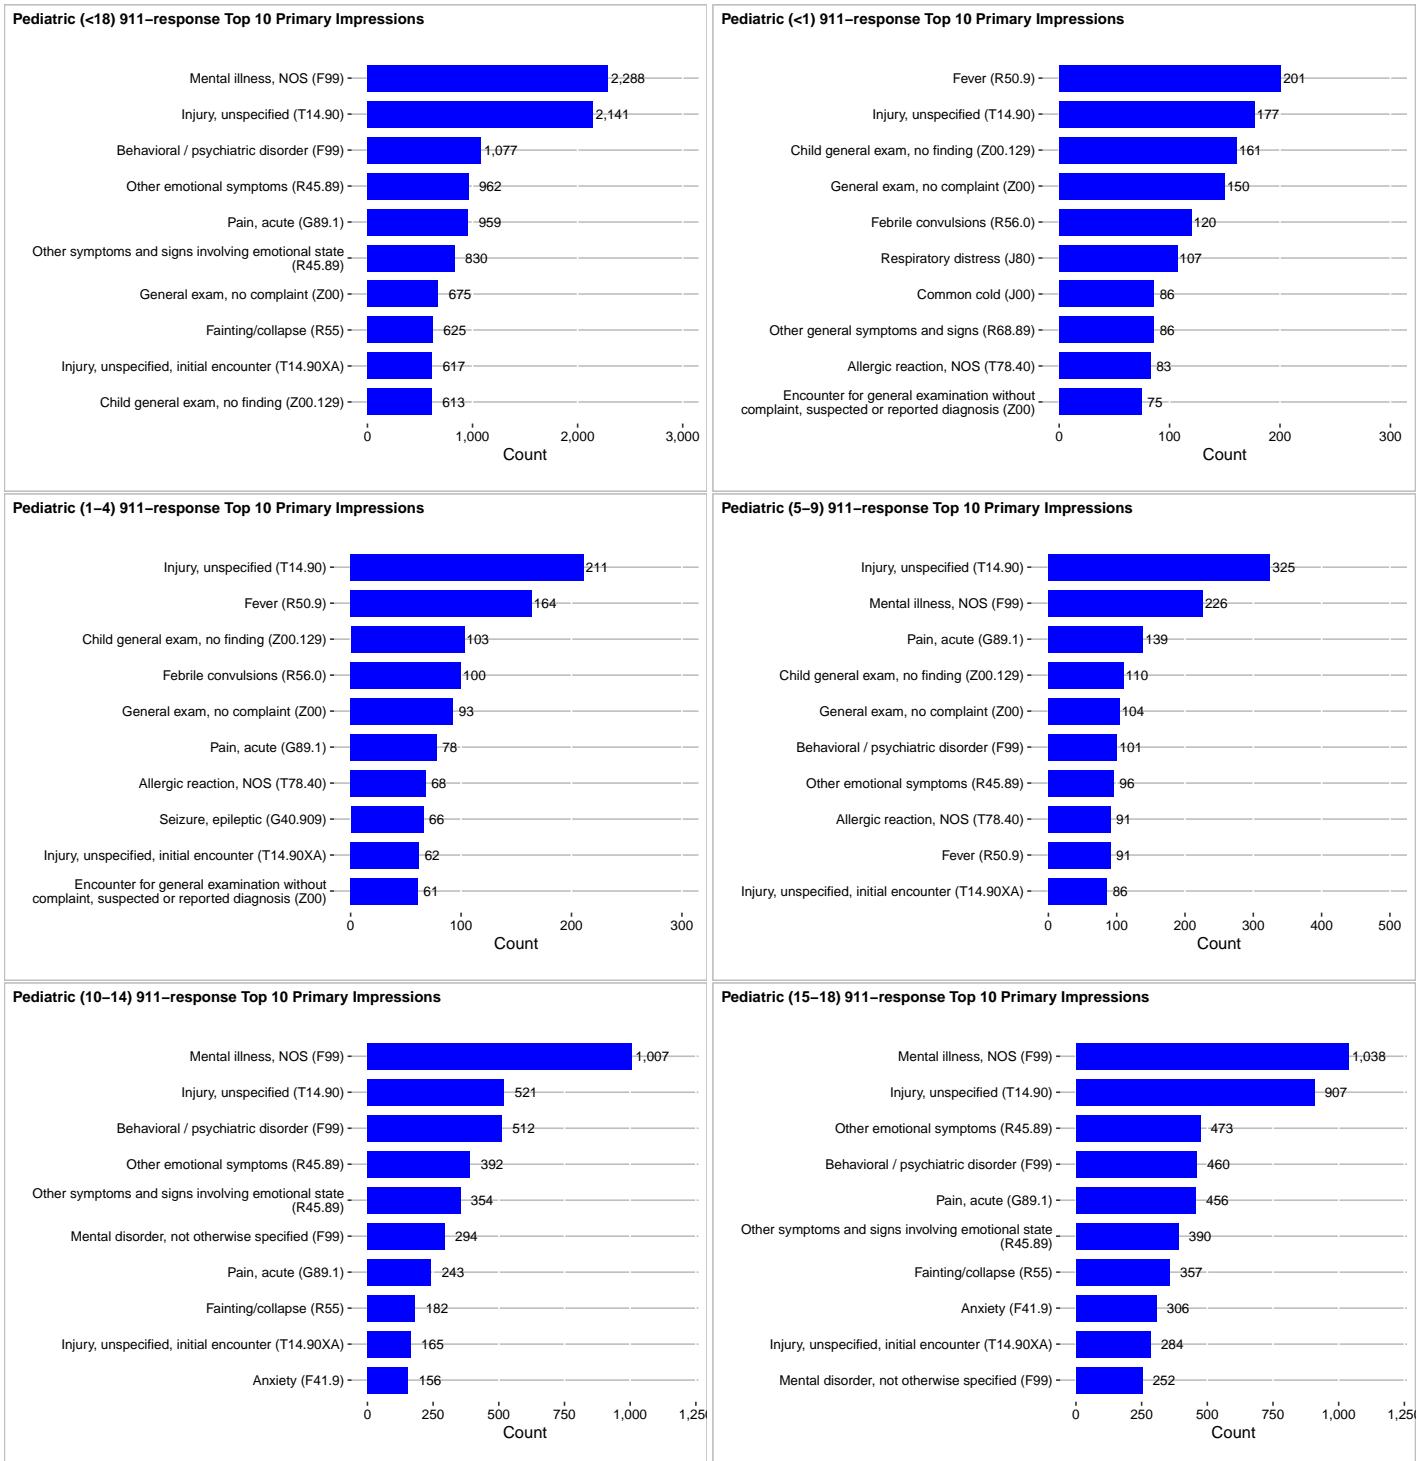

Figure 18: Top 10 Reported 911-Response Primary Impressions for Pediatrics

## Patient Assessment

Initial patient acuity was primarily lower acuity (n = 316,916) (Figure 19). The most cited provider primary impression was Weakness (n=26,590) (Figure 20). Being uncooperative and language were the most frequently reported barriers to patient care (Figure 20).

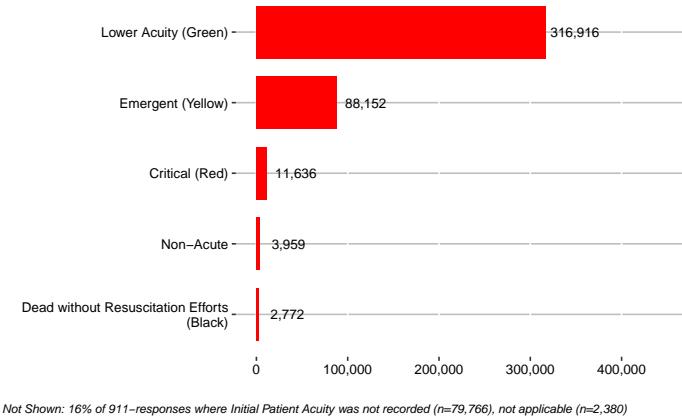

Figure 19: Initial Patient Acuity

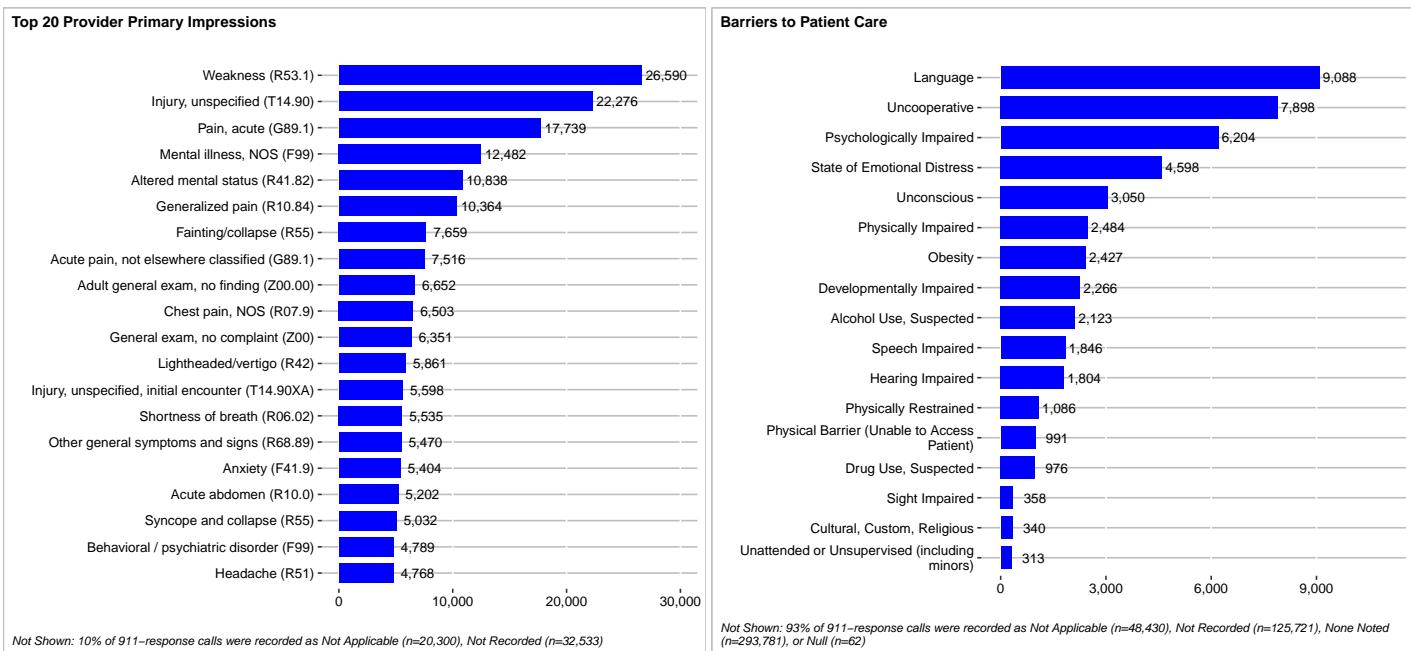

Figure 20: Patient Assessment

## Medications, Protocols, and Procedures

In 2023, there were 142,194 documented medications given to 96,806 unique patients. Figure 21 shows the top 10 medications given to all patients, adults, and pediatric patients age 18 and under. There were 636,969 documented procedures provided to 284,813 unique patients. Figure 22 shows the leading procedures documented. There were 186,623 documented protocols other than “Not Recorded” or “Not Applicable” provided to 182,711 unique patients. Figure 22 also shows the leading protocols documented.

