- Use of natural gas fuel with ULSD fuel as backup;
- Installation of state-of-the-art air quality emission control technology to substantially reduce air emissions;
- Design of the exhaust stack to increase atmospheric dispersion and reduce potential ground-level air quality impacts to comply with all applicable state and National Ambient Air Quality Standards ("NAAQS");
- Use of an air cooled condenser to eliminate the need for surface water withdrawals
 from Bridgeport Harbor and provide cooling for the steam turbine and eliminate the
 potential for thermal discharge of heated cooling water to Bridgeport Harbor;
- Barge delivery of materials, where practicable, during construction, to reduce truck travel through nearby residential neighborhoods. Delivery of ULSD by barge is anticipated; and
- Design and operation of the Facility to meet applicable State of Connecticut and City of Bridgeport noise regulations.

Access to the Site is limited for security reasons with routine traffic entering through the gate at Atlantic Street. Vehicle traffic (including heavy trucks and employee commuters) accessing the Site will most likely use Interstate 95 at Interchanges 26 or 27. Traffic accessing the site and traveling on I-95 northbound will exit the Interstate and enter the industrial area by heading south on either Lafayette Street or Broad Street. In addition, traffic traveling on I-95 southbound to the Site will exit at Interchanges 26 or 27 and head south on Broad Street before entering the heavy industrial area. During the construction phase of this project, truck traffic could potentially increase along Broad Street, Lafayette Street and Atlantic Avenue depending on which direction vehicles will travel to and from the Site.
