

Mortality ANNUAL REPORT

FY 2015

This is the fourteenth of a series of annual reports on mortality, mortality trends and related information pertaining to the health and quality of care received by individuals served by the Connecticut State Department of Developmental Services. Reports focus on an analysis of mortality data and specific findings resulting from the Connecticut DDS mortality case review process. Reports are scheduled for publication March of each year.

Issue Date: January 2017

Mortality ANNUAL REPORT – 2015

Issue Date: March 2016

CT DDS Mortality Report

SECTION ONE OF THIS REPORT: CT DDS MORTALITY REVIEW PROCESS

This section describes the CT DDS Mortality Reporting and Review Process.

SECTION TWO OF THIS REPORT: ANALYSIS OF ALL CT DDS MORTALITIES

This section includes information and data concerning <u>all deaths</u> of individuals served by DDS who were listed in the CT DDS data base and died during the 2015 fiscal year (July 1, 2014- June 30, 2015) including death rates and life expectancy.

SECTION THREE OF THIS REPORT: DATA GENERATED BY THE CT DDS MORTALITY REVIEW PROCESS

This section includes information and analysis of data generated for the 149 deaths reviewed by the DDS nurse investigators, regional mortality review committees and Independent Mortality Review Board (IMRB) for the period of July 1, 2014 – June 30, 2015.

SECTION FOUR OF THIS REPORT: MORTALITY TRENDS CT DDS

This section provides an analysis and synthesis of CT DDS mortality data over time.

SECTION FIVE OF THIS REPORT: *LEADING CAUSES OF DEATH*

This section presents CT DDS leading cause of death data.

SECTION SIX OF THIS REPORT: BENCHMARKS

This section presents and compares CT DDS, National, and State mortality statistics and leading cause of death information.

SECTION SEVEN OF THIS REPORT: SUMMARY MORTALITY CASE REVIEW FINDINGS

This section includes information on the findings identified through the DDS mortality review process and examples of quality initiatives implemented as a result of the CT Mortality Review Process.

Appendix: Includes demographic information on the population served by the CT DDS

This report represents a review of the period between July 1, 2014 to June 30, 2015. Data in this report was obtained from the CT DDS Database system.

Mortality ANNUAL REPORT – 2015

Issue Date: March 2016

Executive Summary 2015 Report

- There were 249 deaths resulting in a crude mortality rate of 15/1000
- The strongest predictors of mortality were age, mobility status, and the need for special assistance when eating
- The average age of death for individuals with ID was 61.1 years
- Starting early in the fifth decade of life there was a progressive increase in the mortality rate for people with intellectual disabilities
- People with intellectual disabilities have a decreased life span as compared to the general population which may be related to the onset of multiple chronic and acute co-morbidities at a younger age
- Mortality is related to the level of intellectual disability. The greater the level of disability the higher the mortality rate
- Heart disease continues to be the leading cause of death in the CT DDS population (31%)
- Aspiration pneumonia/pneumonia accounted for 9.2% of all deaths
- The incidence of deaths related to cancer in the DDS population (10.4%) was lower than the national (22.5%) and state (22.7%) ^{13,14}
- Accidental deaths continue to occur at a rate below that of the general state and national population ^{13,14}
- The average age of death for people with Down syndrome was 57.9 years
- Cardiac Arrest was the leading cause of death for people with Down syndrome
- Hospice supports were provided in 33% of the reviewed deaths which allowed individuals to remain in their home residences in the final stages of a terminal illness

Issue Date: March 2016

CT DDS MORTALITY REVIEW

An important component of the quality and risk management systems present within DDS involves the analysis and review of deaths to identify important patterns and trends that may help increase knowledge about risk factors and provide information to guide systems enhancements. Consequently CT DDS continues to embrace a planned organization wide approach to design performance measurement, analysis and improvement by collecting information pertaining to the deaths of all individuals served by the department. The CT DDS mortality review system has proven to be a valuable quality assurance mechanism providing information to trigger corrective action and reduce future risk.

The CT DDS mortality review process provides a retrospective analysis

THAT

AND GENERATES

- assures compliance with standards
- reduces adverse events
- leads to ongoing improvement
- changes in policy and procedure

- ➤ focused training
- > systems improvement strategies

CT DDS DEATH REPORTING PROCESS

Per State of Connecticut Executive Order No. 42. The Department of Developmental Services shall report all deaths of persons placed or treated under the direction of the Commissioner of the Department of Developmental Services to the Office of Protection and Advocacy whether or not abuse or neglect is suspected or contributed to the individual's death.

The CT DDS death reporting process is a dynamic process that ensures that all deaths are immediately reported to the department and death report forms are submitted to the department within 24 hours of the death notification.

Issue Date: March 2016

SECTION ONE: CT DDS MORTALITY REVIEW PROCESS

CRITICAL COMPONENTS OF THE CT DDS MORTALITY PROCESS:

- Uniform death reporting system
- Screen individual death reports with standard information
- Standardized mortality review process (regional and state)
- Medical professionals participate in the process
- External stakeholders included in the review process
- State level interdisciplinary/independent mortality review board (IMRB) aggregates mortality data over time to identify trends
- Direct link between mortality findings and improvement
- Publically report and document mortality information (Annual CT DDS Mortality Report)

Issue Date: March 2016

Section One Continued

Connecticut law (which comprises statutes and executive order) currently requires CT DDS to review the death of anyone for whom it has direct or oversight responsibility for medical care. The review must cover the events, overall care, quality of life issues, and medical care preceding the death to assure that a vigorous and objective evaluation and review of the circumstances surrounding untimely deaths takes place. The CT DDS does not review the deaths of individuals who lived at home with their families or who were placed by their family/guardian into a licensed nursing facility.

CT DDS has established a three tier mortality review process as part of its quality assurance system to trigger corrective action and reduce future risk for people. As noted below, the three tier system includes an Abridged Review, Regional Mortality Review Committee and Independent Mortality Review Board. In addition, the mortality process includes a Medical Desk Review by trained Nurse Investigators and a final review of all IMRB cases by the CT DDS Commissioner and Director of Health and Clinical Services (IMRB Chair).

The mortality review process seeks to address the following questions:

- Was the death anticipated or unexpected?
- · Could this death have been prevented?
- Are there systems issues identified in the course of the review?
- · Are there case specific issues identified in the course of the review?
- · What actions should DDS take to improve the health and safety of individuals?

Abridged Review Criteria for Review

Any death that had a DNR in force that was reviewed per the DDS DNR review process, was related to a preexisting condition/diagnosis, did not have an allegation/investigation of abuse/neglect at time of death and did not have a post mortem examination. Individual was not a Class Member and did not reside in a ICF/IID.

Regional Mortality Review Committee Criteria for Review

Any death where the department bears direct or oversight responsibility for medical care.

Independent Mortality Review Board Criteria for Review

- · Determined necessary by the regional mortality review committee
- Medical, health or residential care concerns
- Post mortem examination
- Suspicion of abuse/neglect, etc.
- Ongoing abuse/neglect investigation

Assume immediate jurisdiction and conduct an expedited review when determined necessary by the Commissioner or the OPA Executive Director if it is likely that the death occurred because of abuse or neglect or at the request of the Director of Quality Management Services and/or the Director of Health and Clinical Services.