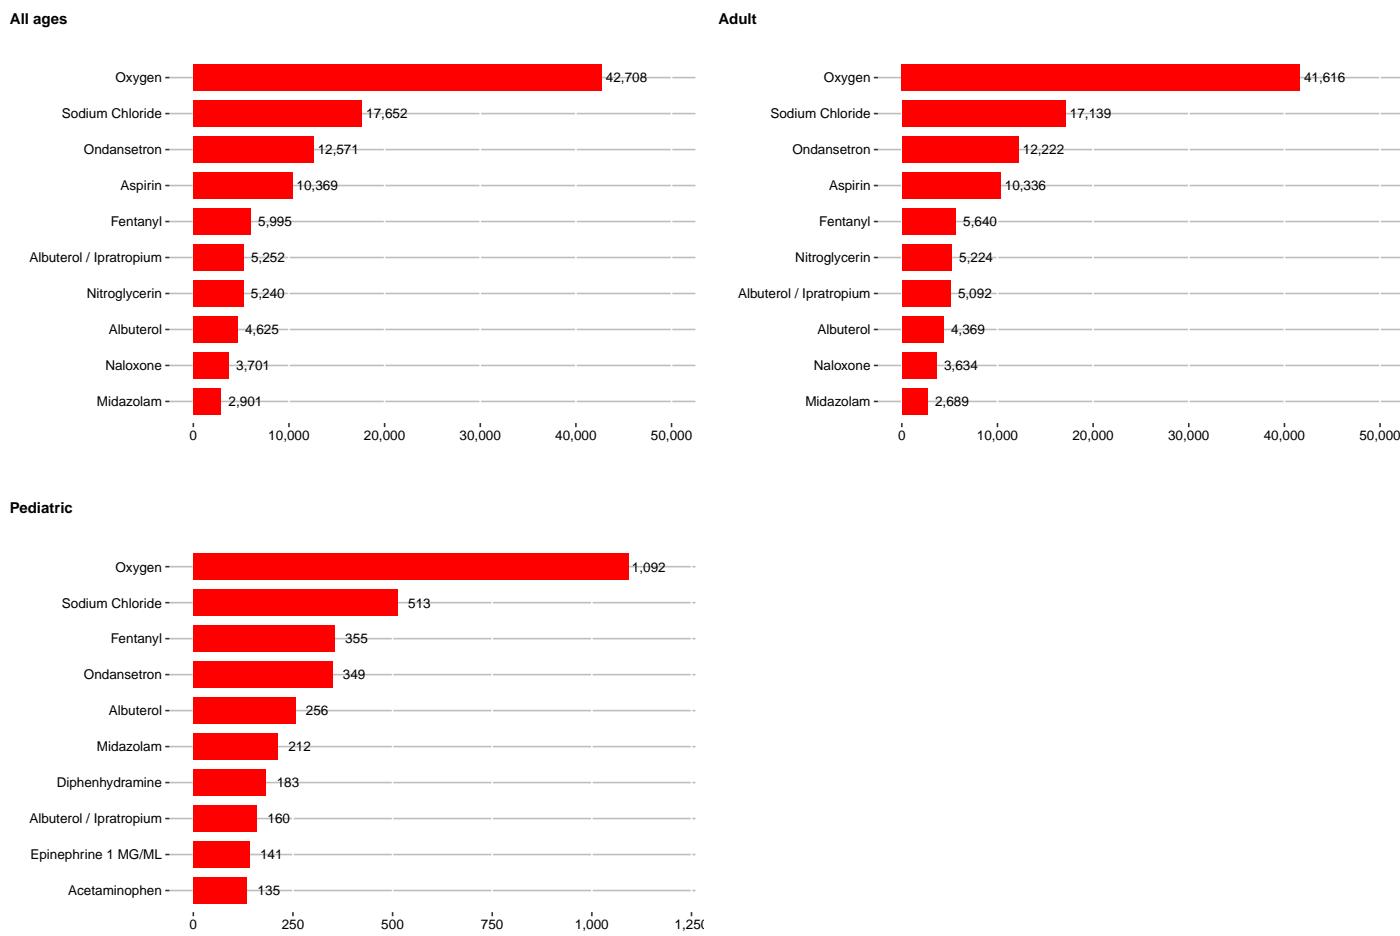

Figure 21: Top 10 Medications Given to All Patients, Adults, and Pediatrics

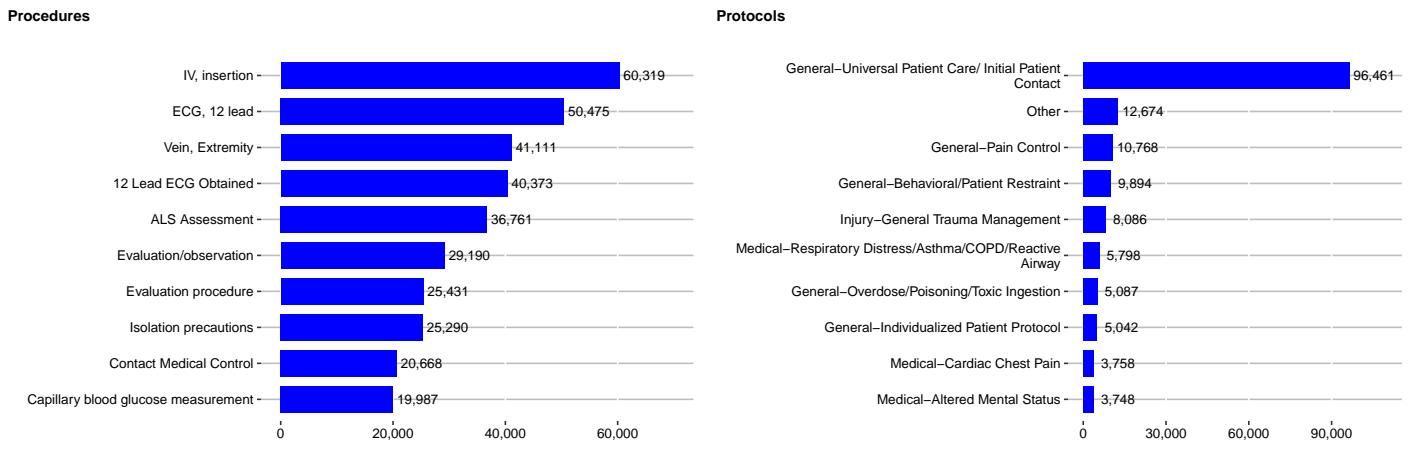

Figure 22: Top 10 Procedures and Protocols

## Call Types of Interest

We classified 911-responses into 23 categories based on injury cause description and 38 categories based on provider primary impressions. We used these categories to further classify injury and medical calls into 56 call types (Figure 23). 10% (n=50,271) of 911-responses had an injury cause description and provider primary impression of not recorded (Figure 23). If we split the population at the age of 18, adults and pediatrics have varying emergencies (Figure 24). Of note, the change from NEMSIS 3.4 to NEMSIS 3.5 was accompanied by software changes for some agencies which led to a different order of choices of injury cause description and provider primary impression which complicates comparisons of certain call types.

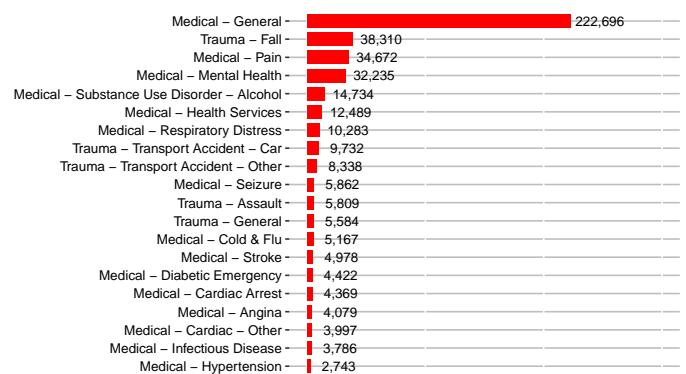

Figure 23: Top 20 Reported 911-Response by Call Type

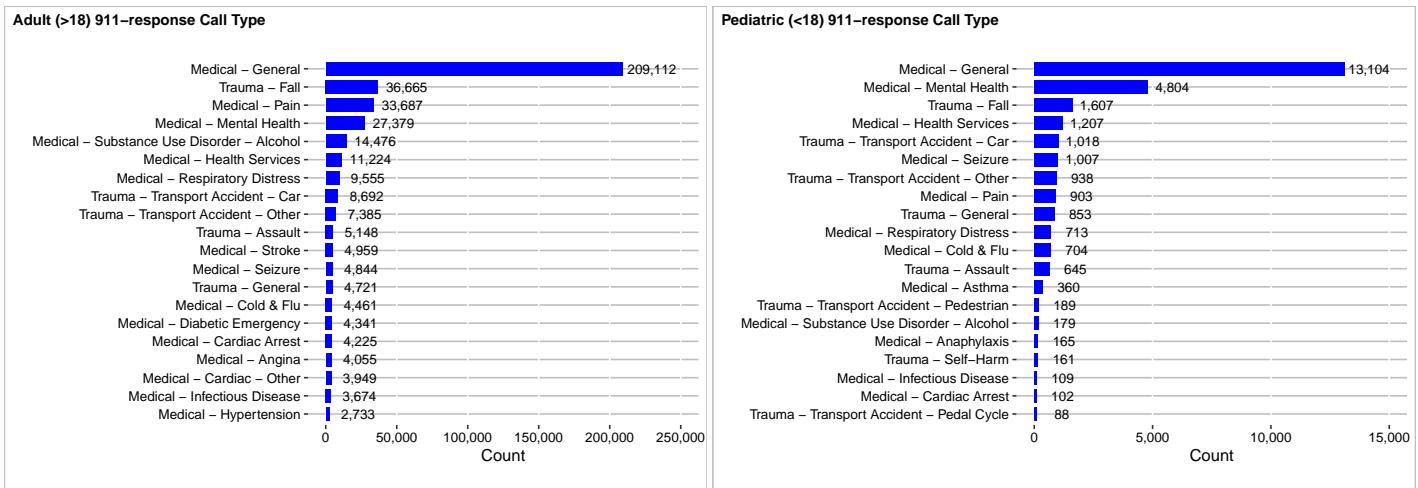

Figure 24: Top 20 Reported 911-Response Categories for Adults and Children

74.34% of patients (n= 345,887) had no injury, 20.12% of patients (n= 93,620) had an injury, and the remainder were recorded as not applicable, not recorded, or unknown (Figure 25).

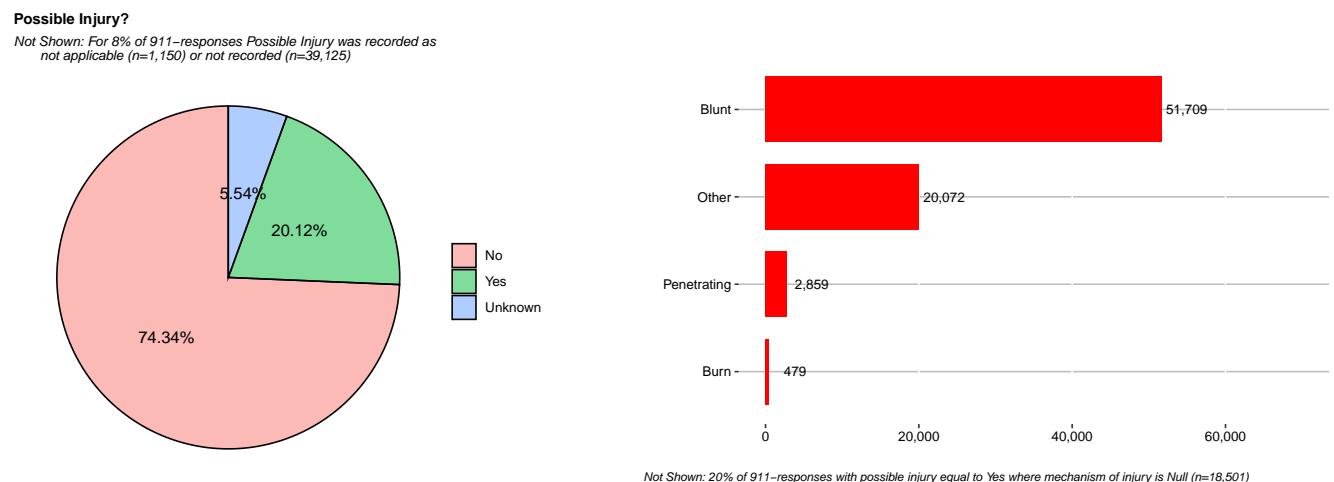

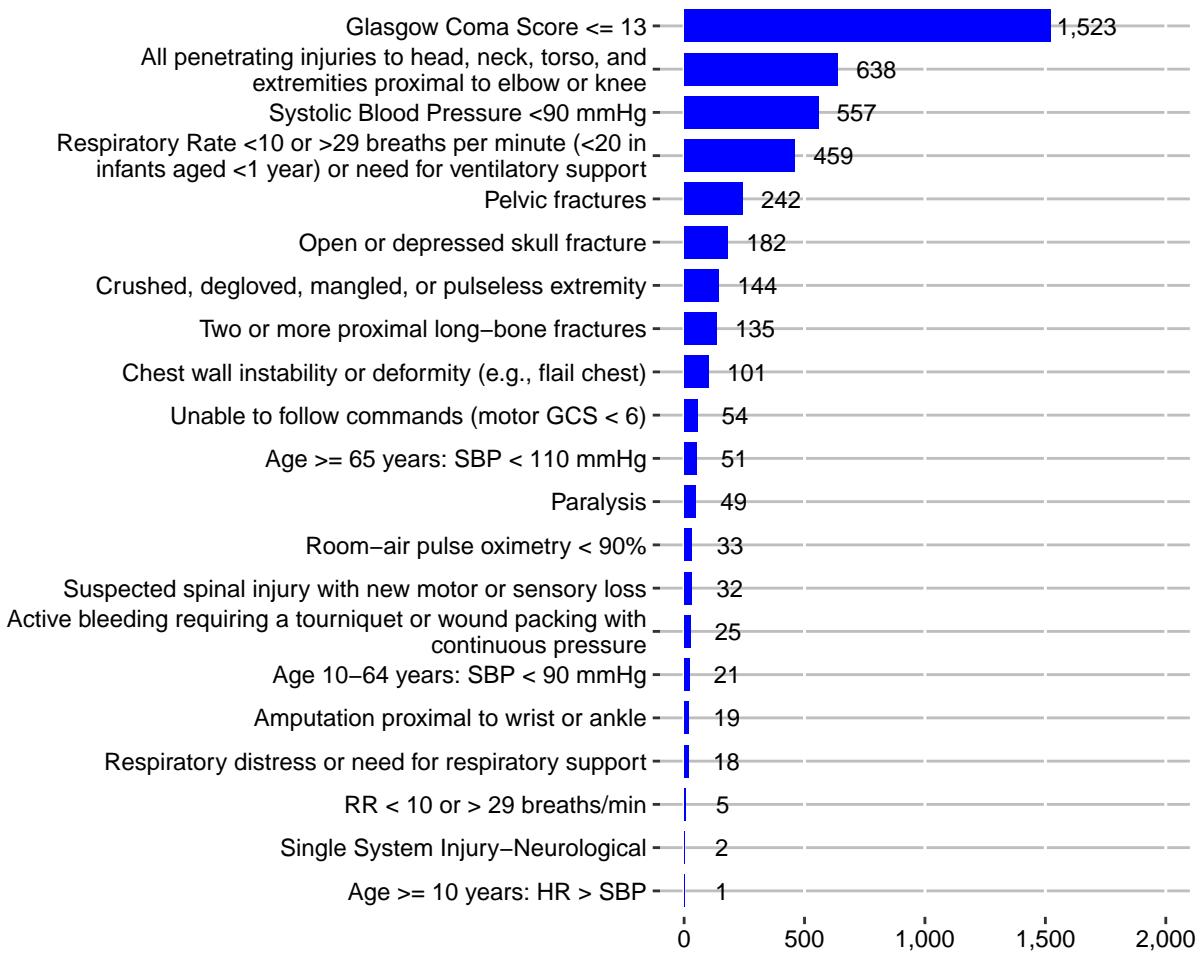

Figure 25: Possible Injury and Mechanism of Injury

There were 75,119 (80%) ePCRs with a 911-response and injury recorded when mechanism of injury was also recorded. In Figure 25 we show the mechanism of injury for 911-response with possible injury. The majority of mechanism of injury was recorded as Blunt (n=51,709) (Figure 25). For 911-response with possible injury (n=93,620) recorded, trauma center criteria and injury risk factors are shown in Figure 26.

## Trauma Criteria

*Not Shown: 96% of 911–responses with possible injury (Yes) had Trauma Center Criteria recorded as Not Applicable (n=36,407), Not Recorded (n=52,455), or Null (n=4,907)*

Figure 26: Trauma Center Criteria

Next we report on certain types of calls in more depth including falls, transport accidents, assaults, asthma, influenza like illnesses and other respiratory illnesses, substance use disorders, mental health and self harm, cardiac, and strokes.

## Fall

There were 38,312 911-responses categorized as falls. The majority of these occurred in female patients between 70 and 100 years old (Figure 27). For patients over the age of 45, most falls occurred in a private residence (Figure 27). Figure 28 shows a four year temporal trend in 911-responses to injuries categorized as falls (2020-2023) where each point on the plot is the monthly count.

