Long. 72-22-31.83 (-72.37550833)

Dear Ms. Bachman:

AT&T Wireless currently maintains six (6) antennas at the 90-foot level of an existing 180 foot self-supported tower located at 130 Bald Hill Road in Tolland. The tower is owned by the Tolland County Mutual Aid. The property is owned by the Tolland County Mutual Aid. AT&T Wireless now seeks to relocate 3 existing antennas, install 3 additional antennas, install a new DC-12 box, add a new surge suppression dome, remove 3 existing RRU-12 units, relocate 6 existing TMAs, install 6 new RRUs, install 2 new DC cables at the 90-foot level of the tower.

The facility was approved by the Connecticut Siting Council in EM-AT&T-142-140127 on February 14, 2014. Five (5) conditions were enumerated in the Council's decision: 1) Any deviation from the modification as specified in the Notice and supporting documentation shall render the acknowledgement invalid: 2) Any material changes to the modification as proposed shall require the filing of a new Notice with the Council; 3) Not less than 45 days after the completion of construction the Council shall be notified in

writing that the construction has been completed; 4) the validity of the action shall expire one year from the date of the letter; and 5) the applicant may request an extension of time beyond the one year deadline provided that such a request is submitted to the Council not less than 60 days prior to the expiration.

Modifications to the facility were approved by the Connecticut Siting Council in EM-AT&T-142-17202 on March 6, 2017. Six (6) conditions were enumerated in the Council's decision: 1) Any deviation from the modification as specified in the Notice and supporting documentation shall render the acknowledgement invalid: 2) Any material changes to the modification as proposed shall require the filing of a new Notice with the Council; 3) Within 45 days after completion of construction the Council shall be notified in writing that the construction has been completed; 4) any nonfunctioning antenna and associated mounting equipment on this facility owned and operated by AT&T shall be removed with 60 days of the date the antenna ceased to function; 5) the validity of the action shall expire one year from the date of the letter; and 6) the applicant may request an extension of time beyond the one year deadline provided that such a request is submitted to the Council not less than 60 days prior to the expiration

Please accept this letter as notification pursuant to Regulations of Connecticut State Agencies section 16-50j-73 for construction that constitutes an exempt modification pursuant to RCSA section 16-50j-72(b)(2). In accordance with RCSA section 16-50j-73, a copy of this letter and attachments is being sent to the Steven Werbner, the Tolland Town Manager; to Heidi Samokar, the Tolland Director of Planning & Community Development, as well as to Tyler Millix, the Executive Director of Tolland County Mutual Aid, the tower owner and to Tyler Millix, the Executive Director of Tolland County Mutual Aid, the property owner.

The planned modifications to the facility fall squarely within those activities expressly provided for in RCSA section 50j-72(b)(2).

1. The proposed modifications will not result in an increase in height of the existing structure.
2. The proposed modifications will not require an extension of the site boundary.
3. The proposed modifications will not increase noise levels at the facility by six decibels or more, or to levels that will exceed state and local limits.
4. The operation of the replacement antennas will not increase radio frequency emissions at the facility to a level at or above the Federal Communications Commission safety standard.
5. The proposed modifications will not cause a change or alteration in the physical or environmental characteristics of the site.
6. The existing structure and its foundation can support the proposed loading.

Emissions Analysis for Site: **CT5331 – Tolland Central**

Centerline Communications, LLC ("Centerline") was directed to analyze the proposed AT&T facility located at **130 Bald Hill Road, Tolland, CT**, for the purpose of determining whether the emissions from the Proposed AT&T Antenna Installation located on this property are within specified federal limits.

All information used in this report was analyzed as a percentage of current Maximum Permissible Exposure (% MPE) as listed in the FCC OET Bulletin 65 Edition 97-01and ANSI/IEEE Std C95.1. The FCC regulates Maximum Permissible Exposure in units of microwatts per square centimeter (μW/cm2). The number of $\mu W/cm^2$ calculated at each sample point is called the power density. The exposure limit for power density varies depending upon the frequencies being utilized. Wireless Carriers and Paging Services use different frequency bands each with different exposure limits, therefore it is necessary to report results and limits in terms of percent MPE rather than power density.