Issue Date: March 2016

Section One Continued

Nurse Investigators Medical Desk Review

In addition to the regional mortality review committees and the Independent Mortality Review Board, the DDS death reporting and mortality review process requires that all deaths are reported to a **Nurse Investigator** (NI) who is assigned to the DDS Investigations Division. The Nurse Investigator conducts a **Medical Desk Review** (MDR), an abbreviated mortality review to determine the need for an abridged review, a comprehensive review by a regional mortality committee and/or the Independent Mortality Review Board or if an immediate investigation of the death by another state agency is warranted.

Role of the Nurse Investigators

The Nurse Investigator will forward the Medical Desk Review and associated documents to the DDS Director of Investigations, DDS Director of Health Services (Chair of the Regional Mortality Review Committee) and the DDS Director of Health and Clinical Services (Chair of the Independent Mortality Review Board) when:

- · Abuse or neglect is suspected according to DDS abuse/neglect policies and procedures
- · Systems deficiencies are identified or suspected
- · For routine mortality review as defined in DDS procedure

Independent Mortality Review Board Membership

Members of the Independent Mortality Review Board (IMRB) are appointed by the CT DDS Commissioner and Executive Director of the CT Office of Protection and Advocacy for DD and include:

- DDS Director of Health and Clinical Services (Chair)
- DDS Director Division of Investigations
- DDS Director Division of Quality Management
- Associate Medical Examiner
 (State Office of the Chief Medical Examiner)

- Community based physician
- State Office of Protection and Advocacy
- State Department of Public Health
- Private provider agency representative
- Family representative

Regional Mortality Committee Membership

Members of the Regional Mortality Review Committees are appointed by the regional or training school (STS) Director and include:

- DDS Regional Health Services Director (Chair)
- Medical Director (for STS campus)
- Non DDS registered nurse
- Non DDS consumer advocate

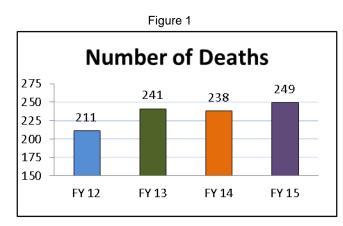

- DDS Residential Manager
- DDS Assistant Regional Director
- DDS abuse/neglect liaison
- · Family representative

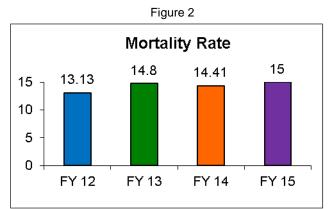

Issue Date: March 2016

SECTION TWO: ANALYSIS OF ALL CT DDS MORTALITIES (JULY 1, 2014 – JUNE 30, 2015) NUMBER OF DEATHS REPORTED = 249

Overall Mortality Rate

During the 12 month time period between July 1, 2014 and June 30, 2015 a **total of 249** individuals supported by CT DDS passed away **resulting in a mortality rate of 15** (Figure 1 & 2 below). Both the number of deaths and mortality rate increased in FY 15.

Mortality and Residence

As can be seen in Figure 3 (to the right), forty-nine percent of deaths occurred in settings that were not operated, funded or licensed by CT DDS.

	% Deaths	% DDS population
CLA	33	23
SNF	30	2
Family	19	46
STS	10	2
IHS	4	17
CRS	2	4
CCH	2	2
RC	1	1

SNF = skilled nursing facility; RC = regional center; STS = Southbury Training School; CLA = community living arrangement (group home); CCH = community companion home (formerly called CTH); IHS = individualized home supports; CRS = continuous residential supports, Family = live with family at home or independently.

Shaded areas represent settings operated, funded or licensed by CT DDS.

Figure 3

Residence at Time of Death

Issue Date: March 2016

Section Two Continued

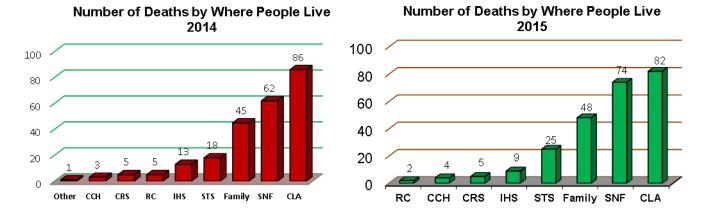

Figure 4

Figure 4 (above) depicts the actual number of deaths by where people live. As last year, the greatest number of deaths occurred in CLAs followed by skilled nursing facilities, family homes and STS. Of note: Sixty-four (64%) of the people DDS supports live in family homes or in their own home with individualized supports, 23% in group homes (CLA's) and only 2% in skilled nursing facilities.

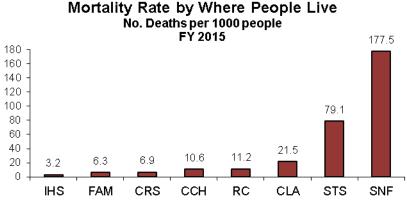

Figure 5 (left) depicts the number of people who died for every 1000 people served by type of support.

Of note: In general, individuals supported by DDS who live in skilled nursing facilities and at STS tend to be older. In addition, residents of skilled nursing facilities have considerable health comorbidities.

Issue Date: March 2016

Section Two Continued

Mortality and Residence Definitions

Family Home: People who live with their family without significant residential DDS supports or independently represent 46% of the DDS population. However, in FY 2015 only 48 deaths (19.3% of all deaths) occurred in a family home with an associated mortality rate of 6.3. All CT DDS deaths of children were for those who lived with their families. Twenty-five of the 48 people died in a hospital, hospital emergency department or SNF.

CLA: These settings serve people with varying levels of intellectual disabilities who require 24 hour supervision for their health and direct care supports. In FY 2015, 82 or 32.9% of all deaths occurred in CLA's compared to 33.6% in FY 14. Fifty of the 82 people died in a hospital, hospital emergency department, hospice or SNF.

CCH: There were 4 reported deaths in the community companion homes compared with 3 reported deaths in FY 2014. The CCH mortality rate of 10.6 was greater than the mortality rate for people living at home with their family or people living in their own home. People living in CCH's represent 2% of the DDS population and accounted for 1.6% of the reported deaths. Two of the people died in a hospital, hospital emergency department or SNF.

CRS: People receiving 24 hour supports in their own homes. People receiving continuous residential supports in their own homes, in most cases, are less medically involved than people living in other settings. Five or 2% of reported deaths occurred in this environment. Four of the people died in a hospital, hospital emergency department or hospice.

IHS: Similar to people living in CRS, however, this population does not require 24 hour support. As with CRS, people receiving individualized home supports in their own homes, in most cases, are less medically involved than people living in other settings. This year 9 or 3.6% of reported deaths occurred in this environment compared with 5.4% last year. Seven of the 9 died in the hospital, hospital emergency department, hospice or SNF.