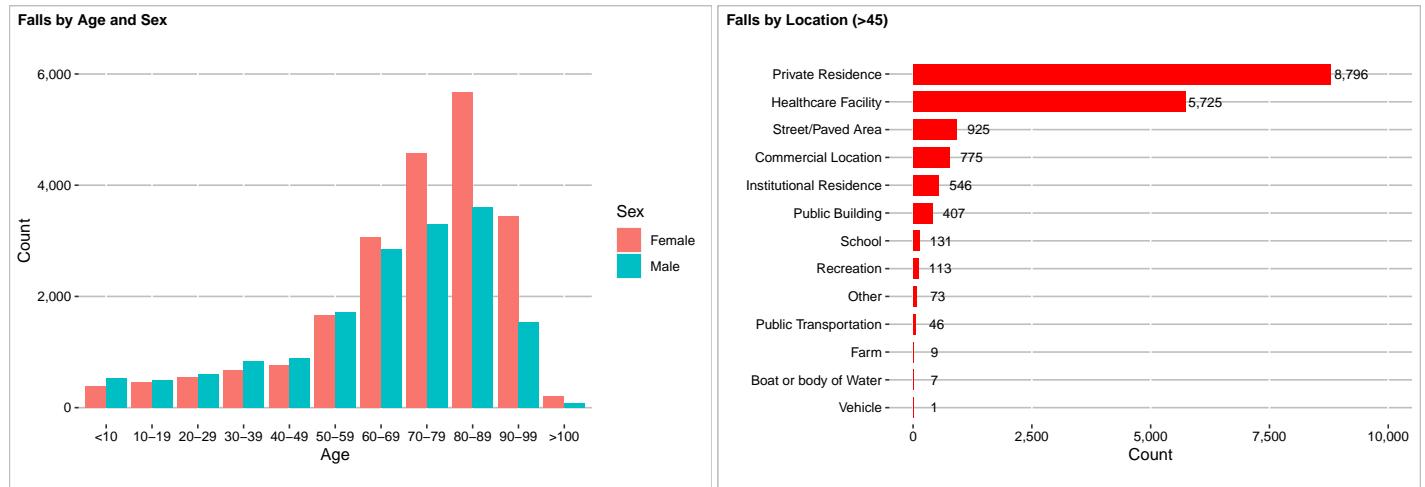

Figure 27: Fall Injuries

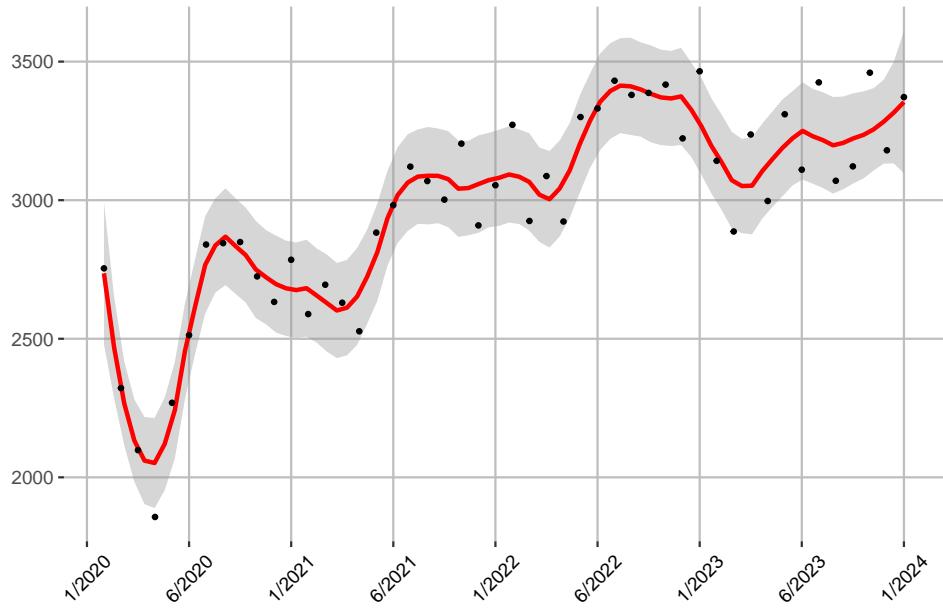

Figure 28: Falls Four Year Trend (2020-2023)

## Transport Accident

There were 20,841 injuries categorized as transport accidents. The majority of these occurred in patients between 20 and 40 years old (Figure 29). Weekdays between 3pm and 6pm had the highest number of transport accidents (Figure 29). Figure 30 shows a four year temporal trend in 911-responses to injuries categorized as transport accidents (2020-2023).

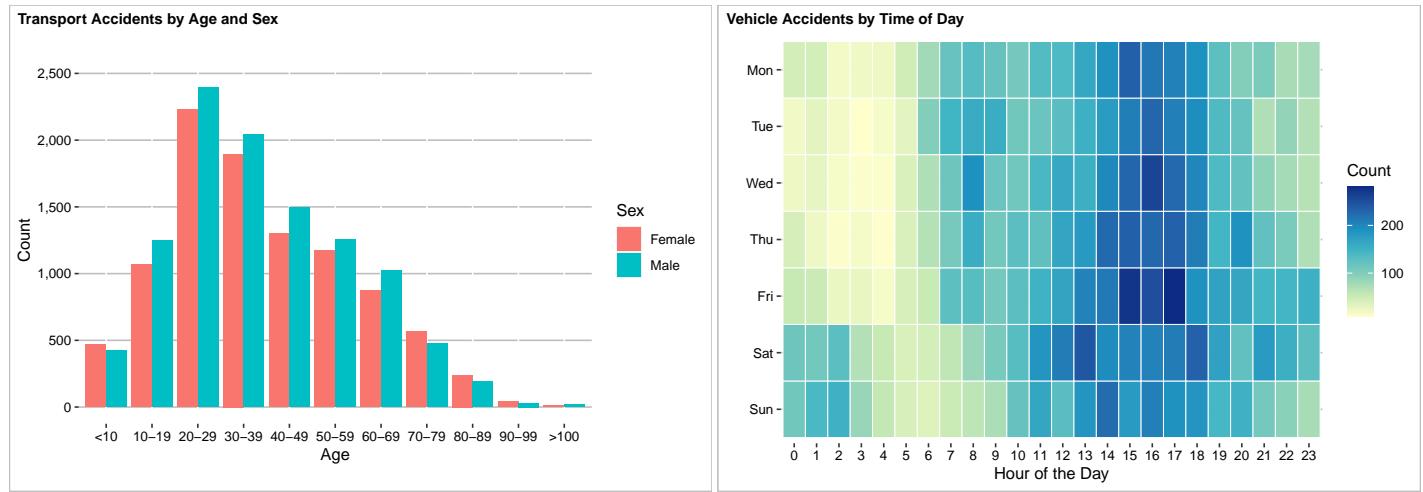

Figure 29: Transport Accidents

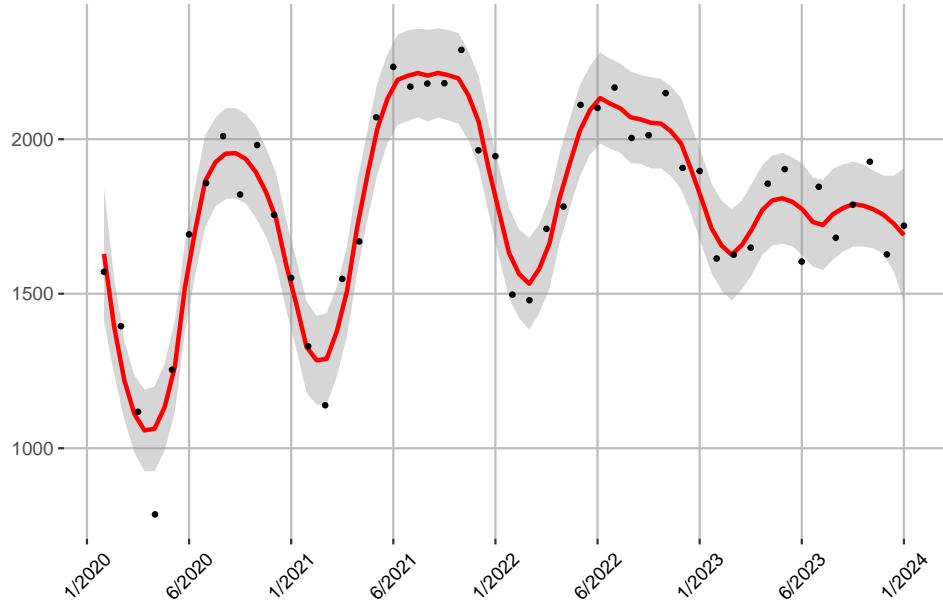

Figure 30: Transport Accidents Four Year Trend (2020-2023)

## Assault

There were 5,809 injuries categorized as assault. The majority of these occurred in patients between 20 and 40 years old and were higher for male patients (Figure 31). Figure 32 shows a four year temporal trend in 911-responses to injuries categorized as assaults (2020-2023).

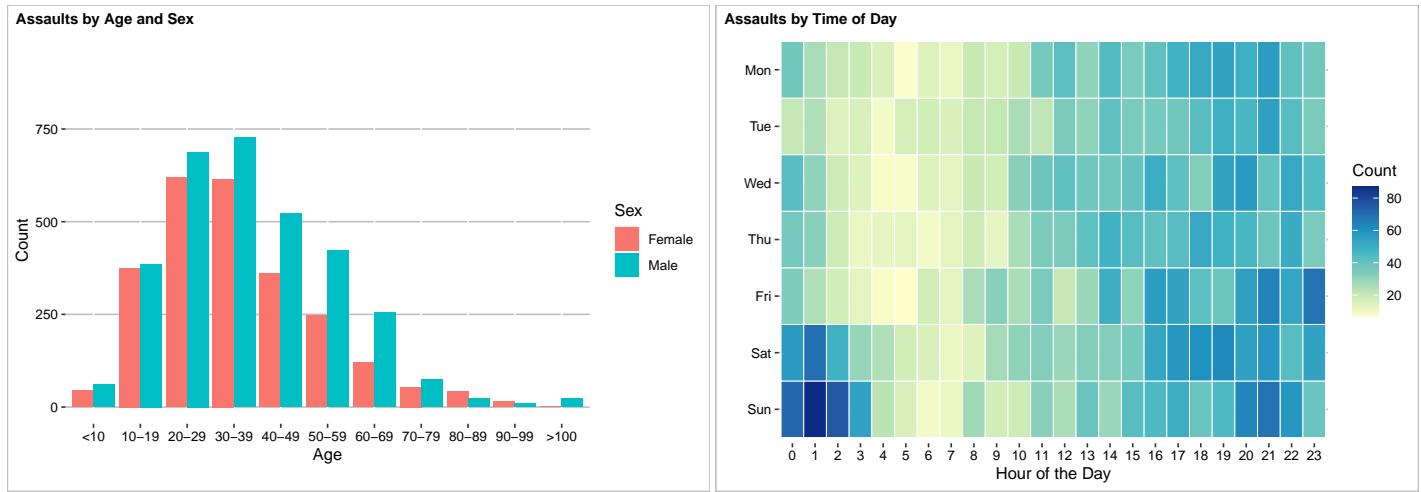

Figure 31: Assault Injuries

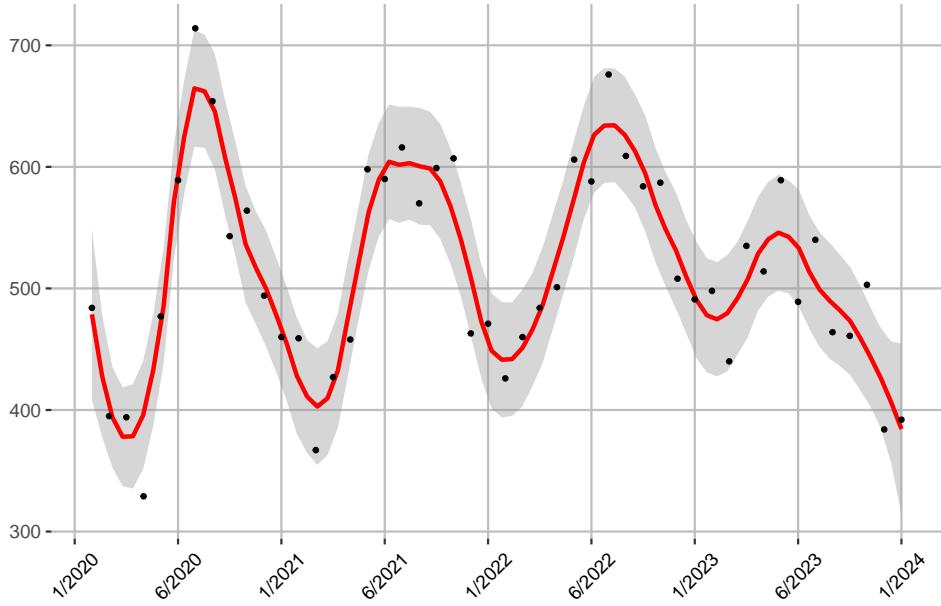

Figure 32: Assaults Four Year Trend (2020-2023)

## Asthma

There were 2,002 911-responses for asthma (Figure 33). Figure 33 shows a four year temporal trend in 911-responses to asthma cases (2020-2023).

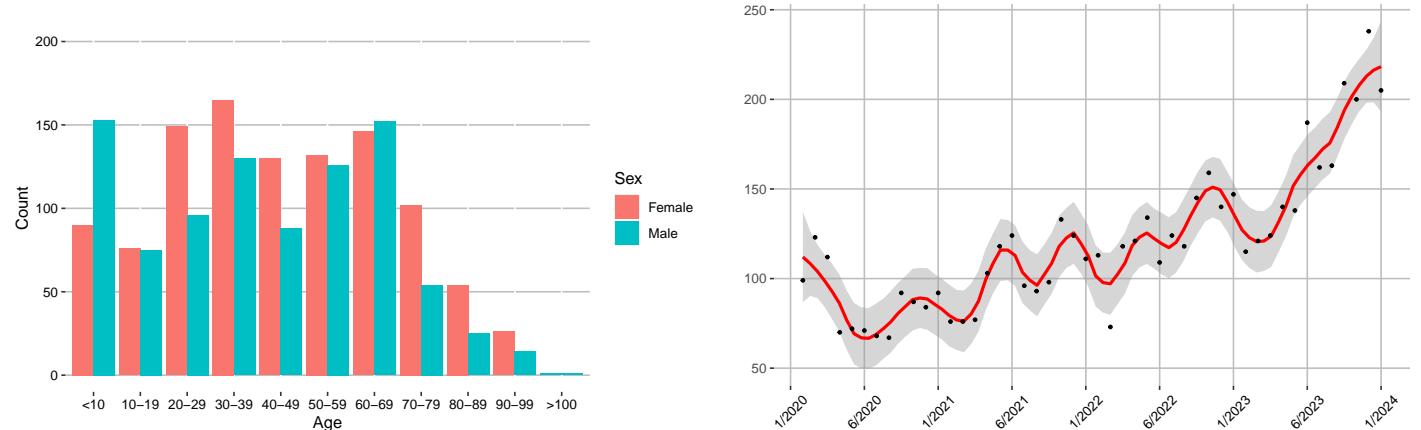

Figure 33: Asthma by Age and Sex and Asthma Trend

## Influenza Like Illness (ILI) and Respiratory Distress

There were 16,637 911-responses for influenza like illness (ILI) and respiratory distress. There were more 911-responses for ILI and respiratory distress in October through December and patients between the ages of 60 and 90 had the highest incidence. Figure 34 shows a four year temporal trend in 911-responses to calls categorized as respiratory/ILI cases (2020-2023).

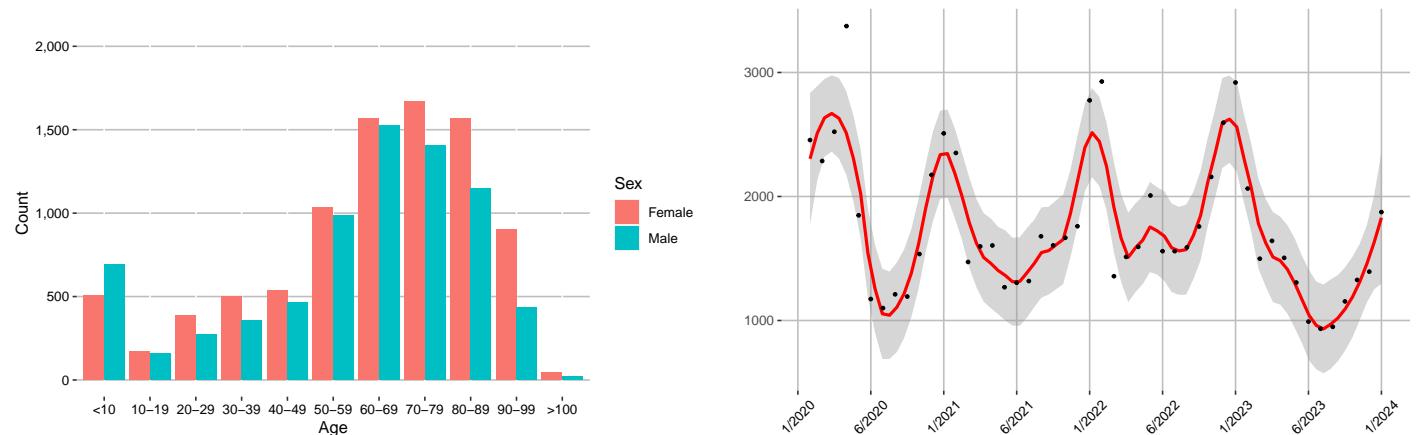

Figure 34: ILI and Respiratory Distress Cases by Age and Sex and Four Year Trend (2020-2023)

## Substance Use Disorder

There were 22,009 911-responses for substance use disorders. Male patients, especially those age 30-60, had the most drug related calls (Figure 35). There were 6,629 suspected opioid overdose calls of which 194 were fatal. Figure 36 shows a four year temporal trend in 911-responses to calls categorized as suspected opioid cases (2020-2023).