All results were compared to the FCC (Federal Communications Commission) radio frequency exposure rules, 47 CFR 1.1307(b)(1) – (b)(3), to determine compliance with the Maximum Permissible Exposure (MPE) limits for General Population/Uncontrolled environments as defined below.

General population/uncontrolled exposure limits apply to situations in which the general population may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Therefore, members of the general population would always be considered under this category when exposure is not employment related, for example, in the case of a telecommunications tower that exposes persons in a nearby residential area.

Population exposure to radio frequencies is regulated and enforced in units of microwatts per square centimeter ($\mu W/cm^2$). The general population exposure limits for the 700 and 850 MHz Bands are approximately 467 $\mu W/cm^2$ and 567 $\mu W/cm^2$ respectively. The general population exposure limit for the 1900 MHz (PCS), 2100 MHz (AWS) and 2300 MHz (WCS) bands is 1000 $\mu W/cm^2$. Because each carrier will be using different frequency bands, and each frequency band has different exposure limits, it is necessary to report percent of MPE rather than power density.

Occupational/controlled exposure limits apply to situations in which persons are exposed as a consequence of their employment and in which those persons who are exposed have been made fully aware of the potential for exposure and can exercise control over their exposure. Occupational/controlled exposure limits also apply where exposure is of a transient nature as a result of incidental passage through a location where exposure levels may be above general population/uncontrolled limits (see below), as long as the exposed person has been made fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

Additional details can be found in FCC OET 65.

CALCULATIONS

Calculations were performed for the proposed AT&T Wireless antenna facility located at **130 Bald Hill Road, Tolland, CT**, using the equipment information listed below. All calculations were performed per the specifications under FCC OET 65. Since AT&T is proposing highly focused directional panel antennas, which project most of the emitted energy out toward the horizon, all calculations were performed assuming a lobe representing the maximum gain of the antenna per the antenna manufactures supplied specifications, minus 10 dB, was focused at the base of the tower. For this report the sample point is the top of a 6-foot person standing at the base of the tower.

Per FCC OET Bulletin No. 65 - Edition 97-01 recommendations to achieve the maximum anticipated value at each sample point, all power levels emitting from the proposed antenna installation are increased by a factor of 2.56 to account for possible in-phase reflections from the surrounding environment. All power values expressed and analyzed are maximum power levels expected to be used on all radios.

All emissions values for additional carriers were taken from the Connecticut Siting Council (CSC) active MPE database. Values in this database are provided by the individual carriers themselves

For each sector the following channel counts, frequency bands and power levels were utilized as shown in *Table 1*:

Technology	Frequency Band	Channel Count	Transmit Power per Channel (W)
UMTS	850 MHz	1	30
UMTS	1900 MHz (PCS)	1	30
LTE	700 MHz	2	60
LTE	2300 MHz (WCS)	4	60
LTE	1900 MHz (PCS)	4	60

Table 1: Channel Data Table

The following antennas listed in *Table 2* were used in the modeling for transmission in the 700 MHz, 850 MHz, 1900 MHz (PCS) and 2300 MHz (WCS) frequency bands. This is based on feedback from the carrier with regards to anticipated antenna selection. Maximum gain values for all antennas are listed in the Inventory and Power Data table below. The maximum gain of the antenna per the antenna manufactures supplied specifications, minus 10 dB, was used for all calculations. This value is a very conservative estimate as gain reductions for these particular antennas are typically much higher in this direction.

Summary

All calculations performed for this analysis yielded results that were **within** the allowable limits for general population exposure to RF Emissions.

The anticipated maximum composite contributions from the AT&T facility as well as the site composite emissions value with regards to compliance with FCC's allowable limits for general population exposure to RF Emissions are shown here:

AT&T Sector	Power Density Value (%)
Sector A:	10.33 %
Sector B:	9.54 %
Sector C:	10.33 %
AT&T Maximum Total (Sectors A & C):	10.33 %
Site Total:	17.19 %
Site Compliance Status:	**COMPLIANT**

The anticipated composite MPE value for this site assuming all carriers present is **17.19 %** of the allowable FCC established general population limit sampled at the ground level. This is based upon values listed in the Connecticut Siting Council database for existing carrier emissions.