STS: The higher mortality rate of 79.1 is not surprising as this larger campus setting serves a population of older adults (average age of 65.9 years). Twenty-five deaths were reported at STS this past fiscal year representing 10% of all DDS deaths. Last year the Training School accounted for 7.6% of all deaths. Twelve of the 25 people died in a hospital or hospital emergency department.

RC: Less than 2% of DDS consumers reside at DDS regional centers. Two RC residents died in FY 2015 accounting for 1% of all DDS deaths. One of the individuals died in a hospital or hospital emergency department.

SNF: Only 2% of people served by CT DDS live in a skilled nursing facility. This older (average age 66.5 years) and medically fragile population accounted for 74 or 29.7% of all reported deaths. People living in licensed nursing facilities had the highest mortality rate 177.5 per thousand. Fourteen percent (13.6%) of all DDS consumers over 65 years of age live in a skilled nursing facility. It is important to note that 27 of the 74 people died in a hospital or hospital emergency.

- Community Living arrangement (CLA): 24 hour support is provided with staff in small group home settings. People share an apartment or house also known as a group home.
- Community Companion Home (CCH): A family setting that is not the consumer's own family. CCH provider has received training and is licensed by DDS to provide services. (Formerly known as CTH, Community Training Home.)
- Continuous Residential Supports (CRS): 24 hours of support for consumers to live in their own home.
- Individualized Home Supports (IHS): Less than 24 hours of support for consumers to live in their own home. Staff support may be from a few hours a day to only a few hours a month depending on the support needs of the individual.
- Southbury Training School (STS): 24 hour support is provided in a large campus setting serving a population of older adults.
- Regional Center (RC): Regional Centers are facilities for over 16 people that provide 24 hour staffing.
- Skilled Nursing Facility (SNF): A Department of Public Health licensed nursing facility for people requiring skilled nursing level of care not licensed or funded by the Department of Developmental Services also known as a nursing home.

Issue Date: March 2016

Section Two Continued

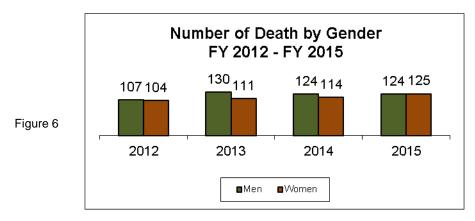

Mortality and Gender

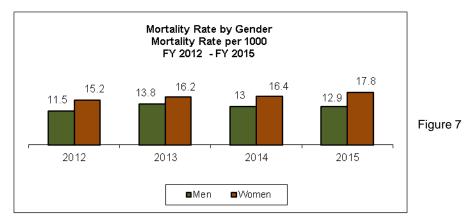

Table 1

Mortality Rate by Gender - 2015

GENDER	All Individuals Served by DDS	Total Number of Consumers	No. Deaths	Percentage of Deaths	Rate (No. Deaths Per 1000)
Men	58%	9,499	124	50%	13
Women	42%	6,829	125	50%	18
Total	100%	16,328	249	100%	15

In FY 2015 the number of females who died within the DDS was higher than the gender distribution served by the department and the number of males was lower.

This year the number of women's deaths was slightly higher than the number of men's deaths and, as with past years, women have a higher mortality rate.

Issue Date: March 2016

Section Two Continued

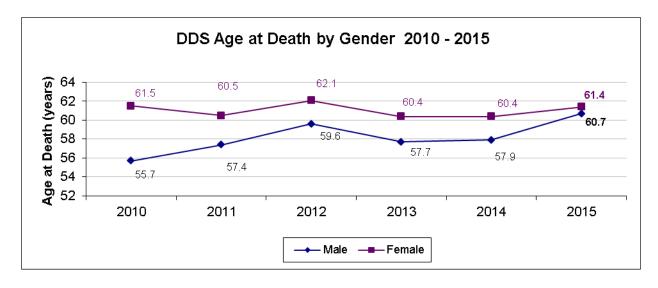

Mortality and Age

Table 2

Age of Death

Year	Men	Women	Average Age
CT DDS FY 2015	60.7	61.4	61.1
CT DDS FY 2014	57.9	60.4	59.1
CT DDS FY 2013	57.7	60.4	59
CT DDS FY 2012	59.6	62.1	60.8

Figure 8

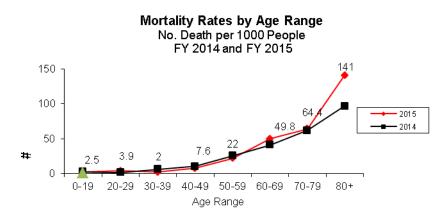

13

Issue Date: March 2016

Section Two Continued

Figure 9

The relationship between **age** and **mortality** demonstrates the expected trend, with the mortality rate increasing as people served by DDS get older. As seen in Figure 9, there is an increase in the mortality rate that begins early in the fifth decade of life that continues to increase with advancing age. This finding is consistent with previous CT DDS mortality rate by age data.

Table 3

Mortality Age Range Distribution Data FY 2015

AGE RANGE	# OF DEATHS	% OF DEATHS	MORTALITY RATE
Age 0-19	8	3.2%	2.5
Age 20-29	15	6%	3.9
Age 30-39	5	2%	2
Age 40-49	16	6%	7.6
Age 50-59	55	22%	22
Age 60-69	79	31.7%	49.8
Age 70-79	39	15.7%	64.4
Age 80+	32	12.9%	141
TOTAL	249	100%	

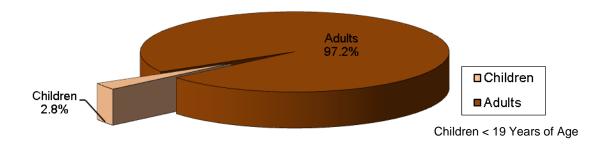

Mortality statistics for the DDS population in Table 3 reveal a progressive increase in the mortality rate as the age range increases.

Issue Date: March 2016

Section Two Continued

Figure 10

Deaths of Children and Adults

In FY15 seven children died. All of the children lived at home with their family.

Average Age and Average Age of Death 2015 80 72.1 69.3 65.9 66.7 70 63.7 66.5 61.8 61.4 60 49.6 48.7 49.3 44.6 50 41.8 39.67 38.4 40 26.7 30 20 10 0 STS CCH SNF CRS IHS CLA RC FAM Average Age of Death by Support Type □Average Age All Individuals by Support Type

Figure 11

The average age of death in the CT DDS population is 61.1. Almost all of the children served by DDS live at home with their family that translates into a much lower average age and age of death. Excluding children the average age of death in the CT DDS population is 62.7 years.

Issue Date: March 2016

SECTION THREE: DATA GENERATED BY THE CT DDS MORTALITY REVIEW PROCESS

IMPORTANT PLEASE NOTE:

THE INFORMATION PRESENTED IN THIS SECTION SUMMARIZES ONLY THOSE DEATHS THAT WERE REVIEWED BY THE NURSE INVESTIGATORS, REGIONALCOMMITTEE AND/OR STATE INDEPENDENT MORTALITY REVIEW BOARD IN FY 2015

THEREFORE, THE MORTALITY DATA WILL DIFFER FROM THE INFORMATION PRESENTED AND DISCUSSED IN SECTION TWO OF THIS REPORT

DDS NURSE INVESTIGATORS/MORTALITY COMMITTEE/BOARD REVIEWS = 149 cases (of total 249 deaths)

** 54 of the 149 cases reviewed were Abridged Reviews **

Community Hospice Support

The concept of end of life planning including hospice care has been embraced by the CT DDS and is routinely requested and provided for individuals served by DDS who live in all settings, including regional centers, Southbury Training School, community living arrangements, community companion homes, continuous residential supports, individualized home supports and family homes. This includes state of the art palliative and hospice care to provide end of life support, hope and comfort to individuals either in the home or in a hospital setting.