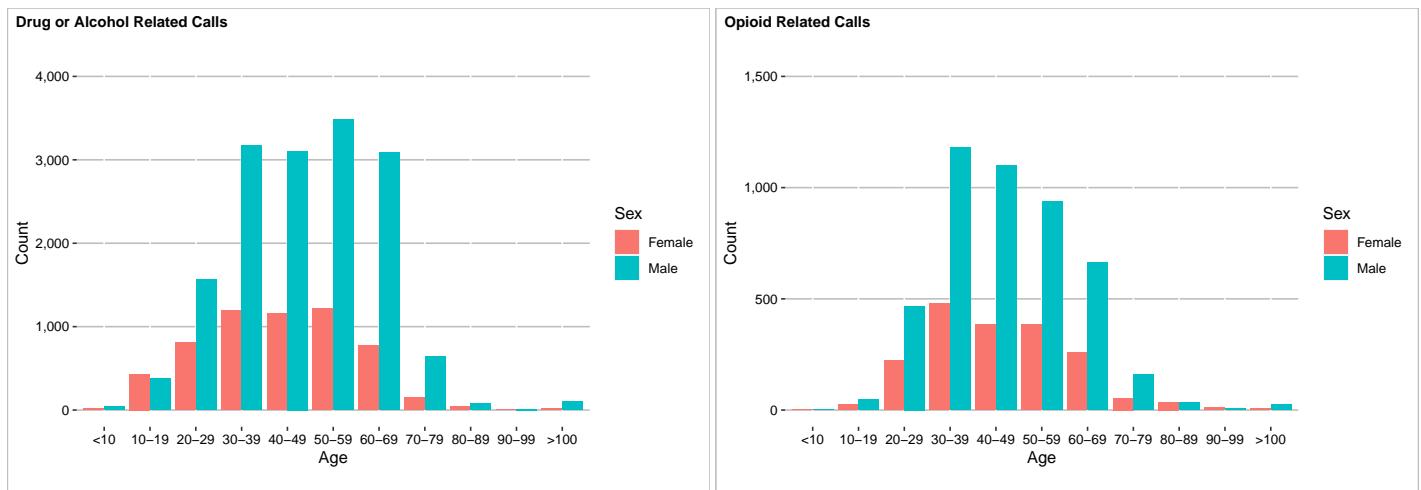

Figure 35: Drug and Opioid Related Calls by Age and Sex

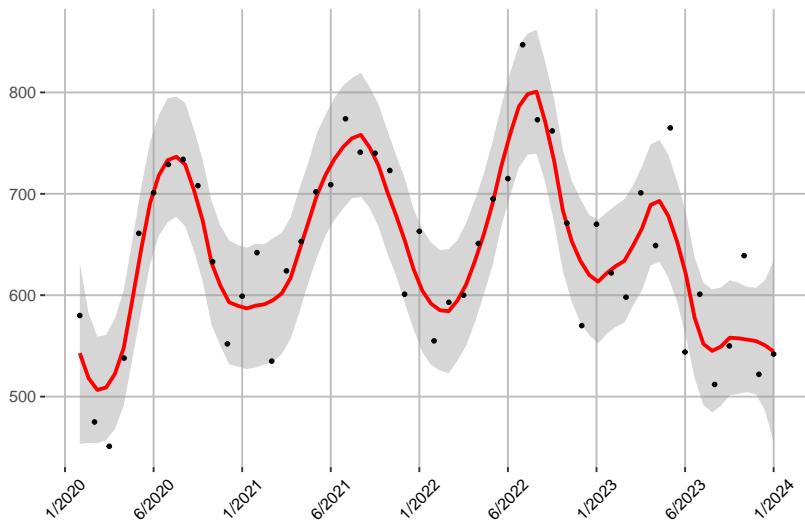

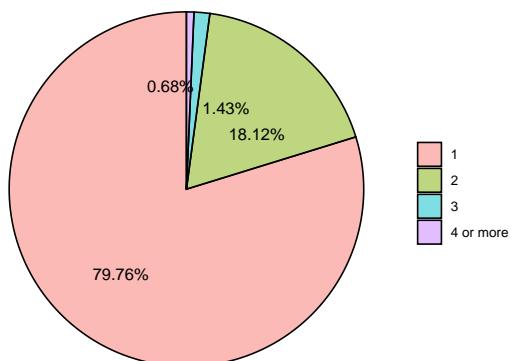

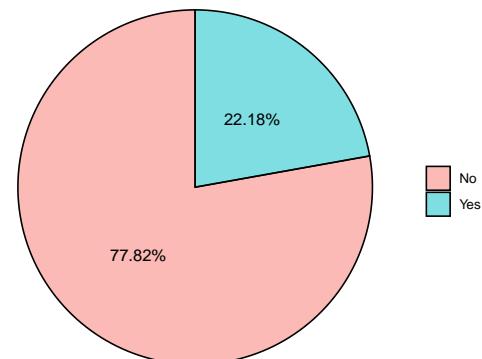

Figure 36: Suspected Opioid Overdoses Four Year Trend (2020-2023)

76.96% of patients who received Narcan (n= 3,540) did not have Narcan administered prior to EMS arrival while 21.93% of patients who received Narcan (n= 1,009) did (Figure 37). 68.42% of Narcan (n= 2,886) was administered by a paramedic. Just 4.17% of Narcan (n= 176) was administered by a non-healthcare professional (Figure 37). 66.81% of patients (n= 2,711) improved after Narcan was administered, 33.05% of patients (n= 1,341) remained unchanged, and 0.15% of patients (n= 6) worsened with Narcan (Figure 37).

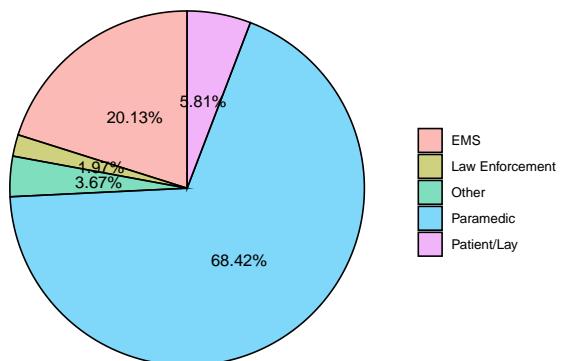

Number of Times Narcan Administered per Patient

Narcan Administered prior to EMS Arrival?

Who Administered Narcan?

Patient Response to Narcan?

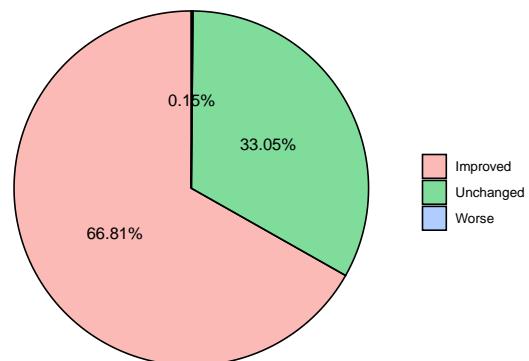

Figure 37: Naloxone Administration

## Mental Health and Self Harm

There were 33,634 911-responses for patients with injuries categorized as self harm or with mental health emergencies. Patients between the ages of 10 and 40 had the most mental health emergencies (Figure 38). Figure 38 shows the four year temporal trend in 911-responses categorized as mental health from 2020-2023.

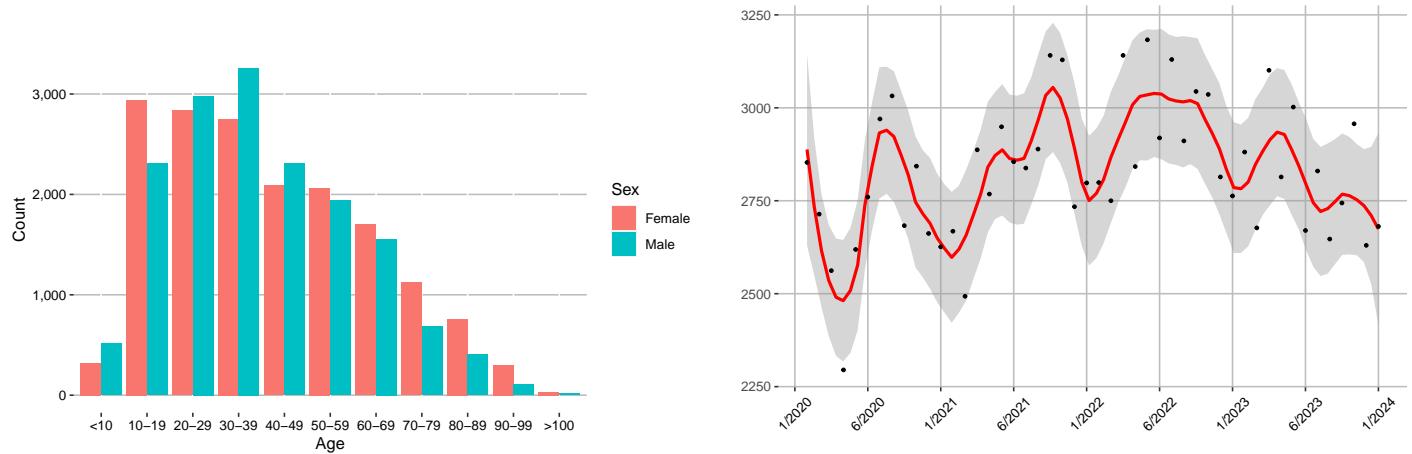

Figure 38: Mental Health and Self Harm 911-Response by Age and Sex and Four year Trend (2020-2023)

## Cardiac

There were 14,450 911-responses for patients with cardiac emergencies. Males between the ages of 50 and 80 represented the most cardiac related and cardiac arrest calls (Figure 39). Figure 41 shows reported cardiac arrest by etiology and sex for 911-response calls. There were 4,422 cardiac arrests. In cardiac arrest calls, cardiopulmonary resuscitation (CPR) was provided prior to EMS arrival approximately half of the time and included both ventilation and compression the majority of the time (Figure 40). An automated external defibrillator (AED) was used with defibrillation in 7.32% of cardiac arrest calls. Most cardiac arrests occurred prior to EMS arrival (Figure 41) and in a private residence (Figure 42). Figures (40, 41, 42, 43) are based on values reported by providers on ePCR.