FCC guidelines state that if a site is found to be out of compliance (over allowable thresholds), that carriers over a 5% contribution to the composite value will require measures to bring the site into compliance. For this facility, the composite values calculated were well within the allowable 100% threshold standard per the federal government.

Objective:

The objective of this report is to determine the capacity of the existing 180' lattice tower structure at the subject facility for the final wireless telecommunications configuration, per the applicable codes and standards.

Introduction:

Maser Consulting P.A. has performed limited field observations on July 26, 2016 to verify the existing condition of the structure and to locate and quantify the existing wireless appurtenances where possible. Maser Consulting P.A. has reviewed the following documents in completing this report:

- RFDS 1789103 provided by Empire Telecom, dated December 9, 2017
- Previous Tower Analysis prepared by Maser Consulting Connecticut, dated February 9, 2017
- Previous structural analysis prepared by Malouf Engineering Professionals, dated August 30, 2016

The existing **AT&T** equipment is supported on an existing 180' lattice tower structure. The main legs are constructed of pipes and the diagonals, horizontals are constructed of angle members. This report is based only upon this information, as well as the information obtained in the field.

Discrete and Linear Appurtenances:

Maser Consulting Connecticut understands the existing & proposed **AT&T** loading to be as follows:

- *(3) Kathrein 80010121 Antennas (Existing)*
- *(3) KMW AM-X-CD-16-65-OOD-RET Antennas (Existing)*
- *(3) Ericsson RRUS-11 (Existing)*
- **(2) Qunitel QS66512-2 Antennas (Proposed)**
- **(1) CCI TPA-65R-LCUUUU-H8 Antenna (Proposed)**
- **(3) Ericsson RRUS-32 B2 (Proposed)**
- **(3) Ericsson RRUS-32 (Proposed)**
- **(1) Raycap DC6 (Proposed)**
- *(1) Raycap DC6 (Existing)*
- *(6) Powerwave LGP21401 TMAs (Existing)*
- *(1) KRECU CO-41AN antenna (Existing)*
- *(6) Coax Cables (Existing)*
- *(1) Fiber Cable (Existing)*
- *(2) DC Trunk Cables (Existing)*
- **(2) DC Trunk Cables (Proposed)**

Note: The overall antenna loading is found in the appendix A of this report.

Codes, Standards and Loading:

Maser Consulting Connecticut utilized the following codes and standards:

- 2016 CT State Building Code and All Subsequent Amendments
- Structural Standards for Antenna Supporting Structures and Antennas ANSI/TIA-222-G
    - Nominal Wind Speed – 97 mph (Per CT Building Code)
    - Exposure Category – B
    - Ice Thickness – 1”
    - Structure Class – II
    - Topographic Category – 1

Analysis Approach & Assumptions:

The analysis approach used in this structural analysis is based on the premise that if the existing lattice tower is structurally adequate to support the existing and proposed equipment per the aforementioned codes and standards, or if the increase in the forces in the structure are deemed to be negligible or acceptable, then the proposed equipment can be installed as intended. TNX, a 3D finite element modeling and analysis program, was used to determine the capacity and usage of the existing antenna support frame.

The following assumptions were utilized in this report:

- Structural Steel Pipes are constructed of A53 Grade B Steel.
- The existing tower is constructed to plumb and is properly maintained with no structural deficiencies and deteriorations.
- It is assumed that the telecommunication equipment supports, antenna supports, and existing structure have been designed by a registered licensed professional engineer for the existing loads acting on the structure, as required by all applicable codes, prior to the proposed modifications listed within this report.
- It is assumed that information provided by the client regarding the structure itself, the antenna models, feed lines, and other relevant information is current and correct.
- It is assumed all other existing appurtenances, antennas, cables, etc. belonging to others have been installed and supported per code and per specifications so as not to damage any existing structural support members, and that any contributing loads from adjacent equipment has been taken into consideration for their design.
- Proposed equipment and locations should not deviate from the proposed locations noted herein and shown on the associated Maser Consulting Connecticut final Construction Drawings.

Calculations:

The Tower Analysis calculations are found in **Appendix A** of this report.