The use of hospice services allowed CT DDS to support people through the final stages of a terminal illness while remaining in their current residence. Thirty-one individuals received hospice services: 58% lived in a community living arrangement, 13% lived at the training school, 19% lived in a nursing home, 3% lived in individual home support, and 3% lived in continuous residential support. The average age of death for people receiving hospice services was 70.

Thirty-one people (33% of all reviewed deaths) received hospice supports *

Autopsies/Post Mortem Examinations

Autopsies are performed by the Office of the Chief Medical Examiner (OCME) for those deaths in which the OCME assumes jurisdiction or by hospital based pathology departments when DDS requests and the family consents to the autopsy.

GUIDELINES FOR REQUESTING AUTOPSIES

• certain sudden or unexpected deaths in which the cause of death is not due to a previously diagnosed condition or disease

- · deaths involving an earlier accident or trauma
- deaths involving questionable contributing factors
- cases involving an allegation of abuse or neglect

Number of post mortem examinations performed:	8 (5.4% of reviewed deaths)
Number of post mortem examination performed by CT OCME:	6

* Does not include Abridged Reviews

Issue Date: March 2016

Section Three Continued

Predictability

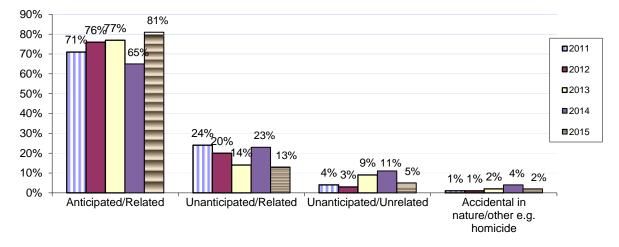

Analysis of the mortality review data indicates a relationship between an individual's pre-existing diagnosed medical condition(s) and his/her immediate cause of death (see Figure 12 below). In ninety-five percent of all deaths, an individual's immediate cause of death was related to a known or previously diagnosed medical condition/disease. For example: An individual who died as a result of a cardiac arrest had a medical history that included coronary artery disease.

Death was anticipated and related to a preexisting diagnosis:	81%
Death was unanticipated but related to a preexisting diagnosis:	13%
Death was unanticipated and unrelated to a preexisting diagnosis:	5%
Death was accidental in nature	2%

Two of the accidental deaths were included in the "anticipated and related to a preexisting diagnosis" percentage.

One of the accidental deaths was included in the "unanticipated and related to a preexisting diagnosis" percentage.

Figure 12

Predictability of Death 2011 - 2015

OF NOTE:

The CT DDS data illustrates that for people over the age of 65 the cause of death was directly related to a pre-existing or known medical condition 97% of the time.

Issue Date: March 2016

Section Three Continued

Context: Manner of Death for Cases Reviewed

According to Connecticut State law, the Office of the Chief Medical Examiner (OCME) determines the cause of death and the manner of death: *natural, accident, suicide, homicide* or *undetermined*.

In the State of Connecticut deaths for which the OCME does not assume jurisdiction, pronouncement is made by a private physician. In these cases the manner of death **must** be classified as natural. According to state statute any other manner of death must be determined by the OCME.

Of the 149 cases reviewed during FY 15, 146 (98%) were classified as **due to natural causes**. Three cases were determined to be the result of an accident.

Table 4

Manner of Death	No.	Percent
Natural	146	98%
Accident	3	2%
Total	149	100%

FY 15 Manner of Death

Cause of death for the deaths determined by the CT OCME to be accidental in nature:

Fall (2) Neck Compression (1)

Issue Date: March 2016

Section Three Continued

UNANTICIPATED/UNRELATED DEATHS:

Of the 7 deaths that were unanticipated and not related to a known condition 4 were due to cardiac arrest, 1 was due to bronchopneumonia, 1 was due to hypoxia/hypotension and 1 was due to intra-abdominal hemorrhage/arterial hemorrhage anastomosis.

ACCIDENTAL DEATHS

Two cases of accidental death were the result of a fall, one case of accidental death was the result of neck compression.

DNR

Per Connecticut State Statute, CT DDS has an established procedure which requires that **specific criteria must be met along with a special review process** for all withholding cardiopulmonary resuscitation (DNR) orders to be issued/implemented for persons who are placed and treated under the direction of the Commissioner of DDS. Documentation regarding end of life planning and withholding of cardiopulmonary resuscitation is required per CT DDS policy.

Do Not Resuscitate (DNR) orders are medically indicated when an individual's attending physician and another physician (second opinion) have diagnosed that an individual is in the final stages of a terminal disease or condition, or is permanently unconscious based upon appropriate tests and studies. This confirmation by the attending physicians that an individual has a terminal disease or condition is reviewed by DDS medical staff (Health Services Directors and in some cases Director of Health and Clinical Services).

For the 149 mortality cases reviewed in FY 2015

125 cases had a DNR order in place 91% of the DNR orders were formally reviewed by DDS 100% of the DNR orders met the established DDS medical criteria

In 9% of all cases in which a DNR was ordered by a medical practitioner DDS was <u>not</u> notified prior to the implementation of the DNR order as is required by DDS procedure. However, the DDS mortality review process determined that in every case the medical criteria to support the decision to initiate the DNR was met. DDS continues to provide written education and support to those agencies that fail to notify of a DNR implementation.

OF NOTE: Eighty-nine percent (89%) of DDS consumers residing in *skilled nursing facilities* had a DNR order in place at the time of their death.

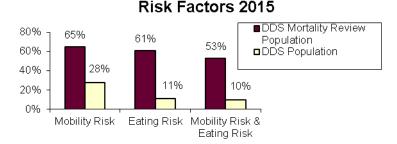

Issue Date: March 2016

Section Three Continued

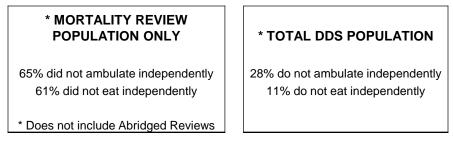

Risk Factors

Mobility impairments and dysphagia/swallowing risks are well known risk indicators that place individuals at significantly higher risk of morbidity and mortality. CT DDS mortality data has consistently demonstrated that people who require the need for special assistance when eating and those who cannot ambulate without assistance have a greater mortality rate. Therefore the CT DDS mortality review process carefully analyzes the presence or absence of these two risk indicators. Once again the FY 2015 data illustrates the relationship between these risk factors and mortality (see Figure 13 below).