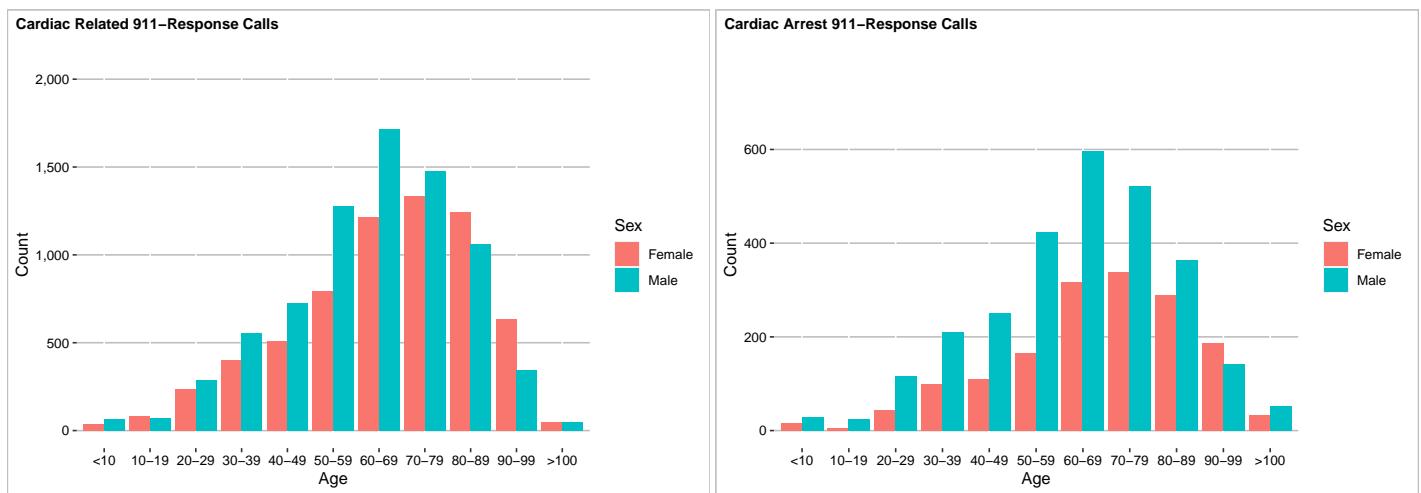

Figure 39: Cardiac Related and Cardiac Arrest Calls by Age and Sex

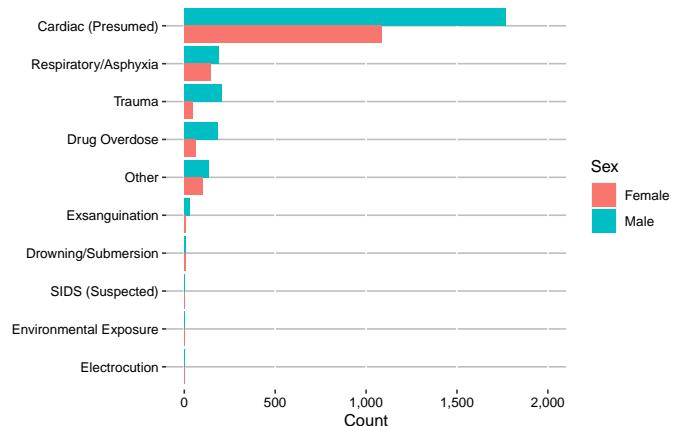

Figure 41: Cardiac Arrest by Etiology and Sex

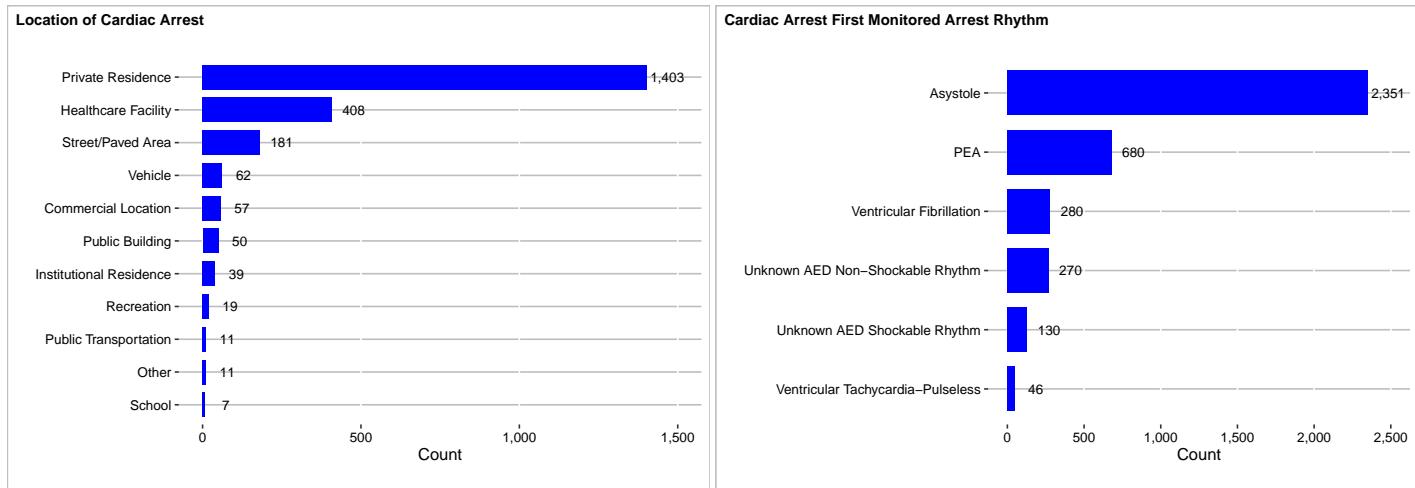

Figure 42: Cardiac Arrest Location and First Monitored Rhythm

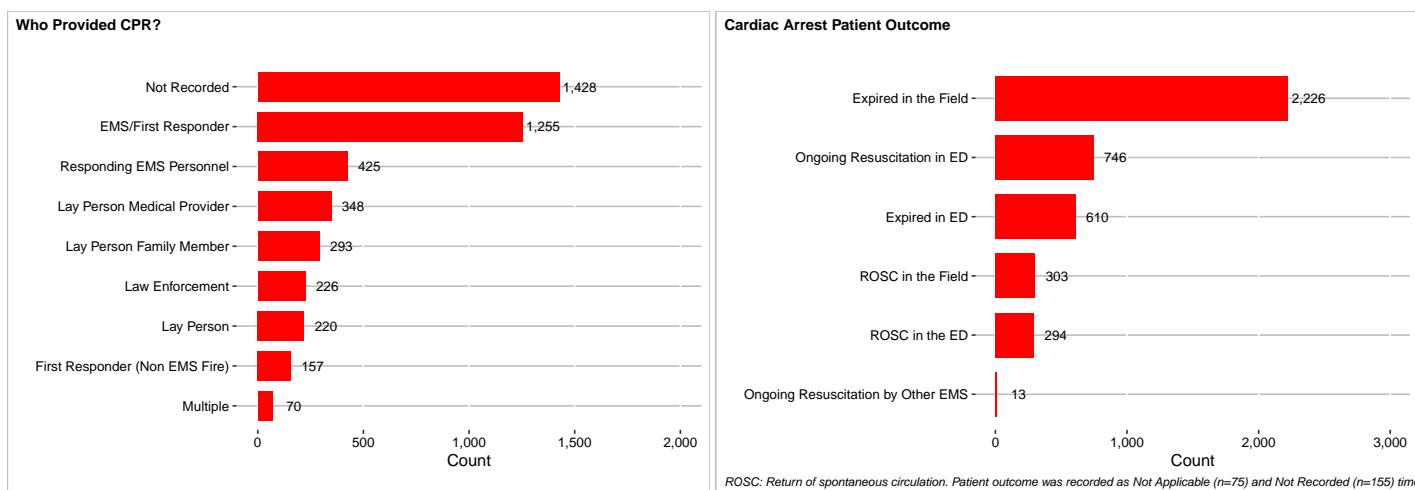

Figure 43: Who provided CPR and Patient Outcome

## Stroke

There were 5,817 911-response for calls categorized as stroke or TIA. Females between 80-90 years old had the highest frequency of strokes compared to other age brackets (Figure 44).

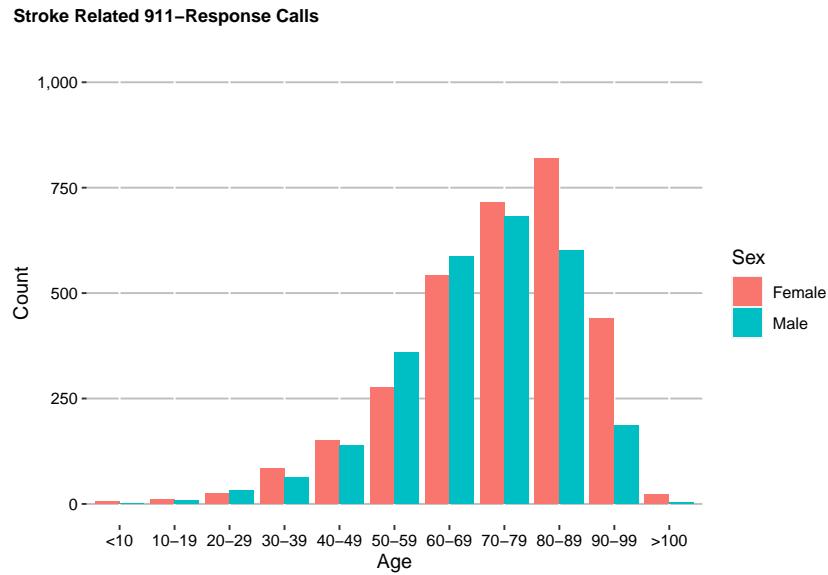

Figure 44: Stroke 911-Response Calls by Age and Sex

## Transport/Disposition

Probably the most significant difference between NEMSIS 3.4 and NEMSIS 3.5 is that one disposition field in NEMSIS 3.4 was broken down into 4 disposition fields in NEMSIS 3.5. We classified combinations of the NEMSIS 3.5 disposition fields into major call types. The majority of 911-response patients were treated and transported (n=390,219) (Figure 45) and of those 90.30% did not use lights and sirens from the scene to destination (n=276,628) (Figure 45). Disposition patient acuity, defined by NEMSIS as the acuity of the patient's condition after EMS care, for 911-response was primarily lower acuity 78.70% (Figure 46).

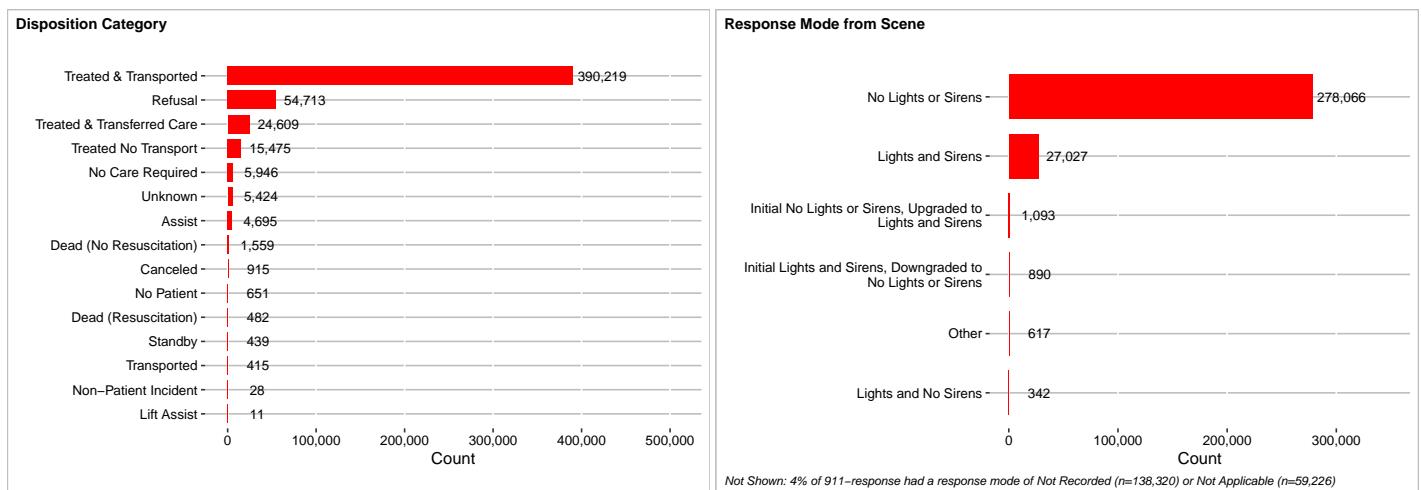

Figure 45: Disposition Category and Response Mode

Transport delay is defined as the reason the EMS crew was delayed transporting the patient from the scene to disposition. Safety, traffic, and distance were cited most frequently as the transport delay reasons (Figure 47). Turn around delay is

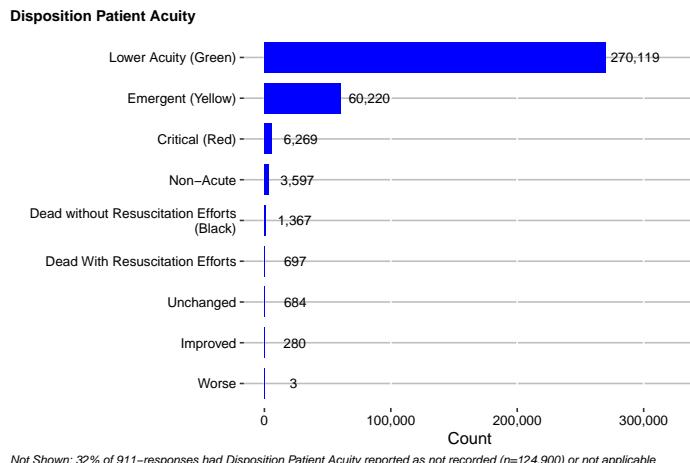

Figure 46: Disposition Patient Acuity

defined as the reason the EMS crew was delayed turning around their unit from the last transport. Decontamination, clean-up, and documentation were cited most frequently as the turn around delay reason (Figure 47). The location the patient was transported to was categorized into 70 categories including 56 facilities (Table 7).

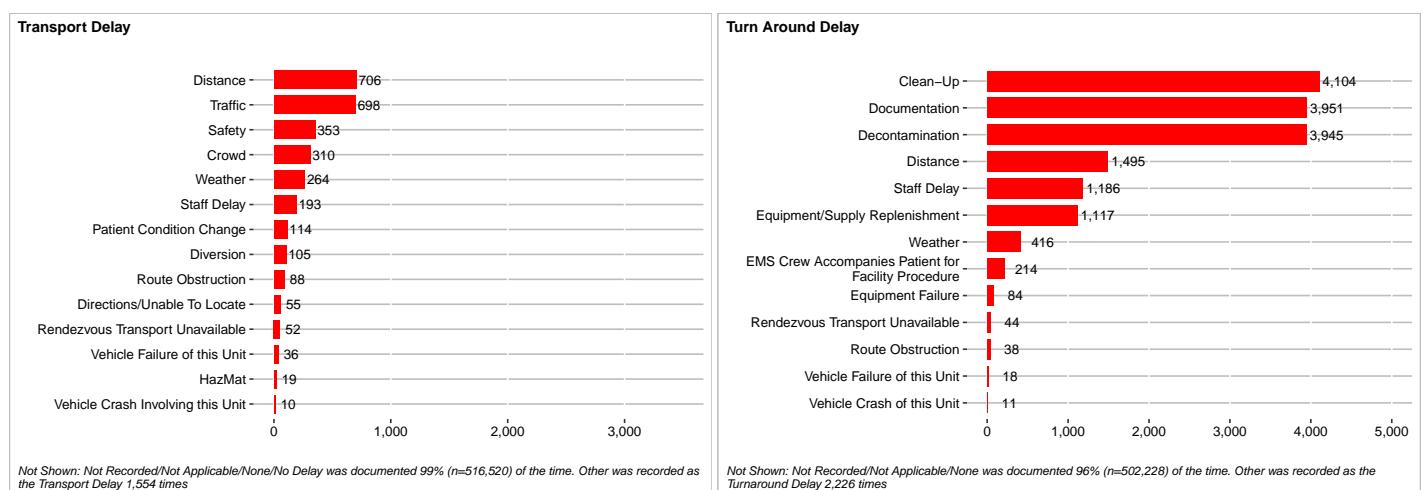

Figure 47: Transport and Turnaround Delay for 911-Responses

# EMS Performance Measure Report

Performance measures were identified by the CEMSAB data committee and/or based on NEMSQA Measures. The intent of the performance measures is to understand what percentage of patients are receiving specific pre-hospital procedures on scene during the EMS encounter **that are documented in the ePCR**.

## Supected Opioid Overdoses

Based on ESO Performance Metrics to look at opioid overdoses and treatment in place.

- What percentage of patients given Naloxone were not Transported? (Figure 48)

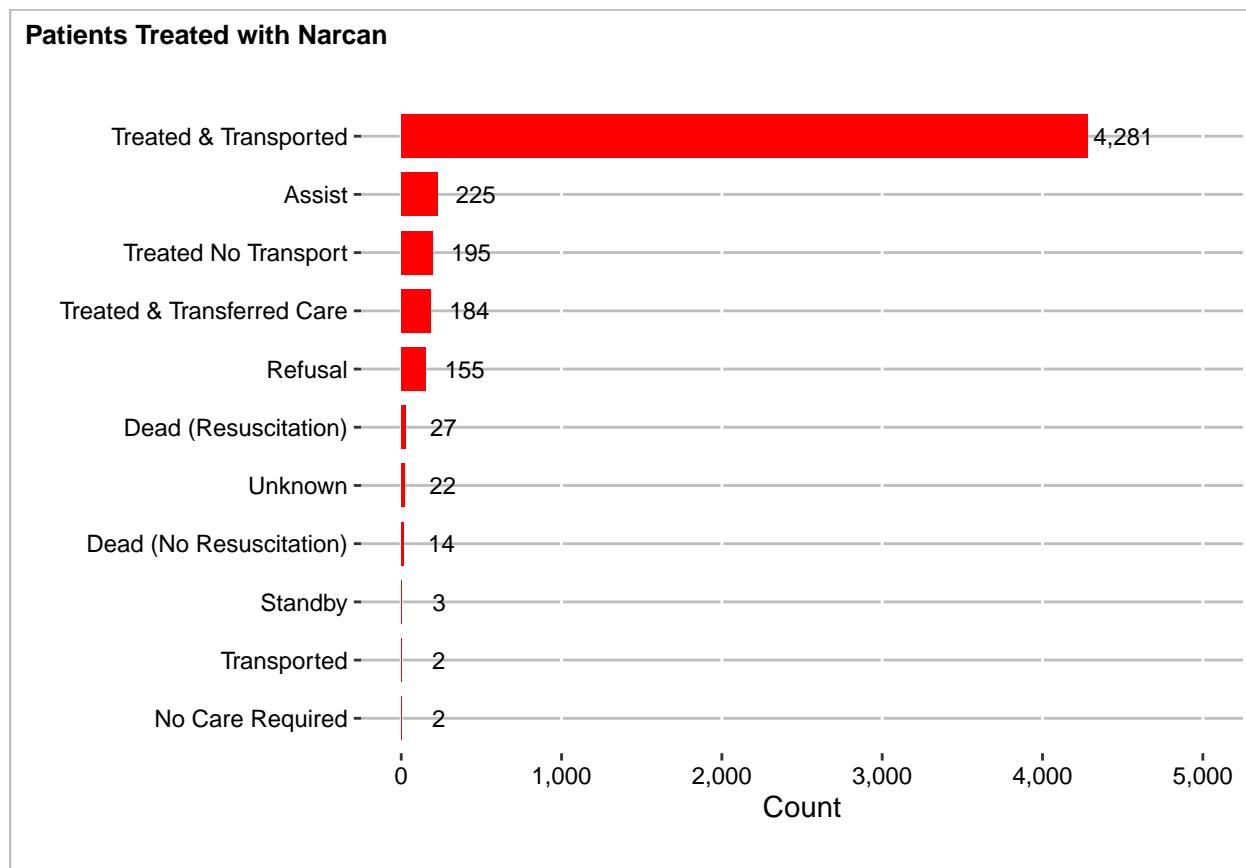

Figure 48: Dispositions for patients treated with Narcan

## Ketamine Administration

Based on ESO Performance Metrics to look at a sedation dose of ketamine and documentation of weight and end tidal carbon dioxide. A ketamine sedation dose was defined as an administration of 200 mg or more of ketamine via the IM route.