The maximum factored foundation loads have been calculated for the proposed loading configuration described above. These reactions have been compared to the previous foundation reactions calculated in the above reference passing structural report completed by Malouf Engineering, Inc. Since the original reactions are based upon and Allowable Stress Design procedure, the reactions have been multiplied by a 1.35 factor for comparison to the reactions determined in accordance with ANSI/TIA-222-G Section 15.5.1, as follows:

Maximum Base Reactions	Previous Malouf Calculated Reactions EIA/TIA-222-F	Factored Malouf Reactions EIA/TIA-222-F (x1.35)	Current Analysis ANSI/TIA-222-G	Percentage Comparison
Moment	3,140 (k-ft)	4,239 (k-ft)	3,185 (k-ft)	**75.1%**
Shear	34 (kips)	45.9 (kips)	35.4 (kips)	**77.1%**
Compression	160 (kips per leg)	216 (kips per leg)	161 (kips per leg)	**74.5%**
Uplift	123 (kips per leg)	166 (kips)	129 (kips per leg)	**77.7%**

Conclusion:

The existing tower structure was analyzed for the loading in the applicable codes and standards. The tower structure has been determined to be structurally **ADEQUATE** to support the proposed and existing antennas, based upon the aforementioned assumptions.

The tower structure has been determined to be stressed to a maximum of **89%** of its structural capacity with the maximum usage occurring at the diagonal members within section height 80'-90'. The bolt connections are stressed to a maximum of **75.3%** of their capacity.

Additionally, our structural analysis indicates that under the proposed conditions noted above, the existing 180' self-support tower foundation in its current condition will have a reduced load impact on the existing foundations as compared to the previous design values established by the Malouf Engineering report. Therefore, the conclusions of the Malouf Engineering report still govern, and the existing foundations are **ADEQUATE** for the proposed loading condition. Therefore, the proposed **AT&T** installation **CAN** be placed as intended.

Prior to the installation of the proposed equipment, the contractor shall verify that all bolted connections are properly fastened from the original installation. Additionally, the contractor shall inspect all existing hardware and verify that it is in its original condition and free of rust and deterioration. If any deficiencies are noted the contractor shall notify the engineer of the conditions prior to installation of any equipment for additional evaluation.

The conclusions reached by Maser Consulting Connecticut in this evaluation are only applicable for the existing structural members supporting the proposed **AT&T** telecommunications installation described herein.

We appreciate the opportunity to be of service on this project. If you should have any questions or require any additional information, please do not hesitate to call our office.

Sincerely,
Maser Consulting Connecticut

Tower Input Data

The main tower is a 3x free standing tower with an overall height of 180.00 ft above the ground line.
The base of the tower is set at an elevation of 0.00 ft above the ground line.
The face width of the tower is 6.56 ft at the top and 24.79 ft at the base.
This tower is designed using the TIA-222-G standard.
The following design criteria apply:

Basic wind speed of 97 mph.
Structure Class II.
Exposure Category B.
Topographic Category 1.
Crest Height 0.00 ft.
Nominal ice thickness of 1.0000 in.
Ice thickness is considered to increase with height.
Ice density of 56 pcf.
A wind speed of 40 mph is used in combination with ice.
Temperature drop of 50 °F.
Deflections calculated using a wind speed of 60 mph.
Weld together tower sections have flange connections..
Connections use galvanized A325 bolts, nuts and locking devices. Installation per TIA/EIA-222 and AISC Specifications..
Tower members are "hot dipped" galvanized in accordance with ASTM A123 and ASTM A153 Standards..
Welds are fabricated with ER-70S-6 electrodes..
A non-linear (P-delta) analysis was used.
Pressures are calculated at each section.
Stress ratio used in tower member design is 1.
Local bending stresses due to climbing loads, feed line supports, and appurtenance mounts are not considered.