It is well documented in the literature that the more compromised an individual's level of mobility, the greater the likelihood of death.^{3,9,10} CT mortality data supports the importance of mobility as an indicator of morbidity and mortality. In FY 2015, 62 (65.3%) of the deceased did not ambulate independently.

Of note: Information regarding the presence and/or risk of silent aspiration is not available and therefore is not included in the eating risk factor data.

	2013 2014		2015	Percent of	
	2013 20	2014	2010	Population	
Mild	4.1	5	2.6	45	
Moderate	4.2	4.7	3.9	30	Table 5
Severe	6.7	8.2	12	13	
Profound	20.6	23.5	22.9	7	

Level of Intellectual Disability and Mortality Rate

Table 5 above illustrates the relationship between an individual's level of intellectual disability and mortality rate. There is an inverse relationship between the level of intellectual disability and the mortality rate within the DDS population. Over the years, individuals with severe or profound intellectual disabilities have a higher mortality rate than those with moderate or mild intellectual disability.

Of note: Traditionally intellectual disabilities have been divided into four levels of severity based largely on IQ scores. Although this classification system is no longer used by CT DDS, data is included for longitudinal comparative purposes.

Issue Date: March 2016

Section Three Continued

Investigations

Office of Protection & Advocacy / Abuse Investigations Division

CT DDS must report <u>all</u> deaths to the Office of Protection and Advocacy for Persons with Disabilities Abuse Investigations Division (OPA/AID) which determines if abuse or neglect was involved in the death.

Of the 149 mortality cases reviewed by DDS, 8 cases were investigated by either the OPA/AID or the DDS through its Investigations Division when abuse or neglect is suspected to have contributed to a person's death. In several cases, deaths that were investigated by the Office of Protection and Advocacy were also referred to and investigated by the CT Department of Public Health.

Disposition of OPA/AID Cases				
Neglect substantiated	1			
Neglect not substantiated	0			
Cases still open	7			

In the cases where neglect was substantiated, the lack of supervision by direct care staff, delay in treatment, delay in recognition of a changing health condition, lack of programmatic safeguards and monitoring of an individual's health care status led to a <u>chain of events</u> that may well have contributed to the individual's death.

Department of Public Health

The CT Department of Public Health investigates the quality of care/practice by licensed practitioners and licensed healthcare facilities that include hospitals, long term care/nursing facilities, dialysis facilities, ambulatory care centers and outpatient surgical centers.

During FY 2015 seven (7) mortality cases were referred by the regional mortality committee or IMRB to the **State of Connecticut Department of Public Health** (DPH) Health Systems Regulation Division for further investigation by the Facilities and/or the Practitioner and Licensing Section.

Disposition of DPH Investigations

Practitioner Division Referrals-(0)

Pronouncement of Death (Location at Time of Death)

Location at Time of Death Hospital 47% CLA 17% SNF 16% 7% Hospital ER Hospice 5% STS 3% RC 1% IHS 1% CRS 1% CCH 1% 10% 20% 30% 50% 0% 40%

Figure 14

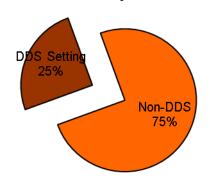

Figure 14 below depicts the location where death was pronounced.

KEY: Location of Death

- Hospital = Admission to the hospital as an inpatient, death occurred in the hospital.
- Hospital ER = Evaluated in hospital ER, died in ER while receiving treatment, not admitted to the hospital.
- All Other = Died where the person lived or worked or other community location.

As can be seen in Figure 15 to the right, 75% of all deaths reviewed by the mortality review committee during FY 15 occurred outside of a DDS operated, licensed or funded residential setting, this represents an decrease in the number of people dying outside of a DDS setting compared to FY 14 (79%).

Issue Date: March 2016

Section Three Continued

SUMMARY OF MORTALITY DATA for the 149deaths <u>that were reviewed</u> in FY15

- •100% of required cases were reviewed **Regionally**.
- 24% of all cases were reviewed by the IMRB.
- 33% of the individuals received Hospice supports prior to their deaths. *
- **5%** of the individuals had **Autopsies** performed.
- 94% of all deaths were **Related** to an existing medical diagnosis.
- 84% of the individuals had a **DNR** order in place at the time of death.
- 53% of the individuals had two Risk Factors (non-ambulatory and could not eat without assistance). *
- 98% of the deaths reviewed were due to **Natural** causes.
- 3 number of deaths that were classified as **Accidental**.
- 7 number of referrals to **Department of Public Health**.
- 8 number of referrals to Office of Protection & Advocacy Abuse Investigation Division.
- number of cases **Neglect** was substantiated by OPA or DDS.

^{*} Does not include Abridged Reviews

Issue Date: March 2016

SECTION FOUR: MORTALITY TRENDS CT DDS

For the past fourteen years the Connecticut Department of Developmental Services has collected, reviewed and analyzed mortality data.

Data collection has focused on mortality and residence, mortality and age, mortality and gender and leading causes and factors associated with death.

The consistency of the cumulative data/statistics from one year to the next seems to validate and support the trends and findings identified within the intellectual disability population group served by the State of Connecticut Department of Developmental Services.

Issue Date: March 2016

Section Four Continued

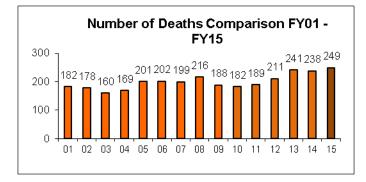

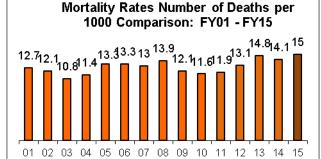

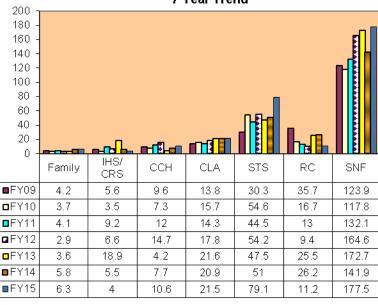

Figure 16

Figure 17

Figures 16 and 17 depict on an annual basis the number of deaths and the average death rate for FY 2001 – 2015 within the population served by DDS. The death rate average over the fifteen year period of time is 12.87/1000 people.

Figure 18

Mortality Rate by Where People Live 7 Year Trend

Figure 18 (to the left) compares the death rate (the number of deaths per 1000 persons served) for the past seven (7) fiscal years by type of support.

Historically, individuals residing in residences (SNF, campus) that require more intensive nursing supports and medical oversight due to their compromised health status have a greater death rate than people living in other types of settings.

Caution must be exercised in reviewing this data since the actual number of deaths in some of these support settings are relatively small.

■FY09 ■FY10 ■FY11 ₽FY12 ■FY13 ■FY14 ■FY15

Table 6

Mortality and Gender (2006 - 2015)

Year	# Deaths Men	# Deaths Women	Mortality Rate Men	Mortality Rate Women
2006	102	100	11.86	15.11
2007	100	99	11.61	15.13
2008	122	94	13.8	14
2009	103	85	11.54	12.78
2010	100	82	11.11	12.27
2011	108	81	11.88	12.01
2012	107	104	11.57	15.23
2013	130	111	13.82	16.16
2014	124	114	13	16.4
2015	124	125	12.9	17.8

With the exception of this year, over the past nine years more men died annually than women and the mortality rate for women exceeded the mortality rate for men.

