

The 2009
Connecticut
Health
Disparities
Report

NOTES ON THE ELECTRONIC (PDF) VERSION

After hardcopy printing, the following changes to *The 2009 Connecticut Health Disparities Report* were made and have been incorporated into this PDF version of the document. Changes are highlighted in *italics*.

- Page 75, Table 19. The Age-adjusted Death Rate for White Connecticut Residents now reads: *1.2* (deaths per 100,000 persons).
- Page 126, last paragraph. The last paragraph on page 126 has been modified to read: In Connecticut, the diversity of our population is not reflected in the health care workforce. Figure 49 indicates the disparity between the state's racial and ethnic populations and the racial and ethnic breakdown of physicians serving the population. The Kaiser Family Foundation noted that in 2007, *of the total state physician population who reported race or ethnicity, 49% were White, 1% was Black, 3% were Asian, and 2% were Hispanic. Approximately 41% of Connecticut physicians did not their report race or ethnicity* (Kaiser Family Foundation 2007). In order to better address health disparities in Connecticut, however, full description of the health care workforce is necessary.
- Page 173, top of the page. The formula for excess deaths (events) now reads:
Excess deaths (or events) = Number of deaths (or events) x [1 – (1/relative risk)]