- Percentage of patients given a sedation dose of ketamine with weight and end tidal carbon dioxide documented? (Figure 49)

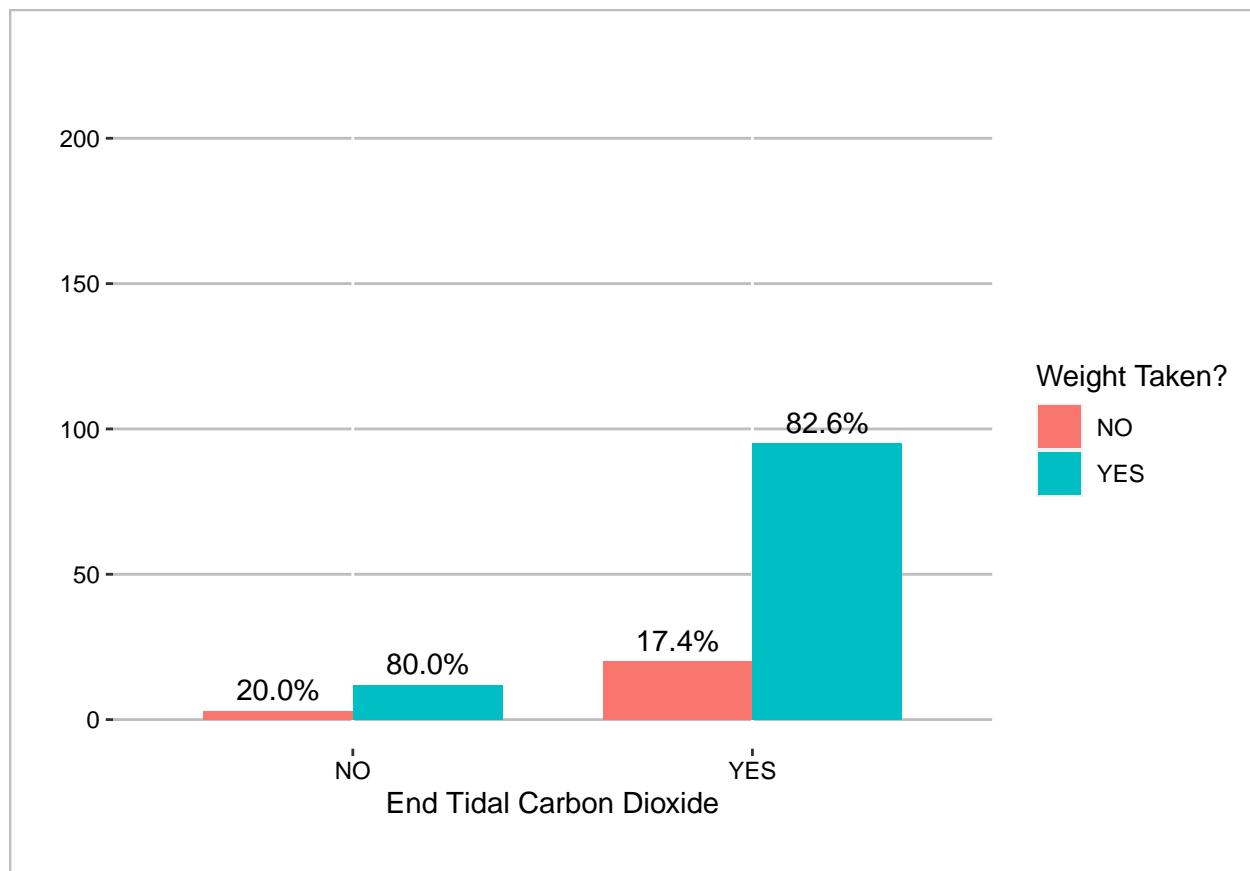

Figure 49: Ketamine – Documentation of Weight and End Tidal Carbon Dioxide

## Stroke

Patients with potential stroke were identified as transported patients originating from a 911-response for responsive (not unresponsive or Glasgow Coma Scale (GCS) > 9) patients with a primary or secondary impression of stroke. For patients with potential stroke:

- What percentage had their blood glucose level (BGL) taken? (Figure 50)
- What percentage had their last known well (LKW) taken? (Figure 51)
- What percentage did scene time exceed 15 minutes? (Figure 52)
- What percentage was a stroke alert activated? (Figure 53)
- What percentage was a stroke assessment performed and documented (NEMSQA Stroke-01)? (Figure 54)

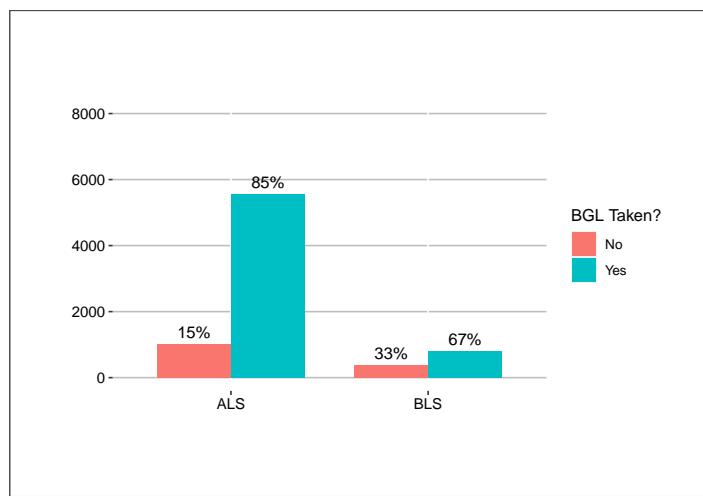

Figure 50: Stroke Patient with Blood Glucose Level Taken

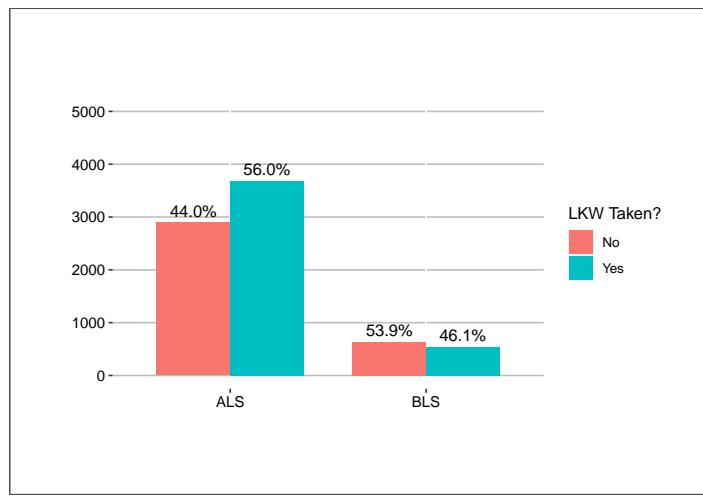

Figure 51: Stroke Patient with Last Known Well Documented

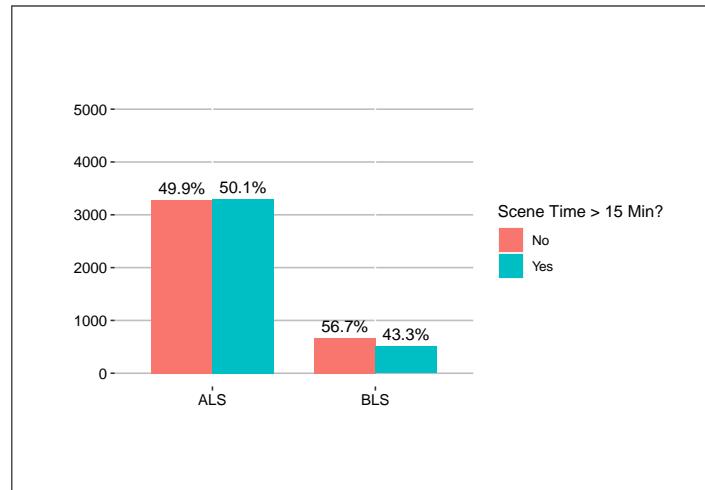

Figure 52: Stroke Patient with Scene Time over 15 Minutes

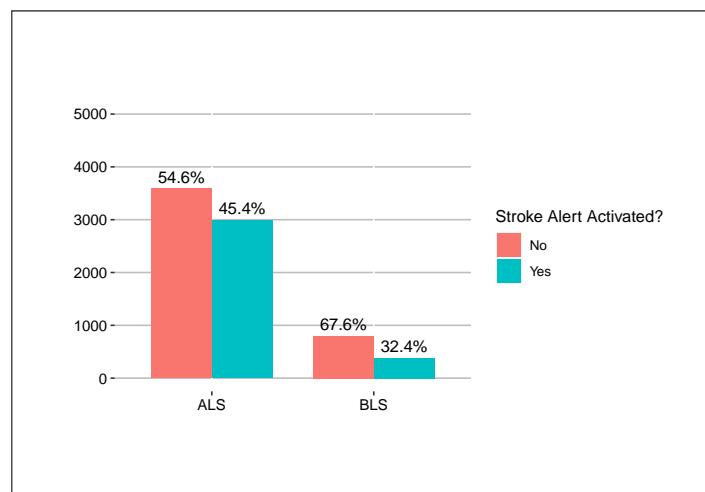

Figure 53: Stroke Patient with Stroke Alert Activation

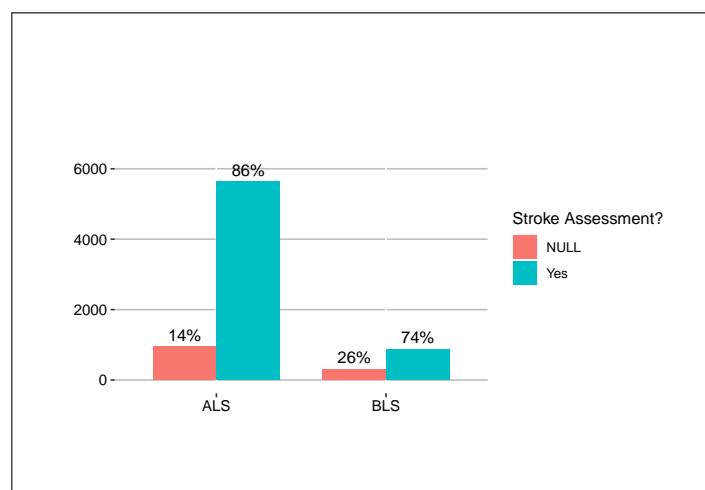

Figure 54: Stroke Patient with Stroke Assessment

## Altered Mental Status

Patients with altered mental status were identified as transported patients originating from 911-response with a Glasgow Coma Scale of less than 15. For patients with altered mental status:

- What percentage had their blood glucose level checked? (Figure 55)
- What percentage had glucose given if their blood glucose level was low ( $BGL < 60$ )? (Figure 56)

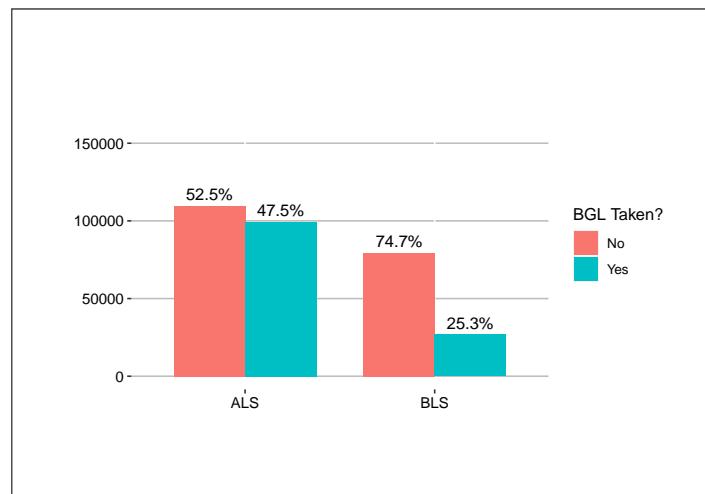

Figure 55: BGL checked for patients with altered mental status (GCS < 15)

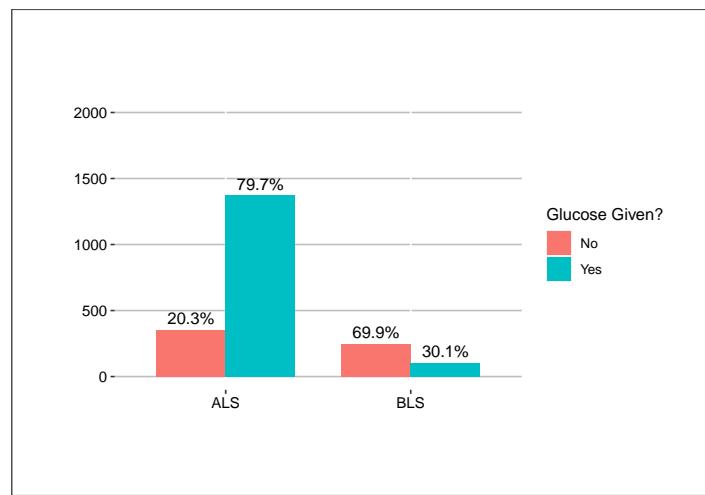

Figure 56: For patients with altered mental status and  $BGL < 60$ , was Glucose given?

## Hypoglycemia

Patients with symptomatic hypoglycemia were identified as transported patients originating from 911-response with a provider's primary impression of hypoglycemic and a recorded GSC < 15 or a provider's primary impression of altered mental status and a low blood glucose level (BGL < 60). For patients with symptomatic hypoglycemia:

- What percentage received treatment to correct their hypoglycemia (NEMSQA Hypoglycemia-01)? (Figure 57)

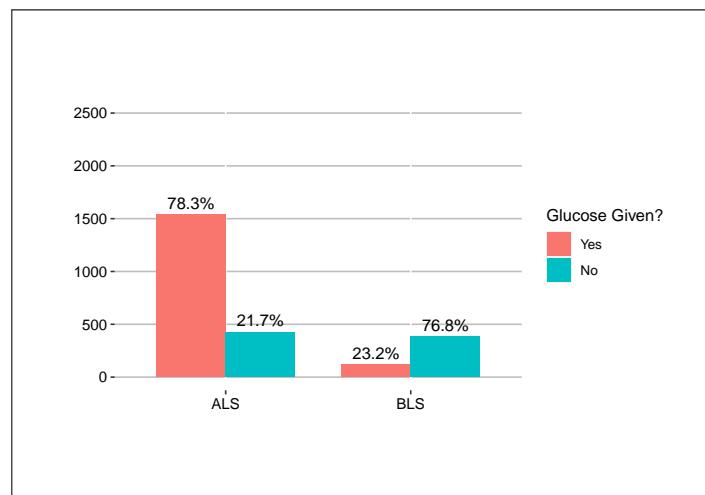

Figure 57: For patients identified as symptomatic hypoglycemia, was glucose given?