Figure 19

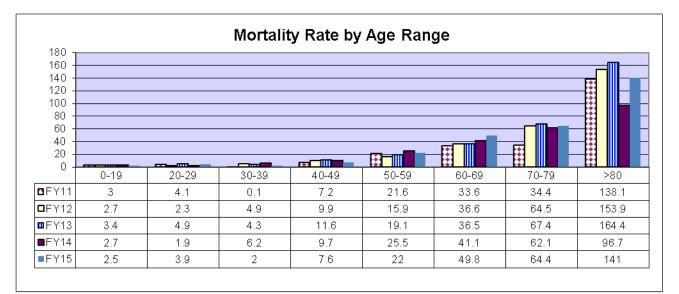

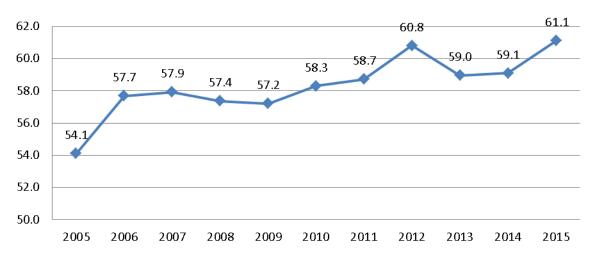

Figure 19 (above) illustrates mortality rate by age range. The data over the past five fiscal years reveals a consistent pattern of increasing mortality rates with each successive decade of life. The mortality rates increase markedly for adults who are in their fifth decade of life. The data also demonstrates that within each age range there is some fluctuation in mortality rates from one year to the next.

Issue Date: March 2016

Section Four Continued

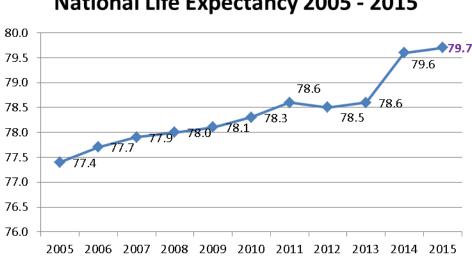

Figure 20

CT DDS Average Age of Death

For 8 out of the last 10 fiscal years the average age of death has held in a tight range within the fifth decade of life. This is lower than the national life expectancy (79.7)¹ and the Connecticut life expectancy (80.8). ^{11,15}

Table 7 depicts the percentage of deaths within various support types over a ten year period of time.

Although there is some variability, the percentage of DDS deaths that occur in SNF's and CLA's is greater than other settings.

Figure 22

End of life planning and hospice care has been a hallmark of the CT DDS system as noted above. Where appropriate, end of life planning and support services were provided prior to death with the individual's team involved in the planning process. The continued integration of hospice supports into the person's support plan can be attributed to mortality review findings and recommendations. Case managers, nurses and other team members actively seek out hospice services in cases where death is anticipated as a result of a terminal illness.

Issue Date: March 2016

SECTION FIVE: LEADING CAUSES OF DEATH

This section discusses cause of death data for people served by the CT DDS. The information used to determine the cause of death for each individual was gathered from the DDS Death Report Form and/or the Certificate of Death.* In addition the documented cause of death is also reviewed by the regional mortality committee and/or IMRB during the mortality review process.

Table 8

Leading Cause of Death Data CT DDS (based on the 2015 fiscal year)

•				
30.9%	of deaths were due to	Heart Disease	including	Acute MI, CHF, Dysrhythmias, Pulmonary HTN, Asystole, Cardiomyopathy
21.2%	of deaths were due to	Respiratory Disease	including	Respiratory Failure, Pulmonary Embolism, Influenza, Multi-System Failure, COPD, ARDS, Asthma
10.4%	of deaths were due to	Cancer	including	Wide variety of primary origin sites
6.4%	of deaths were due to	Sepsis	including	Septicemia, Bacterial, Shock, Urosepsis, Peritonitis
5.6%	of deaths were due to	Aspiration Pneumonia	including	Aspiration Pneumonia
4.4%	of deaths were due to	Alzheimer's Disease	including	Dementia
3.6%	of deaths were due to	Pneumonia	including	Pneumonia
2.4%	of deaths were due to	Brain Disorders	including	TBI, Subdural Hematoma
1.6%	of deaths were due to	Digestive System	including	Intestinal Obstruction, Volvulus
1.6%	of deaths were due to	Renal/Kidney	including	Renal Failure chronic and acute

The 10 leading causes of death in 2015 (Table 8) are noted above. Heart disease remains the leading cause of death for the DDS population with respiratory disease, cancer, sepsis and aspiration pneumonia rounding out the top five.

Heart Disease

According to the Centers for Disease Control¹⁶ "The term 'heart disease' refers to several types of heart conditions. The most common type in the United States is coronary artery disease, which can cause heart attack, angina, heart failure, and arrhythmias."

* CT DDS receives certificates of death and death reports for all deaths reviewed.

Issue Date: March 2016

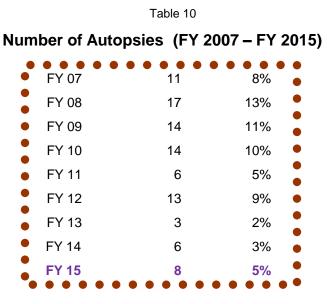

Section Five Continued

Table 9

Location Where Death Pronounced

(FY 2006 - 2015)

											10 Year
Location	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	Total
Hospital	58	63	71	71	61	49	56	67	87	70	653

Hospice	2	2	1	5	0	5	7	7	2	7	38
Other	3	3	5	4	1	1	2	1	5	3	28

As noted in Table 9 above the number of autopsies performed vary from one review year to the next. This variation can be attributed to the number of deaths in a given year, the specific death related circumstances and requests for consent post mortems by family members. The number of post mortem examinations during FY 2015 increased from FY 2014 (5% vs. 3%).

Issue Date: March 2016

Section Five Continued

Table 11 provides an in-depth analysis of the cardiac deaths that were reviewed as part of the DDS mortality review process.* In FY 15 more men died as a result of heart disease than women and women lived longer than men.

Table 11

	Number of	Number of	Average Age	Average Age	
Year	Male Deaths	Female Deaths	Male	Female	Average Age
FY 13	28	17	62.7	62.5	62.6
FY 14	32	15	60.8	66.6	62.7
FY 15	18	13	62.7	67	64.5

Deaths Due to Heart Disease

As in the general population, many of the individuals served by DDS who died as a result of cardiovascular disease had at least one or more identified risk factors prior to their death such as high blood cholesterol, high blood pressure, coronary artery disease, peripheral vascular disease, congenital heart defects, congestive heart failure, physical inactivity, obesity and diabetes mellitus.

In the general population 80% of people who die of coronary heart disease are 65 or older ¹⁷ as compared with only 42% of individuals in the CT DDS population. Of the remaining cardiac related deaths in the DDS population group: Fourteen percent (14%) of the cardiac deaths occurred prior to the age of 50 years and 43% percent of the cardiac deaths occurred between the ages of 50-65.