Options

Consider Moments - Legs	Distribute Leg Loads As Uniform	Use ASCE 10 X-Brace Ly Rules
Consider Moments - Horizontals	√ Assume Legs Pinned	√ Calculate Redundant Bracing Forces
Consider Moments - Diagonals	√ Assume Rigid Index Plate	√ Ignore Redundant Members in FEA
Use Moment Magnification	√ Use Clear Spans For Wind Area	SR Leg Bolts Resist Compression
√ Use Code Stress Ratios	√ Use Clear Spans For KL/r	All Leg Panels Have Same Allowable
√ Use Code Safety Factors - Guys	Retension Guys To Initial Tension	Offset Girt At Foundation
Escalate Ice	Bypass Mast Stability Checks	√ Consider Feed Line Torque
Always Use Max Kz	Use Azimuth Dish Coefficients	Include Angle Block Shear Check
Use Special Wind Profile	√ Project Wind Area of Appurt.	Use TIA-222-G Bracing Resist. Exemption
Include Bolts In Member Capacity	Autocalc Torque Arm Areas	Use TIA-222-G Tension Splice Exemption
Leg Bolts Are At Top Of Section	Add IBC .6D+W Combination	Poles
√ Secondary Horizontal Braces Leg	√ Sort Capacity Reports By Component	Include Shear-Torsion Interaction
Use Diamond Inner Bracing (4 Sided)	Triangulate Diamond Inner Bracing	√ Always Use Sub-Critical Flow
SR Members Have Cut Ends	Treat Feed Line Bundles As Cylinder	Use Top Mounted Sockets
SR Members Are Concentric

RE: AT&T Wireless Modifications to Telecommunication Facility –
130 Bald Hill Road, Tolland, CT 06084

Dear Mr. Millix:

In order to accommodate technological changes, implement the Uniform Mobile Telecommunications System and enhance system performance in the State of Connecticut, AT&T Wireless ("AT&T") will be changing its equipment configuration at the above referenced telecommunications facility. AT&T Wireless currently maintains six (6) antennas at the 90 foot level of an existing 180 foot tall lattice tower located at 130 Bald Hill Road, in Tolland, CT. The tower is owned by Tolland County Mutual Aid. The property is likewise owned by Tolland County Mutual Aid.

AT&T Wireless now seeks to relocate 3 existing antennas, install 3 additional antennas, install a new DC-12 box, add a new surge suppression dome, remove 3 existing RRU-12 units, relocate 6 existing TMAs, install 6 new RRUs, install 2 new DC cables at the 90-foot level of the tower.

This letter is intended to serve as the required notice to the Tower owner and the property owner. As required by the Regulations of Connecticut State Agencies ("RCSA") section 16-50j-73, the Connecticut Siting Council ("CSC") has been notified of the proposed changes and will review

AT&T's proposal. Please accept this letter as notification under RCSA section 16-50j-73 of construction which constitutes an exempt modification pursuant to RCSA section 16-50j-72(b)(2).

RE: AT&T Wireless Modifications to Telecommunication Facility –
130 Bald Hill Road, Tolland, CT 06084

Dear Ms. Samokar:

In order to accommodate technological changes, implement the Uniform Mobile Telecommunications System and enhance system performance in the State of Connecticut, AT&T Wireless ("AT&T") will be changing its equipment configuration at the above referenced telecommunications facility. AT&T Wireless currently maintains six (6) antennas at the 90 foot level of an existing 180 foot tall lattice tower located at 130 Bald Hill Road, in Tolland, CT. The tower is owned by Tolland County Mutual Aid. The property is likewise owned by Tolland County Mutual Aid.

AT&T Wireless now seeks to relocate 3 existing antennas, install 3 additional antennas, install a new DC-12 box, add a new surge suppression dome, remove 3 existing RRU-12 units, relocate 6 existing TMAs, install 6 new RRUs, install 2 new DC cables at the 90-foot level of the tower.

This letter is intended to serve as the required notice to the Town of Tolland Planning Office. As required by the Regulations of Connecticut State Agencies ("RCSA") section 16-50j-73, the Connecticut Siting Council ("CSC") has been notified of the proposed changes and will review

AT&T's proposal. Please accept this letter as notification under RCSA section 16-50j-73 of construction which constitutes an exempt modification pursuant to RCSA section 16-50j-72(b)(2).

The enclosed letter and enclosures to the CSC fully describes AT&T's proposal for the above referenced site. However, if you have any questions or require any additional information concerning our plans or the CSC procedures, please contact me at 443-677-0144 or contact Melanie Bachman, Acting Executive Director of the CSC at 860-872-2935.

Respectfully submitted,