## Cardiac Arrest Scene Time

Suspected cardiac arrest patients are identified as transported patients originating from a 911-response with documented cardiac arrest. For suspected cardiac arrest patients:

- What percentages was scene time greater than 30 minutes? (Figure 58)
- What percentage without return of spontaneous circulation (ROSC) prior to Emergency Department (ED) arrival was scene time greater than 30 minutes? (Figure 59)
- What percentage with ROSC prior to ED arrival was scene time greater than 30 minutes? (Figure 60)

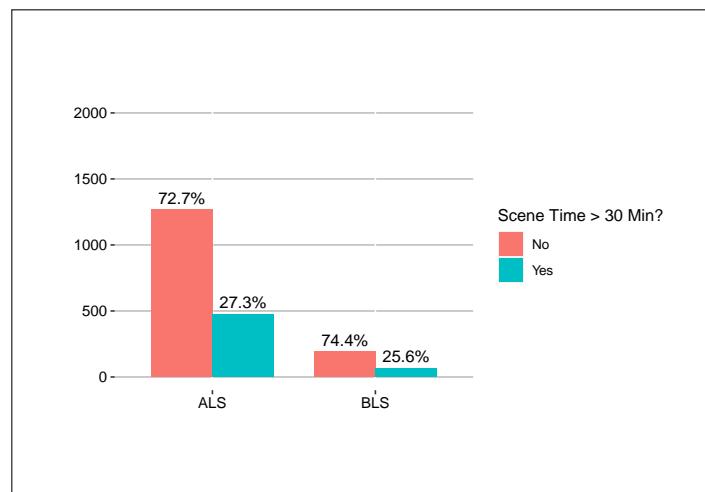

Figure 58: Scene Time for Cardiac Arrest

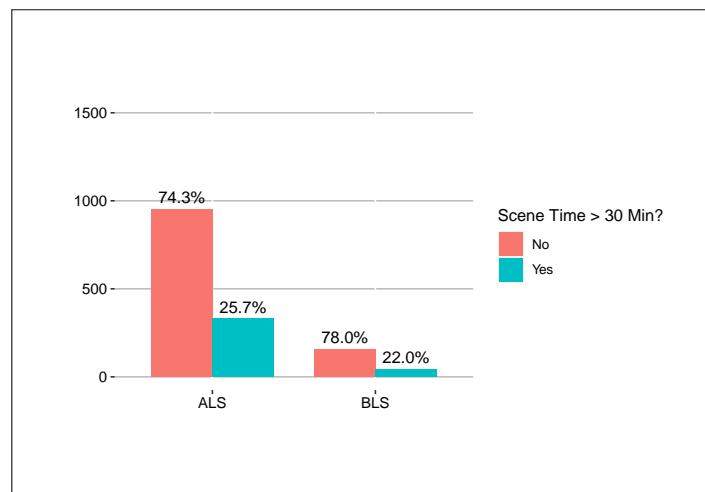

Figure 59: Scene Time for Cardiac Arrest without ROSC

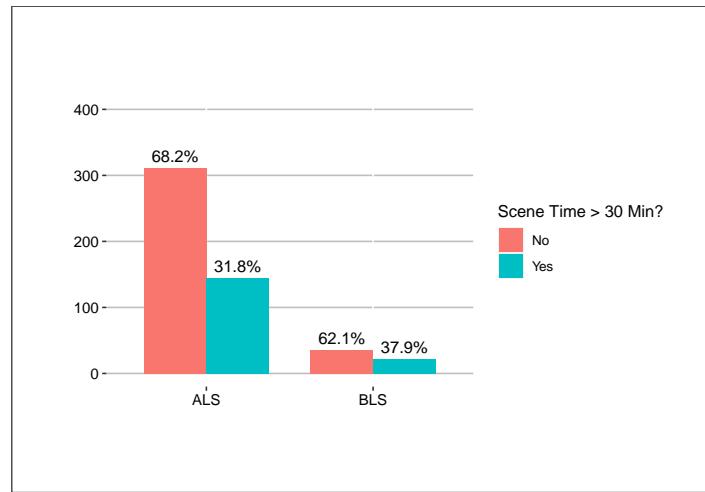

Figure 60: Scene Time for Cardiac Arrest with ROSC

## Airway Management

### Intubation

Patients with intubation were identified as transported patients originating from a 911-response with an intubation procedure performed and documented. For intubated patients:

- What is the number of successful intubation attempts for patients 18 and under? (Figure 61)
- What is the number of successful intubation attempts for patients older than 18? (Figure 62)

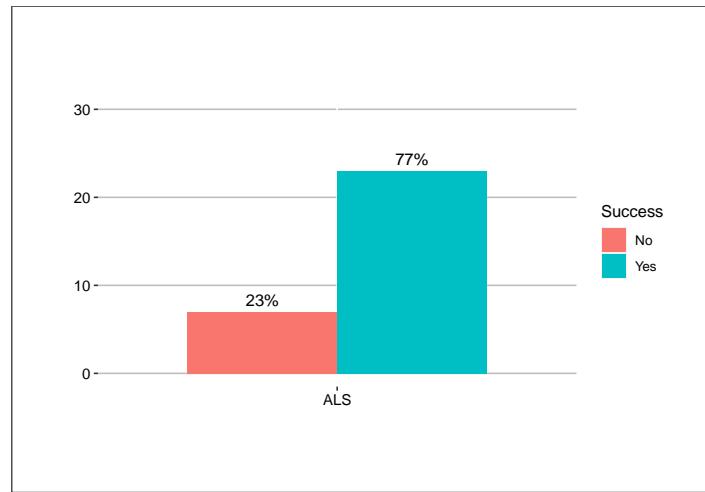

Figure 61: Intubation Success - 18 and Under

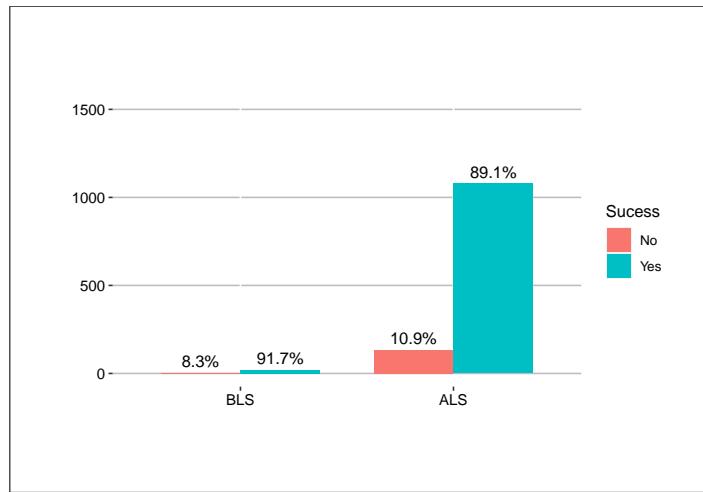

Figure 62: Intubation Success - Over 18

### Respiratory Assessment

Patients experiencing respiratory distress were identified as transported patients originating from a 911-response with a provider primary or secondary impression of respiratory distress. For patients experiencing respiratory distress what percent had pulse oximetry and respiratory rate assessed?

- What percentage 18 and under had a respiratory assessment (NEMSQA Respiratory-01)? (Figure 63)
- What percentage older than 18 had a respiratory assessment? (NEMSQA Respiratory-01) (Figure 64)

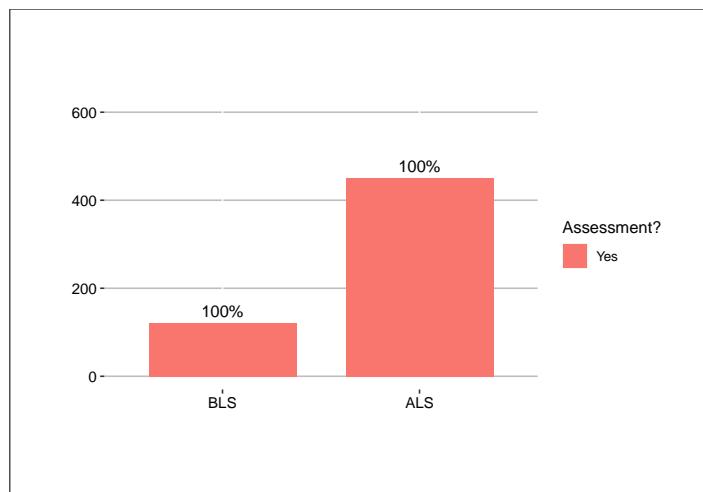

Figure 63: Respiratory Assessment - 18 and Under

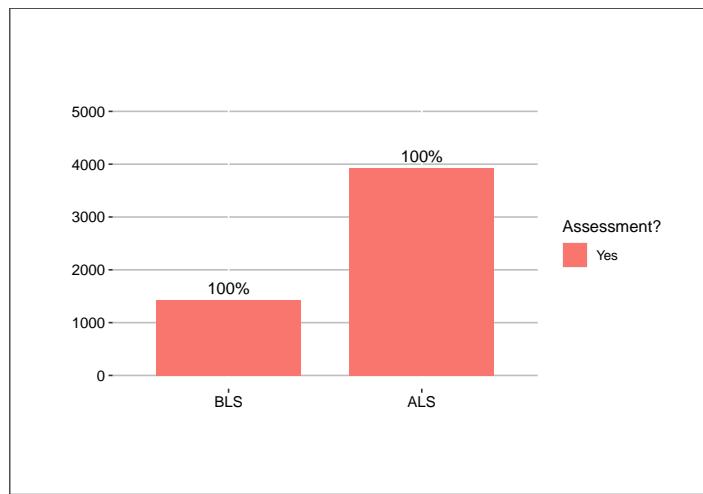

Figure 64: Respiratory Assessment - Over 18

#### Administration of Beta Agonist for Asthma

Patients experiencing asthma exacerbation were identified as transported patients originating from a 911-response with a provider primary or secondary impression of asthma. For patients experiencing asthma exacerbation:

- What percentage 18 and under had an aerosolized beta agonist administered? (Figure 65)
- What percentage older than 18 had an aerosolized beta agonist administered? (Figure 66)

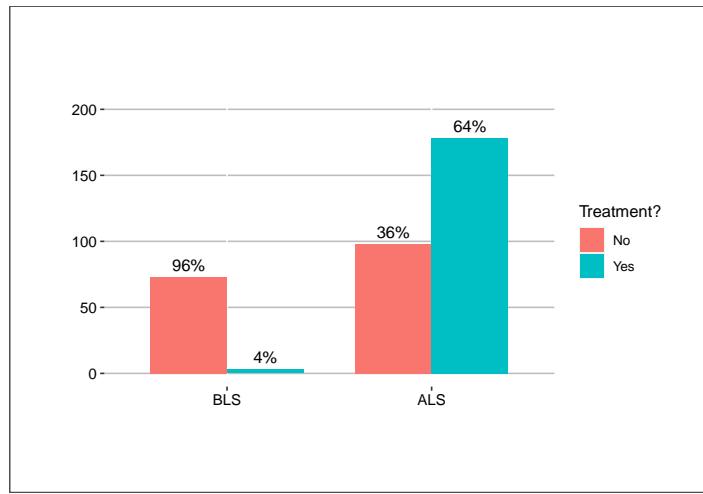

Figure 65: Asthma Treatment - 18 and Under

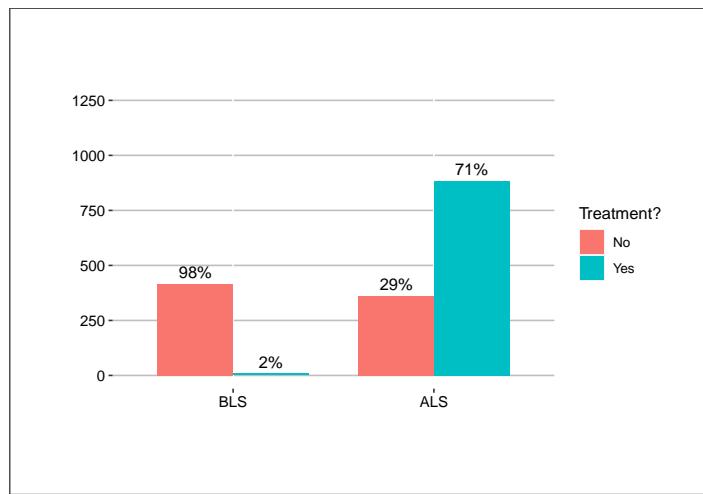

Figure 66: Asthma Treatment - Over 18

## Seizure

Patient with status epilepticus were identified as treated patients originating from a 911-response with a provider primary or secondary impression of seizure. For patients with status epilepticus:

- What percentage received benzodiazepine aimed at terminating their seizure? (Figure 67)
- What percentage had their blood glucose level checked? (Figure 68)

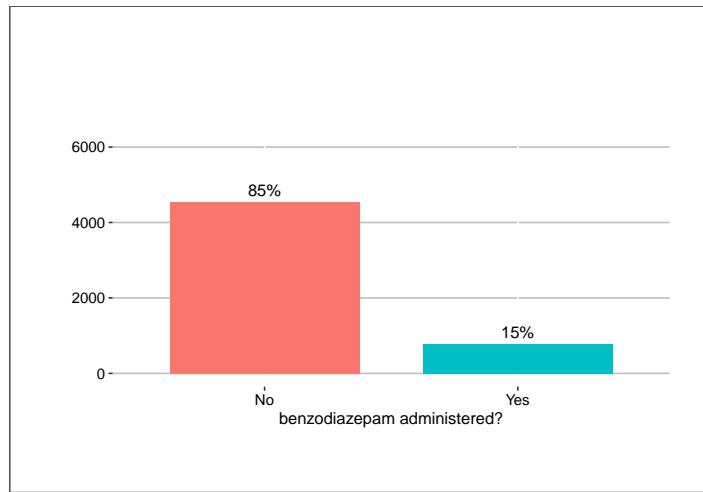

Figure 67: Seizure Patients with Benzodiazepine Administered

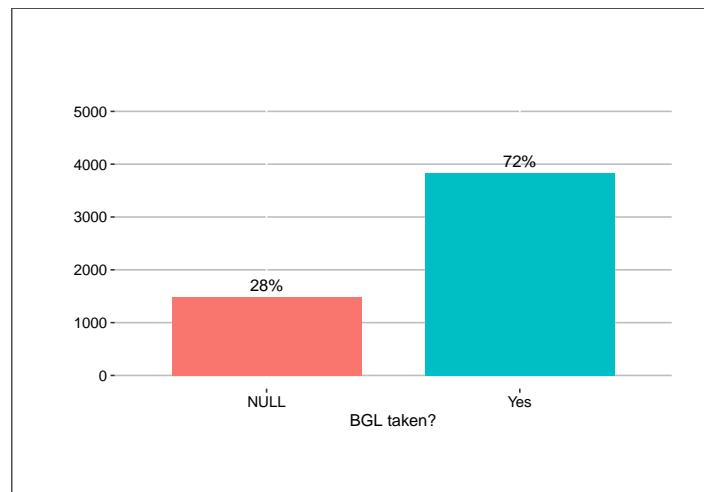

Figure 68: Seizure Patients with BGL Taken

## Pediatric Weight Estimation

- What is the percentage of 911 response requests for transported patients less than 18 years of age who received a medication and had a documented weight in kilograms or length-based weight estimate documented during the EMS response? (Figure 69)

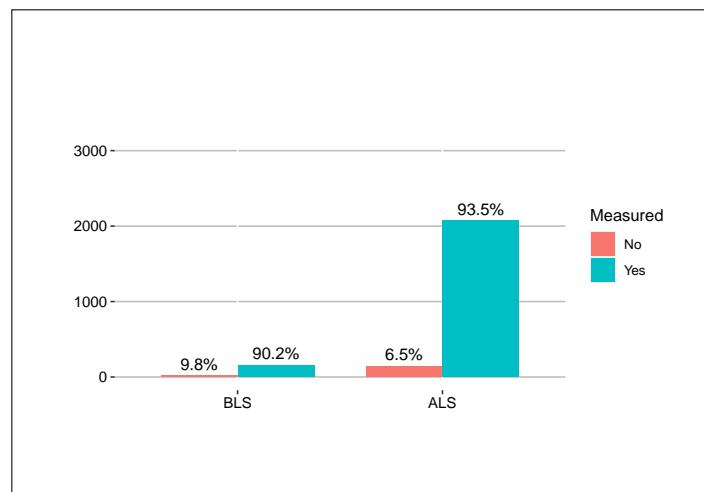

Figure 69: Pediatric Patients with Estimated Weight Measurement Documented

## Pain Assessment

- What is the percentage of EMS transports originating from a 911 request for alert patients with injury who were assessed for pain? (Figure 70)

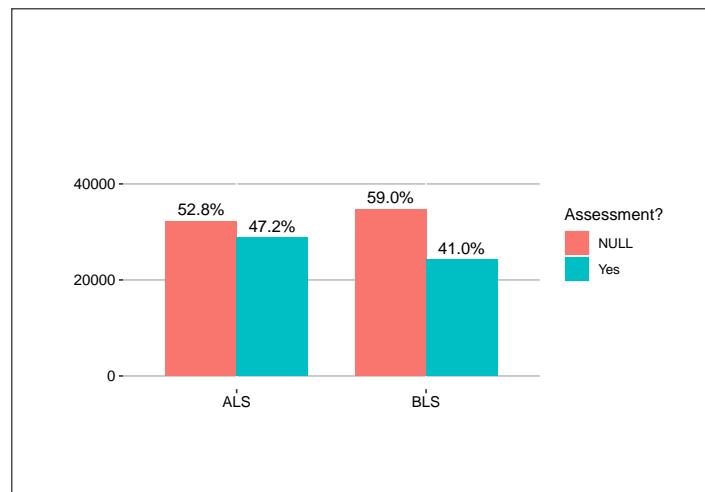

Figure 70: Trauma Patients with Pain Assessment

## Pain Management

To determine if pain is being reduced (helping the patient feel better regardless of drug administration) for EMS patients during the EMS encounter. 911-response requests for alert patients, with injury, treated and transported, with two or more documented pain scores, an initial pain score of  $\geq 4$ , and a final pain score less than the first documented pain score.