There is a greater prevalence of congenital heart conditions and atrioventricular septal defects found in people with Down syndrome.¹² CT DDS data reveals that the incidence of cardiac deaths reported for people with Down syndrome was higher than that of the DDS population.

Respiratory Disease

The 2015 leading cause of death data demonstrates the significant impact of respiratory disease in the CT DDS population.

An analysis of the cases reviewed by the CT DDS mortality review process revealed that more men died as a result of respiratory disease/aspiration pneumonia/pneumonia than women and they had a lower age of death.*

12

FY 15	22	19	58.4	64.6	61.3

* Abridged Reviews Excluded

Issue Date: March 2016

Section Five Continued

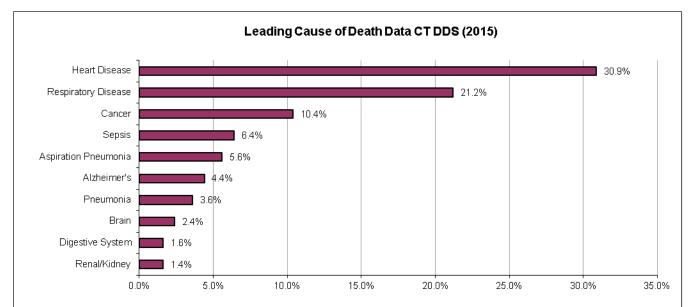

Figure 23

All diseases of the lung/respiratory system due to an identified respiratory disease process such as acute bronchitis, emphysema, asthma, pulmonary embolism, respiratory failure, COPD, ARDS, pneumonia and aspiration pneumonia were responsible for 30.5 of all deaths in 2015 which was slightly lower than the deaths caused by cardiac disease (30.9%).

The frequency of respiratory disease (specifically pneumonia and aspiration pneumonia) and the resultant high mortality rate seem to be closely related to the risk factors of immobility and dysphagia or swallowing dysfunction, restrictive pulmonary function due to curvature of the spine, cerebral palsy, genetic syndromes, hiatal hernia and other anatomical anomalies which are prevalent in the population served by DDS.

Alzheimer's Disease

Alzheimer's disease is the sixth leading cause of death (4%) in the CT DDS leading cause of death statistics. During the mortality review process it was determined that in 21% of the 95 deaths*, the person had a diagnosis of Alzheimer's disease at the time of their death.

^{*} Abridged Reviews excluded

Based on 2015 Fiscal Year Data

Table 13 compares the top ten leading causes of death with CT DDS data from previous years.* Heart disease remained as the leading cause of death in the CT DDS population. There were some changes in the cause of death rankings compared to the 2014 data. For example: Sepsis has become the forth leading cause of death with aspiration pneumonia falling to the fifth leading cause of death and pneumonia falling to seventh leading cause of death. Brain disorders is the eighth leading cause of death followed by digestive system and kidney/renal tied for ninth and tenth leading causes of death. Respiratory disease, aspiration pneumonia and pneumonia as a cause of death once again represented over 1/3 of all CT DDS deaths.

* 2014, 2013 and 2012 data is based on fiscal year data - the previous years' data was based on calendar year data.

Leading Causes of Death for People with Down Syndrome *

Table 14

FY15

Primary Cause of Death/Down Syndrome

Cardiac Arrest	3
Alzheimer's Disease	2
Respiratory Failure	1
Aspiration Pneumonia	1
Pneumonia	1
Sepsis	1
Total	9

This year cardiac arrest was the leading cause of death for persons with Down syndrome (33%). (Table 14)

Since 2006 aspiration pneumonia and respiratory failure have accounted for 49% of all deaths for people with Down syndrome. (Table 15)

DDS mortality findings are also in line with other research studies that indicate that the life expectancy among adults with Down syndrome is about 55 years of age.^{5,6,7,8} The average age of death for people with Down syndrome in the CT DDS system is 57.9.

Based on the DDS Down syndrome and death data (Table 16) there is no appreciable difference in lifespan for those individuals with or without Alzheimer's disease.

Although Alzheimer's disease was rarely documented as a cause of death the majority of people with Down syndrome had a diagnosis of Alzheimer's disease at the time of their death (67%). This data supports other research studies that found increased prevalence of Alzheimer's disease in people with Down syndrome.^{4,5}

Endometrial	1	53.4
Esophagus	1	59.5
Unknown Origin	1	84.8
Urethra	1	64.4
TOTAL	26	61.7

In FY 2015 cancer was the third leading cause of death for people supported by the CT DDS

For FY 15 the distribution of cancers in men were: Leukemia (3), colon (2), lung (2), lymphoma (2), esophagus (1), pancreas (1), stomach (1), urethra (1).

The FY 15 distribution of cancers in women were: Pancreas (3), liver (2), bladder (1), breast (1), cholangio (1), colon (1), endometrial (1), non-Hodgkins lymphoma (1), stomach (1), unknown origin (1).

The average age of death for all cancer victims (62.4 years) was above the average age of death for all CT DDS deaths (61.1 years).

The rate of death due to cancer in the CT DDS population (1.6/1000) is lower than the rate in the state of CT and nationally.^{13,14}

Over the past 10 years cancers have represented 10% of CT DDS mortalities.

SECTION SIX: BENCHMARKS

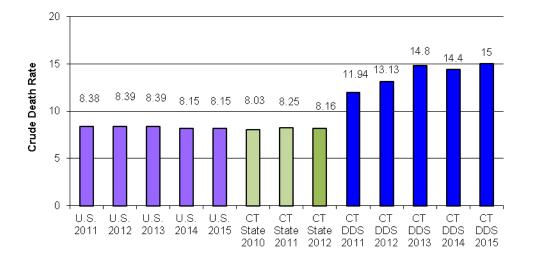

Mortality Rate Comparison

Benchmarks are standards by which similar items can be compared and allow the reader to place findings in context. Thus, the use of benchmarks including comparative data from other populations is an important mechanism for helping to understand analytical findings and trend data such as those presented in this report.

There are few relative benchmarks (data from other state agencies) available for use in comparing mortality data for persons with ID/DD and when data does exist, there may be differences in the way the data is reported and analyzed.

The overall CT DDS crude death rate of 15/1000 is higher than the rate of 8.16 in Connecticut (2012) and the rate of 8.15 in the general United States population (2015).^{1,13} This would be expected due to the many health and functional complications associated with intellectual disabilities.

Figure 24

Overall Death Rate Comparison of Average Death Rates/1,000

While comparison of CT DDS mortality data with benchmarks from the general population (state and national) are of interest, the comparison should be made with caution recognizing there are differences in population characteristics, adjusted age and statistical methods etc.^{1,13,14}

In this report we use the term "average death rate" to reflect what is more commonly referred to as the "crude" death rate in mortality and epidemiological research. It is a measure of how many people out of every thousand served by CT DDS died within the fiscal year. It is determined by multiplying the number of individuals who died during the year times one thousand and dividing this number by the total number of individuals served by DDS during the same period of time.

