INTRODUCTION

This report provides data on invasive cancers diagnosed in 2000 through 2005 among male and female residents of Connecticut towns who were 0-19 years of age at diagnosis, as reported to the Connecticut Tumor Registry. Cancers in this age group are sometimes called “pediatric” cancers, although the age range covers both childhood and adolescence. The National Cancer Institute (NCI) routinely publishes statistics on “childhood” cancers that include data for both age groups 0-14 years and 0-19 years. Cancers in these age groups appear to be of special interest and concern to the general public.

Only malignant (also called “invasive”) cancers are included. Because of difficulties in accurate registration of bladder cancers, however, “in situ” (pre-invasive) bladder tumors have been recoded to “invasive.” This is routinely done in various reports from the Connecticut Tumor Registry and NCI. “In situ” cancers have not penetrated (microscopically) into deeper layers of the tissue in which the cancer originated, and therefore have little chance of spreading to other tissues or organs.

Numbers of cancers and incidence rates tend to fluctuate from year to year, in the entire state and (especially) in specific towns, so that combining several years of data provides statistically more useful data for analysis. This report shows average annual estimated incidence rates for males and females for the period 2000-2005 for each town. The rates represent the number of cancers diagnosed in the age group 0-19 years during 2000-2005 in a specific town divided by the estimated number of persons age 0-19 years in the Connecticut population in that town. The rate is expressed as cancers per 100,000

population (age 0-19 years) per year. The population estimates used for each town are from the 2000 census. Because accurate population estimates are not available by age and sex for each town for each calendar year after 2000, the population data for 2000 were used for each of the six years (2000 through 2005). It must be recognized that inaccuracies in these population estimates would affect cancer incidence rates.

Numbers of incident cancers and incidence rates are shown for each of the 169 towns in Connecticut, with the exception that data for Canaan and North Canaan have been combined together, due to problems in coding the correct town of residence.

Confidence limits on each incidence rate are also tabulated. These 95% confidence limits provide an indication of the statistical reliability of each rate. The estimated confidence limits are based on the “standard error” (SE) of each rate, which is estimated as the rate divided by the square root of the number of cancers involved in that rate (that is, the numerator of the rate). For estimating 95% confidence limits, the SE is multiplied by two, and this number is subtracted from the town rate to obtain the lower confidence limit, and added to the town rate to obtain the upper limit. Lower limits less than zero have been changed to zero for this report. The confidence limits for each town rate can be compared with the rate for the entire state. If the lower confidence limit on the town rate is not higher than the rate for the entire state, or the rate for the entire state lies within the range of the 95% confidence limits (also called the “confidence interval”) then a town rate that appears to be high is likely to be due to chance.

High rates for specific towns are often based on small numbers of cancers, and confidence intervals are often very wide. Also, confidence limits have not been adjusted for

the large number of statistical comparisons involved in analyses of data for 169 towns; such statistical adjustments are used to minimize the risk of falsely deciding that the difference between two cancer rates is “statistically significant” (that is, not due to chance or random variation).

Data are shown for all malignant cancers combined, and also separately for all leukemias, the most common type of cancer in the age group 0-19 years.

Data are shown for males and females separately, because cancer incidence rates differ between males and females. Also, any general environmental factor suspected as being involved in pediatric cancer risk would tend to affect both males and females. However, reported “clusters” of pediatric cancer (especially leukemias) in the scientific literature have involved males more often than females. Current theories involve unidentified common infectious agents that affect males more often than females at certain ages, and somehow increase the risk of leukemia in certain children or adolescents.

The cancer rates in this report have not been adjusted for the effects of differences among towns in the age composition, and/or in the racial-ethnic composition, of the population of each town. Pediatric cancer incidence rates are higher at age 0-4 years and at age 15-19 years than at ages 5-9 and 10-14 years; therefore, differences in the age structure of the population by town would affect cancer rates. Other surveillance work done by the Connecticut Tumor Registry involves statistical methods that adjust for differences in age composition among the towns.

Pediatric cancer rates are higher in “white” than in “African American” (or “black”) populations, so that towns with relatively high proportions of African Americans in the population would tend to have lower rates of pediatric cancer than certain other towns.

The National Cancer Institute’s (NCI’s) Surveillance, Epidemiology and End Results (SEER) Program website www.seer.cancer.gov describes the program of cancer registries funded by NCI, which includes the Connecticut Tumor Registry. This website also discusses the issue of delayed reporting of cancers to SEER registries. The numbers and rates in this monograph were obtained from a data file that was prepared in June 2007. Delayed reports for cancers diagnosed in 2000-2005 will be received by the Registry from hospitals, clinical laboratories and other sources, and the Registry database is continuously updated.

General information on pediatric cancers in the U.S. can be found on the Internet at the NCI’s website: www.cancer.gov. The NCI periodically updates its Fact Sheet on “National Cancer Institute Research on Childhood Cancers,” which describes the results of recent studies supported by NCI and ongoing work on the causes and treatment of cancers in children and adolescents. Statistics on childhood/pediatric cancer in the SEER Program can be found at www.seer.cancer.gov.