- What percentage showed a decrease in documented pain score for patients older than 8? (Figure 71)
- What percentage showed a decrease in documented pain score for patients 8 and under? (Figure 72)

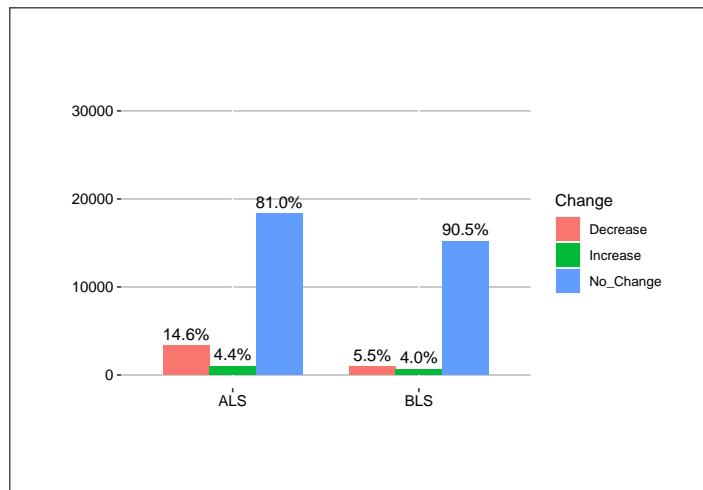

Figure 71: Over Eight Trauma Patients

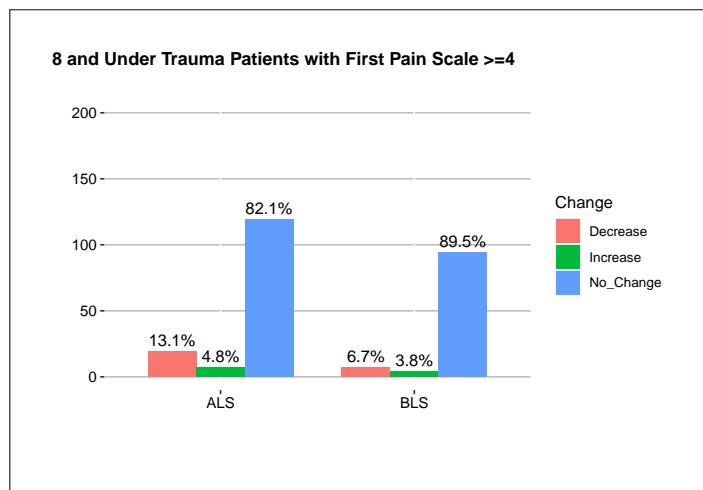

Figure 72: Eight and Under Trauma Patients

## Trauma Center

- What Percentage of EMS transports originating from a 911 request for patients who meet CDC criteria for trauma are transported to a trauma center? (Figure 73)

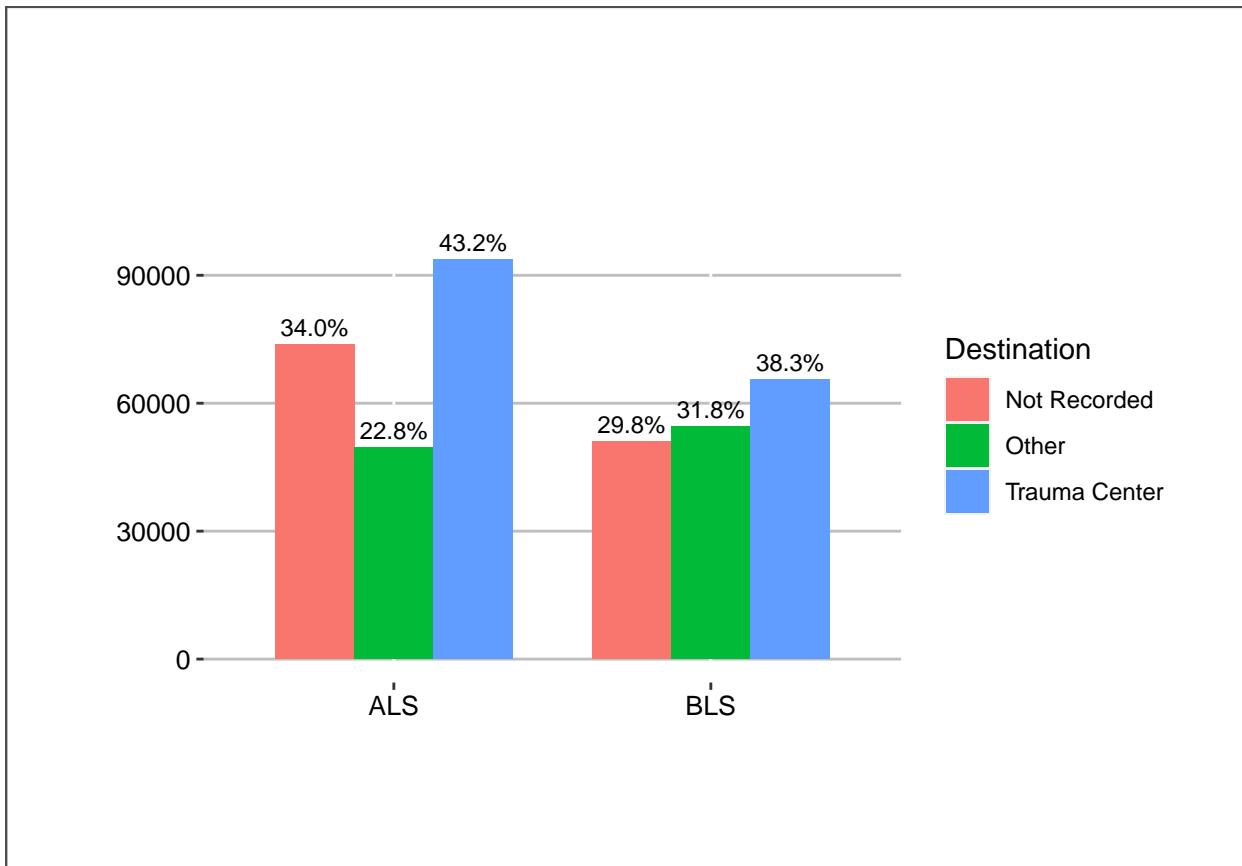

Figure 73: Trauma Patient Destination

## Lights and Sirens

Includes 911-response requests when lights and sirens were documented at any point during response or transport even if downgraded to no lights or Sirens. NHTSA recommends that less than 30% of responses and less than 5% of transports use Lights & Sirens.

- What percentage of 911-responses documented lights and sirens to the scene? (Figure 74)
- What percentage of 911-responses documented lights and sirens from the scene? (Figure 75)
- What percentage of 911-responses documented lights and sirens to scene and lights and sirens from scene? (Figure 76)
- What percentage of 911-responses documented no lights and sirens to scene but lights and sirens from scene? (Figure 77)

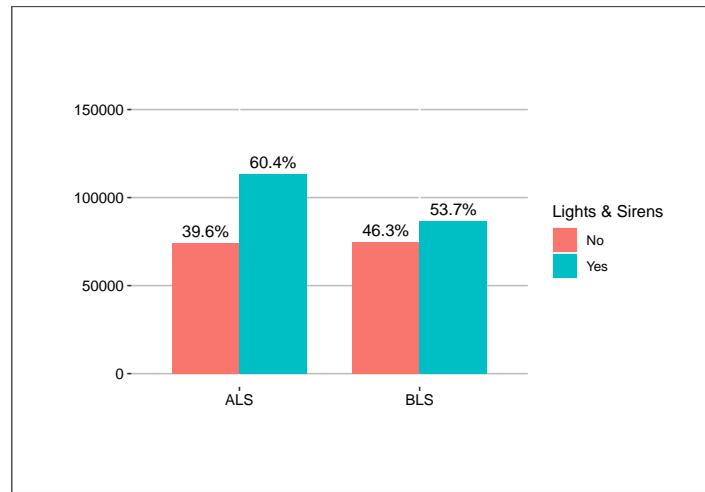

Figure 74: Lights and Sirens to Scene

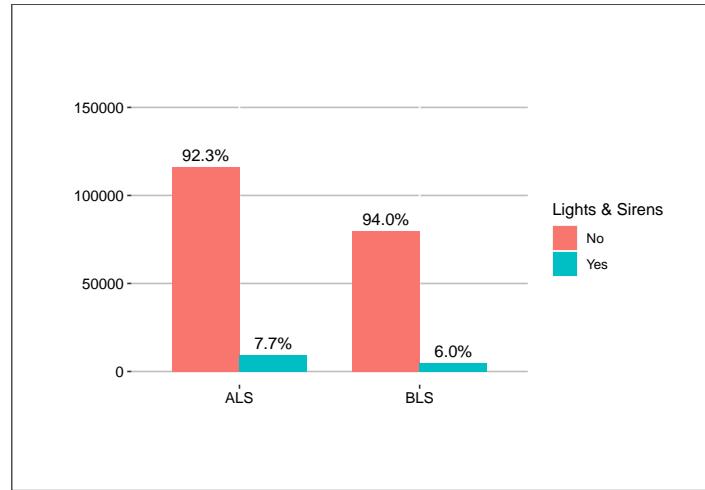

Figure 75: Lights and Sirens from Scene

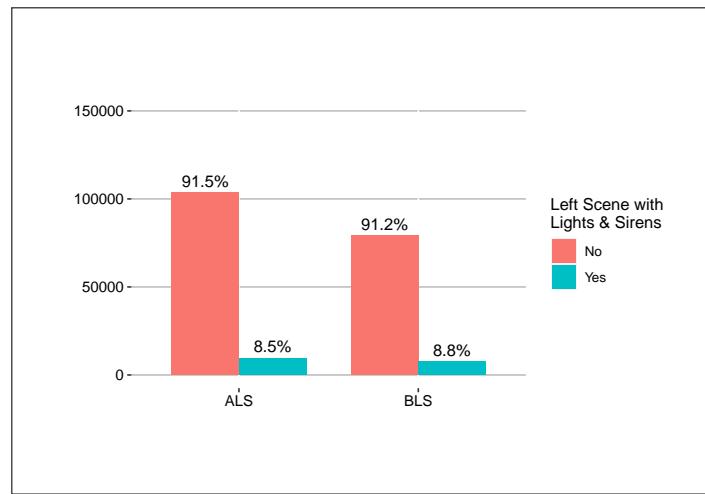

Figure 76: Lights and Sirens to Scene, percent left scene with lights and sirens

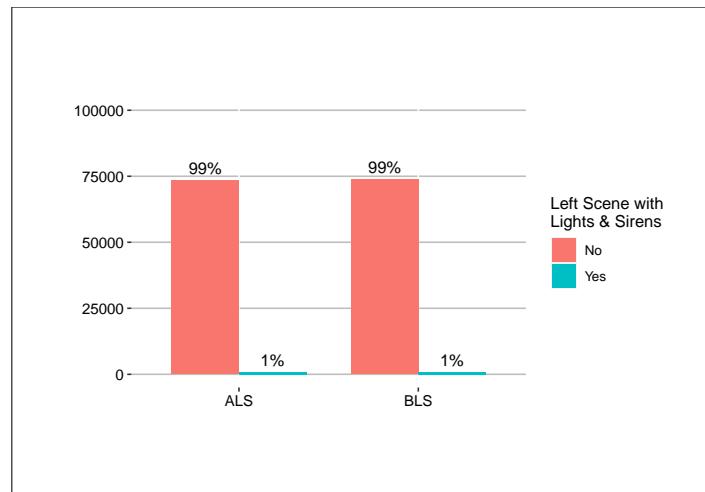

Figure 77: No Lights or Sirens to Scene, percent left scene with lights and sirens

## Trauma Report

The state trauma registry is established in the state's trauma regulations and all acute care hospitals are required by regulation (Section 19a-177-7) to submit trauma data quarterly. There are twenty-seven Acute Care Hospitals in Connecticut but only 14 hospitals provide data to the state trauma registry. The state does not have registries for specific illnesses such as stroke or ST-elevation myocardial infarction (STEMI), however individual EMS services do participate in the CARES data collection program for cardiac arrest.

Of the fourteen hospitals that provide data to the state trauma registry, five are Level I, seven are Level II, two are Level III, and one is an undesignated Trauma Facility. Of the Level 1 trauma facilities, two are designated pediatric facilities and are also full service Children's hospitals. DPH Regulation 19a-177 allows for Level IV trauma centers within Connecticut; however, there is neither a state process nor current ACS process to verify Level IV trauma centers.

Here we report aggregate data across all trauma levels as well as broken down by trauma center level. This report only includes data from the fourteen reporting trauma facilities for admitted patients who meet the NTDB criteria. In addition, due to NTDB inclusion criteria the number of burn patients does not represent all burn patients in Connecticut for 2023.

In 2023, there were a total of 14,566 trauma patient records submitted to the state trauma registry. Of these 7,352 were from Level I, 4,983 from level II, and 1,445 from Level III facilities (Figure 78). Included are reports on ER admissions times (Figure 79), race (Figure 80), age and gender (Figure 81), incident location (see maps), Abbreviated Injury Scale (AIS) region (Figure 82), Mechanism of Injury (MOI) category (Figure 83), Injury Severity Score (ISS) category (Figure 84), Hospital Length of Stay (LOS) (Figure 85), and fatalities (Figure 86).