Issue Date: March 2016

Section Six Continued

Leading Causes of Death Benchmarks: National, State of CT and CT DDS

Table 19 compares the top ten leading causes of death for people served by CT DDS with vital statistics benchmarks data for the State of Connecticut, and United States. Year over year data comparisons continue to demonstrate consistency in the leading causes of death data.^{1,13,14}

<u>Heart Disease</u>: (Due to various cardiac diagnoses) is the number one cause of death for all of the referenced populations. As in past years the prevalence of cardiac disease is slightly greater in the DDS population at 27.4% versus 23.9% in the CT general population and 23.5% nationally.

<u>Respiratory Diseases</u>: Is the second leading cause of death in the CT DDS population (24.9%). This category which includes influenza causes death in the CT DDS population at a rate 4 times the rates reported in the CT and national vital statistics data base (4.5%) and (5.7%) respectively.

<u>Cancer</u>: Is the third leading cause of death in the CT DDS population responsible for 9.9% of deaths. Unlike the other mentioned leading causes of death, cancer in DDS occurs less frequently in the CT DDS population than in the CT (22.3%) and national (22.5) general populations.

Septicemia: Originating from various sites and usually acute in onset is the forth leading cause of death in the CT DDS population resulting in 6.6% of deaths. Septicemia is the ninth leading cause of death in the CT general population (1.9%) and not reflected in the national vital statistics as one of the top ten leading causes of death.

Aspiration Pneumonia: Is the fifth leading cause of death in the DDS population (6.2%) and as mentioned earlier in this report is unique to the ID/DD population due to many factors including the prevalence of dysphagia, Down syndrome, Alzheimer's disease and enteral feedings. In comparison, aspiration pneumonia is not reflected in the state of CT or national vital statistics as one of the top ten leading causes of death.

Pneumonia: Is the sixth leading cause of death accounting for 4.1% of CT DDS deaths compared to <3% in the US population. Many of the multiple co-morbidities found in the CT DDS ID/DD population such as cerebral palsy, congenital syndromes, epilepsy, GERD, hiatal hernia, and immuno-deficiency disorders result in a compromised pulmonary system that makes this population vulnerable for developing pneumonia.

<u>Alzheimer's Disease</u>: In calendar year 2015 the percent of deaths resulting from Alzheimer's Disease in the CT DDS system (3.3%) was the seventh leading causes of death and was higher than the percentage of Alzheimer's Disease deaths in the CT general population (2.8%) and the same as in the 2013 US population (3.3%).

<u>Caution</u>: While comparison of CT DDS mortality data with benchmarks from the general population (state and national) are of interest, they are not very practical for direct comparison purposes due to differences in population characteristics, adjusted age and statistical methods etc. For example, the added medical health concerns (co-morbidities) inherent in people with intellectual disabilities are related to a greater mortality rate. Also, many individuals in the CT DDS system had a diagnosis of dysphagia and or gastro esophageal reflux disease at the time of their death. Both of which have been linked to aspiration pneumonia, respiratory failure, sepsis and death in the ID/DD population.^{2,9}

Seasonal variations in mortality require consistency when conducting comparative analysis and, therefore, the previous data regarding leading causes of death is based on the calendar year 2015. Leading cause of death data for the calendar year will allow benchmark data from CT DDS to be consistent with Connecticut and national mortality benchmarks developed for the general population calendar year.

Issue Date: March 2016

SECTION SEVEN: SUMMARY MORTALITY CASE REVIEW FINDINGS

The CT DDS mortality review process has evolved into a powerful quality assurance system for ensuring the delivery of optimal health care oversight and services in the CT DDS. The regional and state recommendations regarding health care oversight and standardization of health care practices for professional and non-professional staff have improved basic health care services and mitigated health related risk. The impact of mortality findings and recommendations has been observed within DDS and has extended to community based health care providers including practitioners in private practice licensed nursing facilities, acute care hospitals, hospice providers, health and dental clinics and other state agencies.

Table 20

Mortality Case Review Summary (FY 2015)

Death Reviewed by Regional Committees *		Cases Closed at Regional Level **		QA Cases Closed by Region **	Total Cases Reviewed by IMRB **
149	135 (76%)	70 (62%)	36 (32%)	7 (10%)	43 (38%)

The table above, provides a summary of all deaths reviewed by the CT DDS Mortality Review Committees. Seventy-six percent of the 149 cases reviewed were closed by the local regional mortality committees. The regional committees referred 43 mortality cases to the state Independent Mortality Review Board for further review. The reasons for the case referrals are noted in Table 21 (below).

The CT DDS Mortality Review Process requires that at least 10% of all cases that are closed at the regional level are reviewed by the Independent Mortality Review Board (IMRB) for quality assurance purposes. This year the IMRB reviewed 10% of cases closed by regional mortality committees.

Section Seven Continued

II. General Community Awareness Findings

These are general findings that we believe the community at large should be aware of.

- 1. Individuals living in their own home or receiving individualized supports benefit from health education and training that focuses on health promotion and disease prevention.
- 2. Post mortem examinations are a valuable tool to confirm the cause and manner of death in cases where the cause of death was not immediately determined.
- 3. As individuals age, the "aging in place phenomenon" within the ID/DD population presents a future challenge for the CT DDS service system and for all care providers, but must be embraced through creative solutions and strengthened partnerships.
- 4. The aging Down syndrome population requires specialized and comprehensive supports.
- 5. CT DDS has sustained quality in the area of water temperature safety. There have been no mortality events related to scalding. The anti scalding devices continue to assist in ensuring maximum water temperature safety practices.

APPENDICES

Appendix A:	Overview of DDS Population
-------------	-----------------------------------

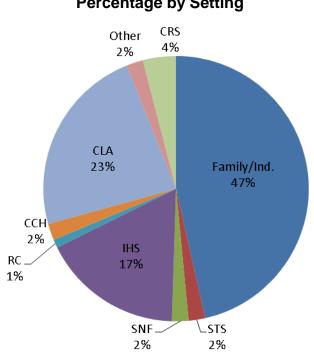

Appendix B: DDS Consumers by Residential Setting DDS Population by Age

- Appendix C: Percentage Population by Age Ranges Level of Intellectual Disability
- Appendix D: Age Category and Residence Consumers by Program Type

APPENDIX A

Overview of DDS Population

Intellectual Disability is a developmental disability that is present in about 1% of the Connecticut population. In order for a person to be eligible for DDS services they must have significant deficits in intellectual functioning and in adaptive behavior, both before the age of 18 yrs. As of June 30, 2015 **16,328** individuals with intellectual disability were being supported by the department.

Overview of DDS Population

Almost half of the people served by CT DDS live at home with their family. Almost one third receive support services provided in community living arrangements (CLAs), community companion homes (CCH), regional centers (RC) and a campus program, Southbury Training School (STS). Approximately 19% of the DDS population receive individualized home supports (IHS) or continuous residential supports (CRS). The remainder (4%) of the people are supported by other state or local government and/or private entities including licensed nursing facilities (SNF), the CT Department of Mental Health and Addiction Services, the CT Department of Children and Families, the CT Department of Corrections and residential schools.
